awplus(config-router)# neighbor 10.10.10.72 peer-group group1
awplus(config-router)# neighbor group1 override-capability
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 override-capability
```

**Examples**  
**[BGP4+]**

```
awplus# configure terminal
awplus(config)# router bgp 12
awplus(config-router)# neighbor 2001:0db8:010d::1
override-capability
awplus# configure terminal
awplus(config)# router bgp 12
awplus(config-router)# no neighbor 2001:0db8:010d::1
override-capability
awplus# configure terminal
awplus(config)# router bgp 12
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
peer-group group1
awplus(config-router-af)# exit
awplus(config-router)# neighbor group1 override-capability
awplus# configure terminal
awplus(config)# router bgp 12
awplus(config-router)# no neighbor group1 override-capability
```

**Related commands** [neighbor peer-group \(add a neighbor\)](#)  
[neighbor route-map](#)

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.7-2.4: BGP support added for IE300 series

# neighbor passive

**Overview** Use this command to configure the local BGP or BGP4+ router to be passive with regard to the specified BGP or BGP4+ neighbor. This has the effect that the BGP or BGP4+ router will not attempt to initiate connections to this BGP or BGP4+ neighbor, but will accept incoming connection attempts from the BGP or BGP4+ neighbor.

Use the **no** variant of this command to disable this function.

**Syntax** `neighbor <neighborid> passive`  
`no neighbor <neighborid> passive`

| Parameter    | Description  |
|--------------|--|
| <neighborid> | {<ip-address>   <ipv6-addr>   <peer-group>}  |
| <ip-address> | Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.   |
| <ipv6-addr>  | Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.  |
| <peer-group> | Enter the name of an existing peer-group. For information on how to create peer groups, refer to the <a href="#">neighbor peer-group (add a neighbor)</a> command, and <a href="#">neighbor route-map</a> command. When this parameter is used with this command, the command applies on all peers in the specified group. |

**Mode [BGP]** Router Configuration or IPv4 Address Family Configuration

**Mode [BGP4+]** Router Configuration

**Examples [BGP]**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.0.72 passive
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.0.72 passive
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.72 remote-as 10
awplus(config-router)# neighbor 10.10.10.72 peer-group group1
awplus(config-router)# neighbor group1 passive
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 passive
```

**Examples [BGP4+]**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 2001:0db8:010d::1 passive
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 2001:0db8:010d::1 passive
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
peer-group group1
awplus(config-router-af)# exit
awplus(config-router)# neighbor group1 passive
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 passive
```

**Related commands** [neighbor peer-group \(add a neighbor\)](#)  
[neighbor route-map](#)

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.7-2.1: BGP support added for x510 and x550 series

## Version 5.4.7-2.4: BGP support added for IE300 series

# neighbor password

**Overview** Use this command to enable MD5 authentication on a TCP connection between BGP and BGP4+ neighbors. No authentication is applied by default. To setup authentication for the session, you must first apply authentication on each connected peer for the session.

Use the **no** variant of this command to disable this function.

**Syntax [BGP]** `neighbor {<ip-address>|<peer-group-name>} password <password>`  
`no neighbor {<ip-address>|<peer-group-name>} password`  
`[<password>]`

**Syntax [BGP4+]** `neighbor {<ipv6-addr>|<peer-group-name>} password <password>`  
`no neighbor {<ipv6-addr>|<peer-group-name>} password`  
`[<password>]`

| Parameter                            | Description   |
|--------------------------------------|---|
| <code>&lt;ip-address&gt;</code>      | Specifies the IP address of the BGP neighbor, in A.B.C.D format.  |
| <code>&lt;ipv6-addr&gt;</code>       | Specifies the IPv6 address of the BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.  |
| <code>&lt;peer-group-name&gt;</code> | Name of an existing peer-group. When this parameter is used with this command, the command applies on all peers in the specified group. |
| <code>&lt;password&gt;</code>        | An alphanumeric string of characters to be used as password.  |

**Default** No authentication is applied by default.

**Mode [BGP]** Router Configuration or IPv4 Address Family Configuration

**Mode [BGP4+]** Router Configuration

**Usage notes** When using the `<peer-group-name>` parameter with this command (to apply this command to all peers in the group), see the related commands [neighbor peer-group \(add a neighbor\)](#) and [neighbor route-map](#) for information about how to create peer groups first.

**Examples [BGP]** This example specifies the encryption type and the password 'manager' for the neighbor 10.10.10.1:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.10.1 password manager
```

This example removes the password set for the neighbor 10.10.10.1:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.10.1 password
```

This example specifies the encryption type and the password 'manager' for the neighbor peer group named 'group1':

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.1 remote-as 10
awplus(config-router)# neighbor 10.10.10.1 peer-group group1
awplus(config-router)# neighbor group1 password manager
```

This example removes the password set for the neighbor peer group named group1:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 password
```

**Examples  
[BGP4+]**

This example specifies the encryption type and the password 'manager' for the neighbor 2001:0db8:010d::1:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor password manager
2001:0db8:010d::1
```

This example removes the password set for the neighbor 2001:0db8:010d::1:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor password 2001:0db8:010d::1
```

This example specifies the encryption type and the password 'manager' for the neighbor peer group named group1:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor remote-as 102001:0db8:010d::1
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor peer-group group1
2001:0db8:010d::1
awplus(config-router-af)# exit
awplus(config-router)# neighbor group1 password manager
```

This example removes the password set for the neighbor peer group named 'group1':

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 password
```

**Related commands** [neighbor peer-group \(add a neighbor\)](#)

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.6-2.1: VRF-lite support added to BGP for AR-series products  
Version 5.4.7-2.1: BGP support added for x510 and x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

# neighbor peer-group (add a neighbor)

**Overview** Use this command to add a BGP or a BGP4+ neighbor to an existing peer-group. Use the **no** variant of this command to disable this function.

**Syntax [BGP]** `neighbor <ip-address> peer-group <peer-group>`  
`no neighbor <ip-address> peer-group <peer-group>`

**Syntax [BGP4+]** `neighbor <ipv6-addr> peer-group <peer-group>`  
`no neighbor <ipv6-addr> peer-group <peer-group>`

| Parameter                       | Description   |
|---------------------------------|---|
| <code>&lt;ip-address&gt;</code> | Specify the IPv4 address of the BGP neighbor, entered in the format A.B.C.D.  |
| <code>&lt;ipv6-addr&gt;</code>  | Specify the IPv6 address of the BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.  |
| <code>&lt;peer-group&gt;</code> | Enter the name of the peer-group. When this parameter is used with this command, the command applies on all peers in the specified group. |

**Mode [BGP]** Router Configuration or IPv4 Address Family Configuration

**Mode [BGP4+]** IPv6 Address Family Configuration

**Usage** Use this command to add neighbors with the same update policies to a peer group. This facilitates the updates of various policies, such as, distribute and filter lists. The peer-group is then configured easily with many of the neighbor commands. Any changes made to the peer group affect all members.

To create a peer-group use the [neighbor port](#) command and then use this command to add neighbors to the group.

**Examples [BGP]** This example shows a new peer-group `group1` and the addition of a neighbor `10.10.0.63` to the group.

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.0.63 peer-group group1
```

This example shows a new peer-group `group1` and the removal of a neighbor `10.10.0.63` to the group.

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# no neighbor 10.10.0.63 peer-group group1
```

**Examples [BGP4+]** This example shows a new peer-group `group1` and the addition of a neighbor `2001:0db8:010d::1` to the group.

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor peer-group
group1 2001:0db8:010d::1
```

This example shows a new peer-group `group1` and the removal of a neighbor `2001:0db8:010d::1` to the group.

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# address-family ipv6
awplus(config-router-af)# no neighbor peer-group
group1 2001:0db8:010d::1
```

**Related commands** [neighbor peer-group \(create a peer-group\)](#)

# neighbor peer-group (create a peer-group)

**Overview** Use this command to create a peer-group for BGP and BGP4+. Use the **no** variant of this command to disable this function.

**Syntax** `neighbor <peer-group> peer-group`  
`no neighbor <peer-group> peer-group`

| Parameter                       | Description                       |
|---------------------------------|-----------------------------------|
| <code>&lt;peer-group&gt;</code> | Enter the name of the peer-group. |

**Mode [BGP]** Router Configuration or IPv4 Address Family Configuration

**Mode [BGP4+]** Router Configuration

**Usage notes** Neighbors with the same update policies are grouped into peer groups. This facilitates the updates of various policies, such as, distribute and filter lists. The peer-group is then configured easily with many of the neighbor commands. Any changes made to the peer group affect all members. Use this command to create a peer-group, then use the [neighbor peer-group \(add a neighbor\)](#) command to add neighbors to the group.

**Examples**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 peer-group
```

Version 5.4.7-2.1: BGP support added for x510 and x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

# neighbor port

**Overview** Use this command to specify the TCP port to which packets are sent to on a BGP or a BGP4+ neighbor. TCP port 179 is the default port used to connect BGP and BGP4+ peers. You can specify a different destination port for the TCP session with this command.

Use the **no** variant of this command to reset the port number back to the default value (TCP port 179).

**Syntax [BGP]** `neighbor <neighborid> port <portnum>`  
`no neighbor <neighborid> port [<portnum>]`

| Parameter                       | Description  |
|---------------------------------|--|
| <code>&lt;neighborid&gt;</code> | { <code>&lt;ip-address&gt;</code>   <code>ipv6-addr</code> }   <code>&lt;peer-group&gt;</code> }   |
| <code>&lt;ip-address&gt;</code> | Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.   |
| <code>&lt;ipv6-addr&gt;</code>  | Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.  |
| <code>&lt;peer-group&gt;</code> | Enter the name of an existing peer-group. For information on how to create peer groups, refer to the <a href="#">neighbor peer-group (add a neighbor)</a> command, and <a href="#">neighbor route-map</a> command. When this parameter is used with this command, the command applies on all peers in the specified group. |
| <code>&lt;portnum&gt;</code>    | <code>&lt;0-65535&gt;</code> Specifies the TCP port number.  |

**Default** TCP port 179 is the default port used to connect BGP and BGP4+ peers.

**Mode [BGP]** Router Configuration or IPv4 Address Family Configuration

**Mode [BGP4+]** Router Configuration

**Examples [BGP]**

```
awplus# configure terminal
awplus(config)# router bgp 12
awplus(config-router)# neighbor 10.10.10.10 port 643
awplus# configure terminal
awplus(config)# router bgp 12
awplus(config-router)# no neighbor 10.10.10.10 port 643
awplus# configure terminal
awplus(config)# router bgp 12
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.1 remote-as 10
awplus(config-router)# neighbor 10.10.10.1 peer-group group1
awplus(config-router)# neighbor group1 port 643
awplus# configure terminal
awplus(config)# router bgp 12
awplus(config-router)# no neighbor group1 port 643
```

**Examples [BGP4+]**

```
awplus# configure terminal
awplus(config)# router bgp 12
awplus(config-router)# neighbor port 6432001:0db8:010d::1
awplus# configure terminal
awplus(config)# router bgp 12
awplus(config-router)# no neighbor port 6432001:0db8:010d::1
awplus# configure terminal
awplus(config)# router bgp 12
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as 10
awplus(awplus-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
peer-group group1
awplus(config-router-af)# exit
awplus(config-router)# neighbor group1 port 643
awplus# configure terminal
awplus(config)# router bgp 12
awplus(config-router)# no neighbor group1 port 643
```

**Related commands** [neighbor peer-group \(add a neighbor\)](#)  
[neighbor route-map](#)

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.7-2.1: BGP support added for x510 and x550 series

## Version 5.4.7-2.4: BGP support added for IE300 series

# neighbor prefix-list

**Overview** Use this command to distribute BGP and BGP4+ neighbor information as specified in a prefix list.

Use the **no** variant of this command to remove an entry.

**Syntax** `neighbor <neighborid> prefix-list <listname> {in|out}`  
`no neighbor <neighborid> prefix-list <listname> {in|out}`

| Parameter                       | Description  |
|---------------------------------|--|
| <code>&lt;neighborid&gt;</code> | <code>&lt;ip-address&gt;</code>   <code>&lt;ipv6-addr&gt;</code>   <code>&lt;peer-group&gt;</code>   |
|                                 | <code>&lt;ip-address&gt;</code> Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.   |
|                                 | <code>&lt;ipv6-addr&gt;</code> Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.   |
|                                 | <code>&lt;peer-group&gt;</code> Enter the name of an existing peer-group. For information on how to create peer groups, refer to the <a href="#">neighbor peer-group (add a neighbor)</a> command, and <a href="#">neighbor route-map</a> command. When this parameter is used with this command, the command applies on all peers in the specified group. |
| <code>&lt;listname&gt;</code>   | The name of an IP prefix list.   |
| <code>in</code>                 | Specifies that the IP prefix list applies to incoming advertisements.  |
| <code>out</code>                | Specifies that the IP prefix list applies to outgoing advertisements.  |

**Mode [BGP]** Router Configuration or IPv4 Address Family Configuration

**Mode [BGP4+]** IPv6 Address Family Configuration

**Usage notes** Use this command to specify a prefix list for filtering BGP or BGP4+ advertisements. Filtering by prefix list matches the prefixes of routes with those listed in the prefix list. If there is a match, the route is used. An empty prefix list permits all prefixes. If a given prefix does not match any entries of a prefix list, the route is denied access.

The router begins the search at the top of the prefix list, with the sequence number 1. Once a match or deny occurs, the router does not need to go through the rest of the prefix list. For efficiency the most common matches or denials are listed at the top.

The **neighbor distribute-list** command is an alternative to the **neighbor prefix-list** command and only one of them can be used for filtering to the same neighbor in any direction.

**Examples [BGP]**

```
awplus# configure terminal
awplus(config)# ip prefix-list list1 deny 30.0.0.0/24
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.10.1 prefix-list list1 in
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.10.1 prefix-list list1
in
awplus# configure terminal
awplus(config)# ip prefix-list list1 deny 30.0.0.0/24
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv4
awplus(config-router-af)# neighbor 10.10.10.1 prefix-list list1
in
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv4
awplus(config-router-af)# no neighbor 10.10.10.1 prefix-list
list1 in
awplus# configure terminal
awplus(config)# ip prefix-list list1 deny 30.0.0.0/24
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.1 remote-as 10
awplus(config-router)# neighbor 10.10.10.1 peer-group group1
awplus(config-router)# neighbor group1 prefix-list list1 in
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 prefix-list list1 in
```

**Examples**  
**[BGP4+]**

```
awplus# configure terminal
awplus(config)# ipv6 prefix-list list1 deny
2001:0db8:010d::1/128

awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:: prefix-list
list1 in

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# no neighbor 2001:0db8:: prefix-list
list1 in

awplus# configure terminal
awplus(config)# ip prefix-list list1 deny 2001:0db8:010d::1/128
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
peer-group group1
awplus(config-router-af)# neighbor group1 prefix-list list1 in
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# no neighbor group1 prefix-list list1
in
```

# neighbor remote-as

**Overview** Use this command to configure an internal or external BGP or BGP4+ (iBGP or eBGP) peering relationship with another router.

Use the **no** variant of this command to remove a previously configured BGP or BGP4+ peering relationship.

**Syntax** `neighbor <neighborid> remote-as <as-number>`  
`no neighbor <neighborid> remote-as <as-number>`

| Parameter                       | Description  |
|---------------------------------|--|
| <code>&lt;neighborid&gt;</code> | <code>{ &lt;ip-address&gt;   ipv6-addr   &lt;peer-group&gt; }</code>   |
| <code>&lt;ip-address&gt;</code> | Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.   |
| <code>&lt;ipv6-addr&gt;</code>  | Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.  |
| <code>&lt;peer-group&gt;</code> | Enter the name of an existing peer-group. For information on how to create peer groups, refer to the <a href="#">neighbor peer-group (add a neighbor)</a> command, and <a href="#">neighbor route-map</a> command. When this parameter is used with this command, the command applies on all peers in the specified group. |
| <code>&lt;as-number&gt;</code>  | <code>&lt;1-4294967295&gt;</code> Neighbor's Autonomous System (AS) number.  |

**Mode [BGP]** Router Configuration or IPv4 Address Family Configuration

**Mode [BGP4+]** Router Configuration

**Usage notes** This command is used to configure iBGP and eBGP peering relationships with other BGP or BGP4+ neighbors. A peer-group support of this command is configured only after creating a specific peer-group. Use the **no** variant of this command to remove a previously configured BGP peering relationship.

**Examples [BGP]** To configure a BGP peering relationship from the neighbor with the IPv4 address 10.10.0.73 with another router:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.0.73 remote-as 10
```

To remove a configured BGP peering relationship from the neighbor with the IPv4 address 10.10.0.73 from another router:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.0.73 remote-as 10
```

To configure a BGP peering relationship from the neighbor with the peer group named group1 with another router:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.1 remote-as 10
awplus(config-router)# neighbor 10.10.10.1 peer-group group1
awplus(config-router)# neighbor group1 remote-as 10
```

To remove a configured BGP peering relationship from the neighbor with the peer group named group1 with another router:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 remote-as 10
```

**Examples  
[BGP4+]**

To configure a BGP4+ peering relationship with another router:

```
awplus# configure terminal
awplus(config)# router bgp 11
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as 345
```

To remove a configured BGP4+ peering relationship from another router:

```
awplus# configure terminal
awplus(config)# router bgp 11
awplus(config-router)# no neighbor 2001:0db8:010d::1 remote-as 345
```

To configure a BGP4+ peering relationship from the neighbor with the peer group named group1 with another router:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
peer-group group1
awplus(config-router-af)# exit
awplus(config-router)# neighbor group1 remote-as 10
```

To remove a configured BGP4+ peering relationship from the neighbor with the peer group named group1 with another router:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 remote-as 10
```

**Command  
changes**

Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.6-2.1: VRF-lite support added to BGP for AR-series products

Version 5.4.7-2.1: BGP support added for x510 and x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# neighbor remove-private-AS (BGP only)

**Overview** Use this command to remove the private Autonomous System (AS) number from external outbound updates. Use the **no** variant of this command to revert to the default (disabled).

**Syntax** `neighbor <neighborid> remove-private-AS`  
`no neighbor <neighborid> remove-private-AS`

| Parameter    | Description   |
|--------------|---|
| <neighborid> | { <ip-address>   <tag> }  |
| <ip-address> | The address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.  |
| <tag>        | Name of an existing peer-group. For information on how to create peer groups, refer to the <a href="#">neighbor peer-group (add a neighbor)</a> command, and <a href="#">neighbor remote-as</a> command. When this parameter is used with a command, the command applies on all peers in the specified group. |

**Default** This command is disabled by default.

**Mode** Router Configuration or IPv4 Address Family Configuration

**Usage notes** The private AS numbers range from <64512-65535>. Private AS numbers are not advertised to the Internet. This command is used with external BGP peers only. The router removes the AS numbers only if the update includes private AS numbers. If the update includes both private and public AS numbers, the system treats it as an error.

This command removes private AS numbers for BGP in Router Configuration mode. This command is not supported for BGP4+ in IPv6 Address Family Configuration mode. This command removes a private AS number and makes an update packet with a public AS number as the AS path attribute. So only public AS numbers are entered in Internet BGP routing tables, and private AS numbers are not entered in Internet BGP tables.

For the filtering to apply, both peering devices must be set to use either 2-byte or extended 4- byte ASN (with the same ASN type set on both peers). For example, if a device (which defaults to use a 4-byte ASN), is peered with a device that defaults to a 2-byte ASN, then the device using a 2-byte ASN device also needs to be configured with the command **bgp extended-asn-cap** for the filtering to apply.

**Examples**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.0.63 remove-private-AS
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.0.63 remove-private-AS
```

**Related commands** [show ip bgp \(BGP only\)](#)

**Command changes**

- Added to AlliedWare Plus prior to 5.4.6-1
- Version 5.4.7-2.1: BGP support added for x510 and x550 series
- Version 5.4.7-2.4: BGP support added for IE300 series

# neighbor restart-time

**Overview** Use this command to set a different restart-time other than the global restart-time configured using the **bgp graceful-restart** command for BGP and BGP4+.

Use the **no** variant of this command to restore the device to its default state (see the default value of the **bgp graceful-restart** command).

**Syntax** `neighbor <neighborid> restart-time <delay-value>`  
`no neighbor <neighborid> restart-time <delay-value>`

| Parameter                        | Description  |
|----------------------------------|--|
| <code>&lt;neighborid&gt;</code>  | { <code>&lt;ip-address&gt;</code>   <code>&lt;ipv6-addr&gt;</code>   <code>&lt;peer-group&gt;</code> }   |
| <code>&lt;ip-address&gt;</code>  | Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.   |
| <code>&lt;ipv6-addr&gt;</code>   | Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.  |
| <code>&lt;peer-group&gt;</code>  | Enter the name of an existing peer-group. For information on how to create peer groups, refer to the <a href="#">neighbor peer-group (add a neighbor)</a> command, and <a href="#">neighbor route-map</a> command. When this parameter is used with this command, the command applies on all peers in the specified group. |
| <code>&lt;delay-value&gt;</code> | <code>&lt;1-3600&gt;</code> Delay value in seconds.  |

**Mode [BGP]** Router Configuration or IPv4 Address Family Configuration

**Mode [BGP4+]** Router Configuration

**Usage** This command takes precedence over the restart-time value specified using the **bgp graceful-restart** command.

The restart-time value is the maximum time that a graceful-restart neighbor waits to come back up after a restart. The default is 120 seconds.

Make sure that the restart time specified using this command does not exceed the stalepath-time specified in the Router Configuration mode.

**Examples [BGP]**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.10.1 restart-time 45
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.10.1 restart-time 45
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.1 remote-as 10
awplus(config-router)# neighbor 10.10.10.1 peer-group group1
awplus(config-router)# neighbor group1 restart-time 45
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 restart-time 45
```

**Examples [BGP4+]**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 2001:0db8:010d::1 restart-time 45
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 2001:0db8:010d::1 restart-time 45
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1 peer-group group1
awplus(config-router-af)# exit
awplus(config-router)# neighbor group1 restart-time 45
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 restart-time 45
```

**Related commands**

# neighbor route-map

**Overview** Use this command to apply a route map to incoming or outgoing routes for BGP or BGP4+.

Use the **no** variant of this command to remove a route map from a BGP or BGP4+ route.

**Syntax** `neighbor <neighborid> route-map <mapname> {in|out}`  
`no neighbor <neighborid> route-map <mapname> {in|out}`

| Parameter    | Description  |
|--------------|--|
| <neighborid> | {<ip-address>   ipv6-addr>   <peer-group>}   |
| <ip-address> | Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.   |
| <ipv6-addr>  | Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.  |
| <peer-group> | Enter the name of an existing peer-group. For information on how to create peer groups, refer to the <a href="#">neighbor peer-group (add a neighbor)</a> command, and <a href="#">neighbor route-map</a> command. When this parameter is used with this command, the command applies on all peers in the specified group. |
| <mapname>    | Specifies name of the route-map.   |
| in           | Specifies that the access list applies to incoming advertisements.   |
| out          | Specifies that the access list applies to outgoing advertisements.   |

**Mode [BGP]** Router Configuration or IPv4 Address Family Configuration

**Mode [BGP4+]** IPv6 Address Family Configuration

**Usage notes** Use the **neighbor route-map** command to filter updates and modify attributes. A route map is applied to inbound or outbound updates. Only the routes that pass the route map are sent or accepted in updates.

**Examples [BGP]** The following example shows the configuration of the route-map name **rmap2** and then the use of this map name in the **neighbor route-map** command for the neighbor with the IPv4 address 10.10.10.1 in the Router Configuration mode.

```
awplus# configure terminal
awplus(config)# route-map rmap2 permit 6
awplus(config-route-map)# match origin incomplete
awplus(config-route-map)# set metric 100
awplus(config-route-map)# exit
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.10.1 route-map rmap2 in
```

The following example shows the removal of the route-map name **rmap2** in the **neighbor route-map** command for the neighbor with the IPv4 address 10.10.10.1 in the Router Configuration mode.

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.10.1 route-map rmap2
in
```

The following example shows the configuration of the route-map name **rmap2** and then the use of this map name in the **neighbor route-map** command for the neighbor with the IPv4 address 10.10.10.1 in the IPv4 Address Family Configuration mode.

```
awplus# configure terminal
awplus(config)# route-map rmap2 permit 6
awplus(config-route-map)# match origin incomplete
awplus(config-route-map)# set metric 100
awplus(config-route-map)# exit
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv4
awplus(config-router-af)# neighbor 10.10.10.1 route-map rmap2
in
```

The following example shows the removal of the route-map name **rmap2** in the **neighbor route-map** command for the neighbor with the IPv4 address 10.10.10.1 in the IPv4 Address Family Configuration mode.

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv4
awplus(config-router-af)# no neighbor 10.10.10.1 route-map
rmap2 in
```

The following example shows the configuration of the route-map name **rmap2** and then the use of this map name in the **neighbor route-map** command for the neighbor with the peer group named group1 in the Router Configuration mode.

```
awplus# configure terminal
awplus(config)# route-map rmap2 permit 6
awplus(config-route-map)# match origin incomplete
awplus(config-route-map)# set metric 100
awplus(config-route-map)# exit
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.1 remote-as 10
awplus(config-router)# neighbor 10.10.10.1 peer-group group1
awplus(config-router)# neighbor group1 route-map rmap2 in
```

The following example shows the removal the route-map name **rmap2** in the **neighbor route-map** command for the neighbor with the peer group named group1 in the Router Configuration mode.

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 route-map rmap2 in
```

**Examples**  
**[BGP4+]**

The following example shows the configuration of the route-map name **rmap2** and then the use of this map name in the **neighbor route-map** command for the neighbor with the IPv6 address 2001:0db8:010d::1 in the IPv6 Address Family Configuration mode.

```
awplus# configure terminal
awplus(config)# route-map rmap2 permit 6
awplus(config-route-map)# match origin incomplete
awplus(config-route-map)# set metric 100
awplus(config-route-map)# exit
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1 route-map
rmap2 in
```

The following example shows the removal of the route-map name **rmap2** in the **neighbor route-map** command for the neighbor with the IPv6 address 2001:0db8:010d::1 in the IPv6 Address Family Configuration mode.

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# no neighbor 2001:0db8:010d::1
route-map rmap2 in
```

The following example shows the configuration of the route-map name **rmap2** and then the use of this map name in the **neighbor route-map** command for the neighbor with the peer group named group1 in the Router Configuration mode.

```
awplus# configure terminal
awplus(config)# route-map rmap2 permit 6
awplus(config-route-map)# match origin incomplete
awplus(config-route-map)# set metric 100
awplus(config-route-map)# exit
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
peer-group group1
awplus(config-router-af)# neighbor group1 route-map rmap2 in
```

The following example shows the removal the route-map name **rmap2** in the **neighbor route-map** command for the neighbor with the peer group named group1 in the Router Configuration mode.

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# no neighbor group1 route-map rmap2 in
```

**Related  
commands**

[address-family](#)  
[neighbor peer-group \(add a neighbor\)](#)  
[route-map](#)

**Command  
changes**

Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.7-2.1: BGP support added for x510 and x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

# neighbor route-reflector-client (BGP only)

**Overview** Use this command to configure the router as a BGP route reflector and configure the specified neighbor as its client.

Use the **no** variant of this command to indicate that the neighbor is not a client.

**Syntax** `neighbor <neighborid> route-reflector-client`  
`no neighbor <neighborid> route-reflector-client`

| Parameter    | Description  |
|--------------|--|
| <neighborid> | {<ip-address>   <peer-group>}  |
| <ip-address> | The address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.   |
| <peer-group> | Enter the name of an existing peer-group. For information on how to create peer groups, refer to the <a href="#">neighbor peer-group (add a neighbor)</a> command, and <a href="#">neighbor route-map</a> command. When this parameter is used with this command, the command applies on all peers in the specified group. |

**Mode** Router Configuration or IPv4 Address Family Configuration

**Usage notes** Route reflectors are a solution for the explosion of iBGP peering within an autonomous system. By route reflection the number of iBGP peers within an AS is reduced. Use the **neighbor route-reflector-client** command to configure the local router as the route reflector and specify neighbors as its client.

An AS can have more than one route reflector. One route reflector treats the other route reflector as another iBGP speaker.

In the following configuration, Router1 is the route reflector for clients 3.3.3.3 and 2.2.2.2; it also has a non-client peer 6.6.6.6:

```
Router1#  
router bgp 200  
neighbor 3.3.3.3 remote-as 200  
neighbor 3.3.3.3 route-reflector-client  
neighbor 2.2.2.2 remote-as 200  
neighbor 2.2.2.2 route-reflector-client  
neighbor 6.6.6.6 remote-as 200
```

**Examples**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.0.72
route-reflector-client

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.0.72
route-reflector-client
```

**Command changes**

# neighbor route-server-client (BGP only)

**Overview** Use this command to specify the peer as route server client.  
Use the **no** variant of this command to disable this function.

**Syntax** neighbor <neighborid> route-server-client  
no neighbor <neighborid> route-server-client

| Parameter    | Description  |
|--------------|--|
| <neighborid> | {<ip-address> <peer-group>}  |
| <ip-address> | The address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.   |
| <peer-group> | Enter the name of an existing peer-group. For information on how to create peer groups, refer to the <a href="#">neighbor peer-group (add a neighbor)</a> command, and <a href="#">neighbor route-map</a> command. When this parameter is used with this command, the command applies on all peers in the specified group. |

**Mode** Router Configuration

**Examples**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.0.72 route-server-client
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.0.72
route-server-client
```

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.7-2.1: BGP support added for x510 and x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

# neighbor send-community

**Overview** Use this command to specify that a community attribute should be sent to a BGP or BGP4+ neighbor.

Use the **no** variant of this command to remove the entry for the community attribute.

**Syntax** `neighbor <neighborid> send-community {both|extended|standard}`  
`no neighbor <neighborid> send-community {both|extended|standard}`

| Parameter    | Description  |
|--------------|--|
| <neighborid> | {<ip-address>   <ipv6-addr>   <peer-group>}  |
| <ip-address> | Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.   |
| <ipv6-addr>  | Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.  |
| <peer-group> | Enter the name of an existing peer-group. For information on how to create peer groups, refer to the <a href="#">neighbor peer-group (add a neighbor)</a> command, and <a href="#">neighbor route-map</a> command. When this parameter is used with this command, the command applies on all peers in the specified group. |
| both         | Sends Standard and Extended Community attributes. Specifying this parameter with the <b>no</b> variant of this command results in no standard or extended community attributes being sent.   |
| extended     | Sends Extended Community attributes. Specifying this parameter with the <b>no</b> variant of this command results in no extended community attributes being sent.  |
| standard     | Sends Standard Community attributes. Specifying this parameter with the <b>no</b> variant of this command results in no standard community attributes being sent.  |

**Default** Both **standard** and **extended** community attributes are sent to a neighbor.

**Mode [BGP]** Router Configuration or IPv4 Address Family Configuration

**Mode [BGP4+]** Router Configuration and IPv6 Address Family Configuration

**Usage notes** This command is used to specify a community attribute to be sent to a neighbor. The community attribute groups destinations in a certain community and applies routing decisions according to those communities. On receiving community attributes the router reannounces them to the neighbor. Only when the **no**

parameter is used with this command the community attributes are not reannounced to the neighbor.

By default, both **standard** and **extended** community attributes are sent to a neighbor.

**Examples [BGP]**

```
awplus# configure terminal
awplus(config)# bgp config-type standard
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.0.72 send-community
extended

awplus# configure terminal
awplus(config)# bgp config-type standard
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.0.72 send-community
extended

awplus# configure terminal
awplus(config)# bgp config-type standard
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv4
awplus(config-router-af)# neighbor 10.10.0.72 send-community
extended

awplus# configure terminal
awplus(config)# bgp config-type standard
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv4
awplus(config-router-af)# no neighbor 10.10.0.72 send-community
extended

awplus# configure terminal
awplus(config)# bgp config-type standard
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.1 remote-as 10
awplus(config-router)# neighbor 10.10.10.1 peer-group group1
awplus(config-router)# neighbor group1 send-community extended
```

**Examples**  
**[BGP4+]**

```
awplus# configure terminal
awplus(config)# bgp config-type standard
awplus(config)# router bgp 10
awplus(config-router)# neighbor 2001:0db8:010d::1
send-community extended
awplus# configure terminal
awplus(config)# bgp config-type standard
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 2001:0db8:010d::1
send-community extended
awplus# configure terminal
awplus(config)# bgp config-type standard
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
send-community extended
awplus# configure terminal
awplus(config)# bgp config-type standard
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# no neighbor 2001:0db8:010d::1
send-community extended
awplus# configure terminal
awplus(config)# bgp config-type standard
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
peer-group group1
awplus(config-router-af)# exit
awplus(config-router)# neighbor group1 send-community extended
awplus# configure terminal
awplus(config)# bgp config-type standard
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 send-community
extended
```

# neighbor shutdown

**Overview** Use this command to disable a peering relationship with a BGP or BGP4+ neighbor. Use the **no** variant of this command to re-enable the BGP or BGP4+ neighbor.

**Syntax** neighbor <neighborid> shutdown  
no neighbor <neighborid> shutdown

| Parameter    | Description  |
|--------------|--|
| <neighborid> | { <ip-address>   <peer-group> }  |
| <ip-address> | Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.   |
| <ipv6-addr>  | Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.  |
| <peer-group> | Enter the name of an existing peer-group. For information on how to create peer groups, refer to the <a href="#">neighbor peer-group (add a neighbor)</a> command, and <a href="#">neighbor route-map</a> command. When this parameter is used with this command, the command applies on all peers in the specified group. |

**Mode [BGP]** Router Configuration or IPv4 Address Family Configuration

**Mode [BGP4+]** Router Configuration

**Usage notes** This command shuts down any active session for the specified BGP or BGP4+ neighbor and clears all related routing data.

**Examples [BGP]**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.0.72 shutdown
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.0.72 shutdown
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 shutdown
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 shutdown
```

**Examples**  
**[BGP4+]**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 2001:0db8:010d::1 shutdown
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 2001:0db8:010d::1 shutdown
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 shutdown
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 shutdown
```

Version 5.4.7-2.4: BGP support added for IE300 series

# neighbor soft-reconfiguration inbound

**Overview** Use this command to configure the device to start storing all updates from the BGP or BGP4+ neighbor, without any consideration of any inward route filtering policy that might be applied to the connection with this BGP or BGP4+ neighbor. This is so that the full set of the neighbor's updates are available locally to be used in a soft-reconfiguration event.

You may need to apply this older method of clearing routes if the peer does not support route refresh.

Use the **no** variant of this command to disable this function for a BGP or BGP4+ neighbor.

**Syntax** `neighbor <neighborid> soft-reconfiguration inbound`  
`no neighbor <neighborid> soft-reconfiguration inbound`

| Parameter    | Description  |
|--------------|--|
| <neighborid> | { <ip-address>   <ipv6-addr>   <peer-group> }  |
| <ip-address> | Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.   |
| <ipv6-addr>  | Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.  |
| <peer-group> | Enter the name of an existing peer-group. For information on how to create peer groups, refer to the <a href="#">neighbor peer-group (add a neighbor)</a> command, and <a href="#">neighbor route-map</a> command. When this parameter is used with this command, the command applies on all peers in the specified group. |

**Mode [BGP]** Router Configuration or IPv4 Address Family Configuration

**Mode [BGP4+]** IPv6 Address Family Configuration

**Usage** Use this command to store updates for inbound soft reconfiguration. Soft-reconfiguration may be used in lieu of BGP route refresh capability. Using this command enables local storage of all the received routes and their attributes. This requires additional memory. When a soft reset (inbound) is done on this neighbor, the locally stored routes are re-processed according to the inbound policy. The BGP neighbor connection is not affected.

**Examples [BGP]**

```
awplus# configure terminal
awplus(config)# router bgp 12
awplus(config-router)# neighbor 10.10.10.10
soft-reconfiguration inbound
awplus# configure terminal
awplus(config)# router bgp 12
awplus(config-router)# no neighbor 10.10.10.10
soft-reconfiguration inbound
awplus# configure terminal
awplus(config)# router bgp 12
awplus(config-router)# address-family ipv4
awplus(config-router-af)# neighbor 10.10.10.10 soft-reconfiguration inbound
awplus# configure terminal
awplus(config)# router bgp 12
awplus(config-router)# address-family ipv4
awplus(config-router-af)# no neighbor 10.10.10.10 soft-reconfiguration inbound
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.1 remote-as 10
awplus(config-router)# neighbor 10.10.10.1 peer-group group1
awplus(config-router)# neighbor group1 soft-reconfiguration
inbound
awplus# configure terminal
awplus(config)# router bgp 12
awplus(config-router)# no neighbor group1 soft-reconfiguration
inbound
```

**Examples**  
**[BGP4+]**

```
awplus# configure terminal
awplus(config)# router bgp 12
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
soft-reconfiguration inbound
awplus# configure terminal
awplus(config)# router bgp 12
awplus(config-router)# address-family ipv6
awplus(config-router-af)# no neighbor 2001:0db8:010d::1
soft-reconfiguration inbound
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
peer-group group1
awplus(config-router-af)# neighbor group1 soft-reconfiguration
inbound
awplus# configure terminal
awplus(config)# router bgp 12
awplus(config-router)# address-family ipv6
awplus(config-router-
af)# no neighbor group1 soft-reconfiguration inbound
```

Version 5.4.7-2.4: BGP support added for IE300 series

# neighbor timers

**Overview** Use this command to set the keepalive, holdtime, and connect timers for a specific BGP or BGP4+ neighbor.

Use the **no** variant of this command to clear the timers for a specific BGP or BGP4+ neighbor.

**Syntax** `neighbor <neighborid> timers {<keepalive> <holdtime>|connect <connect>}`

`no neighbor <neighborid> timers [connect]`

| Parameter                       | Description  |
|---------------------------------|--|
| <code>&lt;neighborid&gt;</code> | <code>{&lt;ip-address&gt;   &lt;ipv6-addr&gt;   &lt;peer-group&gt;}</code>   |
| <code>&lt;ip-address&gt;</code> | Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.   |
| <code>&lt;ipv6-addr&gt;</code>  | Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.  |
| <code>&lt;peer-group&gt;</code> | Enter the name of an existing peer-group. For information on how to create peer groups, refer to the <a href="#">neighbor peer-group (add a neighbor)</a> command, and <a href="#">neighbor route-map</a> command. When this parameter is used with this command, the command applies on all peers in the specified group. |
| <code>&lt;keepalive&gt;</code>  | <code>&lt;0-65535&gt;</code> Frequency (in seconds) at which a router sends keepalive messages to its neighbor.  |
| <code>&lt;holdtime&gt;</code>   | <code>&lt;0-65535&gt;</code> Interval (in seconds) after which, on not receiving a keepalive message, the router declares a neighbor dead.   |
| <code>&lt;connect&gt;</code>    | <code>connect &lt;1-65535&gt;</code> Specifies the connect timer in seconds. The default connect timer value is 120 seconds as per RFC 4271. Modify this value as needed for interoperability.   |

**Default** The keepalive timer default is 60 seconds, the holdtime timer default is 90 seconds, and the connect timer default is 120 seconds as per RFC 4271. Holdtime is `keepalive * 3`.

**Mode [BGP]** Router Configuration or IPv4 Address Family Configuration

**Mode [BGP4+]** Router Configuration

**Usage** Keepalive messages are sent by a router to inform another router that the BGP connection between the two is still active. The keepalive interval is the period of time between each keepalive message sent by the router. The holdtime interval is the time the router waits to receive a keepalive message and if it does not receive

a message for this period it declares the neighbor dead. The holdtime value must be 3 times the value of the keepalive value.

**Examples [BGP]**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.10.1 timers 60 120
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.10.1 timers
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.1 remote-as 10
awplus(config-router)# neighbor 10.10.10.1 peer-group group1
awplus(config-router)# neighbor group1 timers 60 120
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 timers
```

**Examples [BGP4+]**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 2001:0db8:010d::1 timers 60 120
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 2001:0db8:010d::1 timers
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
peer-group group1
awplus(config-router-af)# exit
awplus(config-router)# neighbor group1 timers 60 120
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 timers
```

# neighbor transparent-as

**Overview** Use this command to specify not to append your AS path number even if the BGP or BGP4+ peer is an eBGP peer.

Note this command has the same effect as invoking [neighbor attribute-unchanged](#) and specifying the optional **as-path** parameter.

**Syntax** neighbor <neighborid> transparent-as

| Parameter    | Description  |
|--------------|--|
| <neighborid> | {<ip-address>   <ipv6-addr>   <peer-group>}  |
| <ip-address> | Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.   |
| <ipv6-addr>  | Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.  |
| <peer-group> | Enter the name of an existing peer-group. For information on how to create peer groups, refer to the <a href="#">neighbor peer-group (add a neighbor)</a> command, and <a href="#">neighbor route-map</a> command. When this parameter is used with this command, the command applies on all peers in the specified group. |

**Mode** Router Configuration

**Examples [BGP]**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.10.1 transparent-as
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.1 remote-as 10
awplus(config-router)# neighbor 10.10.10.1 peer-group group1
awplus(config-router)# neighbor group1 transparent-as
```

**Examples**  
**[BGP4+]**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 2001:0db8:010d::1
transparent-as
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
peer-group group1
awplus(config-router-af)# exit
awplus(config-router)# neighbor group1 transparent-as
```

# neighbor transparent-nextthop

**Overview** Use this command to keep the next hop value of the route even if the BGP or BGP4+ peer is an eBGP peer.

Note this command has the same effect as invoking [neighbor attribute-unchanged](#) and specifying the optional **next-hop** parameter.

**Syntax** `neighbor <neighborid> transparent-nextthop`

| Parameter    | Description  |
|--------------|--|
| <neighborid> | {<ip-address>   <ipv6-addr>   <peer-group>}  |
| <ip-address> | Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.   |
| <ipv6-addr>  | Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.  |
| <peer-group> | Enter the name of an existing peer-group. For information on how to create peer groups, refer to the <a href="#">neighbor peer-group (add a neighbor)</a> command, and <a href="#">neighbor route-map</a> command. When this parameter is used with this command, the command applies on all peers in the specified group. |

**Mode** Router Configuration

**Examples [BGP]**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.10.1 transparent-nextthop
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.1 remote-as 10
awplus(config-router)# neighbor 10.10.10.1 peer-group group1
awplus(config-router)# neighbor group1 transparent-nextthop
```

**Examples**  
**[BGP4+]**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 2001:0db8:010d::1
transparent-nexthop
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
peer-group group1
awplus(config-router-af)# exit
awplus(config-router)# neighbor group1 transparent-nexthop
```

**Related commands**

# neighbor unsuppress-map

**Overview** Use this command to selectively leak more specific routes to a particular BGP or BGP4+ neighbor.

Use the **no** variant of this command to remove selectively leaked specific routes to a particular BGP or BGP4+ neighbor.

**Syntax** `neighbor <neighborid> unsuppress-map <route-map-name>`  
`no neighbor <neighborid> unsuppress-map <route-map-name>`

| Parameter        | Description  |
|------------------|--|
| <neighborid>     | { <ip-address>   <ipv6-addr>   <peer-group> }  |
| <ip-address>     | Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.   |
| <ipv6-addr>      | Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.  |
| <peer-group>     | Enter the name of an existing peer-group. For information on how to create peer groups, refer to the <a href="#">neighbor peer-group (add a neighbor)</a> command, and <a href="#">neighbor route-map</a> command. When this parameter is used with this command, the command applies on all peers in the specified group. |
| <route-map-name> | The name of the route-map used to select routes to be unsuppressed.  |

**Mode [BGP]** Router Configuration or IPv4 Address Family Configuration

**Mode [BGP4+]** IPv6 Address Family Configuration

**Usage** When the [aggregate-address](#) command is used with the **summary-only** option, the more-specific routes of the aggregate are suppressed to all neighbors. Use this command instead to selectively leak more-specific routes to a particular neighbor.

**Examples [BGP]** To allow the device to advertise specific routes in the routemap 'mymap', which would have otherwise been aggregated to neighbor 10.10.0.73, use the commands:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.0.73 unsuppress-map mymap
```

To stop the device from advertising specific routes in the routemap, use the commands:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.0.73 unsuppress-map
mymap
```

To allow the device to advertise specific IPv4 routes in the routemap 'mymap', which would have otherwise been aggregated to neighbor 10.10.0.73, use the commands:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv4 unicast
awplus(config-router-af)# neighbor 10.10.0.70 unsuppress-map
mymap
```

To stop the device from advertising specific IPv4 routes in the routemap, use the commands:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv4 unicast
awplus(config-router-af)# no neighbor 10.10.0.70 unsuppress-map
mymap
```

To allow the device to advertise specific routes in the routemap 'mymap', which would have otherwise been aggregated to peer group 'group1', use the commands:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.1 remote-as 10
awplus(config-router)# neighbor 10.10.10.1 peer-group group1
awplus(config-router)# neighbor group1 unsuppress-map mymap
```

To stop the device from advertising specific routes in the routemap to peer group 'group1', use the commands:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 unsuppress-map mymap
```

**Examples [BGP4+]** To allow the device to advertise specific IPv6 routes in the routemap 'mymap', which would have otherwise been aggregated to neighbor 2001:0db8:010d::1, use the commands:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6 unicast
awplus(config-router-af)# neighbor 2001:0db8:010d::1
unsuppress-map mymap
```

To stop the device from advertising specific IPv6 routes in the routemap, use the commands:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6 unicast
awplus(config-router-af)# no neighbor 2001:0db8:010d::1
unsuppress-map mymap
```

To allow the device to advertise specific IPv6 routes in the routemap 'mymap', which would have otherwise been aggregated to peer group 'group1', use the commands

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
peer-group group1
awplus(config-router-af)# neighbor group1 unsuppress-map mymap
```

To stop the device from advertising specific IPv6 routes in the routemap to peer group 'group1', use the commands:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# no neighbor group1 unsuppress-map
mymap
```

**Related commands** [aggregate-address](#)  
[neighbor peer-group \(add a neighbor\)](#)  
[neighbor route-map](#)

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.7-2.1: BGP support added for x510 and x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

# neighbor update-source

**Overview** Use this command to specify the source IPv4 or IPv6 address of BGP or BGP4+ packets, which are sent to the neighbor for routing updates, as the IPv4 or IPv6 address configured on the specified interface. The specified interface is usually the local loopback (lo) interface to allow internal BGP or BGP4+ connections to stay up regardless of which interface is used to reach a neighbor.

Use the **no** variant of this command to remove the IPv4 or IPv6 address from the interface as the source IPv4 or IPv6 address of BGP or BGP4+ packets sent to the neighbor, and restores the interface assignment to the closest interface, which is also called the best local address.

**Syntax** `neighbor <neighborid> update-source <interface>`  
`no neighbor <neighborid> update-source`

| Parameter                       | Description  |
|---------------------------------|--|
| <code>&lt;neighborid&gt;</code> | { <code>&lt;ip-address&gt;</code>   <code>&lt;ipv6-addr&gt;</code>   <code>&lt;peer-group&gt;</code> }   |
| <code>&lt;ip-address&gt;</code> | Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.   |
| <code>&lt;ipv6-addr&gt;</code>  | Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.  |
| <code>&lt;peer-group&gt;</code> | Enter the name of an existing peer-group. For information on how to create peer groups, refer to the <a href="#">neighbor peer-group (add a neighbor)</a> command, and <a href="#">neighbor route-map</a> command. When this parameter is used with this command, the command applies on all peers in the specified group. |
| <code>&lt;interface&gt;</code>  | Specifies the local loopback interface (lo).   |

**Default** Use of this command sets a default value of 2 for the maximum hop count.

**Mode [BGP]** Router Configuration or IPv4 Address Family Configuration

**Mode [BGP4+]** Router Configuration

**Usage** Use this command in conjunction with any specified interface on the router. The local loopback interface is the interface that is most commonly used with this command. The use of local loopback interface eliminates a dependency and BGP or BGP4+ does not have to rely on the availability of a particular interface for making BGP or BGP4+ peer relationships.

**Examples [BGP]** To source BGP connections for neighbor 10.10.0.72 with the IP address of the local loopback address instead of the best local address, enter the commands listed below:

```
awplus(config)# interface lo
awplus(config-if)# ip address 10.10.0.73/24
awplus(config-if)# exit
awplus(config)# router bgp 100
awplus(config-router)# network 10.10.0.0
awplus(config-router)# neighbor 10.10.0.72 remote-as 110
awplus(config-router)# neighbor 10.10.0.72 update-source lo
```

To remove BGP connections for neighbor 10.10.0.72 with the IP address of the local loopback address instead of the best local address, enter the commands listed below:

```
awplus(config)# router bgp 100
awplus(config-router)# no neighbor 10.10.0.72 update-source
```

To source BGP connections for neighbor group1 with the IP address of the local loopback address instead of the best local address, enter the commands listed below:

```
awplus(config)# interface lo
awplus(config-if)# ip address 10.10.0.73/24
awplus(config-if)# exit
awplus(config)# router bgp 100
awplus(config-router)# network 10.10.0.0
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.0.72 remote-as 100
awplus(config-router)# neighbor 10.10.0.72 peer-group group1
awplus(config-router)# neighbor group1 update-source lo
```

To remove BGP connections for neighbor group1 with the IP address of the local loopback address instead of the best local address, enter the commands listed below:

```
awplus(config)# router bgp 100
awplus(config-router)# neighbor group1 update-source lo
```

**Examples** To source BGP connections for neighbor 2001:0db8:010d::1 with the IPv6 address of the local loopback address instead of the best local address, enter the commands listed below:

**[BGP4+]**

```
awplus(config)# interface lo
awplus(config-if)# ipv6 address 2001:0db8:010d::1/128
awplus(config-if)# exit
awplus(config)# router bgp 100
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as 110
awplus(config-router)# neighbor 2001:0db8:010d::1
update-source lo
```

To remove BGP connections for neighbor 2001:0db8:010d::1 with the IPv6 address of the local loopback address instead of the best local address, enter the commands listed below:

```
awplus(config)# router bgp 100
awplus(config-router)# no neighbor 2001:0db8:010d::1
update-source
```

To source BGP connections for neighbor group1 with the IPv6 address of the local loopback address instead of the best local address, enter the commands listed below:

```
awplus(config)# interface lo
awplus(config-if)# ipv6 address 2001:0db8:010d::1/128
awplus(config-if)# exit
awplus(config)# router bgp 100
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as 100
awplus(config-router)# address-family ipv6
awplus(config-router-
af)# neighbor 2001:0db8:010d::1 peer-group group1
awplus(config-router-
af)# exit
awplus(config-router)# neighbor group1 update-source lo
```

To remove BGP connections for neighbor group1 with the IPv6 address of the local loopback address instead of the best local address, enter the commands listed below:

```
awplus(config)# router bgp 100
awplus(config-router)# neighbor group1 update-source lo
```

**Related commands** [neighbor peer-group \(add a neighbor\)](#)  
[neighbor route-map](#)

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.7-2.1: BGP support added for x510 and x550 series

## Version 5.4.7-2.4: BGP support added for IE300 series

# neighbor version (BGP only)

**Overview** Use this command to configure the device to accept only a particular BGP version. Use the **no** variant of this command to use the default BGP version (version 4).

**Syntax** `neighbor <neighborid> version <version>`  
`no neighbor <neighborid> version`

| Parameter                       | Description  |
|---------------------------------|--|
| <code>&lt;neighborid&gt;</code> | <code>{ &lt;ip-address&gt;   &lt;peer-group&gt; }</code>   |
|                                 | <code>&lt;ip-address&gt;</code> The address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.   |
|                                 | <code>&lt;peer-group&gt;</code> Enter the name of an existing peer-group. For information on how to create peer groups, refer to the <a href="#">neighbor peer-group (add a neighbor)</a> command, and <a href="#">neighbor route-map</a> command. When this parameter is used with this command, the command applies on all peers in the specified group. |
| <code>&lt;version&gt;</code>    | <code>{4}</code> Specifies the BGP version number.   |

**Mode** Router Configuration or IPv4 Address Family Configuration

**Usage notes** By default, the system uses BGP version 4 and on request dynamically negotiates down to version 2. Using this command disables the router's version-negotiation capability and forces the router to use only a specified version with the neighbor.

**Examples**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.10.1 version 4
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.1 remote-as 10
awplus(config-router)# neighbor 10.10.10.1 peer-group group1
awplus(config-router)# neighbor group1 version 4
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.10.1 version
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 version
```

**Related commands** [neighbor peer-group \(add a neighbor\)](#)  
[neighbor route-map](#)

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.7-2.1: BGP support added for x510 and x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

# neighbor weight

**Overview** Use this command to set default weights for routes from this BGP or BGP4+ neighbor.

Use the **no** variant of this command to remove a weight assignment.

**Syntax** `neighbor <neighborid> weight <weight>`  
`no neighbor <neighborid> weight [<weight>]`

| Parameter                       | Description  |
|---------------------------------|--|
| <code>&lt;neighborid&gt;</code> | <code>{&lt;ip-address&gt; &lt;ipv6-addr&gt; &lt;peer-group&gt;}</code>   |
| <code>&lt;ip-address&gt;</code> | Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.   |
| <code>&lt;ipv6-addr&gt;</code>  | Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.  |
| <code>&lt;peer-group&gt;</code> | Enter the name of an existing peer-group. For information on how to create peer groups, refer to the <a href="#">neighbor peer-group (add a neighbor)</a> command, and <a href="#">neighbor route-map</a> command. When this parameter is used with this command, the command applies on all peers in the specified group. |
| <code>&lt;weight&gt;</code>     | <code>&lt;0-65535&gt;</code> Specifies the weight this command assigns to the route.   |

**Mode [BGP]** Router Configuration or IPv4 Address Family Configuration

**Mode [BGP4+]** IPv6 Address Family Configuration

**Usage notes** Use this command to specify a weight value to all routes learned from a BGP or BGP4+ neighbor. The route with the highest weight gets preference when there are other routes on the network.

Unlike the local-preference attribute, the weight attribute is relevant only to the local router.

The weights assigned using the **set weight** command overrides the weights assigned using this command.

**Examples [BGP]**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.10.1 weight 60
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.10.1 weight
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv4
awplus(config-router-af)# neighbor 10.10.10.1 weight 60
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv4
awplus(config-router-af)# no neighbor 10.10.10.1 weight
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.1 remote-as 10
awplus(config-router)# neighbor 10.10.10.1 peer-group group1
awplus(config-router)# neighbor group1 weight 60
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 weight
```

**Examples**  
**[BGP4+]**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1 weight 60
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# no neighbor 2001:0db8:010d::1 weight
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
peer-group group1
awplus(config-router-af)# neighbor group1 weight 60
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# no neighbor group1 weight
```

**Related commands** [neighbor peer-group \(add a neighbor\)](#)  
[neighbor route-map](#)

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.7-2.1: BGP support added for x510 and x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

# network (BGP and BGP4+)

**Overview** Use this command to specify particular routes to be advertised into the BGP or BGP4+ routing process. A unicast network address without a mask is accepted if it falls into the natural boundary of its class. A class-boundary mask is derived if the address matches its natural class-boundary.

Note that you can specify a prefix length for the prefix being added, and you can also specify a classful network without a prefix length and an appropriate prefix length is added. Note that specifying a non-classful prefix without a prefix length results in a /32 prefix length on an IPv4 route.

Use the **no** variant of this command to remove a network route entry.

**Syntax [BGP]** `network {<ip-prefix/length>|<ip-network-addr>} [mask <network-mask>] [route-map <route-map-name>] [backdoor]`  
`no network {<ip-prefix/length>|<ip-network-addr>} [mask <network-mask>] [route-map <route-map-name>] [backdoor]`

**Syntax [BGP4+]** `network {<ipv6-prefix/length>|<ipv6-network-addr>} [route-map <route-map-name>]`  
`no network {<ipv6-prefix/length>|<ipv6-network-addr>} [route-map <route-map-name>]`

| Parameter                               | Description   |
|---|---|
| <code>&lt;ip-prefix/length&gt;</code>   | IP network prefix and prefix length entered in dotted decimal format for the IP network prefix, then slash notation for the prefix length in the format A.B.C.D/M, e.g. 192.168.1.224/27        |
| <code>&lt;ip-network-addr&gt;</code>    | IP network prefix entered in dotted decimal format A.B.C.D, e.g. 192.168.1.224  |
| <code>&lt;network-mask&gt;</code>       | Specify a network mask in the format A.B.C.D, e.g. 255.255.255.224.   |
| <code>&lt;ipv6-prefix/length&gt;</code> | IPv6 network prefix and prefix length entered in dotted decimal format for the IPv6 network prefix, then slash notation for the IPv6 prefix length in the format X:X::X/X/M, e.g. 2001:db8::/64 |
| <code>&lt;ipv6-network-addr&gt;</code>  | IP network prefix entered in dotted decimal format A.B.C.D, e.g. 192.168.1.224  |
| <code>&lt;route-map-name&gt;</code>     | Specify the name of the route map.  |
| <code>backdoor</code>                   | Specify a BGP backdoor route that is not advertised.  |

**Mode [BGP]** Router Configuration and IPv4 Address Family [ipv4 unicast] mode

**Mode [BGP4+]** IPv6 Address Family Configuration

**Usage notes** It does not matter how the route is arranged in the IP or IPv6 routing table. The route can arrive in the IP routing table by a static route, or the route can be learned from OSPF or OSPFv3 or RIP or RIPng routing.

If you configure a route-map, then that route-map will be used in filtering the network, or the route-map will be used to modify the attributes that are advertised with the route.

**Example [BGP]** The following example illustrates a Class-A address configured as a network route. The natural Class-A network prefix mask length of 8 will be internally derived, that is, 2.0.0.0/8.

```
awplus(config)# router bgp 100
awplus(config-router)# network 2.0.0.0
```

**Output [BGP]** Figure 30-1: Example output from the **show running-config** command after entering **network 2.0.0.0**

```
awplus#show running-config
router bgp 100
network 2.0.0.0/8
```

**Example [BGP]** The following example illustrates a network address which does not fall into its natural class boundary, and hence, is perceived as a host route, that is, 192.0.2.224/27.

```
awplus(config)# router bgp 100
awplus(config-router)# network 192.0.2.224 mask 255.255.255.224
```

**Output [BGP]** Figure 30-2: Example output from the **show running-config** command after entering **network 192.0.2.224 mask 255.255.255.224**

```
awplus#show running-config
router bgp 100
network 192.0.2.224/27
```

**Example [BGP]** The following example is the same as the previous example for host route 192.0.2.224/27, but is entered in prefix/length format using slash notation (instead of prefix plus mask in dotted decimal format using the **mask** keyword before the network mask in dotted decimal format):

```
awplus(config)# router bgp 100
awplus(config-router)# network 192.0.2.224/27
```

**Example [BGP4+]** The following example is the same as the previous example for host route 2001:db8::/32:

```
awplus(config)# router bgp 100
awplus(config-router)# address-family ipv6
awplus(config-router-af)# network 2001:db8::/32
```

**Output [BGP4+]** Figure 30-3: Example output from the **show running-config** command after entering **network 2001:db8::/32**

```
awplus#show running-config

router bgp 100
 network 2001:db8::/32
```

**Command  
changes**

Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.7-2.1: BGP support added for x510 and x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# network synchronization

**Overview** Use this command to ensure the exact same static network prefix, specified through any of the **network** commands, is local or has IGP reachability before introduction to BGP or BGP4+.

Use the **no** variant of this command to disable this function.

**Syntax** `network synchronization`  
`no network synchronization`

**Default** Network synchronization is disabled by default.

**Mode [BGP]** Router Configuration and IPv4 Address Family [ipv4 unicast] Configuration

**Mode [BGP4+]** IPv6 Address Family [ipv6 unicast] Configuration

**Examples [BGP]** The following example enables IGP synchronization of BGP static network routes in the Router Configuration mode.

```
awplus# configure terminal
awplus(config)# router bgp 11
awplus(config-router)# network synchronization
```

The following example enables IGP synchronization of BGP static network routes in the IPv4-Unicast address family.

```
awplus# configure terminal
awplus(config)# router bgp 11
awplus(config-router)# address-family ipv4 unicast
awplus(config-router-af)# network synchronization
```

**Example [BGP4+]** The following example enables IGP synchronization of BGP4+ static network routes in the IPv6-Unicast address family.

```
awplus# configure terminal
awplus(config)# router bgp 11
awplus(config-router)# address-family ipv6 unicast
awplus(config-router-af)# network synchronization
```

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.7-2.1: BGP support added for x510 and x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

# redistribute (into BGP or BGP4+)

**Overview** Use this command to inject routes from one routing process into a BGP or BGP4+ routing table.

Use the **no** variant of this command to disable this function.

**Syntax** redistribute {ospf|rip|connected|static} [route-map  
<route-map-entry-pointer>]  
  
no redistribute {ospf|rip|connected|static} [route-map  
<route-map-entry-pointer>]

| Parameter                 | Description   |
|---------------------------|---|
| connected                 | Specifies the redistribution of connected routes for both BGP and BGP4+.                  |
| ospf                      | Specifies the redistribution of OSPF information for BGP or OSPFv3 information for BGP4+. |
| rip                       | Specifies the redistribution of RIP information for BGP or RIPng information for BGP4+.   |
| static                    | Specifies the redistribution of Static routes for both BGP and BGP4+.                     |
| route-map                 | Route map reference for both BGP and BGP4+.   |
| <route-map-entry-pointer> | Pointer to route-map entries.   |

**Mode [BGP]** Router Configuration or IPv4 Address Family Configuration

**Mode [BGP4+]** Router Configuration or IPv6 Address Family Configuration

**Usage notes** Redistribution is used by routing protocols to advertise routes that are learned by some other means, such as by another routing protocol or by static routes. Since all internal routes are dumped into BGP, careful filtering is applied to make sure that only routes to be advertised reach the internet, not everything. This command allows redistribution by injecting prefixes from one routing protocol into another routing protocol.

**Examples [BGP/ BGP+]** The following example shows the configuration of a route-map named `rmap1`, which is then applied using the **redistribute route-map** command.

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 1
awplus(config-route-map)# match origin incomplete
awplus(config-route-map)# set metric 100
awplus(config-route-map)# exit
awplus(config)# router bgp 12
awplus(config-router)# redistribute ospf route-map rmap1
```

The following example shows the configuration of a route-map named `rmap2`, which is then applied using the **redistribute route-map** command.

```
awplus# configure terminal
awplus(config)# route-map rmap2 permit 3
awplus(config-route-map)# match interface vlan1
awplus(config-route-map)# set metric-type 1
awplus(config-route-map)# exit
awplus(config)# router ospf 100
awplus(config-router)# redistribute bgp route-map rmap2
```

Note that configuring a route-map and applying it with the **redistribute route-map** command allows you to filter which routes are distributed from another routing protocol (such as OSPF with BGP). A route-map can also set the metric, tag, and metric-type of the redistributed routes.

**Command  
changes**

Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.6-2.1: VRF-lite support added to BGP for AR-series products

Version 5.4.7-2.1: BGP support added for x510 and x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# restart bgp graceful (BGP only)

**Overview** Use this command to force the device to perform a graceful BGP restart.

**Syntax** `restart bgp graceful`

**Mode** Privileged Exec

**Usage** Before using this command, BGP graceful-restart capabilities must be enabled within the router BGP ([bgp graceful-restart](#) command), and each neighbor configured on the device should be set to advertise its graceful-restart capability ([bgp graceful-restart graceful-reset](#) command). The neighbor devices also need to have BGP graceful-restart capabilities enabled ([bgp graceful-restart](#) command).

This command stops the whole BGP process and makes the device retain the BGP routes and mark them as stale. Receiving BGP speakers, retain and mark as stale all BGP routes received from the restarting speaker for all the address families received in the Graceful Restart Capability exchange.

When a **restart bgp graceful** command is issued, the BGP configuration is reloaded from the last saved configuration. Ensure you first issue a **copy running-config startup-config**.

**Example** `awplus# restart bgp graceful`

**Related commands** [bgp graceful-restart](#)  
[bgp graceful-restart graceful-reset](#)

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.7-2.1: BGP support added for x510 and x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

# router bgp

**Overview** Use this command to configure a BGP routing process, specifying the 32-bit Autonomous System (AS) number.

Use the **no** variant of this command to disable a BGP routing process, specifying the 32-bit AS number.

**Syntax** router bgp <asn>  
no router bgp <asn>

| Parameter | Description  |
|-----------|--|
| <asn>     | <1-4294967295> Specifies the 32-bit Autonomous System (AS) number. |

**Mode** Global Configuration

**Usage** The **router bgp** command enables a BGP routing process:

```
router bgp 1
  neighbor 10.0.0.1 remote-as 1
  neighbor 10.0.0.2 remote-as 1
  !
router bgp 2
  neighbor 10.0.0.3 remote-as 2
  neighbor 10.0.0.4 remote-as 2
```

**Examples**

```
awplus# configure terminal
awplus(config)# router bgp 12
awplus(config-router)#
awplus# configure terminal
awplus(config)# no router bgp 12
awplus(config)#
```

**Command changes**

- Added to AlliedWare Plus prior to 5.4.6-1
- Version 5.4.7-2.1: BGP support added for x510 and x550 series
- Version 5.4.7-2.4: BGP support added for IE300 series

# route-map

**Overview** Use this command to configure a route map entry, and to specify whether the device will process or discard matching routes and BGP update messages.

The device uses a name to identify the route map, and a sequence number to identify each entry in the route map.

The **route-map** command puts you into route-map configuration mode. In this mode, you can use the following:

- one or more of the **match** commands to create match clauses. These specify what routes or update messages match the entry.
- one or more of the **set** commands to create set clauses. These change the attributes of matching routes or update messages.

Use the **no** variant of this command to delete a route map or to delete an entry from a route map.

**Syntax**

```
route-map <mapname> {deny|permit} <seq>  
no route-map <mapname>  
no route-map <mapname> {deny|permit} <seq>
```

| Parameter | Description   |
|-----------|---|
| <mapname> | A name to identify the route map.   |
| deny      | The route map causes a routing process to discard matching routes or BGP update messages.                                 |
| permit    | The route map causes a routing process to use matching routes or BGP update messages.                                     |
| <seq>     | <1-65535> The sequence number of the entry. You can use this parameter to control the order of entries in this route map. |

**Mode** Global Configuration

**Usage notes** Route maps allow you to control and modify routing information by filtering routes and setting route attributes. You can apply route maps when the device:

- processes BGP update messages that it has received from a peer
- prepares BGP update messages to send to peers
- redistributes routes from one routing protocol into another
- redistributes static routes into routing protocols
- uses BGP route flap dampening

When a routing protocol passes a route or update message through a route map, it checks the entries in order of their sequence numbers, starting with the lowest numbered entry.

If it finds a match on a route map with an action of permit, then it applies any set clauses and accepts the route. Having found a match, the route is not compared against any further entries of the route map.

If it finds a match on a route map with an action of deny, it will discard the matching route.

If it does not find a match, it discards the route or update message. This means that route maps end with an implicit deny entry. To permit all non-matching routes or update messages, end your route map with an entry that has an action of **permit** and no match clause.

**Examples** To enter route-map mode for entry 1 of the route map called "route1", and then add a match and set clause to it, use the commands:

```
awplus# configure terminal
awplus(config)# route-map route1 permit 1
awplus(config-route-map)# match as-path 60
awplus(config-route-map)# set weight 70
```

To enter route-map mode for entry 2 of the route map called "route1", and then add a match and set clause to it, use the commands:

```
awplus# configure terminal
awplus(config)# route-map route1 permit 2
awplus(config-route-map)# match interface vlan2
awplus(config-route-map)# set metric 20
```

Note how the prompt changes when you go into route map configuration mode.

To make the device process non-matching routes instead of discarding them, add a command like the following one:

```
awplus(config)# route-map route1 permit 100
```

**Related commands**

For BGP:

- [show route-map](#)
- [bgp dampening](#)
- [neighbor default-originate](#)
- [neighbor route-map](#)
- [neighbor unsuppress-map](#)
- [network \(BGP and BGP4+\)](#)
- [redistribute \(into BGP or BGP4+\)](#)
- [show ip bgp route-map \(BGP only\)](#)

For OSPF:

- [distribute-list \(OSPF\)](#)
- [default-information originate](#)
- [redistribute \(OSPF\)](#)

For RIP:  
`redistribute (RIP)`

# set as-path

**Overview** Use this command to add an AS path set clause to a route map entry.

When a BGP update message matches the route map entry, the device prepends the specified Autonomous System Number (ASN) or ASNs to the update's AS path attribute.

The AS path attribute is a list of the autonomous systems through which the announcement for the prefix has passed. As prefixes pass between autonomous systems, each autonomous system adds its ASN to the beginning of the list. This means that the AS path attribute can be used to make routing decisions.

Use the **no** variant of this command to remove the set clause.

**Syntax** `set as-path prepend <1-65535> [<1-65535>]...`  
`no set as-path prepend [<1-65535> [<1-65535>]...]`

| Parameter                    | Description  |
|------------------------------|--|
| <code>prepend</code>         | Prepends the autonomous system path.   |
| <code>&lt;1-65535&gt;</code> | The number to prepend to the AS path. If you specify multiple ASNs, separate them with spaces. |

**Mode** Route-map mode

**Usage notes** Use the **set as-path** command to specify an autonomous system path. By specifying the length of the AS-Path, the device influences the best path selection by a neighbor. Use the `prepend` parameter with this command to prepend an AS path string to routes increasing the AS path length.

This command is valid for BGP update messages only.

**Example** To use entry 3 of the route map called `myroute` to prepend ASN 8 and 24 to the AS path of matching update messages, use the commands:

```
awplus# configure terminal
awplus(config)# route-map myroute permit 3
awplus(config-route-map)# set as-path prepend 8 24
```

**Related commands** [match as-path](#)  
[route-map](#)  
[show route-map](#)

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.7-2.1: BGP support added for x510 and x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

# set community

**Overview** Use this command to add a community set clause to a route map entry.

When a BGP update message matches the route map entry, the device takes one of the following actions:

- changes the update's community attribute to the specified value or values, or
- adds the specified community value or values to the update's community attribute, if you specify the **additive** parameter after specifying another parameter. or
- removes the community attribute from the update, if you specify the **none** parameter

Use the **no** variant of this command to remove the set clause.

**Syntax**

```
set community {[<1-65535>][AA:NN] [internet] [local-AS]
[no-advertise] [no-export] [additive]}
no set community {[AA:NN] [internet] [local-AS] [no-advertise]
[no-export] [additive]}
set community none
no set community none
```

| Parameter    | Description   |
|--------------|---|
| <1-65535>    | The AS number of the community as an integer not in AA:NN format.   |
| AA:NN        | The Autonomous System (AS) number of the community, in AA:NN format. AS numbers are assigned to the regional registries by the IANA ( <a href="http://www.iana.org">www.iana.org</a> ) and can be obtained from the registry in your region. AA and NN are both integers from 1 to 65535. AA is the AS number; NN is a value chosen by the ASN administrator. |
| local-AS     | The community of routes that must not be advertised to external BGP peers (this includes peers in other members' Autonomous Systems inside a BGP confederation).  |
| internet     | The community of routes that can be advertised to all BGP peers.  |
| no-advertise | The community of routes that must not be advertised to other BGP peers.   |
| no-export    | The community of routes that must not be advertised outside a BGP confederation boundary (a standalone Autonomous System that is not part of a confederation should be considered a confederation itself).  |

| Parameter | Description   |
|-----------|---|
| none      | The device removes the community attribute from matching update messages.   |
| additive  | The device adds the specified community value to the update message's community attribute, instead of replacing the existing attribute. By default this parameter is not included, so the device replaces the existing attribute. |

**Mode** Route-map Configuration

**Usage notes** This command is valid for BGP update messages only.

**Examples** To use entry 3 of the route map called `rmap1` to put matching routes into the no-advertise community, use the commands:

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# set community no-advertise
```

To use entry 3 of the route map called `rmap1` to put matching routes into several communities, use the commands:

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# set community 10:01 23:34 12:14
no-export
```

To use entry 3 of the route map called `rmap1` to put matching routes into a single AS community numbered 16384, use the commands:

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# set community 16384 no-export
```

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.7-2.1: BGP support added for x510 and x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

# show bgp ipv6 (BGP4+ only)

**Overview** Use this command to display BGP4+ network information for a specified IPv6 address.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show bgp ipv6 <ipv6-addr>`

| Parameter                      | Description  |
|--------------------------------|--|
| <code>&lt;ipv6-addr&gt;</code> | Specifies the IPv6 address, entered in hexadecimal in the format X:X::X:X. |

**Mode** User Exec and Privileged Exec

**Example** `awplus# show bgp ipv6 2001:0db8:010d::1`

**Related commands** [show bgp ipv6 longer-prefixes \(BGP4+ only\)](#)

**Command changes**  
Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.7-2.1: BGP support added for x510 and x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

# show bgp ipv6 community (BGP4+ only)

**Overview** Use this command to display routes that match specified communities within an IPv6 environment. Use the [show ip bgp community \(BGP only\)](#) command within an IPv4 environment.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

You may use any combination and repetition of parameters listed in the *<type>* placeholder.

**Syntax** `show bgp ipv6 community [<type>] [exact-match]`

| Parameter           | Description   |
|---------------------|---|
| <i>&lt;type&gt;</i> | {[ <i>AA:NN</i> ] [ <i>local-AS</i> ] [ <i>no-advertise</i> ] [ <i>no-export</i> ] }                        |
| <i>AA:NN</i>        | Specifies the Autonomous System (AS) community number, in AA:NN format.                                     |
| <i>local-AS</i>     | Do not send outside local Autonomous Systems (well-known community).  |
| <i>no-advertise</i> | Do not advertise to any peer (well-known community).  |
| <i>no-export</i>    | Do not export to next AS (well-known community).  |
| <i>exact-match</i>  | Specifies that the exact match of the communities is displayed. This optional parameter cannot be repeated. |

**Mode** User Exec and Privileged Exec

**Examples** Note that the AS numbers shown are examples only.

```
awplus# show bgp ipv6 community 64497:64499 exact-match
awplus# show bgp ipv6 community 64497:64499 64500:64501
exact-match
awplus# show bgp ipv6 community 64497:64499 64500:64501
64510:64511no-advertise
awplus# show bgp ipv6 community no-advertise
no-advertiseno-advertise exact-match
awplus# show bgp ipv6 community no-export 64510:64511
no-advertise local-AS no-export
awplus# show bgp ipv6 community no-export 64510:64511
no-advertise 64497:64499 64500:64501 no-export
awplus# show bgp ipv6 community no-export 64497:64499
no-advertise local-AS no-export
```

**Related commands** [show ip bgp community \(BGP only\)](#)

**Command changes**  
Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.7-2.1: BGP support added for x510 and x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

# show bgp ipv6 community-list (BGP4+ only)

**Overview** Use this command to display routes that match the given community-list within an IPv6 environment. Use the [show ip bgp community-list \(BGP only\)](#) command within an IPv4 environment.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show bgp ipv6 community-list <listname> [exact-match]`

| Parameter   | Description  |
|-------------|--|
| <listname>  | Specifies the community list name.                                     |
| exact-match | Displays only routes that have exactly the same specified communities. |

**Mode** User Exec and Privileged Exec

**Example** `awplus# show bgp ipv6 community-list mylist exact-match`

**Related commands** [show ip bgp community-list \(BGP only\)](#)

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.7-2.1: BGP support added for x510 and x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

# show bgp ipv6 dampening (BGP4+ only)

**Overview** Use this command to show dampened routes from a BGP4+ instance within an IPv6 environment. Use the [show ip bgp dampening \(BGP only\)](#) command to show dampened routes from a BGP instance within an IPv4 environment.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show bgp ipv6 dampening`  
`{dampened-paths|flap-statistics|parameters}`

| Parameter       | Description   |
|-----------------|---|
| dampened-paths  | Display paths suppressed due to dampening.          |
| flap-statistics | Display flap statistics of routes.                  |
| parameters      | Display details of configured dampening parameters. |

**Mode** User Exec and Privileged Exec

**Usage notes** Enable BGP4+ dampening to maintain dampened-path information in memory.

**Examples**

```
awplus# show bgp ipv6 dampening dampened-path
awplus# show bgp ipv6 dampening flap-statistics
awplus# show bgp ipv6 dampening parameter
```

**Related commands** [show ip bgp dampening \(BGP only\)](#)

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.7-2.1: BGP support added for x510 and x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

# show bgp ipv6 filter-list (BGP4+ only)

**Overview** Use this command to display routes conforming to the filter-list within an IPv6 environment. Use the [show ip bgp filter-list \(BGP only\)](#) command to display routes conforming to the filter-list within an IPv4 environment.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show bgp ipv6 filter-list <listname>`

| Parameter  | Description  |
|------------|--|
| <listname> | Specifies the regular-expression access list name. |

**Mode** User Exec and Privileged Exec

**Example** `awplus# show bgp ipv6 filter-list mylist`

**Related commands** [show ip bgp filter-list \(BGP only\)](#)

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.7-2.1: BGP support added for x510 and x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

# show bgp ipv6 inconsistent-as (BGP4+ only)

**Overview** Use this command to display routes with inconsistent AS Paths within an IPv6 environment. Use the [show ip bgp inconsistent-as \(BGP only\)](#) command to display routes with inconsistent AS paths within an IPv4 environment.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show bgp ipv6 inconsistent-as`

**Mode** User Exec and Privileged Exec

**Example** `awplus# show bgp ipv6 inconsistent-as`

**Related commands** [show ip bgp inconsistent-as \(BGP only\)](#)

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.7-2.1: BGP support added for x510 and x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

# show bgp ipv6 longer-prefixes (BGP4+ only)

**Overview** Use this command to display the route of the local BGP4+ routing table for a specific prefix with a specific mask or for any prefix having a longer mask than the one specified.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show bgp ipv6 <ipv6-addr/prefix-length> longer-prefixes`

| Parameter                                    | Description  |
|--|--|
| <code>&lt;ipv6-addr/prefix-length&gt;</code> | Specifies the IPv6 address with prefix length. The IPv6 address uses the format X:X::X/X/Prefix-Length. The prefix-length is usually set between 0 and 64. |

**Mode** User Exec and Privileged Exec

**Example** `awplus# show bgp ipv6 2001:0db8::/64 longer-prefixes`

**Related commands** [show bgp ipv6 \(BGP4+ only\)](#)

**Command changes**  
Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.7-2.1: BGP support added for x510 and x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

# show bgp ipv6 neighbors (BGP4+ only)

**Overview** Use this command to display detailed information on peering connections to all BGP4+ neighbors within an IPv6 environment.

Use the [show ip bgp neighbors \(BGP only\)](#) command to display detailed information on peering connections to all BGP neighbors within an IPv4 environment.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show bgp ipv6 neighbors [<ipv6-addr> [advertised-routes | received prefix-filter | received-routes | routes]]`

| Parameter              | Description   |
|------------------------|---|
| <ipv6-addr>            | Specifies the IPv6 address, entered in hexadecimal in the format X:X::X:X.  |
| advertised-routes      | Displays the routes advertised to a BGP4+ neighbor.   |
| received prefix-filter | Displays received prefix-list filters.  |
| received-routes        | Displays the received routes from the neighbor. To display all the received routes from the neighbor, configure the BGP4+ soft reconfigure first. |
| routes                 | Displays all accepted routes learned from neighbors.  |

**Mode** User Exec and Privileged Exec

**Examples [BGP4+]**

```
awplus# show bgp ipv6 neighbors 2001:0db8:010d::1 advertised-routes
awplus# show bgp ipv6 neighbors 2001:0db8:010d::1 received prefix-filter
awplus# show bgp ipv6 neighbors 2001:0db8:010d::1 received-routes
awplus# show bgp ipv6 neighbors 2001:0db8:010d::1 routes
```

**Output** Figure 30-4: Example output from **show bgp ipv6 neighbors 2001:db8:b::1**

```
awplus#show bgp ipv6 neighbors 2001:db8:b::1
BGP neighbor is 2001:db8:b::1, remote AS 200, local AS 100, external link
  BGP version 4, remote router ID 2.2.2.1
  BGP state = Established, up for 01:03:26
  Last read 01:03:26, hold time is 90, keepalive interval is 30 seconds
  Neighbor capabilities:
    Route refresh: advertised and received (old and new)
    4-Octet ASN Capability: advertised and received
    Address family IPv4 Unicast: advertised and received
    Address family IPv6 Unicast: advertised and received
  Received 157 messages, 0 notifications, 0 in queue
  Sent 228 messages, 0 notifications, 0 in queue
  Route refresh request: received 0, sent 0
  Minimum time between advertisement runs is 30 seconds
  Update source is lo
For address family: IPv4 Unicast
  BGP table version 1, neighbor version 1
  Index 2, Offset 0, Mask 0x4
  Community attribute sent to this neighbor (both)
  0 accepted prefixes
  0 announced prefixes

For address family: IPv6 Unicast
  BGP table version 66, neighbor version 66
  Index 2, Offset 0, Mask 0x4
  AF-dependant capabilities:
    Graceful restart: advertised, received

  Community attribute sent to this neighbor (both)
  Default information originate, default sent
  Inbound path policy configured
  Incoming update prefix filter list is *BGP_FILTER_LIST
  Route map for incoming advertisements is *BGP_LOCAL_PREF_MAP
  8 accepted prefixes
  8 announced prefixes

Connections established 1; dropped 0
Graceful-restart Status:
  Remote restart-time is 90 sec

  External BGP neighbor may be up to 2 hops away.
Local host: 2001:db8:a::1, Local port: 179
Foreign host: 2001:db8:b::1, Foreign port: 50672
Nexthop: 1.1.1.1
Nexthop global: 2001:db8:a::1
Nexthop local: ::
BGP connection: non shared network
```

If available the following is shown:

- Session information
  - Neighbor address, ASN information and if the link is external or internal
  - BGP version and status
  - Neighbor capabilities for the BGP session
  - Number of messages transmitted and received
- IPv6 unicast address family information
  - BGP4+ table version
  - IPv6 Address Family dependent capabilities
  - IPv6 Communities
  - IPv6 Route filters for ingress and egress updates
  - Number of announced and accepted IPv6 prefixes
- Connection information
  - Connection counters
  - Graceful restart timer
  - Hop count to the peer
  - Next hop information
  - Local and external port numbers

**Related commands** [show ip bgp neighbors \(BGP only\)](#)

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.7-2.1: BGP support added for x510 and x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

# show bgp ipv6 paths (BGP4+ only)

**Overview** Use this command to display BGP4+ path information within an IPv6 environment. Use the [show ip bgp paths \(BGP only\)](#) command to display BGP path information within an IPv4 environment.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show bgp ipv6 paths`

**Mode** User Exec and Privileged Exec

**Example** `awplus# show bgp ipv6 paths`

**Related commands** [show ip bgp paths \(BGP only\)](#)

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.7-2.1: BGP support added for x510 and x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

# show bgp ipv6 prefix-list (BGP4+ only)

**Overview** Use this command to display routes matching the prefix-list within an IPv6 environment. Use the [show ip bgp prefix-list \(BGP only\)](#) command to display routes matching the prefix-list within an IPv4 environment.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show bgp ipv6 prefix-list <list>`

| Parameter | Description                                 |
|-----------|---|
| <list>    | Specifies the name of the IPv6 prefix list. |

**Mode** User Exec and Privileged Exec

**Example** `awplus# show bgp ipv6 prefix-list mylist`

**Related commands** [show ip bgp prefix-list \(BGP only\)](#)

**Command changes**  
Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.7-2.1: BGP support added for x510 and x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

# show bgp ipv6 quote-regexp (BGP4+ only)

**Overview** Use this command to display routes matching the AS path regular expression within an IPv6 environment. Use the [show ip bgp quote-regexp \(BGP only\)](#) command to display routes matching the AS path regular expression within an IPv4 environment.

Note that you must use quotes to enclose the regular expression with this command. Use the regular expressions listed below with the *<expression>* parameter:

| Symbol | Character     | Meaning  |
|--------|---------------|--|
| ^      | Caret         | Used to match the beginning of the input string. When used at the beginning of a string of characters, it negates a pattern match. |
| \$     | Dollar sign   | Used to match the end of the input string.   |
| .      | Period        | Used to match a single character (white spaces included).  |
| *      | Asterisk      | Used to match none or more sequences of a pattern.   |
| +      | Plus sign     | Used to match one or more sequences of a pattern.  |
| ?      | Question mark | Used to match none or one occurrence of a pattern.   |
| _      | Underscore    | Used to match spaces, commas, braces, parenthesis, or the beginning and end of an input string.                                    |
| [ ]    | Brackets      | Specifies a range of single-characters.  |
| -      | Hyphen        | Separates the end points of a range.   |

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show bgp ipv6 quote-regexp <expression>`

**Mode** User Exec and Privileged Exec

**Example** `awplus# show bgp ipv6 quote-regexp myexpression`

**Related commands** [show ip bgp quote-regexp \(BGP only\)](#)

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.7-2.1: BGP support added for x510 and x550 series

# show bgp ipv6 regexp (BGP4+ only)

**Overview** Use this command to display routes matching the AS path regular expression within an IPv6 environment. Use the [show ip bgp regexp \(BGP only\)](#) command to display routes matching the AS path regular expression within an IPv4 environment.

Use the regular expressions listed below with the *<expression>* parameter:

| Symbol | Character     | Meaning  |
|--------|---------------|--|
| ^      | Caret         | Used to match the beginning of the input string. When used at the beginning of a string of characters, it negates a pattern match. |
| \$     | Dollar sign   | Used to match the end of the input string.   |
| .      | Period        | Used to match a single character (white spaces included).  |
| *      | Asterisk      | Used to match none or more sequences of a pattern.   |
| +      | Plus sign     | Used to match one or more sequences of a pattern.  |
| ?      | Question mark | Used to match none or one occurrence of a pattern.   |
| _      | Underscore    | Used to match spaces, commas, braces, parenthesis, or the beginning and end of an input string.                                    |
| [ ]    | Brackets      | Specifies a range of single-characters.  |
| -      | Hyphen        | Separates the end points of a range.   |

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show bgp ipv6 regexp <expression>`

| Parameter                 | Description   |
|---------------------------|---|
| <i>&lt;expression&gt;</i> | Specifies a regular-expression to match the BGP4+ AS paths. |

**Mode** User Exec and Privileged Exec

**Example** `awplus# show bgp ipv6 regexp myexpression`

**Related commands** [show ip bgp regexp \(BGP only\)](#)

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.7-2.1: BGP support added for x510 and x550 series

## Version 5.4.7-2.4: BGP support added for IE300 series

# show bgp ipv6 route-map (BGP4+ only)

**Overview** Use this command to display BGP4+ routes that match the specified route-map within an IPv6 environment. Use the [show ip bgp route-map \(BGP only\)](#) command to display BGP routes that match the specified route-map within an IPv4 environment.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show bgp ipv6 route-map <route-map>`

| Parameter                      | Description                            |
|--------------------------------|--|
| <code>&lt;route-map&gt;</code> | Specifies a route-map that is matched. |

**Mode** User Exec and Privileged Exec

**Example** To show routes that match the route-map `myRouteMap`, use the command:

```
awplus# show bgp ipv6 route-map myRouteMap
```

**Related commands** [show ip bgp route-map \(BGP only\)](#)

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.7-2.1: BGP support added for x510 and x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

# show bgp ipv6 summary (BGP4+ only)

**Overview** Use this command to display a summary of a BGP4+ neighbor status within an IPv6 environment. Use the [show ip bgp summary \(BGP only\)](#) command to display a summary of a BGP neighbor status within an IPv4 environment.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show bgp ipv6 summary`

**Mode** User Exec and Privileged Exec

**Example** `awplus# show bgp ipv6 summary`

**Output** Figure 30-5: Example output from the **show ip bgp summary** command

```
awplus>show ip bgp summary

BGP router identifier 1.0.0.1, local AS number 65541
BGP table version is 12
4 BGP AS-PATH entries
0 BGP community entries

Neighbor          V      AS   MsgRc  MsgSnt  TblVer  InOutQ  Up/Down  State/PfxRcd
2001:0db8:cccc::1 4     65544    20     24     11 0/0   00:07:19      1
2001:0db8:dddd::1 4     65545     0      0      0 0/0   never         Active
2001:0db8:eeee::1 4     65542    34     40      0 0/0   00:00:04     Active
2001:0db8:ffff::1 4     65543    29     32     11 0/0   00:07:03     13

Number of neighbors 4
```

The Up/Down column in this output is a timer that shows:

- "never" if the peer session has never been established
- The up time, if the peer session is currently up
- The down time, if the peer session is currently down.

In the example above, the session with 2001:0db8:eeee::1 has been down for 4 seconds, and the session with 2001:0db8:dddd::1 has never been established.

**Related commands** [show ip bgp summary \(BGP only\)](#)

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.7-2.1: BGP support added for x510 and x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

# show bgp memory maxallocation (BGP only)

**Overview** This command displays the maximum percentage of total memory that is allocated to BGP processes.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show bgp memory maxallocation`

**Mode** User Exec and Privileged Exec

**Example** To display the maximum amount of memory allocated for BGP processes, use the command:

```
awplus# show bgp memory maxallocation
```

**Output** Figure 30-6: Example output from the **show bgp memory maxallocation** command

```
BGP maximum RAM allocation is 100%
```

**Command changes**

- Added to AlliedWare Plus prior to 5.4.6-1
- Version 5.4.7-2.1: BGP support added for x510 and x550 series
- Version 5.4.7-2.4: BGP support added for IE300 series

# show bgp nexthop-tracking (BGP only)

**Overview** Use this command to display BGP next hop tracking status.

**Syntax** `show bgp nexthop-tracking`

**Mode** User Exec and Privileged Exec

**Example** To display BGP next hop tracking status, use the command:

```
awplus# show bgp nexthop-tracking
```

**Related commands** [bgp nexthop-trigger-count](#)  
[show bgp nexthop-tree-details \(BGP only\)](#)

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.7-2.1: BGP support added for x510 and x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

# show bgp nexthop-tree-details (BGP only)

**Overview** Use this command to display BGP next hop tree details.

**Syntax** `show bgp nexthop-tree-details`

**Mode** User Exec and Privileged Exec

**Example** To display BGP next hop tree details, use the command:

```
awplus# show bgp nexthop-tree-details
```

**Related commands** [show bgp nexthop-tracking \(BGP only\)](#)

**Command changes**

- Added to AlliedWare Plus prior to 5.4.6-1
- Version 5.4.7-2.1: BGP support added for x510 and x550 series
- Version 5.4.7-2.4: BGP support added for IE300 series

# show debugging bgp (BGP only)

**Overview** Use this command to see what debugging is turned on for BGP.  
For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show debugging bgp`

**Mode** User Exec and Privileged Exec

**Example** `awplus# show debugging bgp`

**Output** Figure 30-7: Example output from the **show debugging bgp** command

```
BGP debugging status:
  BGP debugging is on
  BGP events debugging is on
  BGP updates debugging is on
  BGP fsm debugging is on
```

**Related commands** [debug bgp \(BGP only\)](#)

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.6-2.1: VRF-lite support added to BGP for AR-series products  
Version 5.4.7-2.1: BGP support added for x510 and x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

# show ip bgp community (BGP only)

**Overview** Use this command to display routes that match specified communities from a BGP instance within an IPv4 environment. Use the [show bgp ipv6 community \(BGP4+ only\)](#) command within an IPv6 environment.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

You may use any combination and repetition of parameters listed in the `<type>` placeholder.

**Syntax** `show ip bgp community [<type>] [exact-match]`

| Parameter                 | Description   |
|---------------------------|---|
| <code>&lt;type&gt;</code> | <code>{[AA:NN] [local-AS] [no-advertise] [no-export]}</code>  |
| <code>AA:NN</code>        | Specifies the Autonomous System (AS) community number, in AA:NN format.                                     |
| <code>local-AS</code>     | Do not send outside local Autonomous Systems (well-known community).  |
| <code>no-advertise</code> | Do not advertise to any peer (well-known community).  |
| <code>no-export</code>    | Do not export to next AS (well-known community).  |
| <code>exact-match</code>  | Specifies that the exact match of the communities is displayed. This optional parameter cannot be repeated. |

**Mode** User Exec and Privileged Exec

**Examples** Note that the AS numbers shown are examples only.

```
awplus# show ip bgp community 64497:64499 exact-match
awplus# show ip bgp community 64497:64499 64500:64501
exact-match
awplus# show ip bgp community 64497:64499 64500:64501
64510:64511no-advertise
awplus# show ip bgp community no-advertise
no-advertiseno-advertise exact-match
awplus# show ip bgp community no-export 64510:64511
no-advertise local-AS no-export
awplus# show ip bgp community no-export 64510:64511
no-advertise 64497:64499 64500:64501 no-export
awplus# show ip bgp community no-export 64497:64499
no-advertise local-AS no-export
```

**Related commands** [set community](#)  
[show bgp ipv6 community \(BGP4+ only\)](#)

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.6-2.1: VRF-lite support added to BGP for AR-series products  
Version 5.4.7-2.1: BGP support added for x510 and x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

# show ip bgp community-info (BGP only)

- Overview** Use this command to list all BGP community information.  
For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).
- Syntax** `show ip bgp community-info`
- Mode** User Exec and Privileged Exec
- Example** `awplus# show ip bgp community-info`
- Command changes**  
Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.7-2.1: BGP support added for x510 and x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

# show ip bgp community-list (BGP only)

**Overview** Use this command to display routes that match the given community-list from a BGP instance within an IPv4 environment. Use the [show bgp ipv6 community-list \(BGP4+ only\)](#) command within an IPv6 environment.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip bgp community-list <listname> [exact-match]`

| Parameter   | Description  |
|-------------|--|
| <listname>  | Specifies the community list name.                                     |
| exact-match | Displays only routes that have exactly the same specified communities. |

**Mode** User Exec and Privileged Exec

**Example** `awplus# show ip bgp community-list mylist exact-match`

**Related commands** [show bgp ipv6 community-list \(BGP4+ only\)](#)

**Command changes**

- Added to AlliedWare Plus prior to 5.4.6-1
- Version 5.4.6-2.1: VRF-lite support added to BGP for AR-series products
- Version 5.4.7-2.1: BGP support added for x510 and x550 series
- Version 5.4.7-2.4: BGP support added for IE300 series

# show ip bgp dampening (BGP only)

**Overview** Use this command to show dampened routes from a BGP instance within an IPv4 environment. Use the [show bgp ipv6 dampening \(BGP4+ only\)](#) command within an IPv6 environment.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip bgp dampening`  
{dampened-paths|flap-statistics|parameters}

| Parameter       | Description   |
|-----------------|---|
| dampened-paths  | Display paths suppressed due to dampening.          |
| flap-statistics | Display flap statistics of routes.                  |
| parameters      | Display details of configured dampening parameters. |

**Mode** User Exec and Privileged Exec

**Usage notes** Enable BGP dampening to maintain dampened-path information in memory.

**Examples** `awplus# show ip bgp dampening dampened-paths`

**Output** Figure 30-11: Example output from the **show ip bgp dampening** command

```
dampening 15 750 2000 60 15
  Reachability Half-Life time      : 15 min
  Reuse penalty                     : 750
  Suppress penalty                  : 2000
  Max suppress time                 : 60 min
  Un-reachability Half-Life time    : 15 min
  Max penalty (ceil)                : 11999
  Min penalty (floor)               : 375
```

The following example output shows that the internal route (i), has flapped 3 times and is now categorized as history (h).

Figure 30-12: Example output from the **show ip bgp dampening flap-statistics** command

```
awplus# show ip bgp dampening flap-statistics
BGP table version is 1, local router ID is 30.30.30.77
Status codes: s suppressed, d damped, h history, * valid, > best, i - internal, S
Stale
Origin codes: i - IGP, e - EGP, ? - incomplete
  Network          From            Flaps  Duration  Reuse  Path
  ----          -
  hi1.1.1.0/24    10.100.0.62      3  00:01:20  i
```

The following example output shows a dampened route in the 1.1.1.0/24 network.

Figure 30-13: Example output from the **show ip bgp dampening dampened-path** command

```
awplus# show ip bgp dampening dampened-paths
BGP table version is 1, local router ID is 30.30.30.77
Status codes: s suppressed, d damped, h history, * valid, > best, i - internal, S
Stale
Origin codes: i - IGP, e - EGP, ? - incomplete

# show ip bgp filter-list (BGP only)

**Overview** Use this command to display routes conforming to the filter-list within an IPv4 environment. Use the [show bgp ipv6 filter-list \(BGP4+ only\)](#) command to display routes conforming to the filter-list within an IPv6 environment

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip bgp filter-list <listname>`

| Parameter  | Description  |
|------------|--|
| <listname> | Specifies the regular-expression access list name. |

**Mode** User Exec and Privileged Exec

**Example** `awplus# show ip bgp filter-list mylist`

**Related commands** [show bgp ipv6 filter-list \(BGP4+ only\)](#)

**Command changes**

- Added to AlliedWare Plus prior to 5.4.6-1
- Version 5.4.6-2.1: VRF-lite support added to BGP for AR-series products
- Version 5.4.7-2.1: BGP support added for x510 and x550 series
- Version 5.4.7-2.4: BGP support added for IE300 series

# show ip bgp inconsistent-as (BGP only)

**Overview** Use this command to display routes with inconsistent AS Paths within an IPv4 environment. Use the [show bgp ipv6 inconsistent-as \(BGP4+ only\)](#) command to display routes with inconsistent AS paths within an IPv6 environment.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip bgp inconsistent-as`

**Mode** User Exec and Privileged Exec

**Example** `awplus# show ip bgp inconsistent-as`

**Related commands** [show bgp ipv6 inconsistent-as \(BGP4+ only\)](#)

**Command changes**

- Added to AlliedWare Plus prior to 5.4.6-1
- Version 5.4.6-2.1: VRF-lite support added to BGP for AR-series products
- Version 5.4.7-2.1: BGP support added for x510 and x550 series
- Version 5.4.7-2.4: BGP support added for IE300 series

# show ip bgp longer-prefixes (BGP only)

**Overview** Use this command to display the route of the local BGP routing table for a specific prefix with a specific mask, or for any prefix having a longer mask than the one specified.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip bgp <ip-address/m> longer-prefixes`

| Parameter                         | Description  |
|-----------------------------------|--|
| <code>&lt;ip-address/m&gt;</code> | Neighbor’s IP address and subnet mask, entered in the form A.B.C.D/M, where M is the subnet mask length. |

**Mode** User Exec and Privileged Exec

**Example** `awplus# show ip bgp 10.10.0.10/24 longer-prefixes`

**Command changes**

- Added to AlliedWare Plus prior to 5.4.6-1
- Version 5.4.6-2.1: VRF-lite support added to BGP for AR-series products
- Version 5.4.7-2.1: BGP support added for x510 and x550 series
- Version 5.4.7-2.4: BGP support added for IE300 series

# show ip bgp neighbors (BGP only)

**Overview** Use this command to display detailed information on peering connections to all BGP neighbors within an IPv4 environment.

Use the [show bgp ipv6 neighbors \(BGP4+ only\)](#) command to display detailed information on peering connections to all BGP4+ neighbors within an IPv6 environment.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax [BGP]** `show ip bgp neighbors [<ipv4-addr> [advertised-routes|received prefix-filter|received-routes|routes]]`

| Parameter              | Description   |
|------------------------|---|
| <ipv4-addr>            | The IPv4 address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.   |
| advertised-routes      | Displays the routes advertised to a BGP neighbor.   |
| received prefix-filter | Displays the received prefix-list filters.  |
| received-routes        | Displays the received routes from the neighbor. To display all the received routes from the neighbor, configure the BGP soft reconfigure first. |
| routes                 | Displays all accepted routes learned from neighbors.  |

**Mode [BGP]** User Exec and Privileged Exec

**Examples [BGP]**

```
awplus# show ip bgp neighbors 10.10.10.72 advertised-routes
awplus# show ip bgp neighbors 10.10.10.72 received
prefix-filter
awplus# show ip bgp neighbors 10.10.10.72 received-routes
awplus# show ip bgp neighbors 10.10.10.72 routes
```

**Output** Figure 30-14: Example output from **show ip bgp neighbors 10.10.10.72**

```
awplus#show ip bgp neighbors 10.10.10.72
BGP neighbor is 10.10.10.72, remote AS 100, local AS 100, internal
link
Member of peer-group group1 for session parameters
  BGP version 4, remote router ID 0.0.0.0
  BGP state = Active
  Last read          , hold time is 90, keepalive interval is 30 seconds
  Received 0 messages, 0 notifications, 0 in queue
  Sent 0 messages, 0 notifications, 0 in queue
  Route refresh request: received 0, sent 0
  Minimum time between advertisement runs is 5 seconds
For address family: IPv4 Unicast
  BGP table version 1, neighbor version 0
  Index 1, Offset 0, Mask 0x2
  group1 peer-group member
  NEXT_HOP is always this router
  0 accepted prefixes
  0 announced prefixes

Connections established 0; dropped 0
Next connect timer due in 33 seconds
```

If available the following is shown:

- Session information
  - Neighbor address, ASN information and if the link is external or internal
  - BGP version and status
  - Neighbor capabilities for the BGP session
  - Number of messages transmitted and received
- IPv4 unicast address family information
  - BGP table version
  - IPv4 Address Family dependent capabilities
  - IPv4 Communities
  - IPv4 Route filters for ingress and egress updates
  - Number of announced and accepted IPv4 prefixes
- Connection information
  - Connection counters
  - Graceful restart timer
  - Hop count to the peer
  - Next hop information
  - Local and external port numbers

**Related commands** [show bgp ipv6 neighbors \(BGP4+ only\)](#)

**Command changes**

- Added to AlliedWare Plus prior to 5.4.6-1
- Version 5.4.6-2.1: VRF-lite support added to BGP for AR-series products
- Version 5.4.7-2.1: BGP support added for x510 and x550 series
- Version 5.4.7-2.4: BGP support added for IE300 series

# show ip bgp neighbors connection-retrytime (BGP only)

**Overview** Use this command to display the configured connection-retrytime value of the peer at the session establishment time with the neighbor.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip bgp neighbors <ipv4-addr> connection-retrytime`

| Parameter                      | Description   |
|--------------------------------|---|
| <code>&lt;ipv4-addr&gt;</code> | The IPv4 address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D. |

**Mode** User Exec and Privileged Exec

**Example** `awplus# show ip bgp neighbors 10.11.4.26 connection-retrytime`

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.7-2.1: BGP support added for x510 and x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

# show ip bgp neighbors hold-time (BGP only)

**Overview** Use this command to display the configured holdtime value of the peer at the session establishment time with the neighbor.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip bgp neighbors <ipv4-addr> hold-time`

| Parameter                      | Description   |
|--------------------------------|---|
| <code>&lt;ipv4-addr&gt;</code> | The IPv4 address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D. |

**Default** The holdtime timer default is 90 seconds as per RFC 4271. Holdtime is `keepalive * 3`.

**Mode** User Exec and Privileged Exec

**Examples** `awplus# show ip bgp neighbors 10.11.4.26 hold-time`

**Related commands** [neighbor timers](#)

Version 5.4.7-2.4: BGP support added for IE300 series

# show ip bgp neighbors notification (BGP only)

**Overview** Use this command to display the number of notification messages sent to the neighbor from the peer throughout the session.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip bgp neighbors <ipv4-addr> notification`

| Parameter                      | Description   |
|--------------------------------|---|
| <code>&lt;ipv4-addr&gt;</code> | The IPv4 address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D. |

**Mode** User Exec and Privileged Exec

**Example** `awplus# show ip bgp neighbors 10.11.4.26 notification`

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.7-2.1: BGP support added for x510 and x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

# show ip bgp neighbors open (BGP only)

**Overview** Use this command to display the number of open messages sent to the neighbor from the peer throughout the session.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip bgp neighbors <ipv4-addr> open`

| Parameter                      | Description   |
|--------------------------------|---|
| <code>&lt;ipv4-addr&gt;</code> | The IPv4 address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D. |

**Mode** User Exec and Privileged Exec

**Example** `awplus# show ip bgp neighbors 10.11.4.26 open`

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.7-2.1: BGP support added for x510 and x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

# show ip bgp neighbors rcvd-msgs (BGP only)

**Overview** Use this command to display the number of messages received by the neighbor from the peer throughout the session.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip bgp neighbors <ipv4-addr> rcvd-msgs`

| Parameter                      | Description   |
|--------------------------------|---|
| <code>&lt;ipv4-addr&gt;</code> | The IPv4 address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D. |

**Mode** User Exec and Privileged Exec

**Example** `awplus# show ip bgp neighbors 10.11.4.26 rcvd-msgs`

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.7-2.1: BGP support added for x510 and x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

# show ip bgp neighbors sent-msgs (BGP only)

**Overview** Use this command to display the number of messages sent to the neighbor from the peer throughout the session.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip bgp neighbors <ipv4-addr> sent-msgs`

| Parameter                      | Description   |
|--------------------------------|---|
| <code>&lt;ipv4-addr&gt;</code> | The IPv4 address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D. |

**Mode** User Exec and Privileged Exec

**Example** `awplus# show ip bgp neighbors 10.11.4.26 sent-msgs`

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.7-2.1: BGP support added for x510 and x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

# show ip bgp neighbors update (BGP only)

**Overview** Use this command to display the number of update messages sent to the neighbor from the peer throughout the session.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip bgp neighbors <ipv4-addr> update`

| Parameter                      | Description   |
|--------------------------------|---|
| <code>&lt;ipv4-addr&gt;</code> | The IPv4 address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D. |

**Mode** User Exec and Privileged Exec

**Example** `awplus# show ip bgp neighbors 10.11.4.26 update`

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.7-2.1: BGP support added for x510 and x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

## show ip bgp paths (BGP only)

**Overview** Use this command to display BGP4 path information within an IPv4 environment. Use the [show bgp ipv6 paths \(BGP4+ only\)](#) command to display BGP4+ path information within an IPv4 environment.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip bgp paths`

**Mode** User Exec and Privileged Exec

**Example** `awplus# show ip bgp paths`

**Related commands** [show bgp ipv6 paths \(BGP4+ only\)](#)

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.7-2.1: BGP support added for x510 and x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

# show ip bgp prefix-list (BGP only)

**Overview** Use this command to display routes matching the prefix-list within an IPv4 environment. Use the [show bgp ipv6 prefix-list \(BGP4+ only\)](#) command to display routes matching the prefix-list within an IPv6 environment.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip bgp prefix-list <list>`

| Parameter | Description                               |
|-----------|---|
| <list>    | Specifies the name of the IP prefix list. |

**Mode** User Exec and Privileged Exec

**Examples** `awplus# show ip bgp prefix-list mylist`

**Related commands** [show bgp ipv6 prefix-list \(BGP4+ only\)](#)

**Command changes**

- Added to AlliedWare Plus prior to 5.4.6-1
- Version 5.4.6-2.1: VRF-lite support added to BGP for AR-series products
- Version 5.4.7-2.1: BGP support added for x510 and x550 series
- Version 5.4.7-2.4: BGP support added for IE300 series

# show ip bgp quote-regexp (BGP only)

**Overview** Use this command to display routes matching the AS path regular expression within an IPv4 environment. Use the [show bgp ipv6 quote-regexp \(BGP4+ only\)](#) command to display routes matching the AS path regular expression within an IPv6 environment.

Note that you must use quotes to enclose the regular expression with this command. Use the regular expressions listed below with the *<expression>* parameter:

| Symbol | Character     | Meaning  |
|--------|---------------|--|
| ^      | Caret         | Used to match the beginning of the input string. When used at the beginning of a string of characters, it negates a pattern match. |
| \$     | Dollar sign   | Used to match the end of the input string.   |
| .      | Period        | Used to match a single character (white spaces included).  |
| *      | Asterisk      | Used to match none or more sequences of a pattern.   |
| +      | Plus sign     | Used to match one or more sequences of a pattern.  |
| ?      | Question mark | Used to match none or one occurrence of a pattern.   |
| _      | Underscore    | Used to match spaces, commas, braces, parenthesis, or the beginning and end of an input string.                                    |
| [ ]    | Brackets      | Specifies a range of single-characters.  |
| -      | Hyphen        | Separates the end points of a range.   |

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip bgp quote-regexp <expression>`

| Parameter                 | Description   |
|---------------------------|---|
| <i>&lt;expression&gt;</i> | Specifies a regular-expression to match the BGP AS paths. |

**Mode** User Exec and Privileged Exec

**Examples** `awplus# show ip bgp quote-regexp myexpression`

**Related commands** [show bgp ipv6 quote-regexp \(BGP4+ only\)](#)

- Command changes**
- Added to AlliedWare Plus prior to 5.4.6-1
  - Version 5.4.6-2.1: VRF-lite support added to BGP for AR-series products
  - Version 5.4.7-2.1: BGP support added for x510 and x550 series
  - Version 5.4.7-2.4: BGP support added for IE300 series

# show ip bgp regexp (BGP only)

**Overview** Use this command to display routes matching the AS path regular expression within an IPv4 environment. Use the [show bgp ipv6 regexp \(BGP4+ only\)](#) command to display routes matching the AS path regular expression within an IPv6 environment.

Use the regular expressions listed below with the *<expression>* parameter:

| Symbol | Character     | Meaning  |
|--------|---------------|--|
| ^      | Caret         | Used to match the beginning of the input string. When used at the beginning of a string of characters, it negates a pattern match. |
| \$     | Dollar sign   | Used to match the end of the input string.   |
| .      | Period        | Used to match a single character (white spaces included).  |
| *      | Asterisk      | Used to match none or more sequences of a pattern.   |
| +      | Plus sign     | Used to match one or more sequences of a pattern.  |
| ?      | Question mark | Used to match none or one occurrence of a pattern.   |
| _      | Underscore    | Used to match spaces, commas, braces, parenthesis, or the beginning and end of an input string.                                    |
| [ ]    | Brackets      | Specifies a range of single-characters.  |
| -      | Hyphen        | Separates the end points of a range.   |

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip bgp regexp <expression>`

| Parameter                 | Description   |
|---------------------------|---|
| <i>&lt;expression&gt;</i> | Specifies a regular-expression to match the BGP AS paths. |

**Mode** User Exec and Privileged Exec

**Examples** `awplus# show ip bgp regexp myexpression`

**Related commands** [show bgp ipv6 regexp \(BGP4+ only\)](#)

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.6-2.1: VRF-lite support added to BGP for AR-series products

Version 5.4.7-2.1: BGP support added for x510 and x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# show ip bgp route-map (BGP only)

**Overview** Use this command to display BGP routes that match the specified route-map within an IPv4 environment. Use the [show bgp ipv6 route-map \(BGP4+ only\)](#) command to display BGP4+ routes that match the specified route-map within an IPv6 environment.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip bgp route-map <route-map>`

| Parameter                      | Description                            |
|--------------------------------|--|
| <code>&lt;route-map&gt;</code> | Specifies a route-map that is matched. |

**Mode** User Exec and Privileged Exec

**Examples** To show routes that match the route-map `myRouteMap`, use the command:

```
awplus# show ip bgp route-map myRouteMap
```

**Related commands** [show bgp ipv6 route-map \(BGP4+ only\)](#)

**Command changes**

- Added to AlliedWare Plus prior to 5.4.6-1
- Version 5.4.6-2.1: VRF-lite support added to BGP for AR-series products
- Version 5.4.7-2.1: BGP support added for x510 and x550 series
- Version 5.4.7-2.4: BGP support added for IE300 series

# show ip bgp scan (BGP only)

**Overview** Use this command to display BGP scan status.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip bgp scan`

**Mode** User Exec and Privileged Exec

**Example** `awplus# show ip bgp scan`

**Output** Figure 30-15: Example output from the **show ip bgp scan** command

```
BGP scan is running
BGP scan interval is 60
BGP instance : AS is 11,DEFAULT
Current BGP nexthop cache:
BGP connected route:
 10.10.10.0/24
 10.10.11.0/24
```

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.7-2.1: BGP support added for x510 and x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# show ip bgp summary (BGP only)

**Overview** Use this command to display a summary of a BGP neighbor status within an IPv4 environment. Use the [show bgp ipv6 summary \(BGP4+ only\)](#) command to display a summary of BGP4+ neighbors.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip bgp summary`

**Mode** User Exec and Privileged Exec

**Examples** `awplus# show ip bgp summary`

**Output** Figure 30-16: Example output from the **show ip bgp summary** command

```
awplus>show ip bgp summary

BGP router identifier 1.0.0.1, local AS number 65541
BGP table version is 12
4 BGP AS-PATH entries
0 BGP community entries

Neighbor      V      AS      MsgRc   MsgSnt  TblVer  InOutQ  Up/Down   State/PfxRcd
192.168.3.2   4      65544    20      24      11 0/0    00:07:19      1
192.168.4.2   4      65545     0       0       0 0/0    never        Active
192.168.11.2  4      65542    34      40       0 0/0    00:00:04    Active
192.168.21.2  4      65543    29      32      11 0/0    00:07:03     13

Number of neighbors 4
```

The Up/Down column in this output is a timer that shows:

- "never" if the peer session has never been established
- The up time, if the peer session is currently up
- The down time, if the peer session is currently down.

In the example above, the session with 192.168.11.2 has been down for 4 seconds, and the session with 192.168.4.2 has never been established.

**Related commands** [show bgp ipv6 summary \(BGP4+ only\)](#)

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.6-2.1: VRF-lite support added to BGP for AR-series products

Version 5.4.7-2.1: BGP support added for x510 and x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# show ip community-list

**Overview** Use this command to display routes that match a specified community-list name or number.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip community-list [<listnumber>|<listname>]`

| Parameter                       | Description  |
|---------------------------------|--|
| <code>&lt;listnumber&gt;</code> | Specifies the community list number in the range <1-199> as specified by a previously issued <b>ip community-list</b> command. |
| <code>&lt;listname&gt;</code>   | Specifies the community list name as specified by a previously issued <b>ip community-list</b> command.                        |

**Mode** User Exec and Privileged Exec

**Examples**  
`awplus# show ip community-list mylist`  
`awplus# show ip community-list 99`

**Related commands**  
[ip community-list](#)  
[ip community-list expanded](#)  
[ip community-list standard](#)

**Command changes**  
Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.7-2.1: BGP support added for x510 and x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

# show ip extcommunity-list

**Overview** Use this command to display a configured extcommunity-list.  
For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip extcommunity-list [<1-199>|<extcommunity-listname>]`

| Parameter               | Description              |
|-------------------------|--------------------------|
| <1-199>                 | Extcommunity-list number |
| <extcommunity-listname> | Extcommunity-list name   |

**Mode** User Exec and Privileged Exec

**Example** `awplus# show ip extcommunity-list 33`

**Related commands** [ip extcommunity-list expanded](#)  
[ip extcommunity-list standard](#)

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.7-2.1: BGP support added for x510 and x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

# show ip prefix-list

**Overview** Use this command to display the IPv4 prefix-list entries.  
Note that this command is valid for RIP and BGP routing protocols only.

**Syntax** `show ip prefix-list [<name>|detail|summary]`

| Parameter | Description   |
|-----------|---|
| <name>    | Specify the name of a prefix list in this placeholder.                    |
| detail    | Specify this parameter to show detailed output for all IPv4 prefix lists. |
| summary   | Specify this parameter to show summary output for all IPv4 prefix lists.  |

**Mode** User Exec and Privileged Exec

**Example**

```
awplus# show ip prefix-list
awplus# show ip prefix-list 10.10.0.98/8
awplus# show ip prefix-list detail
```

**Related commands** [ip prefix-list](#)

# show ipv6 prefix-list

**Overview** Use this command to display the prefix-list entries.

Note that this command is valid for RIPng and BGP4+ routing protocols only.

**Syntax** `show ipv6 prefix-list [<name>|detail|summary]`

| Parameter | Description   |
|-----------|---|
| <name>    | Specify the name of an individual IPv6 prefix list.                       |
| detail    | Specify this parameter to show detailed output for all IPv6 prefix lists. |
| summary   | Specify this parameter to show summary output for all IPv6 prefix lists.  |

**Mode** User Exec and Privileged Exec

**Example**

```
awplus# show ipv6 prefix-list
awplus# show ipv6 prefix-list 10.10.0.98/8
awplus# show ipv6 prefix-list detail
```

**Related commands** [ipv6 prefix-list](#)

# show ip protocols bgp (BGP only)

**Overview** Use this command to display BGP process parameters and statistics.  
For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip protocols bgp`

**Mode** User Exec and Privileged Exec

**Example** To display BGP process parameters and statistics, use the command:

```
awplus# show ip protocols bgp
```

**Output** Figure 30-17: Example output from the **show ip protocols bgp** command

```
Routing Protocol is "bgp 100"
  IGP synchronization is disabled
  Automatic route summarization is disabled
  Default local-preference applied to incoming route is 100
  Redistributing:
  Neighbor(s):
  Address AddressFamily FiltIn FiltOut DistIn DistOut RouteMapIn RouteMapOut
  Weight
  10.10.10.1                unicast
```

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.7-2.1: BGP support added for x510 and x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

# show route-map

**Overview** Use this command to display information about one or all route maps.

**Syntax** `show route-map <map-name>`

| Parameter                     | Description                       |
|-------------------------------|-----------------------------------|
| <code>&lt;map-name&gt;</code> | A name to identify the route map. |

**Mode** User Exec and Privileged Exec

**Example** To display information about the route-map named `example-map`, use the command:

```
awplus# show route-map example-map
```

**Output** Figure 30-18: Example output from the **show route-map** command

```
route-map example-map, permit, sequence 1
  Match clauses:
    ip address prefix-list example-pref
  Set clauses:
    metric 100
route-map example-map, permit, sequence 200
  Match clauses:
  Set clauses:
```

**Related commands** [route-map](#)

# synchronization

**Overview** Use this command in Router Configuration mode or in Address Family Configuration mode to ensure BGP does not advertise router learned from iBGP peers until they are learned locally, or are propagated throughout the AS via an IGP.

Use the **no** variant of this command to disable this function.

**Syntax** `synchronization`  
`no synchronization`

**Default** Disabled.

**Mode** Router Configuration and Address Family Configuration mode

**Usage notes** Synchronization is used when a BGP router should not advertise routes learned from iBGP neighbors, unless those routes are also present in an IGP (for example, OSPF). These routes must be in the RIB (Routing Information Base) learned locally or via an IGP.

Synchronization may be enabled when all the routers in an autonomous system do not speak BGP, and the autonomous system is a transit for other autonomous systems.

Use the **no synchronization** command when BGP router can advertise routes learned from iBGP neighbors, without waiting for IGP reachability, when routes are in the RIB.

**Example** The following example enables IGP synchronization of iBGP routes in Router Configuration mode:

```
awplus# configure terminal
awplus(config)# router bgp 11
awplus(config-router)# synchronization
```

The following example enables IGP synchronization of iBGP routes in IPv4 unicast Address Family Configuration mode:

```
awplus# configure terminal
awplus(config)# router bgp 11
awplus(config)# address-family ipv4 unicast
awplus(config-af)# synchronization
```

The following example enables IGP synchronization of iBGP routes in the IPv6 unicast Address Family Configuration mode:

```
awplus# configure terminal
awplus(config)# router bgp 11
awplus(config)# address-family ipv6 unicast
awplus(config-af)# synchronization
```

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.7-2.1: BGP support added for x510 and x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

# timers (BGP)

**Overview** Use this command sets the BGP keepalive timer and holdtime timer values.  
Use the **no** variant of this command to reset timers to the default.

**Syntax** `timers bgp <keepalive> <holdtime>`  
`no timers bgp [<keepalive> <holdtime>]`

| Parameter                      | Description  |
|--------------------------------|--|
| <code>&lt;keepalive&gt;</code> | <code>&lt;0-65535&gt;</code> The frequency with which the keepalive messages are sent to the neighbors. The default is 30 seconds as per RFC 4271. Cisco IOS uses a 60 second keepalive timer default value. Adjust keepalive timers for interoperability as required. Maintain the keepalive value at the holdtime value / 3.                                     |
| <code>&lt;holdtime&gt;</code>  | <code>&lt;0-65535&gt;</code> The interval after which the neighbor is considered dead if keepalive messages are not received. The default holdtime value is 90 seconds as per RFC 4271. Cisco IOS uses a 180 second holdtime timer default value. Adjust holdtime timers for interoperability as required. Maintain the holdtime value at the keepalive value * 3. |

**Default** The keepalive timer default is 60 seconds, the holdtime timer default is 90 seconds, and the connect timer default is 120 seconds as per RFC 4271. Holdtime is keepalive \* 3.

**Mode** Router Configuration

**Usage notes** This command is used globally to set or unset the keepalive and holdtime values for all the neighbors.

**Examples**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# timers bgp 40 120
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no timers bgp 30 90
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no timers bgp
```

**Related commands**

# undebug bgp (BGP only)

**Overview** Use this command to disable BGP debugging functions.

**Syntax** undebug bgp  
[all|dampening|events|filters|fsm|keepalives|nht|nsm|updates]  
undebug all bgp

| Parameter  | Description   |
|------------|---|
| all        | Disable all debugging for BGP.                              |
| dampening  | Disable debugging for BGP dampening.                        |
| events     | Disable debugging for BGP events.                           |
| filters    | Disable debugging for BGP filters.                          |
| fsm        | Disable debugging for BGP Finite State Machine (FSM).       |
| keepalives | Disable debugging for BGP keepalives.                       |
| nht        | Disable debugging for BGP NHT (Next Hop Tracking) messages. |
| nsm        | Disable debugging for NSM messages.                         |
| updates    | Disable debugging for BGP updates.                          |

**Mode** Privileged Exec and Global Configuration

**Example** awplus# undebug bgp events  
awplus# undebug bgp nht  
awplus# undebug bgp updates

**Related commands** [debug bgp \(BGP only\)](#)

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.7-2.1: BGP support added for x510 and x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

# 31

# Route Map Commands

## Introduction

**Overview** This chapter provides an alphabetical reference for route map commands. For more information, see the [Routemaps Feature Overview and Configuration Guide](#). These commands can be divided into the following categories:

- the [route-map](#) command, which is used to create a route map and/or route map entry, and to put you into route map mode
- **match** commands, used to determine which routes or BGP update messages the route map applies to
- **set** commands, used to modify matching routes or BGP update messages

- Command List**
- ["match as-path"](#) on page 1608
  - ["match community"](#) on page 1610
  - ["match interface"](#) on page 1612
  - ["match ip address"](#) on page 1613
  - ["match ip next-hop"](#) on page 1615
  - ["match ipv6 address"](#) on page 1617
  - ["match ipv6 next-hop"](#) on page 1619
  - ["match metric"](#) on page 1620
  - ["match origin"](#) on page 1621
  - ["match route-type"](#) on page 1623
  - ["match tag"](#) on page 1624
  - ["route-map"](#) on page 1625
  - ["set aggregator"](#) on page 1628
  - ["set as-path"](#) on page 1629
  - ["set atomic-aggregate"](#) on page 1630

- [“set comm-list delete”](#) on page 1631
- [“set community”](#) on page 1632
- [“set dampening”](#) on page 1634
- [“set extcommunity”](#) on page 1636
- [“set ip next-hop \(route map\)”](#) on page 1638
- [“set ipv6 next-hop”](#) on page 1639
- [“set local-preference”](#) on page 1640
- [“set metric”](#) on page 1641
- [“set metric-type”](#) on page 1643
- [“set origin”](#) on page 1644
- [“set originator-id”](#) on page 1645
- [“set tag”](#) on page 1646
- [“set weight”](#) on page 1647
- [“show route-map”](#) on page 1648

# match as-path

**Overview** Use this command to add an autonomous system (AS) path match clause to a route map entry. Specify the AS path attribute value or values to match by specifying the name of an AS path access list. To create the AS path access list, enter Global Configuration mode and use the [ip as-path access-list](#) command.

A BGP update message matches the route map if its attributes include AS path values that match the AS path access list.

Each entry of a route map can only match against one AS path access list in one AS path match clause. If the route map entry already has an AS path match clause, entering this command replaces that match clause with the new clause.

Note that AS path access lists and route map entries both specify an action of deny or permit. The action in the AS path access list determines whether the route map checks update messages for a given AS path value. The route map action and its **set** clauses determine what the route map does with update messages that contain that AS path value.

Use the **no** variant of this command to remove the AS path match clause from a route map entry.

**Syntax** `match as-path <as-path-listname>`  
`no match as-path [<as-path-listname>]`

| Parameter                             | Description                            |
|---------------------------------------|--|
| <code>&lt;as-path-listname&gt;</code> | Specifies an AS path access list name. |

**Mode** Route-map Configuration

**Usage notes** This command is valid for BGP update messages only.

**Example** To add entry 34 to the route map called `myroute`, which will discard update messages if they contain the AS path values that are included in `myaccesslist`, use the commands:

```
awplus# configure terminal
awplus(config)# route-map myroute deny 34
awplus(config-route-map)# match as-path myaccesslist
```

**Related commands** [route-map](#)  
[set as-path](#)  
[show route-map](#)

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.7-2.1: BGP support added for x510 and x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# match community

**Overview** Use this command to add a community match clause to a route map entry. Specify the community value or values to match by specifying a community list. To create the community list, enter Global Configuration mode and use the [ip community-list](#) command.

A BGP update message matches the route map if its attributes include community values that match the community list.

Each entry of a route map can only match against one community list in one community match clause. If the route map entry already has a community match clause, entering this command replaces that match clause with the new clause.

Note that community lists and route map entries both specify an action of deny or permit. The action in the community list determines whether the route map checks update messages for a given community value. The route map action and its **set** clauses determine what the route map does with update messages that contain that community value.

Use the **no** variant of this command to remove the community match clause from a route map.

**Syntax**

```
match community  
{<community-listname>|<1-99>|<100-199>} [exact-match]  
  
no match community  
[<community-listname>|<1-99>|<100-199>|exact-match]
```

| Parameter            | Description                             |
|----------------------|---|
| <community-listname> | The community list name or number.      |
| <1-99>               | Community list number (standard range). |
| <100-199>            | Community list number (expanded range). |
| exact-match          | Exact matching of communities.          |

**Mode** Route-map Configuration

**Usage notes** This command is valid for BGP update messages only.

Communities are used to group and filter routes. They are designed to provide the ability to apply policies to large numbers of routes by using match and set commands. Community lists are used to identify and filter routes by their common attributes.

**Example** To add entry 3 to the route map called `myroute`, which will process update messages if they contain the community values that are included in `mylist`, use the commands:

```
awplus# configure terminal
awplus(config)# route-map myroute permit 3
awplus(config-route-map)# match community mylist
```

**Related commands**

- [ip community-list](#)
- [route-map](#)
- [set comm-list delete](#)
- [set community](#)
- [show route-map](#)

**Command changes**

- Added to AlliedWare Plus prior to 5.4.6-1
- Version 5.4.7-2.1: BGP support added for x510 and x550 series
- Version 5.4.7-2.4: BGP support added for IE300 series

# match interface

**Overview** Use this command to add an interface match clause to a route map entry. Specify the interface name to match.

A route matches the route map if its interface matches the interface name.

Each entry of a route map can only match against one interface in one interface match clause. If the route map entry already has an interface match clause, entering this command replaces that match clause with the new clause.

Use the **no** variant of this command to remove the interface match clause from the route map entry. Use the **no** variant of this command without a specified interface to remove all interfaces.

**Syntax** `match interface <interface>`  
`no match interface [<interface>]`

| Parameter                      | Description             |
|--------------------------------|-------------------------|
| <code>&lt;interface&gt;</code> | The interface to match. |

**Mode** Route-map Configuration

**Usage** This command is valid for RIP and OSPF routes only.

**Example** To add entry 10 to the route map called 'mymap1', which will process routes if they use the interface vlan1, use the commands:

```
awplus# configure terminal
awplus(config)# route-map mymap1 permit 10
awplus(config-route-map)# match interface vlan1
```

To remove all interfaces from the route map called 'mymap1', use the commands:

```
awplus# configure terminal
awplus(config)# route-map mymap1 permit 10
awplus(config-route-map)# no match interface
```

**Related commands**

- [match ip address](#)
- [match ip next-hop](#)
- [match route-type](#)
- [match tag](#)
- [route-map](#)
- [show route-map](#)

# match ip address

**Overview** Use this command to add an IP address prefix match clause to a route map entry. You can specify the prefix or prefixes to match by either:

- specifying the name of an access list. To create the access list, enter Global Configuration mode and use the **access-list** command.
- specifying the name of a prefix list. To create the prefix list, enter Global Configuration mode and use the **ip prefix-list** command.

A route matches the route map entry if the route's prefix matches the access list or prefix list.

Use the **no** variant of this command to remove the IP address match clause from a route map entry. To remove a prefix list-based match clause you must also specify the **prefix-list** parameter.

**Syntax**

```
match ip address <access-list-id>
match ip address prefix-list <prefix-listname>
no match ip address
no match ip address <access-list-id>
no match ip address prefix-list <prefix-listname>
```

| Parameter                           | Description  |
|-------------------------------------|--|
| <code>&lt;access-list-id&gt;</code> | Use an ACL to specify which prefixes to match.                             |
|                                     | <code>&lt;access-list-name&gt;</code> The IP access list name.             |
|                                     | <code>&lt;1-199&gt;</code> The IP access list number.                      |
|                                     | <code>&lt;1300-2699&gt;</code> The IP access list number (expanded range). |
| prefix-list                         | Use an IP prefix list to specify which prefixes to match.                  |
|                                     | <code>&lt;prefix-listname&gt;</code> The prefix list name.                 |

**Mode** Route-map Configuration

**Usage notes** Each entry of a route map can have at most one access list-based IP address match clause and one prefix list-based IP address match clause. If the route map entry already has one of these match clauses, entering this command replaces that match clause with the new clause.

Note that access lists, prefix lists and route map entries all specify an action of deny or permit. The action in the access list or prefix list determines whether the route map checks update messages and routes for a given prefix. The action in the route map, and the map's **set** clauses, determine what the device does with update messages or routes that contain that prefix.

If the **match ip address** command results in a match against the specified IP address, then the outcome is:

- If **permit** is specified, then the route is redistributed or controlled, as specified by the set action.
- If **deny** is specified, then the route is not redistributed or controlled.

If the match criteria are not met, the route is neither accepted nor forwarded, irrespective of **permit** or **deny** specifications.

This command is valid for:

- OSPF routes
- routes in BGP update messages
- RIP routes.

**Examples** To add entry 3 to the route map called 'myroute', which will process routes that match the ACL called 'List1', use the commands:

```
awplus# configure terminal
awplus(config)# route-map myroute permit 3
awplus(config-route-map)# match ip address List1
```

To add entry 3 to the route map called 'rmap1', which will process routes that match the prefix list called 'mylist', use the commands:

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# match ip address prefix-list mylist
```

**Related commands**

[access-list \(extended numbered\)](#)

[access-list \(standard numbered\)](#)

[ip prefix-list](#)

[route-map](#)

[show ip access-list](#)

[show route-map](#)

# match ip next-hop

**Overview** Use this command to add a next-hop match clause to a route map entry. You can specify the next hop to match by either:

- specifying the name of an access list. To create the access list, enter Global Configuration mode and use the **access-list** command.
- specifying the name of a prefix list. To create the prefix list, enter Global Configuration mode and use the **ip prefix-list** command.

A route matches the route map if the route's next hop matches the access list or prefix list.

Each entry of a route map can have at most one access list-based next-hop match clause and one prefix list-based next-hop match clause. If the route map entry already has one of these match clauses, entering this command replaces that match clause with the new clause.

Note that the lists and route map entries specify an action of deny or permit. The action in the list determines whether the route map checks update messages and routes for a given next-hop value. The route map action and its **set** clauses determine what the route map does with update messages and routes that contain that next hop.

Use the **no** variant of this command to remove the next-hop match clause from a route map entry. To remove a prefix list-based match clause you must also specify the prefix-list parameter.

**Syntax**

```
match ip next-hop <access-list-id>
match ip next-hop prefix-list <prefix-listname>
no match ip next-hop [<access-list-id>]
no match ip next-hop prefix-list [<prefix-listname>]
```

| Parameter                           | Description  |
|-------------------------------------|--|
| <code>&lt;access-list-id&gt;</code> | Use an ACL to specify which next hops to match.                            |
|                                     | <code>&lt;access-list-name&gt;</code> The IP access list name.             |
|                                     | <code>&lt;1-199&gt;</code> The IP access list number.                      |
|                                     | <code>&lt;1300-2699&gt;</code> The IP access list number (expanded range). |
| prefix-list                         | Use an IP prefix list to specify which next hops to match.                 |
|                                     | <code>&lt;prefix-listname&gt;</code> The prefix list name.                 |

**Mode** Route-map Configuration

**Usage notes** This command is valid for:

- OSPF routes

- routes in BGP update messages
- RIP routes.

**Examples** To add entry 3 to the route map called 'rmap1', which will process routes whose next hop matches the ACL called 'mylist', use the commands:

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# match ip next-hop mylist
```

To add entry 3 to the route map called 'mymap', which will process routes whose next hop matches the prefix list called 'list1', use the commands:

```
awplus# configure terminal
awplus(config)# route-map mymap permit 3
awplus(config-route-map)# match ip next-hop prefix-list list1
```

**Related commands**

- [access-list \(extended numbered\)](#)
- [access-list \(standard numbered\)](#)
- [ip prefix-list](#)
- [route-map](#)
- [show ip access-list](#)
- [show ip prefix-list](#)
- [show route-map](#)

# match ipv6 address

**Overview** Use this command to add an IPv6 address prefix match clause to a route map entry. You can specify the prefix or prefixes to match by either:

- specifying the name of an access list. To create the access list, enter Global Configuration mode and use the **access-list** command.
- specifying the name of a prefix list. To create the prefix list, enter Global Configuration mode and use the **ipv6 prefix-list** command.

A route matches the route map entry if the route's prefix matches the access list or prefix list.

Use the **no** variant of this command to remove the IPv6 address match clause from a route map entry.

**Syntax**

```
match ipv6 address <access-list-id>
match ipv6 address prefix-list <prefix-listname>
no match ipv6 address
no match ipv6 address <access-list-id>
no match ipv6 address prefix-list <prefix-listname>
```

| Parameter          | Description  |
|--------------------|--|
| <access-list-id>   | {<access-list-name> <1-199> <1300-2699>}<br>The IP access list name or number. |
| <access-list-name> | The IP access list name.   |
| <1-199>            | The IP access list number.   |
| <1300-2699>        | The IP access list number (expanded range).                                    |
| prefix-list        | Use an IP prefix list to specify which prefixes to match.                      |
| <prefix-listname>  | The prefix list name.  |

**Mode** Route-map Configuration

**Usage notes** Each entry of a route map can have at most one access list-based IPv6 address match clause and one prefix list-based IPv6 address match clause. If the route map entry already has one of these match clauses, entering this command replaces that match clause with the new clause.

Note that access lists, prefix lists and route map entries all specify an action of deny or permit. The action in the access list or prefix list determines whether the route map checks update messages and routes for a given prefix. The action in the route map, and the map's **set** clauses, determine what the device does with update messages or routes that contain that prefix.

If the **match ipv6 address** command results in a match against the specified IPv6 address, then the outcome is:

- If **permit** is specified, then the route is redistributed or controlled, as specified by the set action.
- If **deny** is specified, then the route is not redistributed or controlled.

If the match criteria are not met, the route is neither accepted nor forwarded, irrespective of **permit** or **deny** specifications.

This command is valid for:

- OSPF routes
- routes in BGP update messages
- RIP routes.

**Examples** To avoid processing the routes specified by the ACL named "acl1", use the commands:

```
awplus# configure terminal
awplus(config)# route-map rmap1 deny 1
awplus(config-route-map)# match ipv6 address acl1
```

To match traffic according to the prefix list named "mylist", use the commands:

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# match ipv6 address prefix-list mylist
```

# match ipv6 next-hop

**Overview** Use this command to specify a next-hop address to be matched by the route-map. Use the **no** variant of this command to disable this function.

**Syntax**

```
match ipv6 next-hop <access-list-name>
match ipv6 next-hop <ipv6-addr>
match ipv6 next-hop prefix-list <prefix-listname>
no match ipv6 next-hop [<access-list-name>]
match ipv6 next-hop [<ipv6-addr>]
match ipv6 next-hop [prefix-list <prefix-listname>]
```

| Parameter          | Description   |
|--------------------|---|
| <access-list-name> | The name of the IPv6 access list that specifies criteria for the addresses to match.      |
| <ipv6-addr>        | The IPv6 address of the next hop. The IPv6 address uses the format X:X::X:X.              |
| <prefix-listname>  | The name of the IPv6 prefix list that specifies criteria for the addresses to be matched. |

**Mode** Route-map Configuration

**Usage notes** The **match ipv6 next-hop** command specifies the next-hop address to be matched. If there is a match for the specified next-hop address, and permit is specified, the route is redistributed or controlled as specified by the set action. If the match criteria are met, and deny is specified, the route is not redistributed or controlled. If the match criteria are not met, the route is neither accepted nor forwarded, irrespective of permit or deny specifications.

**NOTE:** This command is valid only for BGP.

**Example**

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# match ipv6 next-hop 2001:0db8::/32
```

# match metric

**Overview** Use this command to add a metric match clause to a route map entry. Specify the metric value to match.

A route matches the route map if its metric matches the route map's metric.

A BGP update message matches the route map if its MED attribute value matches the route map's metric.

Each entry of a route map can only match against one metric value in one metric match clause. If the route map entry already has a metric match clause, entering this command replaces that match clause with the new clause.

Use the **no** variant of this command to remove the metric match clause from the route map entry.

**Syntax** `match metric <metric>`  
`no match metric [<metric>]`

| Parameter | Description                                |
|-----------|--|
| <metric>  | <0-4294967295> Specifies the metric value. |

**Mode** Route-map Configuration

**Usage notes** This command is valid for:

- OSPF routes
- routes in BGP update messages
- RIP routes.

**Example** To stop entry 3 of the route map called "myroute" from processing routes with a metric of 888999, use the commands:

```
awplus# configure terminal
awplus(config)# route-map myroute permit 3
awplus(config-route-map)# no match metric 888999
```

**Related commands** [route-map](#)  
[set metric](#)  
[show route-map](#)

# match origin

**Overview** Use this command to add an origin match clause to a route map entry. Specify the origin attribute value to match.

A BGP update message matches the route map if its origin attribute value matches the route map's origin value.

Each entry of a route map can only match against one origin in one origin match clause. If the route map entry already has an origin match clause, entering this command replaces that match clause with the new clause.

Use the **no** variant of this command to remove the origin match clause from the route map entry.

**Syntax** `match origin {egp|igp|incomplete}`  
`no match origin [egp|igp|incomplete]`

| Parameter  | Description                                      |
|------------|--|
| egp        | Learned from an exterior gateway protocol.       |
| igp        | Learned from a local interior gateway protocol.  |
| incomplete | Of unknown heritage, for example a static route. |

**Mode** Route-map Configuration

**Usage** The origin attribute defines the origin of the path information. The **egp** parameter is indicated as an **e** in the routing table, and it indicates that the origin of the information is learned via Exterior Gateway Protocol. The **igp** parameter is indicated as an **i** in the routing table, and it indicates the origin of the path information is interior to the originating AS. The **incomplete** parameter is indicated as a **?** in the routing table, and indicates that the origin of the path information is unknown or learned through other means. If a static route is redistributed into BGP, the origin of the route is incomplete.

The **match origin** command specifies the origin to be matched. If there is a match for the specified origin, and **permit** is specified, the route is redistributed or controlled as specified by the set action. If the match criteria are met, and **deny** is specified, the route is not redistributed or controlled. If the match criteria are not met, the route is neither accepted nor forwarded, irrespective of **permit** or **deny** specifications.

This command is valid for BGP update messages only.

**Example** To add entry 34 to the route map called "rmap1", which will drop externally-originated routes, use the commands:

```
awplus# configure terminal
awplus(config)# route-map myroute deny 34
awplus(config-route-map)# match origin egp
```

**Related  
commands** route-map  
set origin  
show route-map

# match route-type

**Overview** Use this command to add an external route-type match clause to a route map entry. Specify whether to match OSPF type-1 external routes or OSPF type-2 external routes.

An OSPF route matches the route map if its route type matches the route map's route type.

Each entry of a route map can only match against one route type in one match clause. If the route map entry already has a route type match clause, entering this command replaces that match clause with the new clause.

Use the **no** variant of this command to remove the route type match clause from the route map entry.

**Syntax** `match route-type external {type-1|type-2}`  
`no match route-type external [type-1|type-2]`

| Parameter | Description                  |
|-----------|------------------------------|
| type-1    | OSPF type-1 external routes. |
| type-2    | OSPF type-2 external routes. |

**Mode** Route-map Configuration

**Usage** Use the **match route-type external** command to match specific external route types. AS- external LSA is either Type-1 or Type-2. **external type-1** matches only Type 1 external routes, and **external type-2** matches only Type 2 external routes. This command is valid for OSPF routes only.

**Example** To add entry 10 to the route map called `mymap1`, which will process type-1 external routes, use the commands:

```
awplus# configure terminal
awplus(config)# route-map mymap1 permit 10
awplus(config-route-map)# match route-type external type-1
```

**Related commands**

- [match interface](#)
- [match ip address](#)
- [match ip next-hop](#)
- [match tag](#)
- [route-map](#)
- [set metric-type](#)
- [show route-map](#)

# match tag

**Overview** Use this command to add a tag match clause to a route map entry. Specify the route tag value to match.

An OSPF route matches the route map if it has been tagged with the route map's tag value. Routes can be tagged through OSPF commands or through another route map's set clause.

Each entry of a route map can only match against one tag in one match clause. If the route map entry already has a tag match clause, entering this command replaces that match clause with the new clause.

Use the **no** variant of this command to remove the tag match clause from the route map entry.

**Syntax** `match tag <0-4294967295>`  
`no match tag [<0-4294967295>]`

**Mode** Route-map Configuration

**Usage** This command is valid for OSPF routes only.

**Example** To add entry 10 to the route map called `mymap1`, which will process routes that are tagged 100, use the following commands:

```
awplus# configure terminal
awplus(config)# route-map mymap1 permit 10
awplus(config-route-map)# match tag 100
```

**Related commands**

- [match interface](#)
- [match ip address](#)
- [match ip next-hop](#)
- [match route-type](#)
- [route-map](#)
- [set tag](#)
- [show route-map](#)

# route-map

**Overview** Use this command to configure a route map entry, and to specify whether the device will process or discard matching routes and BGP update messages.

The device uses a name to identify the route map, and a sequence number to identify each entry in the route map.

The **route-map** command puts you into route-map configuration mode. In this mode, you can use the following:

- one or more of the **match** commands to create match clauses. These specify what routes or update messages match the entry.
- one or more of the **set** commands to create set clauses. These change the attributes of matching routes or update messages.

Use the **no** variant of this command to delete a route map or to delete an entry from a route map.

**Syntax**

```
route-map <mapname> {deny|permit} <seq>
no route-map <mapname>
no route-map <mapname> {deny|permit} <seq>
```

| Parameter | Description   |
|-----------|---|
| <mapname> | A name to identify the route map.   |
| deny      | The route map causes a routing process to discard matching routes or BGP update messages.                                 |
| permit    | The route map causes a routing process to use matching routes or BGP update messages.                                     |
| <seq>     | <1-65535> The sequence number of the entry. You can use this parameter to control the order of entries in this route map. |

**Mode** Global Configuration

**Usage notes** Route maps allow you to control and modify routing information by filtering routes and setting route attributes. You can apply route maps when the device:

- processes BGP update messages that it has received from a peer
- prepares BGP update messages to send to peers
- redistributes routes from one routing protocol into another
- redistributes static routes into routing protocols
- uses BGP route flap dampening

When a routing protocol passes a route or update message through a route map, it checks the entries in order of their sequence numbers, starting with the lowest numbered entry.

If it finds a match on a route map with an action of permit, then it applies any set clauses and accepts the route. Having found a match, the route is not compared against any further entries of the route map.

If it finds a match on a route map with an action of deny, it will discard the matching route.

If it does not find a match, it discards the route or update message. This means that route maps end with an implicit deny entry. To permit all non-matching routes or update messages, end your route map with an entry that has an action of **permit** and no match clause.

**Examples** To enter route-map mode for entry 1 of the route map called "route1", and then add a match and set clause to it, use the commands:

```
awplus# configure terminal
awplus(config)# route-map route1 permit 1
awplus(config-route-map)# match as-path 60
awplus(config-route-map)# set weight 70
```

To enter route-map mode for entry 2 of the route map called "route1", and then add a match and set clause to it, use the commands:

```
awplus# configure terminal
awplus(config)# route-map route1 permit 2
awplus(config-route-map)# match interface vlan2
awplus(config-route-map)# set metric 20
```

Note how the prompt changes when you go into route map configuration mode.

To make the device process non-matching routes instead of discarding them, add a command like the following one:

```
awplus(config)# route-map route1 permit 100
```

**Related commands**

For BGP:

- show route-map
- bgp dampening
- neighbor default-originate
- neighbor route-map
- neighbor unsuppress-map
- network (BGP and BGP4+)
- redistribute (into BGP or BGP4+)
- show ip bgp route-map (BGP only)

For OSPF:

- distribute-list (OSPF)
- default-information originate
- redistribute (OSPF)

For RIP:  
`redistribute (RIP)`

# set aggregator

**Overview** Use this command to add an aggregator set clause to a route map entry.

When a BGP update message matches the route map entry, the device sets the update's aggregator attribute. The aggregator attribute specifies the AS and IP address of the device that performed the aggregation.

Use the **no** variant of this command to remove the set clause.

**Syntax** `set aggregator as <asnum> <ip-address>`  
`no set aggregator as`

| Parameter    | Description                       |
|--------------|-----------------------------------|
| <asnum>      | The AS number of the aggregator.  |
| <ip-address> | The IP address of the aggregator. |

**Mode** Route-map Configuration

**Usage** An Autonomous System (AS) is a collection of networks under a common administration sharing a common routing strategy. It is subdivided by areas, and is assigned a unique 16-bit number. Use the **set aggregator** command to assign an AS number for the aggregator.

This command is valid for BGP update messages only.

**Example** To use entry 3 of the route map called `myroute` to set the aggregator attribute to 43 10.10.0.3 in matching update messages, use the commands:

```
awplus# configure terminal
awplus(config)# route-map myroute permit 3
awplus(config-route-map)# set aggregator as 43 10.10.0.3
```

To remove all aggregator attributes for entry 3 of the route map called `myroute`, use the commands:

```
awplus# configure terminal
awplus(config)# route-map myroute permit 3
awplus(config-route-map)# no set aggregator as
```

**Related commands** [route-map](#)  
[show route-map](#)

# set as-path

**Overview** Use this command to add an AS path set clause to a route map entry.

When a BGP update message matches the route map entry, the device prepends the specified Autonomous System Number (ASN) or ASNs to the update's AS path attribute.

The AS path attribute is a list of the autonomous systems through which the announcement for the prefix has passed. As prefixes pass between autonomous systems, each autonomous system adds its ASN to the beginning of the list. This means that the AS path attribute can be used to make routing decisions.

Use the **no** variant of this command to remove the set clause.

**Syntax** `set as-path prepend <1-65535> [<1-65535>]...`  
`no set as-path prepend [<1-65535> [<1-65535>]...]`

| Parameter                    | Description  |
|------------------------------|--|
| <code>prepend</code>         | Prepends the autonomous system path.   |
| <code>&lt;1-65535&gt;</code> | The number to prepend to the AS path. If you specify multiple ASNs, separate them with spaces. |

**Mode** Route-map mode

**Usage notes** Use the **set as-path** command to specify an autonomous system path. By specifying the length of the AS-Path, the device influences the best path selection by a neighbor. Use the `prepend` parameter with this command to prepend an AS path string to routes increasing the AS path length.

This command is valid for BGP update messages only.

**Example** To use entry 3 of the route map called `myroute` to prepend ASN 8 and 24 to the AS path of matching update messages, use the commands:

```
awplus# configure terminal
awplus(config)# route-map myroute permit 3
awplus(config-route-map)# set as-path prepend 8 24
```

**Related commands** [match as-path](#)  
[route-map](#)  
[show route-map](#)

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.7-2.1: BGP support added for x510 and x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

# set atomic-aggregate

**Overview** Use this command to add an atomic aggregate set clause to a route map entry. When a BGP update message matches the route map entry, the device adds the atomic aggregate attribute to the update. Use the **no** variant of this command to remove the set clause.

**Syntax** `set atomic-aggregate`  
`no set atomic-aggregate`

**Mode** Route-map Configuration

**Usage** This command is valid for BGP update messages only.

**Example** To use entry 3 of the route map called `rmap1` to add the atomic aggregator attribute to matching update messages, use the commands:

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# set atomic-aggregate
```

**Related commands** [route-map](#)  
[show route-map](#)

# set comm-list delete

**Overview** Use this command to delete one or more communities from the community attribute of a BGP update message. Specify the communities to delete by specifying a community list. To create the community list, enter Global Configuration mode and use the [ip community-list](#) command.

When a BGP update message matches the route map entry, the device deletes the specified communities from the update's community attribute.

Use the **no** variant of this command to stop deleting the communities.

**Syntax**

```
set comm-list {<1-199>|<100-199>|<word>} delete  
no set comm-list {<1-199>|<100-199>|<word>} delete
```

| Parameter | Description                     |
|-----------|---------------------------------|
| <1-99>    | Standard community-list number. |
| <100-199> | Expanded community-list number. |
| <word>    | Name of the Community-list.     |

**Mode** Route-map Configuration

**Usage** This command is valid for BGP update messages only.

**Example** To use entry 3 of the route map called `myroute` to delete the communities in community list 34 from matching update messages, use the commands:

```
awplus# configure terminal  
awplus(config)# route-map myroute permit 3  
awplus(config-route-map)# set comm-list 34 delete
```

**Related commands**

- [ip community-list](#)
- [match community](#)
- [route-map](#)
- [set community](#)
- [show route-map](#)

# set community

**Overview** Use this command to add a community set clause to a route map entry.

When a BGP update message matches the route map entry, the device takes one of the following actions:

- changes the update's community attribute to the specified value or values, or
- adds the specified community value or values to the update's community attribute, if you specify the **additive** parameter after specifying another parameter. or
- removes the community attribute from the update, if you specify the **none** parameter

Use the **no** variant of this command to remove the set clause.

**Syntax**

```
set community {[<1-65535>][AA:NN] [internet] [local-AS]
[no-advertise] [no-export] [additive]}
no set community {[AA:NN] [internet] [local-AS] [no-advertise]
[no-export] [additive]}
set community none
no set community none
```

| Parameter    | Description   |
|--------------|---|
| <1-65535>    | The AS number of the community as an integer not in AA:NN format.   |
| AA:NN        | The Autonomous System (AS) number of the community, in AA:NN format. AS numbers are assigned to the regional registries by the IANA ( <a href="http://www.iana.org">www.iana.org</a> ) and can be obtained from the registry in your region. AA and NN are both integers from 1 to 65535. AA is the AS number; NN is a value chosen by the ASN administrator. |
| local-AS     | The community of routes that must not be advertised to external BGP peers (this includes peers in other members' Autonomous Systems inside a BGP confederation).  |
| internet     | The community of routes that can be advertised to all BGP peers.  |
| no-advertise | The community of routes that must not be advertised to other BGP peers.   |
| no-export    | The community of routes that must not be advertised outside a BGP confederation boundary (a standalone Autonomous System that is not part of a confederation should be considered a confederation itself).  |

| Parameter | Description   |
|-----------|---|
| none      | The device removes the community attribute from matching update messages.   |
| additive  | The device adds the specified community value to the update message's community attribute, instead of replacing the existing attribute. By default this parameter is not included, so the device replaces the existing attribute. |

**Mode** Route-map Configuration

**Usage notes** This command is valid for BGP update messages only.

**Examples** To use entry 3 of the route map called `rmap1` to put matching routes into the no-advertise community, use the commands:

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# set community no-advertise
```

To use entry 3 of the route map called `rmap1` to put matching routes into several communities, use the commands:

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# set community 10:01 23:34 12:14
no-export
```

To use entry 3 of the route map called `rmap1` to put matching routes into a single AS community numbered 16384, use the commands:

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# set community 16384 no-export
```

**Related commands** [match community](#)  
[route-map](#)

[set aggregator](#)  
[set comm-list delete](#)  
[set extcommunity](#)  
[show route-map](#)

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.7-2.1: BGP support added for x510 and x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

# set dampening

**Overview** Use this command to add a route flap dampening set clause to a route map entry.

Also use the route map by specifying it in the command [bgp dampening route-map](#).

When a route matches the route map entry, the device enables route flap dampening for that route. If the set clause includes dampening parameter values, the device uses those values when dampening the matching route.

Use the **no** variant of this command to remove the set clause. This disables dampening on matching routes.

**Syntax**

```
set dampening
set dampening [<reachtime>]
set dampening <reachtime> [<reuse> <suppress> <maxsuppress>]
[<unreachtime>]
no set dampening
no set dampening [<reachtime>]
no set dampening <reachtime> [<reuse> <suppress> <maxsuppress>]
[<unreachtime>]
```

| Parameter   | Description  |
|-------------|--|
| <reachtime> | <1-45><br>The time it takes, in minutes, for the route's instability penalty to halve if the route remains stable. The instability penalty is called the Figure of Merit (FoM). For example, if reachtime is 15, the FoM of a stable route halves over a 15 minute period, quarters over a 30 minute period, and so on. The default is 15 minutes. |
| <reuse>     | <1-20000><br>The value that the instability penalty (FoM) must reach for the device to use a suppressed route again. Once a route is suppressed, it remains suppressed until its FoM falls below this threshold. Reuse must not exceed suppress. The default is 750.   |
| <suppress>  | <1-20000><br>The instability penalty (FoM) at which the route is suppressed. Suppress must be greater than or equal to reuse. If suppress is less than 1000, a route is suppressed when it becomes unreachable for the first time. The default is 2000.  |

| Parameter                        | Description  |
|----------------------------------|--|
| <code>&lt;maxsuppress&gt;</code> | <code>&lt;1-255&gt;</code><br>A number that is multiplied by reachtime to give the maximum time in minutes for which a suppressed route must remain stable in order to become unsuppressed. The lowest maxsuppress value of 1 gives a maximum suppression time of 1 x reachtime, and the highest maxsuppress value of 255 gives a maximum suppression time of 255 x reachtime.<br>For example, if reachtime is 15 and maxsuppress is 4, the route is unsuppressed after 60 minutes of stability even if its FoM still exceeds reuse. The default is 4. |
| <code>&lt;unreachtime&gt;</code> | <code>&lt;1-45&gt;</code><br>The time it takes, in minutes, for the route's instability penalty to halve if the route remains unstable. The default is 15 minutes.   |

**Mode** Route-map Configuration

**Usage** Set the unreachability half-life time to be equal to, or greater than, reachability half-life time. The suppress-limit value must be greater than or equal to the reuse limit value.

This command is valid for BGP routes only.

**Example** To use entry 24 of the route map called R1 to enable dampening of matching routes and set the dampening parameters, use the commands:

**Related commands**

- [bgp dampening](#)
- [route-map](#)
- [show route-map](#)

# set extcommunity

**Overview** Use this command to add an extended community set clause to a route map entry. A route map entry can have a route target extended community set clause, a site-of-origin extended community set clause, or both.

When a BGP update message matches the route map entry, the device sets the update's extended community attribute to the specified value or values.

Use the **no** variant of this command to remove the set clause.

**Syntax** `set extcommunity {rt|soo} <extcomm-number>`  
`no set extcommunity {rt|soo} [<extcomm-number>]`

| Parameter        | Description  |
|------------------|--|
| rt               | Configure a route target extended community. This consists of routers that will receive matching routes.           |
| soo              | Configure a site-of-origin extended community. This consists of routers that will inject matching routes into BGP. |
| <extcomm-number> | The extended community number, in the format AA:NN or IPADD:N.   |

**Mode** Route-map Configuration

**Usage notes** This command is valid for BGP update messages only.

**Examples** To use entry 3 of the route map called `rmap1` to set the route target extended community attribute to `06:01`, use the commands:

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# set extcommunity rt 06:01
```

To instead specify the extended community number in dotted decimal notation, use the command:

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# set extcommunity rt 0.0.0.6:01
```

To use entry 3 of the route map called `rmap1` to set the site-of-origin extended community attribute to `06:01`, use the commands:

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# set extcommunity soo 06:01
```

To instead specify the extended community number in dotted decimal notation, use the command:

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# set extcommunity soo 0.0.0.6:01
```

**Related  
commands**

[match community](#)  
[route-map](#)  
[set comm-list delete](#)  
[set community](#)  
[show route-map](#)

# set ip next-hop (route map)

**Overview** Use this command to add a next-hop set clause to a route map entry.

When a route or BGP update message matches the route map entry, the device sets the route's next hop to the specified IP address.

Use the **no** variant of this command to remove the set clause.

**Syntax** `set ip next-hop <ip-address>`  
`no set ip next-hop [<ip-address>]`

| Parameter                       | Description  |
|---------------------------------|--|
| <code>&lt;ip-address&gt;</code> | The IP address of the next hop, entered in the form A.B.C.D. |

**Mode** Route-map Configuration

**Usage notes** Use this command to set the next-hop IP address to the routes.

This command is valid for:

- OSPF routes
- routes in BGP update messages
- RIP routes.

**Example** To use entry 3 of the route map called `mymap` to give matching routes a next hop of 10.10.0.67, use the commands:

```
awplus# configure terminal
awplus(config)# route-map mymap permit 3
awplus(config-route-map)# set ip next-hop 10.10.0.67
```

**Related commands** [match ip next-hop](#)  
[route-map](#)  
[show route-map](#)

# set ipv6 next-hop

**Overview** Use this command to set a next hop-address.

Use the **no** variant of this command to delete an entry.

**Syntax** `set ipv6 next-hop {<ipv6-addr-global>|local <ipv6-addr>}`  
`no set ipv6 next-hop [<ipv6-addr-global>|local [<ipv6-addr>]]`

| Parameter                             | Description   |
|---------------------------------------|---|
| <code>&lt;ipv6-addr-global&gt;</code> | The IPv6 global address of next hop. The IPv6 address uses the format X:X::X:X. |
| <code>local</code>                    | Specifies that the address is local.  |
| <code>&lt;ipv6-addr&gt;</code>        | The IPv6 local address of next hop. The IPv6 address uses the format X:X::X:X.  |

**Mode** Route-map Configuration

**Usage notes** Use this command to set the next-hop IPv6 address to the routes.

This command is valid only for BGP.

**Examples**

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# set ipv6 next-hop local
fe80::203:47ff:fe97:66dc
awplus(config-route-map)# no set ipv6 next-hop
```

# set local-preference

**Overview** This command changes the default local preference value.

The local preference indicates the BGP local preference path attribute when there are multiple paths to the same destination. The path with the higher preference is chosen.

Use this command to define the preference of a particular path. The preference is sent to all routers and access servers in the local autonomous system.

The **no** variant of this command reverts to the default setting.

**Syntax** `set local-preference <pref-value>`  
`no set local-preference [<pref-value>]`

| Parameter                       | Description  |
|---------------------------------|--|
| <code>&lt;pref-value&gt;</code> | <code>&lt;0-4294967295&gt;</code> Configure local preference value. The default local preference value is 100. |

**Mode** Route-map Configuration

**Examples**

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# set local-preference 2345555
awplus# configure terminal
awplus(config)# router bgp 100
awplus(config-route-map)# no set local-preference
```

**Related commands** For related Route Map commands:

[route-map](#)

[show route-map](#)

For related BGP commands:

[bgp default local-preference \(BGP only\)](#)

[neighbor route-map](#)

# set metric

**Overview** Use this command to add a metric set clause to a route map entry.

When a route or BGP update message matches the route map entry, the device takes one of the following actions:

- changes the metric (or for BGP, the MED attribute value) to the specified value, or
- adds or subtracts the specified value from the metric or MED attribute, if you specify + or - before the value (for example, to increase the metric by 2, enter +2)

Use the **no** variant of this command to remove the set clause.

**Syntax** `set metric {+<metric-value>|-<metric-value>|<metric-value>}`  
`no set metric [+<metric-value>|-<metric-value>|<metric-value>]`

| Parameter      | Description   |
|----------------|---|
| +              | Increase the metric or MED attribute by the specified amount.   |
| -              | Decrease the metric or MED attribute by the specified amount.   |
| <metric-value> | <0-4294967295><br>The new metric or MED attribute value, or the amount by which to increase or decrease the existing value. |

**Default** The default metric value for routes redistributed into OSPF and OSPFv3 is 20.

**Mode** Route-map Configuration

**Usage notes** For BGP, if you want the device to compare MED values in update messages from peers in different ASes, also enter the command [bgp always-compare-med](#). You do not need to enter this command if you only want the device to compare MED values in update messages from peers in the same AS, because it always does.

This command is valid for:

- OSPF routes
- routes in BGP update messages
- RIP routes.

Note that defining the OSPF metric in a route map supersedes the metric defined using a [redistribute \(OSPF\)](#) or a [redistribute \(IPv6 OSPF\)](#) command. For more information, see the [OSPFv3 Feature Overview and Configuration Guide](#) and the [OSPF Feature Overview and Configuration Guide](#).

**Examples** To use entry 3 of the route map called "rmap1" to give matching routes a metric of 600, use the commands:

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# set metric 600
```

To use entry 3 of the route map called "rmap1" to increase the metric of matching routes by 2, use the commands:

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# set metric +2
```

**Related commands**

- [match metric](#)
- [route-map](#)
- [show route-map](#)

# set metric-type

**Overview** Use this command to add a metric-type set clause to a route map entry.

When a route matches the route map entry, the device sets its route type to the specified value.

Use the **no** variant of this command to remove the set clause.

**Syntax** `set metric-type {type-1|type-2}`  
`no set metric-type [type-1|type-2]`

| Parameter | Description   |
|-----------|---|
| type-1    | Redistribute matching routes into OSPF as type-1 external routes. |
| type-2    | Redistribute matching routes into OSPF as type-2 external routes. |

**Mode** Route-map Configuration

**Usage notes** This command is valid for OSPF routes only.

**Example** To use entry 3 of the route map called `rmap1` to redistribute matching routes into OSPF as type-1 external routes, use the commands:

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# set metric-type 1
```

**Related commands**

- [redistribute \(OSPF\)](#)
- [match route-type](#)
- [route-map](#)
- [show route-map](#)

# set origin

**Overview** Use this command to add an origin set clause to a route map entry.

When a BGP update message matches the route map entry, the device sets its origin attribute to the specified value.

Use the **no** variant of this command to remove the set clause.

**Syntax**

```
set origin {egp|igp|incomplete}
no set origin [egp|igp|incomplete]
```

| Parameter  | Description                                      |
|------------|--|
| egp        | Learned from an exterior gateway protocol.       |
| igp        | Learned from a local interior gateway protocol.  |
| incomplete | Of unknown heritage, for example a static route. |

**Mode** Route-map Configuration

**Usage** This command is valid for BGP update messages only.

**Example** To use entry 3 of the route map called `rmap1` to give matching update messages an origin of `egp`, use the commands:

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# set origin egp
```

**Related commands**

- [match origin](#)
- [route-map](#)
- [show route-map](#)

# set originator-id

- Overview** Use this command to add an originator ID set clause to a route map entry.
- The originator ID is the router ID of the IBGP peer that first learned this route, either via an EBGP peer or by some other means such as importing it.
- When a BGP update message matches the route map entry, the device sets its originator ID attribute to the specified value.
- Use the **no** variant of this command to remove the set clause.

**Syntax** `set originator-id <ip-address>`  
`no set originator-id [<ip-address>]`

| Parameter                       | Description  |
|---------------------------------|--|
| <code>&lt;ip-address&gt;</code> | The IP address of the originator, entered in the form A.B.C.D. |

**Mode** Route-map Configuration

**Usage** This command is valid for BGP update messages only.

**Example** To use entry 3 of the route map called `rmap1` to give matching update messages an originator ID of `1.1.1.1`, use the commands:

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# set originator-id 1.1.1.1
```

**Related commands** [route-map](#)  
[show route-map](#)

# set tag

**Overview** Use this command to add a tag set clause to a route map entry.

When a route matches the route map entry, the device sets its tag to the specified value when it redistributes the route into OSPF.

Use the **no** variant of this command to remove the set clause.

**Syntax** `set tag <tag-value>`  
`no set tag [<tag-value>]`

| Parameter                      | Description   |
|--------------------------------|---|
| <code>&lt;tag-value&gt;</code> | <code>&lt;0-4294967295&gt;</code><br>Value to tag matching routes with. |

**Mode** Route-map Configuration

**Usage notes** This command is valid only when redistributing routes into OSPF.

**Example** To use entry 3 of the route map called `rmap1` to tag matching routes with the number 6, use the commands:

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# set tag 6
```

**Related commands**

- [default-information originate](#)
- [redistribute \(OSPF\)](#)
- [match tag](#)
- [route-map](#)
- [show route-map](#)

# set weight

**Overview** Use this command to add a weight set clause to a route map entry.

The weight value assists in best path selection of BGP routes. It is stored with the route in the BGP routing table, but is not advertised to peers. When there are multiple routes with a common destination, the device uses the route with the highest weight value.

When a route matches the route map entry, the device sets its weight to the specified value.

Use the **no** variant of this command to remove the set clause.

**Syntax** `set weight <weight>`  
`no set weight [<weight>]`

| Parameter                   | Description  |
|-----------------------------|--|
| <code>&lt;weight&gt;</code> | <code>&lt;0-4294967295&gt;</code><br>The weight value. |

**Mode** Route-map Configuration

**Usage** This command is valid for BGP routes only.

**Example** To use entry 3 of the route map called `rmap1` to give matching routes a weight of 60, use the commands:

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# set weight 60
```

**Related commands** [route-map](#)  
[show route-map](#)

# show route-map

**Overview** Use this command to display information about one or all route maps.

**Syntax** `show route-map <map-name>`

| Parameter                     | Description                       |
|-------------------------------|-----------------------------------|
| <code>&lt;map-name&gt;</code> | A name to identify the route map. |

**Mode** User Exec and Privileged Exec

**Example** To display information about the route-map named `example-map`, use the command:

```
awplus# show route-map example-map
```

**Output** Figure 31-1: Example output from the **show route-map** command

```
route-map example-map, permit, sequence 1
  Match clauses:
    ip address prefix-list example-pref
  Set clauses:
    metric 100
route-map example-map, permit, sequence 200
  Match clauses:
  Set clauses:

# Part 4: Multicast Applications

# 32

# IGMP and IGMP Snooping Commands

## Introduction

**Overview** Devices running AlliedWare Plus use IGMP (Internet Group Management Protocol) and MLD (Multicast Listener Discovery) to track which multicast groups their clients belong to. This enables them to send the correct multimedia streams to the correct destinations. IGMP is used for IPv4 multicasting, and MLD is used for IPv6 multicasting.

This chapter describes the commands to configure IGMP Querier behaviour and selection, IGMP Snooping and IGMP Proxy.

# clear ip igmp

**Overview** Use this command to clear all IGMP group membership records on all interfaces where it is configured .

**Syntax** `clear ip igmp`

**Mode** Privileged Exec

**Example** To delete all IGMP records, use the command

```
awplus# clear ip igmp
```

**Related commands**

- [clear ip igmp group](#)
- [clear ip igmp interface](#)
- [show ip igmp interface](#)
- [show running-config](#)

**Command changes**

- Version 5.4.7-1.1: VRF-lite support added SBx8100.
- Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

# clear ip igmp group

**Overview** Use this command to clear IGMP group membership records for a specific group on either all interfaces, a single interface, or for a range of interfaces.

**Syntax** `clear ip igmp group *`  
`clear ip igmp group <ip-address> <interface>`

| Parameter    | Description  |
|--------------|--|
| *            | Clears all groups on all interfaces. This has the same effect as the <b>clear ip igmp</b> command.             |
| <ip-address> | Specifies the group whose membership records will be cleared from all interfaces, entered in the form A.B.C.D. |
| <interface>  | Specifies the name of the interface; all groups learned on this interface are deleted.                         |

**Mode** Privileged Exec

**Usage notes** This command applies to groups learned by IGMP, IGMP Snooping, or IGMP Proxy. In addition to the group, an interface can be specified. Specifying this will mean that only entries with the group learned on the interface will be deleted.

**Examples** To delete all group records, use the command:

```
awplus# clear ip igmp group *
```

To delete records for 224.1.1.1 on vlan1, use the command:

```
awplus# clear ip igmp group 224.1.1.1 vlan1
```

**Related commands**

- [clear ip igmp](#)
- [clear ip igmp interface](#)
- [show ip igmp interface](#)
- [show running-config](#)

**Command changes** Version 5.4.7-1.1: VRF-lite support added SBx8100.  
Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

# clear ip igmp interface

**Overview** Use this command to clear IGMP group membership records on a particular interface.

**Syntax** `clear ip igmp interface <interface>`

| Parameter   | Description  |
|-------------|--|
| <interface> | Specifies the name of the interface. All groups learned on this interface are deleted. |

**Mode** Privileged Exec

**Usage notes** This command applies to interfaces configured for IGMP, IGMP Snooping, or IGMP Proxy.

**Example** To delete records for vlan1, use the command:

```
awplus# clear ip igmp interface vlan1
```

**Related commands**

- [clear ip igmp](#)
- [clear ip igmp group](#)
- [show ip igmp interface](#)
- [show running-config](#)

**Command changes**

- Version 5.4.7-1.1: VRF-lite support added SBx8100.
- Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

# debug igmp

**Overview** Use this command to enable debugging of either all IGMP or a specific component of IGMP.

Use the **no** variant of this command to disable all IGMP debugging, or debugging of a specific component of IGMP.

**Syntax** `debug igmp {all|decode|encode|events|fsm|tib}`  
`no debug igmp {all|decode|encode|events|fsm|tib}`

| Parameter | Description                                   |
|-----------|---|
| all       | Enable or disable all debug options for IGMP  |
| decode    | Debug of IGMP packets that have been received |
| encode    | Debug of IGMP packets that have been sent     |
| events    | Debug IGMP events                             |
| fsm       | Debug IGMP Finite State Machine (FSM)         |
| tib       | Debug IGMP Tree Information Base (TIB)        |

**Modes** Privileged Exec and Global Configuration

**Example** `awplus# configure terminal`  
`awplus(config)# debug igmp all`

**Related commands** [show debugging igmp](#)  
[undebug igmp](#)

**Command changes** Version 5.4.7-1.1: VRF-lite support added SBx8100.  
Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

# ip igmp

**Overview** Use this command to enable IGMP on an interface. The command configures the device as an IGMP querier.

Use the **no** variant of this command to return all IGMP related configuration to the default on this interface.

**Syntax** ip igmp  
no ip igmp

**Default** Disabled

**Mode** Interface Configuration for a VLAN interface.

**Usage notes** An IP address must be assigned to the interface first, before this command will work.

**Example** To specify an interface as an IGMP querier, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip igmp
```

**Related commands** [show ip igmp interface](#)  
[show running-config](#)

# ip igmp access-group

**Overview** This command adds an access control list to a VLAN interface configured for IGMP, IGMP Snooping, or IGMP Proxy. The access control list is used to control and filter the multicast groups learned on the VLAN interface.

The **no** variant of this command disables the access control filtering on the interface.

**Syntax** `ip igmp access-group {<access-list-number>|<access-list-name>}`  
`no ip igmp access-group`

| Parameter                               | Description  |
|---|--|
| <code>&lt;access-list-number&gt;</code> | Standard IP access-list number, in the range <1-99>. |
| <code>&lt;access-list-name&gt;</code>   | Standard IP access-list name.                        |

**Default** By default there are no access lists configured on any interface.

**Mode** Interface Configuration for a VLAN interface.

**Usage notes** This command applies to VLAN interfaces configured for IGMP, IGMP Snooping, or IGMP Proxy.

**Example** In the following example, hosts serviced by VLAN interface vlan2 can only join the group 225.2.2.2:

```
awplus# configure terminal
awplus(config)# access-list 1 permit 225.2.2.2 0.0.0.0
awplus(config)# interface vlan2
awplus(config-if)# ip igmp access-group 1
```

# ip igmp flood-group

**Overview** Use this command to configure a static multicast group that will flood matching packets to all ports in the VLAN and not mirror any packets matching that group to the CPU.

Use the **no** variant of this command to remove an IGMP flooding group.

**Syntax** `ip igmp flood-group <ip-address> [<vlan-id>]`  
`no ip igmp flood-group <ip-address>`

| Parameter                       | Description  |
|---------------------------------|--|
| <code>&lt;ip-address&gt;</code> | Standard IP Multicast group address, entered in the form A.B.C.D.              |
| <code>&lt;vlan-id&gt;</code>    | Layer 3 downstream interface list for Layer 3 forwarding of multicast packets. |

**Default** Not set.

**Mode** Interface Configuration

**Usage notes** Multicast packets from an unregistered source will be mirrored to the CPU to ensure IGMP and PIM-SM knows about the group. In certain networks, it is possible for a large number of packets with a number of different sources destined for the same group address, to overwhelm a switches hardware table. This could cause packets to be stuck mirrored to the CPU forever, resulting in high CPU usage and in some cases stack failovers.

This command adds an all sources multicast entry into the switches multicast hardware table, to flood multicast packets to all ports within the VLAN without mirroring the traffic to CPU. This significantly reduces the number of hardware entries consumed.

The Layer 3 variant of this command:

```
ip igmp flood-group <ip-address> <vlan-id>
```

is only supported on one VLAN group address. Any number of the Layer 2 variants can be used.

**Example** To configure an IGMP flooding group to Layer 2 ports only, use the following commands. This will flood any UDP packet to group 239.255.255.250 to all ports in vlan1:

```
awplus# configure terminal
awplus(config)# int vlan1
awplus(config-if)# ip igmp flood-group 239.255.255.250
```

To configure an IGMP flooding group to Layer 2 ports and Layer 3 forwarding, use the following commands. This will flood any UDP packet to group 239.255.255.250 to all ports in vlan2 and forward any UDP packet to all ports in vlan3:

```
awplus# configure terminal
awplus(config)# int vlan2
awplus(config-if)# ip igmp flood-group 239.255.255.250 vlan3
```

To remove an IGMP flooding group from vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# int vlan2
awplus(config-if)# no ip igmp flood-group 239.255.255.250
```

IGMP Flooding Groups are integrated into the existing command: **show ip igmp groups**

**Output** Figure 32-1: Example output from **show ip igmp groups**

```
awplus#show ip igmp groups
IGMP Connected Group Membership
Group Address      Interface  Uptime    Expires   Last Reporter
239.255.255.250   vlan3000  01:20:59  stopped  0.0.0.0
```

**Related commands** [ip igmp static-group](#)

**Command changes** Version 5.5.0-2.3: command added

# ip igmp flood specific-query

**Overview** Use this command if you want IGMP to flood specific queries to all VLAN member ports, instead of only sending the queries to multicast group member ports.

Use the **no** variant of this command if you want IGMP to only send the queries to multicast group member ports.

**Syntax** `ip igmp flood specific-query`  
`no ip igmp flood specific-query`

**Default** By default, specific queries are flooded to all VLAN member ports.

**Mode** Global Configuration

**Usage** In an L2 switched network running IGMP, it is considered more robust to flood all specific queries. In most cases, the benefit of flooding specific queries to all VLAN member ports outweighs the disadvantages.

However, sometimes this is not the case. For example, if hosts with very low CPU capability receive specific queries for multicast groups they are not members of, their performance may degrade unacceptably. In this situation, it is desirable for IGMP to send specific queries to known member ports only. This minimizes the performance degradation of such hosts. In those circumstances, use this command to turn off flooding of specific queries.

**Example** To cause IGMP to flood specific queries only to multicast group member ports, use the commands:

```
awplus# configure terminal
awplus(config)# no ip igmp flood specific-query
```

**Related commands** [show ip igmp interface](#)

**Command changes** Version 5.4.7-1.1: VRF-lite support added SBx8100.

Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

# ip igmp immediate-leave

**Overview** In IGMP version 2, use this command to minimize the leave latency of IGMP memberships for specified multicast groups. The specified access list number or name defines the multicast groups in which the immediate leave feature is enabled.

Use the **no** variant of this command to disable this feature.

**Syntax**

```
ip igmp immediate-leave group-list  
{<access-list-number>|<access-list-number-expanded>|  
<access-list-name>}  
  
no ip igmp immediate-leave
```

| Parameter                     | Description  |
|-------------------------------|--|
| <access-list-number>          | Access-list number, in the range <1-99>.                       |
| <access-list-number-expanded> | Access-list number (expanded range), in the range <1300-1999>. |
| <access-list-name>            | Standard IP access-list name.                                  |

**Default** Disabled by default.

**Mode** Interface Configuration for a VLAN interface.

**Usage notes** This command applies to VLAN interfaces configured for IGMP, IGMP Snooping, or IGMP Proxy.

**Example** The following example shows how to enable the immediate-leave feature on the VLAN interface vlan2 for a specific range of multicast groups:

```
awplus# configure terminal  
awplus(config)# interface vlan2  
awplus(config-if)# ip igmp immediate-leave group-list 34  
awplus(config-if)# exit  
awplus(config)# access-list 34 permit 225.192.20.0 0.0.0.255
```

**Related commands** [ip igmp last-member-query-interval](#)

# ip igmp last-member-query-count

**Overview** Use this command to set the last-member query-count value for an interface.  
Use the **no** variant of this command to return to the default on an interface.

**Syntax** `ip igmp last-member-query-count <2-7>`  
`no ip igmp last-member-query-count`

| Parameter | Description                    |
|-----------|--------------------------------|
| <2-7>     | Last member query count value. |

**Default** The default last member query count value is 2.

**Mode** Interface Configuration for a VLAN interface.

**Usage notes** This command applies to VLAN interfaces configured for IGMP, IGMP Snooping, or IGMP Proxy.

**Example** To set the last-member query-count to 3 on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip igmp last-member-query-count 3
```

**Related commands** [ip igmp last-member-query-interval](#)  
[ip igmp startup-query-count](#)  
[show ip igmp interface](#)  
[show running-config](#)

# ip igmp last-member-query-interval

**Overview** Use this command to configure the frequency at which the router sends IGMP group specific host query messages.

Use the **no** variant of this command to set this frequency to the default.

**Syntax** `ip igmp last-member-query-interval <interval>`  
`no ip igmp last-member-query-interval`

| Parameter                     | Description   |
|-------------------------------|---|
| <code>&lt;interval&gt;</code> | The frequency in milliseconds at which IGMP group-specific host query messages are sent, in the range 1000-25500. |

**Default** 1000 milliseconds

**Mode** Interface Configuration for a VLAN interface.

**Usage notes** This command applies to VLAN interfaces configured for IGMP, IGMP Snooping, or IGMP Proxy.

**Example** To change the IGMP group-specific host query message interval to 2 seconds (2000 milliseconds) on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip igmp last-member-query-interval 2000
```

**Related commands** [ip igmp immediate-leave](#)  
[ip igmp last-member-query-count](#)  
[show ip igmp interface](#)  
[show running-config](#)

# ip igmp limit

**Overview** Use this command to configure the limit on the maximum number of group membership entries for the device as a whole or for the specified interface (if in interface mode). Once the specified number of group memberships is reached, all further membership reports will be ignored.

Optionally, you can configure an access-list to stop certain addresses from being subject to the limit.

Use the **no** variant of this command to unset the limit and any specified exception access-list.

**Syntax**

```
ip igmp limit <limit-value> [except  
{<access-list-number>|<access-list-number-expanded>|  
<access-list-name>}]  
  
no ip igmp limit
```

| Parameter                     | Description   |
|-------------------------------|---|
| <limit-value>                 | Maximum number of group membership entries, from 2 to 512.      |
| <access-list-number>          | Access-list number, in the range 1 to 99.                       |
| <access-list-number-expanded> | Access-list number (expanded range), in the range 1300 to 1999. |
| <access-list-name>            | IP access-list name.  |

**Default** 512

**Mode** Global Configuration and Interface Configuration for a VLAN interface.

**Usage notes** This command applies to VLAN interfaces configured for IGMP, IGMP Snooping, or IGMP Proxy.

**Example** To configure an IGMP limit of 100 group membership entries on vlan2, use the commands:

```
awplus# configure terminal  
awplus(config)# interface vlan2  
awplus(config-if)# ip igmp limit 100
```

To configure an IGMP limit of 100 group membership entries across all interfaces on which IGMP is enabled, and exclude group 224.1.1.1 from this limitation, use the commands:

```
awplus# configure terminal  
awplus(config)# access-list 1 permit 224.1.1.1 0.0.0.0  
awplus(config)# ip igmp limit 100 except 1
```

# ip igmp maximum-groups

**Overview** Use this command to set a limit, per switch port, on the number of IGMP groups clients can join. This stops a single client from using all the switch's available group-entry resources, and ensures that clients on all ports have a chance to join IGMP groups.

Use the **no** variant of this command to remove the limit.

**Syntax** `ip igmp maximum-groups <0-65535>`  
`no ip igmp maximum-groups`

| Parameter                    | Description   |
|------------------------------|---|
| <code>&lt;0-65535&gt;</code> | The maximum number of IGMP groups clients can join on this switch port. 0 means no limit. |

**Default** The default is 0, which means no limit

**Mode** Interface mode for a switch port

**Usage notes** We recommend using this command with IGMP snooping fast leave on the relevant VLANs. To enable fast leave, use the command:

```
awplus(config-if)# ip igmp snooping fast-leave
```

The device keeps count of the number of groups learned by each port. This counter is incremented when group joins are received via IGMP reports. It is decremented when:

- Group memberships time out
- Group leaves are received via leave messages or reports

Also, the port's group counter is cleared when:

- The port goes down
- You run the command **clear ip igmp group \***
- The port is removed from a VLAN

You can see the current value of the group counter by using either of the commands:

```
awplus# show ip igmp snooping statistics interface <port-list>
```

```
awplus# show ip igmp interface <port>
```

**Example** To limit clients to 10 groups on port 1.0.1, which is in vlan1, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# ip igmp maximum-groups 10
awplus(config-if)# exit
awplus(config)# interface vlan1
awplus(config-if)# ip igmp snooping fast-leave
```

**Related commands**

- clear ip igmp group
- ip igmp snooping fast-leave
- show ip igmp interface
- show ip igmp snooping statistics

# ip igmp mroute-proxy

**Overview** Use this command to enable IGMP mroute proxy on this downstream interface and associate it with the upstream proxy service interface.

Use the **no** variant of this command to remove the association with the proxy-service interface.

**Syntax** `ip igmp mroute-proxy <interface>`  
`no ip igmp mroute-proxy`

| Parameter   | Description                |
|-------------|----------------------------|
| <interface> | The name of the interface. |

**Mode** Interface Configuration for a VLAN interface.

**Usage notes** This command applies to VLAN interfaces configured for IGMP Proxy. You must also enable the IGMP proxy service on the upstream interface, using the [ip igmp proxy-service](#) command. You can associate one or more downstream mroute proxy interfaces on the device with a single upstream proxy service interface. This downstream mroute proxy interface listens for IGMP reports, and forwards them to the upstream IGMP proxy service interface.

IGMP Proxy does not work with other multicast routing protocols, such as PIM-SM or PIM-DM.

**Example** To configure vlan3 as the upstream proxy-service interface for the downstream vlan2 interface, use the commands:

```
awplus# configure terminal
awplus(config)# ip multicast-routing
awplus(config)# interface vlan3
awplus(config-if)# ip igmp proxy-service
awplus(config-if)# ip igmp
awplus(config)# interface vlan2
awplus(config-if)# ip igmp mroute-proxy vlan3
awplus(config-if)# ip igmp
```

**Related commands** [ip igmp](#)  
[ip igmp proxy-service](#)  
[ip multicast-routing](#)

# ip igmp proxy-service

**Overview** Use this command to enable an interface to be the upstream IGMP proxy-service interface for the device. All associated downstream IGMP mroute proxy interfaces on this device will have their memberships consolidated on this proxy service interface, according to IGMP host-side functionality.

Use the **no** variant of this command to remove the designation of the interface as an upstream proxy-service interface.

**Syntax** `ip igmp proxy-service`  
`no ip igmp proxy-service`

**Mode** Interface Configuration for a VLAN interface.

**Usage notes** This command applies to VLAN interfaces configured for IGMP Proxy.

This command is used with the `ip igmp mroute-proxy` command to enable forwarding of IGMP reports to a proxy service interface for all forwarding entries for this interface. You must also enable the downstream IGMP mroute proxy interfaces on this device using the command `ip igmp mroute-proxy`.

IGMP Proxy does not work with other multicast routing protocols, such as PIM-SM or PIM-DM.

From version 5.4.7-1.1 onwards, IGMP mroute proxy interfaces do not have to be configured with an IP address before they can operate. Instead, it is possible to have an addressless interface operate as an IGMP mroute proxy interface.

This feature is useful when IGMP Proxy needs to run on many downstream interfaces. For example, you may want to use it if your device has one subscriber (multicast receiver) per VLAN, and many receivers (many VLANs) connected to the device. In such a situation, assigning IP addresses to each VLAN may not be practicable.

Note that for such interface to be able to send queries to hosts directly attached to the interface, it is necessary to enable IGMP snooping querier on the interface, using the command `ip igmp snooping querier`.

**Example** To configure vlan3 as the upstream proxy-service interface for the downstream vlan2 interface, use the commands:

```
awplus# configure terminal
awplus(config)# ip multicast-routing
awplus(config)# interface vlan3
awplus(config-if)# ip igmp proxy-service
awplus(config-if)# ip igmp
awplus(config)# interface vlan2
awplus(config-if)# ip igmp mroute-proxy vlan3
awplus(config-if)# ip igmp
```

**Related commands** `ip igmp`  
`ip igmp mroute-proxy`  
`ip igmp snooping querier`  
`ip multicast-routing`

**Command changes** Version 5.4.7-1.1: Addressless interface support added.  
Version 5.4.7-1.1: VRF-lite support added to SBx8100.  
Version 5.4.8-1.1: VRF-lite support added to x930, SBx908 GEN2.

# ip igmp querier-timeout

**Overview** Use this command to configure the timeout period before the device takes over as the querier for the interface after the previous querier has stopped querying.

Use the **no** variant of this command to restore the default.

**Syntax** `ip igmp querier-timeout <timeout>`  
`no ip igmp querier-timeout`

| Parameter                    | Description   |
|------------------------------|---|
| <code>&lt;timeout&gt;</code> | IGMP querier timeout interval value in seconds, in the range 1-65535. |

**Default** The default timeout interval is 255 seconds.

**Mode** Interface Configuration for a VLAN interface.

**Usage notes** This command applies to VLAN interfaces configured for IGMP.  
The timeout value should not be less than the current active querier's general query interval.

**Example** To configure the device to wait 130 seconds from the time it received the last query before it takes over as the querier for vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip igmp querier-timeout 130
```

**Related commands** `ip igmp query-interval`  
`show ip igmp interface`  
`show running-config`

# ip igmp query-holdtime

**Overview** This command sets the time that an IGMP Querier waits after receiving a query solicitation before it sends an IGMP Query. IGMP General Query messages will not be sent during the hold time interval.

Use the **no** variant of this command to return to the default query hold time period.

**Syntax** `ip igmp query-holdtime <interval>`  
`no ip igmp query-holdtime`

| Parameter  | Description  |
|------------|--|
| <interval> | Query interval value in milliseconds, in the range <100-5000>. |

**Default** By default the delay before sending IGMP General Query messages is 500 milliseconds.

**Mode** Interface Configuration for a VLAN interface.

**Usage notes** Use this command to configure a value for the IGMP query hold time in the current network. IGMP Queries can be generated after receiving Query Solicitation (QS) packets and there is a possibility of a DoS (Denial of Service) attack if a stream of Query Solicitation (QS) packets are sent to the IGMP Querier, eliciting a rapid stream of IGMP Queries. This command applies to interfaces on which the device is acting as an IGMP Querier.

Use the `ip igmp query-interval` command when a delay for IGMP general query messages is required and IGMP general query messages are required. The **ip igmp query-holdtime** command stops IGMP query messages during the configured holdtime interval, so the rate of IGMP Queries that can be sent out of an interface can be restricted.

See the [IGMP Feature Overview and Configuration Guide](#) for introductory information about the Query Solicitation feature.

**Examples** To set the IGMP query holdtime to 900 ms for vlan20, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan20
awplus(config-if)# ip igmp query-holdtime 900
```

To reset the IGMP query holdtime to the default (500 ms) for vlan10, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# no ip igmp query-holdtime
```

**Related commands**

- ip igmp query-interval
- ip igmp snooping tcn query solicit
- show ip igmp interface
- show running-config

# ip igmp query-interval

**Overview** Use this command to configure the period for sending IGMP General Query messages.

The IGMP query interval specifies the time between IGMP General Query messages being sent.

Use the **no** variant of this command to return to the default query interval period.

**NOTE:** The IGMP query interval must be greater than IGMP query maximum response time.

**Syntax** `ip igmp query-interval <interval>`  
`no ip igmp query-interval`

| Parameter  | Description  |
|------------|--|
| <interval> | Query interval value in seconds, in the range <2-18000>. |

**Default** The default IGMP query interval is 125 seconds.

**Mode** Interface Configuration for a VLAN interface.

**Usage notes** This command applies to interfaces configured for IGMP. Note that the IGMP query interval is automatically set to a greater value than the IGMP query max response time.

For example, if you set the IGMP query max response time to 2 seconds using the [ip igmp query-max-response-time](#) command, and the IGMP query interval is currently less than 3 seconds, then the IGMP query interval period will be automatically reconfigured to be 3 seconds, so it is greater than the IGMP query maximum response time.

Use the **ip igmp query-interval** command when a non-default interval for IGMP General Query messages is required.

The [ip igmp query-holdtime](#) command can occasionally delay the sending of IGMP Queries.

**Examples** To set the period between IGMP host-query messages to 3 minutes (180 seconds) for vlan20, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan20
awplus(config-if)# ip igmp query-interval 180
```

To reset the period between sending IGMP host-query messages to the default (125 seconds) for vlan10, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# no ip igmp query-interval
```

**Related  
commands**

```
ip igmp query-holdtime
ip igmp query-max-response-time
ip igmp startup-query-interval
show ip igmp interface
show running-config
```

# ip igmp query-max-response-time

**Overview** Use this command to configure the maximum response time advertised in IGMP Queries.

Use the **no** variant of this command to restore the default.

**NOTE:** *The IGMP query maximum response time must be less than the IGMP query interval.*

**Syntax** `ip igmp query-max-response-time <response-time>`  
`no ip igmp query-max-response-time`

| Parameter                          | Description  |
|------------------------------------|--|
| <code>&lt;response-time&gt;</code> | Response time value in seconds, in the range 1-3180. |

**Default** The default IGMP query maximum response time is 10 seconds.

**Mode** Interface Configuration for a VLAN interface.

**Usage notes** This command applies to interfaces configured for IGMP.

Note that the IGMP query interval is automatically set to a greater value than the IGMP query maximum response time.

For example, if you set the IGMP query interval to 3 seconds using the `ip igmp query-interval` command, and the current IGMP query interval is less than 3 seconds, then the IGMP query maximum response time will be automatically reconfigured to be 2 seconds, so it is less than the IGMP query interval time.

To get the network to converge faster, use the **ip igmp query-max-response-time** command and set a low response time value, such as one or two seconds, so that the clients will respond immediately with a report as a response to the IGMP Queries.

**Examples** To set a maximum response time of 8 seconds for vlan20, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan20
awplus(config-if)# ip igmp query-max-response-time 8
```

To reset the default maximum response time to the default (10 seconds) for vlan10, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# no ip igmp query-max-response-time
```

**Related commands** ip igmp query-interval  
show ip igmp interface  
show running-config

## ip igmp ra-option

**Overview** Use this command to enable strict Router Alert (RA) option validation. With strict RA option enabled, IGMP packets without RA options are ignored.

Use the **no** variant of this command to disable strict RA option validation.

**Syntax** `ip igmp ra-option`  
`no ip igmp ra-option`

**Default** The default state of RA validation is unset.

**Mode** Interface Configuration for a VLAN interface.

**Usage notes** This command applies to interfaces configured for IGMP and IGMP Snooping.

**Examples** To enable strict Router Alert (RA) option validation on vlan20, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan20
awplus(config-if)# ip igmp ra-option
```

# ip igmp robustness-variable

**Overview** Use this command to change the robustness variable value on an interface.  
Use the **no** variant of this command to return to the default on an interface.

**Syntax** `ip igmp robustness-variable <1-7>`  
`no ip igmp robustness-variable`

| Parameter | Description                    |
|-----------|--------------------------------|
| <1-7>     | The robustness variable value. |

**Default** The default robustness variable value is 2.

**Mode** Interface Configuration for a VLAN interface.

**Usage notes** This command applies to interfaces configured for IGMP and IGMP Snooping.

**Examples** To set the robustness variable to 3 on vlan20, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan20
awplus(config-if)# ip igmp robustness-variable 3
```

**Related commands** [show ip igmp interface](#)  
[show running-config](#)

# ip igmp snooping

**Overview** Use this command to enable IGMP Snooping. When this command is used in the Global Configuration mode, IGMP Snooping is enabled at the device level. When this command is used in Interface Configuration mode, IGMP Snooping is enabled for the specified VLANs.

Use the **no** variant of this command to either globally disable IGMP Snooping, or disable IGMP Snooping on a specified interface.

**NOTE:** *IGMP snooping cannot be disabled on an interface if IGMP snooping has already been disabled globally. IGMP snooping can be disabled on both an interface and globally if disabled on the interface first and then disabled globally.*

**Syntax** `ip igmp snooping`  
`no ip igmp snooping`

**Default** By default, IGMP Snooping is enabled both globally and on all VLANs.

**Mode** Global Configuration and Interface Configuration for a VLAN interface.

**Usage notes** It is possible to disable IGMP snooping globally or on a per-VLAN basis, using the command **no ipv6 igmp snooping**. However, we recommend leaving IGMP snooping enabled unless an Allied Telesis support representative tells you to disable it, even if you are not actively using the device for multicast.

For IGMP snooping to operate on particular VLAN interfaces, it must be enabled both globally by using this command in Global Configuration mode, and on individual VLAN interfaces by using this command in Interface Configuration mode (both are enabled by default).

**Examples** To enable IGMP Snooping on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# ip igmp snooping
awplus(config)# interface vlan2
awplus(config-if)# ip igmp snooping
```

**Related commands** [ipv6 mld snooping](#)  
[show ip igmp interface](#)  
[show running-config](#)

# ip igmp snooping fast-leave

**Overview** Use this command to enable IGMP Snooping fast-leave processing. Fast-leave processing is analogous to immediate-leave processing. The IGMP group-membership entry is removed as soon as an IGMP leave group message is received, without sending out a group-specific query.

Use the **no** variant of this command to disable fast-leave processing.

**Syntax** `ip igmp snooping fast-leave`  
`no ip igmp snooping fast-leave`

**Default** IGMP Snooping fast-leave processing is disabled.

**Mode** Interface Configuration for a VLAN interface.

**Usage notes** This IGMP Snooping command can only be configured on VLAN interfaces.

**Example** To enable fast-leave processing on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip igmp snooping fast-leave
```

**Related commands** [show ip igmp interface](#)  
[show running-config](#)

# ip igmp snooping mrouter

**Overview** Use this command to statically configure the specified port as a multicast router port for IGMP Snooping for an interface. This command applies to interfaces configured for IGMP Snooping.

Use the **no** variant of this command to remove the static configuration of the port as a multicast router port.

**Syntax** `ip igmp snooping mrouter interface <port>`  
`no ip igmp snooping mrouter interface <port>`

| Parameter                 | Description  |
|---------------------------|--|
| <code>&lt;port&gt;</code> | The port may be a device port (e.g. port1.0.2), a static channel group (e.g. sa3), or a dynamic (LACP) channel group (e.g. po4). |

**Mode** Interface Configuration for a VLAN interface.

**Example** To configure port1.0.2 statically as a multicast router interface for vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip igmp snooping mrouter interface port1.0.2
```

**Related commands** [show ip igmp snooping mrouter](#)

# ip igmp snooping querier

**Overview** Use this command to enable IGMP querier operation when no multicast routing protocol is configured. When enabled, the IGMP Snooping querier sends out periodic IGMP queries for all interfaces. This command applies to interfaces configured for IGMP Snooping.

Use the **no** variant of this command to disable IGMP querier configuration.

**Syntax** `ip igmp snooping querier`  
`no ip igmp snooping querier`

**Mode** Interface Configuration for a VLAN interface.

**Usage notes** The IGMP Snooping querier uses the 0.0.0.0 Source IP address because it only masquerades as a proxy IGMP querier for faster network convergence.

It does not start, or automatically cease, the IGMP Querier operation if it detects query message(s) from a multicast router.

If an IP address is assigned to a VLAN, which has IGMP querier enabled on it, then the IGMP Snooping querier uses the VLAN's IP address as the Source IP Address in IGMP queries.

The IGMP Snooping Querier will not stop sending IGMP Queries if there is another IGMP Snooping Querier in the network with a lower Source IP Address.

**NOTE:** Do not enable the IGMP Snooping Querier feature on a Layer 2 device when there is an operational IGMP Querier in the network.

**Example** To configure vlan2 as a Snooping querier, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip igmp snooping querier
```

**Related commands** [show ip igmp interface](#)  
[show running-config](#)

# ip igmp snooping report-suppression

**Overview** Use this command to enable report suppression for IGMP versions 1 and 2. This command applies to interfaces configured for IGMP Snooping.

Report suppression stops reports being sent to an upstream multicast router port when there are already downstream ports for this group on this interface.

Use the **no** variant of this command to disable report suppression.

**Syntax** `ip igmp snooping report-suppression`  
`no ip igmp snooping report-suppression`

**Default** Report suppression does not apply to IGMPv3, and is turned on by default for IGMPv1 and IGMPv2 reports.

**Mode** Interface Configuration for a VLAN interface.

**Example** To enable report suppression for IGMPv2 reports for vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip igmp version 2
awplus(config-if)# ip igmp snooping report-suppression
```

**Related commands** [show ip igmp interface](#)  
[show running-config](#)

# ip igmp snooping routermode

**Overview** Use this command to set the destination IP addresses as router multicast addresses.

Use the **no** variant of this command to set it to the default. You can also remove a specified IP address from a custom list of multicast addresses.

**Syntax** `ip igmp snooping routermode`  
`{all|default|ip|multicastrouter|address <ip-address>}`  
`no ip igmp snooping routermode [address <ip-address>]`

| Parameter               | Description   |
|-------------------------|---|
| all                     | All reserved multicast addresses (224.0.0.x). Packets from all possible addresses in range 224.0.0.x are treated as coming from routers.  |
| default                 | Default set of reserved multicast addresses. Packets from 224.0.0.1, 224.0.0.2, 224.0.0.4, 224.0.0.5, 224.0.0.6, 224.0.0.9, 224.0.0.13, 224.0.0.15 and 224.0.0.24 are treated as coming from routers. |
| ip                      | Custom reserved multicast addresses. Packets from custom IP address in the 224.0.0.x range are treated as coming from routers.  |
| multicastrouter         | Packets from DVMRP (224.0.0.4) and PIM (224.0.0.13) multicast addresses are treated as coming from routers.   |
| address<br><ip-address> | Packets from the specified multicast address are treated as coming from routers. The address must be in the 224.0.0.x range.  |

**Default** The default routermode is **default** (not **all**) and shows the following reserved multicast addresses:

```
Router mode.....Def
Reserved multicast address
224.0.0.1
224.0.0.2
224.0.0.4
224.0.0.5
224.0.0.6
224.0.0.9
224.0.0.13
224.0.0.15
224.0.0.24
```

**Mode** Global Configuration

**Examples** To set **ip igmp snooping routermode** for all default reserved addresses enter:

```
awplus(config)# ip igmp snooping routermode default
```

To remove the multicast address 224.0.0.5 from the custom list of multicast addresses enter:

```
awplus(config)# no ip igmp snooping routermode address  
224.0.0.5
```

**Related commands** [ip igmp trusted](#)  
[show ip igmp snooping routermode](#)

**Command changes** Version 5.4.7-1.1: VRF-lite support added SBx8100.  
Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

# ip igmp snooping source-timeout

**Overview** Use this command to set the global IGMP Snooping source time-out value (in seconds) on the switch.

Use the **no** variant of this command to set the source time-out value to be the same as the group membership timeout.

**Syntax** `ip igmp snooping source-timeout <timeout>`  
`no ip igmp snooping source-timeout <timeout>`

| Parameter                    | Description  |
|------------------------------|--|
| <code>&lt;timeout&gt;</code> | Time-out value in seconds <code>&lt;0-86400&gt;</code> |

**Default** Global IGMP Snooping source-timeout is disabled by default, and unregistered multicast will be timed-out like normal entries.

Interface IGMP Snooping source timeout is disabled by default, and unregistered multicast will be timed-out like normal entries.

**Mode** Interface/Global Configuration

**Usage notes** The timeout determines how long unregistered multicast entries will be kept for. If the value '0' is specified, then effectively all unregistered multicast entries will never be timed out, and can only be cleared by using the command **clear ip igmp group**. The interface settings will always take precedence over the global setting.

**Example** To configure IGMP Snooping source timeout on 'vlan1', use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan1
awplus(config-if)# ip igmp snooping source-timeout 200
```

**Related commands** [show ip igmp snooping source-timeout](#)

# ip igmp snooping tcn query solicit

**Overview** Use this command to enable IGMP (Internet Group Management Protocol) Snooping TCN (Topology Change Notification) Query Solicitation feature. When this command is used in the Global Configuration mode, Query Solicitation is enabled.

Use the **no** variant of this command to disable IGMP Snooping TCN Query Solicitation. When the **no** variant of this command is used in Interface Configuration mode, this overrides the Global Configuration mode setting and Query Solicitation is disabled.

**Syntax** `ip igmp snooping tcn query solicit`  
`no ip igmp snooping tcn query solicit`

**Default** IGMP Snooping TCN Query Solicitation is disabled by default on the device, unless the device is the Master Node in an EPSR ring, or is the Root Bridge in a Spanning Tree.

When the device is the Master Node in an EPSR ring, or the device is the Root Bridge in a Spanning Tree, then IGMP Snooping TCN Query Solicitation is enabled by default and cannot be disabled using the Global Configuration mode command. However, Query Solicitation can be disabled for specified interfaces using the **no** variant of this command from the Interface Configuration mode.

**Mode** Global Configuration, and Interface Configuration for a VLAN interface.

**Usage notes** Once enabled, if the device is not an IGMP Querier, on detecting a topology change, the device generates IGMP Query Solicit messages that are sent to all the ports of the vlan configured for IGMP Snooping on the device.

On a device that is not the Master Node in an EPSR ring or the Root Bridge in a Spanning Tree, Query Solicitation can be disabled using the **no** variant of this command after being enabled.

If the device that detects a topology change is an IGMP Querier then the device will generate an IGMP Query message.

Note that the **no** variant of this command when issued in Global Configuration mode has no effect on a device that is the Master Node in an EPSR ring or on a device that is a Root Bridge in a Spanning Tree. Query Solicitation is not disabled for the device these instances. However, Query Solicitation can be disabled on a per-vlan basis from the Interface Configuration mode.

See the following state table that shows when Query Solicit messages are sent in these instances:

| Command issued from Global Configuration | Command issued from Interface Configuration | Device is STP Root Bridge or the EPSR Master Node | IGMP Query Solicit message sent on VLAN |
|--|---|---|---|
| No                                       | Yes   | Yes   | Yes                                     |
| Yes                                      | No  | Yes   | No                                      |
| Yes                                      | Yes   | Yes   | Yes                                     |

See the [IGMP Feature Overview and Configuration Guide](#) for introductory information about the Query Solicitation feature.

**Examples** To enable Query Solicitation on a device, use the commands:

```
awplus# configure terminal
awplus(config)# ip igmp snooping tcn query solicit
```

To disable Query Solicitation on a device, use the commands:

```
awplus# configure terminal
awplus(config)# no ip igmp snooping tcn query solicit
```

To enable Query Solicitation for vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip igmp snooping tcn query solicit
```

To disable Query Solicitation for vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip igmp snooping tcn query solicit
```

**Related commands** [ip igmp query-holdtime](#)  
[show ip igmp interface](#)  
[show running-config](#)

**Command changes** Version 5.4.7-1.1: VRF-lite support added SBx8100.  
 Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

# ip igmp source-address-check

**Overview** This command enables the checking of the Source Address for an IGMP Report, rejecting any IGMP Reports originating on devices outside of the local subnet.

Use the **no** variant of this command to disable the checking of the Source Address for an IGMP Report, which allows IGMP Reports from devices outside of the local subnet.

**Syntax** `ip igmp source-address-check`  
`no ip igmp source-address-check`

**Default** Source address checking for IGMP Reports is enabled by default.

**Mode** Interface Configuration for a VLAN interface.

**Usage notes** This is a security feature, and should be enabled unless IGMP Reports from outside the local subnet are expected, for example, if Multicast VLAN Registration is active in the network.

The no variant of this command is required to disable the IGMP Report source address checking feature in networks that use Multicast VLAN Registration to allow IGMP Reports from devices outside of the local subnet.

**Examples** To deny IGMP Reports from outside the current subnet for vlan20, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan20
awplus(config-if)# ip igmp source-address-check
```

To allow IGMP Reports from outside the current subnet for vlan10, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# no ip igmp source-address-check
```

**Related commands** [show ip igmp interface](#)  
[show running-config](#)

# ip igmp ssm

**Overview** Use this command to define a non-default Source Specific Multicast (SSM) range of IP multicast addresses in IGMP. Incoming IGMPv1 and IGMPv2 join requests are ignored if the multicast IP address is in the SSM range and no SSM mapping is configured for these addresses. By default, the SSM range is 232/8. To define the SSM range to be other than the default, use one of the access-list parameter options.

Use the **no** variant of this command to change the SSM range in IGMP back to the default.

**Syntax** `ip igmp ssm range {<access-list-number>|<access-list-name>}`  
`no ip igmp ssm`

| Parameter                               | Description                               |
|---|---|
| <code>&lt;access-list-number&gt;</code> | Access-list number, in the range 1 to 99. |
| <code>&lt;access-list-name&gt;</code>   | Standard IP access-list name.             |

**Default** By default the SSM range is 232/8.

**Mode** Global Configuration

**Examples** To configure a non-default SSM range to be used in IGMP enter the commands:

```
awplus# configure terminal
awplus(config)# access-list 10 permit 224.1.1.0 0.0.0.255
awplus(config)# ip igmp ssm range 10
```

To return to the default configuration enter the commands:

```
awplus# configure terminal
awplus(config)# no ip igmp ssm
```

**Related commands** [access-list \(standard numbered\)](#)  
[ip pim ssm](#)

# ip igmp ssm-map enable

**Overview** Use this command to enable Source Specific Multicast (SSM) mapping on the device.

Use the **no** variant of this command to disable SSM mapping.

**Syntax** `ip igmp ssm-map enable`  
`no ip igmp ssm-map enable`

**Mode** Global Configuration

**Usage notes** This command applies to VLAN interfaces configured for IGMP.

**Example** To enable SSM on the device enter the commands:

```
awplus# configure terminal
awplus(config)# ip igmp ssm-map enable
```

**Related commands** [ip igmp ssm-map static](#)

# ip igmp ssm-map static

**Overview** Use this command to specify the static mode of defining Source Specific Multicast (SSM) mapping. SSM statically assigns sources to IGMPv1 and IGMPv2 groups to translate such (\*,G) groups' memberships to (S,G) memberships for use with PIM-SSM.

Use the **no** variant of this command to remove the SSM map association.

**Syntax**

```
ip igmp ssm-map static  
{<access-list-number>|<access-list-number-extended>|  
<access-list-name>} <ip-address>  
  
no ip igmp ssm-map static  
{<access-list-number>|<access-list-number-extended>|  
<access-list-name>} <ip-address>
```

| Parameter                     | Description  |
|-------------------------------|--|
| <access-list-number>          | Access-list number, in the range 1 to 99.                                |
| <access-list-number-extended> | Access-list number (expanded range), in the range 1300 to 1999.          |
| <access-list-name>            | Standard IP access-list name.  |
| <ip-address>                  | Source address to use for static map group, entered in the form A.B.C.D. |

**Mode** Global Configuration

**Usage notes** This command applies to VLAN interfaces configured for IGMP. You can use Standard numbered and Standard named ACLs plus Expanded Numbered ACLs.

**Examples** This example shows how to configure an SSM static mapping for group-address 224.1.1.1, using a standard numbered ACL shown as 10:

```
awplus# configure terminal  
awplus(config)# access-list 10 permit 224.1.1.1 0.0.0.0  
awplus(config)# ip igmp ssm-map static 10 1.2.3.4
```

This example shows how to configure an SSM static mapping for group-address 224.1.1.1, using an expanded numbered ACL shown as 1301:

```
awplus# configure terminal  
awplus(config)# access-list 1301 permit 224.1.1.1 0.0.0.0  
awplus(config)# ip igmp ssm-map static 1301 1.2.3.4
```

This example shows how to configure an SSM static mapping for group-address 224.1.1.1, using a standard named ACL shown as sales:

```
awplus# configure terminal
awplus(config)# access-list sales permit 224.1.1.1 0.0.0.0
awplus(config)# ip igmp ssm-map static sales 1.2.3.4
```

**Related commands** [ip igmp ssm-map enable](#)

# ip igmp static-group

**Overview** Use this command to statically configure multicast group membership entries on a VLAN interface, or to statically forward a multicast channel out a particular port or port range.

To statically add only a group membership, do not specify any parameters.

To statically add a (\*,g) entry to forward a channel out of a port, specify only the multicast group address and the switch port range.

To statically add an (s,g) entry to forward a channel out of a port, specify the multicast group address, the source IP address, and the switch port range.

To use Source Specific Multicast mapping to determine the source IP address of the multicast server use the **ssm-map** parameter instead of specifying the source IP address.

Use the **no** variant of this command to delete static group membership entries.

**Syntax**

```
ip igmp static-group <ip-address> [source  
{<ip-source-addr>|ssm-map}] [interface <port>]  
no ip igmp static-group <ip-address> [source  
{<ip-source-addr>|ssm-map}] [interface <port>]
```

| Parameter        | Description  |
|------------------|--|
| <ip-address>     | Standard IP Multicast group address, entered in the form A.B.C.D, to be configured as a static group member.   |
| source           | Optional.  |
| <ip-source-addr> | Standard IP source address, entered in the form A.B.C.D, to be configured as a static source from where multicast packets originate.   |
| ssm-map          | This parameter uses Source Specific Multicast (SSM) Mapping to determine the source IP address associated with the specified IP Multicast group address. SSM mappings are configured using the <a href="#">ip igmp ssm-map static</a> command. |
| interface        | Use this parameter to specify a specific switch port or switch port range to statically forward the multicast group out of. If not used, static configuration is applied on all ports in the VLAN.   |
| <port>           | The port or port range to statically forward the group out of. The port may be a switch port (e.g. port1.0.4), a static channel group (e.g. sa2), or a dynamic (LACP) channel group (e.g. po2).  |

**Mode** Interface Configuration for a VLAN interface.

**Usage notes** This command applies to IGMP operation, or to IGMP Snooping on a VLAN interface.

**Example** The following example show how to statically add group and source records for IGMP on vlan3:

```
awplus# configure terminal
awplus(config)# interface vlan3
awplus(config-if)# ip igmp
awplus(config-if)# ip igmp static-group 226.1.2.4 source
10.2.3.4
```

# ip igmp startup-query-count

**Overview** Use this command to configure the IGMP startup query count for an interface. The IGMP startup query count is the number of IGMP General Query messages sent by a querier at startup. The default IGMP startup query count is 2.

Use the **no** variant of this command to return an interface's configured IGMP startup query count to the default.

**Syntax** `ip igmp startup-query-count <startup-query-count>`  
`no ip igmp startup-query-count`

| Parameter                                | Description  |
|--|--|
| <code>&lt;startup-query-count&gt;</code> | Specify the IGMP startup query count, in the range 2-10. |

**Default** The default IGMP startup query count is 2.

**Mode** Interface Configuration for a VLAN interface.

**Example** To set the IGMP startup query count to 4 on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip igmp startup-query-count 4
```

**Related commands** [ip igmp last-member-query-count](#)  
[ip igmp startup-query-interval](#)

# ip igmp startup-query-interval

**Overview** Use this command to configure the IGMP startup query interval for an interface. The IGMP startup query interval is the amount of time in seconds between successive IGMP General Query messages sent by a querier during startup. The default IGMP startup query interval is one quarter of the IGMP query interval value.

Use the **no** variant of this command to return an interface's configured IGMP startup query interval to the default.

**Syntax** `ip igmp startup-query-interval <startup-query-interval>`  
`no ip igmp startup-query-interval`

| Parameter                                   | Description  |
|---|--|
| <code>&lt;startup-query-interval&gt;</code> | Specify the IGMP startup query interval, in the range of 2-1800 seconds. The value must be one quarter of the IGMP query interval value. |

**Default** The default IGMP startup query interval is one quarter of the IGMP query interval value.

**NOTE:** *The IGMP startup query interval must be one quarter of the IGMP query interval.*

**Mode** Interface Configuration for a VLAN interface.

**Example** To set the IGMP startup query interval to 15 seconds for vlan2, which is one quarter of the IGMP query interval of 60 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip igmp query-interval 60
awplus(config-if)# ip igmp startup-query-interval 15
```

**Related commands** [ip igmp last-member-query-interval](#)  
[ip igmp query-interval](#)  
[ip igmp startup-query-count](#)

# ip igmp trusted

**Overview** Use this command to allow IGMP to process packets received on certain trusted ports only.

Use the **no** variant of this command to stop IGMP from processing specified packets if the packets are received on the specified ports or aggregator.

**Syntax** `ip igmp trusted {all|query|report|routermode}`  
`no ip igmp trusted {all|query|report|routermode}`

| Parameter  | Description  |
|------------|--|
| all        | Specifies whether or not the interface is allowed to receive all IGMP and other routermode packets |
| query      | Specifies whether or not the interface is allowed to receive IGMP queries                          |
| report     | Specifies whether or not the interface is allowed to receive IGMP membership reports               |
| routermode | Specifies whether or not the interface is allowed to receive routermode packets                    |

**Default** By default, all ports and aggregators are trusted interfaces, so IGMP is allowed to process all IGMP query, report, and router mode packets arriving on all interfaces.

**Mode** Interface mode for one or more switch ports or aggregators

**Usage** Because all ports are trusted by default, use this command in its **no** variant to stop IGMP processing packets on ports you do not trust.

For example, you can use this command to make sure that only ports attached to approved IGMP routers are treated as router ports.

**Example** To stop ports port1.0.3-port1.0.6 from being treated as router ports by IGMP, use the commands:

```
awplus(config)# interface port1.0.3-port1.0.6  
awplus(config-if)# no ip igmp trusted routermode
```

**Related commands** [ip igmp snooping routermode](#)

# ip igmp version

**Overview** Use this command to set the current IGMP version (IGMP version 1, 2 or 3) on an interface.

Use the **no** variant of this command to return to the default version.

**Syntax** `ip igmp version <1-3>`  
`no ip igmp version`

| Parameter                        | Description                  |
|----------------------------------|------------------------------|
| <code>version &lt;1-3&gt;</code> | IGMP protocol version number |

**Default** The default IGMP version is 3.

**Mode** Interface Configuration for a VLAN interface.

**Example** To set the IGMP version to 2 for vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip igmp version 2
```

**Related commands** [show ip igmp interface](#)

# show debugging igmp

**Overview** Use this command to see what debugging is turned on for IGMP.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show debugging igmp`

**Mode** User Exec and Privileged Exec

**Example** To display the IGMP debugging options set, enter the command:

```
awplus# show debugging igmp
```

**Output** Figure 32-2: Example output from the **show debugging igmp** command

```
IGMP Debugging status:
IGMP Decoder debugging is on
IGMP Encoder debugging is on
IGMP Events debugging is on
IGMP FSM debugging is on
IGMP Tree-Info-Base (TIB) debugging is on
```

**Related commands** [debug igmp](#)

**Command changes** Version 5.4.7-1.1: VRF-lite support added SBx8100.

Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

# show ip igmp groups

**Overview** Use this command to display the multicast groups with receivers directly connected to the router, and learned through IGMP.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip igmp groups [brief]`  
`show ip igmp groups <ip-address> [detail]`  
`show ip igmp groups <interface> [<ip-address>] [detail]`

| Parameter    | Description  |
|--------------|--|
| <ip-address> | Address of the multicast group, entered in the form A.B.C.D. |
| <interface>  | Interface name for which to display local information.       |
| brief        | Brief display of all interfaces.                             |
| detail       | Detailed display of the interface.                           |

**Mode** User Exec and Privileged Exec

**Example** The following command displays local-membership information for all ports in all interfaces:

```
awplus# show ip igmp groups
```

**Output** Figure 32-3: Example output from **show ip igmp groups**

| IGMP Connected Group Membership |           |          |          |               |
|---------------------------------|-----------|----------|----------|---------------|
| Group Address                   | Interface | Uptime   | Expires  | Last Reporter |
| 224.0.1.1                       | port1.0.1 | 00:00:09 | 00:04:17 | 10.10.0.82    |
| 224.0.1.24                      | port1.0.2 | 00:00:06 | 00:04:14 | 10.10.0.84    |
| ...                             |           |          |          |               |

Table 32-1: Parameters in the output of **show ip igmp groups**

| Parameter     | Description  |
|---------------|--|
| Group Address | Address of the multicast group.  |
| Interface     | Port through which the group is reachable.   |
| Uptime        | The time in weeks, days, hours, minutes, and seconds that this multicast group has been known to the device. |

Table 32-1: Parameters in the output of **show ip igmp groups** (cont.)

| Parameter     | Description  |
|---------------|--|
| Expires       | Time (in hours, minutes, and seconds) until the entry expires. |
| Last Reporter | Last host to report being a member of the multicast group.     |

**Command changes**

Version 5.4.7-1.1: VRF-lite support added SBx8100.

Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

Version 5.4.8-2.3: **brief** parameter added.

# show ip igmp interface

**Overview** Use this command to display the state of IGMP, IGMP Proxy service, and IGMP Snooping for a specified VLAN, or all VLANs. IGMP is shown as Active or Disabled in the show output. You can also display the number of groups a switch port belongs to.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip igmp interface [<interface>]`

| Parameter   | Description  |
|-------------|--|
| <interface> | The name of the interface.<br>If you specify a switch port number, the output displays the number of groups the port belongs to, and the port’s group membership limit, if a limit has been set (with the command <code>ip igmp maximum-groups</code> ). |

**Mode** User Exec and Privileged Exec

**Output** The following output shows IGMP interface status for vlan2 with IGMP Snooping enabled:

```
awplus#show ip igmp interface vlan2
Interface vlan2 (Index 202)
  IGMP Disabled, Inactive, Version 3 (default)
  IGMP interface has 0 group-record states
  IGMP activity: 0 joins, 0 leaves
  IGMP robustness variable is 2
  IGMP last member query count is 2
  IGMP query interval is 125 seconds
  IGMP query holdtime is 500 milliseconds
  IGMP querier timeout is 255 seconds
  IGMP max query response time is 10 seconds
  Last member query response interval is 1000 milliseconds
  Group Membership interval is 260 seconds
  Strict IGMPv3 ToS checking is disabled on this interface
  Source Address checking is enabled
  IGMP Snooping is globally enabled
  IGMP Snooping query solicitation is globally disabled
  Num. query-solicit packets: 57 sent, 0 recvd
  IGMP Snooping is enabled on this interface
  IGMP Snooping fast-leave is not enabled
  IGMP Snooping querier is not enabled
  IGMP Snooping report suppression is enabled
```

The following output shows IGMP interface status for vlan2 with IGMP Snooping disabled:

```
awplus#show ip igmp interface vlan2
Interface vlan2 (Index 202)
  IGMP Disabled, Inactive, Version 3 (default)
  IGMP interface has 0 group-record states
  IGMP activity: 0 joins, 0 leaves
  IGMP robustness variable is 2
  IGMP last member query count is 2
  IGMP query interval is 125 seconds
  IGMP query holdtime is 500 milliseconds
  IGMP querier timeout is 255 seconds
  IGMP max query response time is 10 seconds
  Last member query response interval is 1000 milliseconds
  Group Membership interval is 260 seconds
  Strict IGMPv3 ToS checking is disabled on this interface
  Source Address checking is enabled
  IGMP Snooping is globally enabled
  IGMP Snooping query solicitation is globally disabled
  Num. query-solicit packets: 57 sent, 0 recvd
  IGMP Snooping is not enabled on this interface
  IGMP Snooping fast-leave is not enabled
  IGMP Snooping querier is not enabled
  IGMP Snooping report suppression is enabled
```

The following output displays membership information for port1.0.1:

```
awplus#show ip igmp interface port1.0.1
IGMP information for port1.0.1
  Maximum groups limit set: 10
  Number of groups port belongs to: 0
```

**Command  
changes**

Version 5.4.7-1.1: VRF-lite support added SBx8100.

Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

# show ip igmp proxy

**Overview** Use this command to display the state of IGMP Proxy services for a specified interface or for all interfaces.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip igmp proxy`

**Mode** User Exec and Privileged Exec

**Example** To display the state of IGMP Proxy services for all interfaces, enter the command:

```
awplus# show ip igmp proxy
```

**Output** Figure 32-4: Example output from **show ip igmp proxy**

```
awplus#show ip igmp proxy
Interface vlan40 (Index 340)
Administrative status: enabled
Operational status: up
Upstream interface is vlan30
Number of multicast groups: 1
```

**Related commands** [ip igmp proxy-service](#)

# show ip igmp proxy groups

**Overview** Use this command to display multicast groups with receivers directly connected to the router, learned through IGMP, which use a proxy service. You can also use a filter to specify a multicast group IP address and /or interface.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip igmp proxy groups [detail]`  
`show ip igmp proxy groups <multicast-group> [detail]`  
`show ip igmp proxy groups <vlan> [detail]`  
`show ip igmp proxy groups <vlan> <multicast-group> [detail]`

| Parameter         | Description  |
|-------------------|--|
| groups            | Specify IGMP proxy group membership information.                           |
| detail            | Specify detailed IGMPv3 source information.                                |
| <vlan>            | Specify the name of a single VLAN interface, for example <b>vlan1</b> .    |
| <multicast-group> | Specify the IPv4 address in of the multicast group, in the format A.B.C.D. |

**Mode** User Exec

**Example** To display local membership information for IGMP proxy service interfaces, use the command:

```
awplus# show ip igmp proxy groups
```

**Output** Figure 32-5: Example output from **show ip igmp proxy groups**

```
awplus#show ip igmp proxy groups
IGMP Connected Proxy Group Membership
Group Address      Interface          Member state
224.9.10.11       vlan10            Delay
```

**Example** To display local membership information for IGMP proxy service interfaces, use the command:

```
awplus# show ip igmp proxy groups detail
```

**Output** Figure 32-6: Example output from **show ip igmp proxy groups detail**

```
awplus#show ip igmp proxy groups detail
Interface:      vlan10
Group:          224.9.10.11
Group mode:     Exclude
Member state:   Delay
Source list is empty

Summary :
IGMP Connected Proxy Group Membership
Group Address   Interface      Member state
224.9.10.11    vlan10        DelayDetail :
Interface:      vlan10
Group:          224.9.10.11
Group mode:     Exclude
Member state:   Delay
Source list is empty
```

Table 32-2: Parameters in the output of **show ip igmp proxy groups**

| Parameter    | Description  |
|--------------|--|
| Interface    | The interface that received the IGMP report.   |
| Group        | The multicast group address that has been requested by the IGMP report.  |
| Group mode   | <b>Include</b> mode indicates that the multicast receiver has sent an IGMPv3 report for a group with a list of addresses that it wants to receive traffic from.<br><b>Exclude</b> mode indicates that the multicast receiver has sent an IGMPv3 report for a group with a list of addresses that it does not want to receive traffic from. |
| Member state | <b>Delay</b> indicates that no group or source query timers are running for the specified group, otherwise the member state is shown as <b>Idle</b> .  |

**Related commands** [show ip igmp proxy](#)

**Command changes** Version 5.4.7-1.1: VRF-lite support added SBx8100.  
Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

# show ip igmp snooping mrouter

**Overview** Use this command to display the multicast router ports, both static and dynamic, in a VLAN.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip igmp snooping mrouter [interface <interface>]`

| Parameter                      | Description                     |
|--------------------------------|---------------------------------|
| <code>interface</code>         | A specific interface.           |
| <code>&lt;interface&gt;</code> | The name of the VLAN interface. |

**Mode** User Exec and Privileged Exec

**Example** To show all multicast router interfaces, use the command:

```
awplus# show ip igmp snooping mrouter
```

To show the multicast router interfaces in `vlan1`, use the command:

```
awplus# show ip igmp snooping mrouter interface vlan1
```

**Output** Figure 32-7: Example output from **show ip igmp snooping mrouter**

| VLAN | Interface | Static/Dynamic        |
|------|-----------|-----------------------|
| 1    | port1.0.1 | Statically configured |
| 200  | port1.0.2 | Statically configured |

Figure 32-8: Example output from **show ip igmp snooping mrouter interface vlan1**

| VLAN | Interface | Static/Dynamic        |
|------|-----------|-----------------------|
| 1    | port1.0.1 | Statically configured |

**Command changes** Version 5.4.7-1.1: VRF-lite support added SBx8100.

Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

# show ip igmp snooping routermode

**Overview** Use this command to display the current router mode and the list of IP addresses set as router multicast addresses from the [ip igmp snooping routermode](#) command.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip igmp snooping routermode`

**Mode** User Exec and Privileged Exec

**Example** To show the router mode and the list of router multicast addresses, use the command:

```
awplus# show ip igmp snooping routermode
```

**Output** Figure 32-9: Example output from **show ip igmp snooping routermode**

```
awplus#show ip igmp snooping routermode
Router mode.....Def
Reserved multicast address

      224.0.0.1
      224.0.0.2
      224.0.0.4
      224.0.0.5
      224.0.0.6
      224.0.0.9
      224.0.0.13
      224.0.0.15
      224.0.0.24
```

**Related commands** [ip igmp snooping routermode](#)

**Command changes** Version 5.4.7-1.1: VRF-lite support added SBx8100.

Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

# show ip igmp snooping source-timeout

**Overview** Use this command to display the configured IGMP snooping source timeouts for a specified VLAN or VLAN range.

**Syntax** `show ip igmp snooping source-timeout [interface|<interface-range>]`

| Parameter                            | Description                                  |
|--------------------------------------|--|
| <code>&lt;interface-range&gt;</code> | The name of the VLAN interface or VLAN range |

**Mode** Privileged Exec

**Example** To display the configured IGMP snooping source timeouts for all VLANs, use the command:

```
awplus# show ip igmp snooping source-timeout
```

**Output** Figure 32-10: Example output from **show ip igmp snooping source-timeout**

```
awplus#show ip igmp snooping source-timeout
Global IGMP snooping source-timeout is enabled (60 secs)

vlan1          enabled (300 secs)
vlan2          inherits global setting
vlan1000       inherits global settingawplus#show ip igmp
snooping source-timeout int vlan1
Global IGMP snooping source-timeout is enabled (60 secs)vlan1
enabled (300 secs)
```

**Related commands** [ip igmp snooping source-timeout](#)

**Command changes** Version 5.4.7-1.1: VRF-lite support added SBx8100.

Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

# show ip igmp snooping statistics

**Overview** Use this command to display IGMP Snooping statistics data.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip igmp snooping statistics interface <interface-range>  
[group [<ip-address>]]`

| Parameter    | Description  |
|--------------|--|
| <ip-address> | Optionally specify the address of the multicast group, entered in the form A.B.C.D.  |
| <interface>  | Specify the name of the interface or interface range. If you specify a port number, the output displays the number of groups the port belongs to, and the port’s group membership limit, if a limit has been set (with the command <code>ip igmp maximum-groups</code> ) |

**Mode** Privileged Exec

**Example** To display IGMP statistical information for **vlan1** and **vlan2**, use the command:

```
awplus# show ip igmp snooping statistics interface vlan1-vlan2
```

**Output** Figure 32-11: Example output from the **show ip igmp snooping statistics** command for VLANs

```
awplus#show ip igmp interface vlan1-vlan2
IGMP Snooping statistics for vlan1
Interface:      port1.0.1
Group:         224.1.1.1
Uptime:        00:00:09
Group mode:    Exclude (Expires: 00:04:10)
Last reporter: 10.4.4.5
Source list is empty
IGMP Snooping statistics for vlan2
Interface:      port1.0.2
Group:         224.1.1.2
Uptime:        00:00:19
Group mode:    Exclude (Expires: 00:05:10)
Last reporter: 10.4.4.6
Source list is empty
```

Figure 32-12: Example output from the **show ip igmp snooping statistics** command for a switch port

```
awplus#show ip igmp interface port1.0.1
IGMP information for port1.0.1
  Maximum groups limit set: 10
  Number of groups port belongs to: 0
```

**Command  
changes**

Version 5.4.7-1.1: VRF-lite support added SBx8100.

Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

# undebug igmp

**Overview** This command applies the functionality of the no `debug igmp` command.

# 33

# MLD and MLD Snooping Commands

## Introduction

**Overview** This chapter provides an alphabetical reference of configuration, clear, and show commands related to MLD and MLD Snooping.

The Multicast Listener Discovery (MLD) module includes the MLD Proxy service and MLD Snooping functionality. Some of the following commands may have commonalities and restrictions; these are described under the Usage section for each command.

MLD and MLD Snooping commands only apply to switch ports, not Ethernet interfaces.

Before using PIM-SMv6:

- IPv6 must be enabled on an interface ([ipv6 enable](#)),
- IPv6 forwarding must be enabled globally for routing IPv6 ([ipv6 forwarding](#)), and
- IPv6 multicasting must be enabled globally ([ipv6 multicast-routing](#)).

- Command List**
- [“clear ipv6 mld”](#) on page 1716
  - [“clear ipv6 mld group”](#) on page 1717
  - [“clear ipv6 mld interface”](#) on page 1718
  - [“debug mld”](#) on page 1719
  - [“ipv6 mld”](#) on page 1720
  - [“ipv6 mld access-group”](#) on page 1721
  - [“ipv6 mld immediate-leave”](#) on page 1722
  - [“ipv6 mld last-member-query-count”](#) on page 1723
  - [“ipv6 mld last-member-query-interval”](#) on page 1724
  - [“ipv6 mld limit”](#) on page 1725
  - [“ipv6 mld querier-timeout”](#) on page 1727

- [“ipv6 mld query-interval”](#) on page 1728
- [“ipv6 mld query-max-response-time”](#) on page 1729
- [“ipv6 mld robustness-variable”](#) on page 1730
- [“ipv6 mld snooping”](#) on page 1731
- [“ipv6 mld snooping fast-leave”](#) on page 1733
- [“ipv6 mld snooping mrouter”](#) on page 1734
- [“ipv6 mld snooping querier”](#) on page 1736
- [“ipv6 mld snooping report-suppression”](#) on page 1737
- [“ipv6 mld ssm-map enable”](#) on page 1739
- [“ipv6 mld ssm-map static”](#) on page 1740
- [“ipv6 mld static-group”](#) on page 1741
- [“ipv6 mld version”](#) on page 1743
- [“show debugging mld”](#) on page 1744
- [“show ipv6 mld groups”](#) on page 1745
- [“show ipv6 mld interface”](#) on page 1746
- [“show ipv6 mld snooping mrouter”](#) on page 1747
- [“show ipv6 mld snooping statistics”](#) on page 1748

# clear ipv6 mld

**Overview** Use this command to clear all MLD local memberships on all interfaces.

**Syntax** `clear ipv6 mld`

**Mode** Privileged Exec

**Usage** This command applies to interfaces configured for MLD Layer 3 multicast protocols and learned by MLD Snooping.

**Example** To clear all MLD local memberships on all interfaces, use the command:

```
awplus# clear ipv6 mld
```

**Related commands** [clear ipv6 mld group](#)  
[clear ipv6 mld interface](#)

# clear ipv6 mld group

**Overview** Use this command to clear MLD specific local-membership(s) on all interfaces, for all groups or a particular group.

**Syntax** `clear ipv6 mld group {*|<ipv6-address>}`

| Parameter      | Description   |
|----------------|---|
| *              | Clears all groups on all interfaces. This is an alias to the <a href="#">clear ipv6 mld</a> command.  |
| <ipv6-address> | Specify the group address for which MLD local-memberships are to be cleared from all interfaces. Specify the IPv6 multicast group address in the format in the format X:X::X:X. |

**Mode** Privileged Exec

**Usage** This command applies to interfaces configured for MLD Layer 3 multicast protocols and learned by MLD Snooping.

**Example** To clear all groups on all interfaces, use the command:

```
awplus# clear ipv6 mld group *
```

**Related commands** [clear ipv6 mld](#)  
[clear ipv6 mld interface](#)

# clear ipv6 mld interface

**Overview** Use this command to clear MLD interface entries.

**Syntax** `clear ipv6 mld interface <interface>`

| Parameter                      | Description  |
|--------------------------------|--|
| <code>&lt;interface&gt;</code> | Specifies name of the interface; all groups learned from this interface are deleted. |

**Mode** Privileged Exec

**Usage** This command applies to interfaces configured for MLD Layer 3 multicast protocols and learned by MLD Snooping.

**Example** To clear the entries from vlan2, use the command:

```
awplus# clear ipv6 mld interface vlan2
```

**Related commands** [clear ipv6 mld](#)  
[clear ipv6 mld group](#)

# debug mld

**Overview** Use this command to enable all MLD debugging modes, or a specific MLD debugging mode.

Use the **no** variant of this command to disable all MLD debugging modes, or a specific MLD debugging mode.

**Syntax** `debug mld {all|decode|encode|events|fsm|tib}`  
`no debug mld {all|decode|encode|events|fsm|tib}`

| Parameter | Description                            |
|-----------|--|
| all       | Debug all MLD.                         |
| decode    | Debug MLD decoding.                    |
| encode    | Debug MLD encoding.                    |
| events    | Debug MLD events.                      |
| fsm       | Debug MLD Finite State Machine (FSM).  |
| tib       | Debug MLD Tree Information Base (TIB). |

**Mode** Privileged Exec and Global Configuration

**Usage notes** This command applies to interfaces configured for MLD Layer 3 multicast protocols and learned by MLD Snooping.

**Examples**

```
awplus# configure terminal
awplus(config)# debug mld all
awplus# configure terminal
awplus(config)# debug mld decode
awplus# configure terminal
awplus(config)# debug mld encode
awplus# configure terminal
awplus(config)# debug mld events
```

**Related commands** [show debugging mld](#)

# ipv6 mld

**Overview** Use this command to enable the MLD protocol operation on an interface. This command enables MLD protocol operation in stand-alone mode, and can be used to learn local-membership information prior to enabling a multicast routing protocol on the interface.

Use the **no** variant of this command to return all MLD related configuration to the default (including MLD Snooping).

**NOTE:** *There is a 100 MLD interface limit when applying MLD commands to multiple VLANs. Only the first 100 VLANs have the required multicast structures added to the interfaces that allow multicast routing.*

**Syntax** `ipv6 mld`  
`no ipv6 mld`

**Default** MLD is disabled by default.

**Mode** Interface Configuration for a specified VLAN interface or a range of VLAN interfaces.

**Usage notes** MLD requires memory for storing data structures, as well as the hardware tables to implement hardware routing. As the number of ports, VLANs, static and dynamic groups increases then more memory is consumed. You can track the memory used for MLD with the command:

```
awplus# show memory pools nsm | grep MLD
```

Static and dynamic groups (LACP), ports and VLANs are not limited for MLD. For VLANs, this allows you to configure MLD across more VLANs with fewer ports per VLAN, or fewer VLANs with more ports per VLAN. For LACPs, you can configure MLD across more LACP groups with fewer ports per LACP, or fewer LACP groups with more ports per LACP.

**Example** To enable MLD on vlan1, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan1
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 mld
```

**Related commands** [show ipv6 mld interface](#)

# ipv6 mld access-group

**Overview** Use this command to control the multicast local-membership groups learned on an interface.

Use the **no** variant of this command to disable this access control.

**Syntax** `ipv6 mld access-group <IPv6-access-list-name>`  
`no ipv6 mld access-group`

| Parameter                                  | Description   |
|--|---|
| <code>&lt;IPv6-access-list-name&gt;</code> | Specify a Standard or an Extended software IPv6 access-list name. See <a href="#">IPv6 Software Access Control List (ACL) Commands</a> for supported IPv6 ACLs. |

**Default** No access list is configured by default.

**Mode** Interface Configuration for a specified VLAN interface or a range of VLAN interfaces.

**Examples** In the following example, the VLAN interface `vlan2` will only accept MLD joins for groups in the range `ff1e:0db8:0001::/64`:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 access-list standard group1 permit
ff1e:0db8:0001::/64
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 mld access-group group1
```

In the following example, the VLAN interfaces `vlan2-vlan4` will only accept MLD joins for groups in the range `ff1e:0db8:0001::/64`:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 access-list standard group1 permit
ff1e:0db8:0001::/64
awplus(config)# interface vlan2-vlan4
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 mld access-group group1
```

# ipv6 mld immediate-leave

**Overview** Use this command to minimize the leave latency of MLD memberships.

Use the **no** variant of this command to disable this feature.

**Syntax** `ipv6 mld immediate-leave group-list <IPv6-access-list-name>`  
`no ipv6 mld immediate-leave`

| Parameter                                  | Description  |
|--|--|
| <code>&lt;IPv6-access-list-name&gt;</code> | Specify a Standard or an Extended software IPv6 access-list name that defines multicast groups in which the immediate leave feature is enabled.<br>See <a href="#">IPv6 Software Access Control List (ACL) Commands</a> for supported IPv6 ACLs. |

**Default** Disabled

**Mode** Interface Configuration for a specified VLAN interface or a range of VLAN interfaces.

**Example** The following example shows how to enable the immediate-leave feature on an interface for a specific range of multicast groups. In this example, the router assumes that the group access-list consists of groups that have only one node membership at a time per interface:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 mld immediate-leave v6grp
awplus(config-if)# exit
```

**Related commands** [ipv6 mld last-member-query-interval](#)

# ipv6 mld last-member-query-count

**Overview** Use this command to set the last-member query-count value.  
Use the **no** variant of this command to return to the default on an interface.

**Syntax** `ipv6 mld last-member-query-count <value>`  
`no ipv6 mld last-member-query-count`

| Parameter | Description                                |
|-----------|--|
| <value>   | Count value. Valid values are from 2 to 7. |

**Default** The default last-member query-count value is 2.

**Mode** Interface Configuration for a specified VLAN interface or a range of VLAN interfaces.

**Example** To set the last-member query-count to 3 on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 mld last-member-query-count 3
```

# ipv6 mld last-member-query-interval

**Overview** Use this command to configure the interval at which the router sends MLD group-specific host query messages.

Use the **no** variant of this command to set this frequency to the default.

**Syntax** `ipv6 mld last-member-query-interval <milliseconds>`  
`no ipv6 mld last-member-query-interval`

| Parameter                         | Description   |
|-----------------------------------|---|
| <code>&lt;milliseconds&gt;</code> | The time delay between successive query messages (in milliseconds). Valid values are from 1000 to 25500 milliseconds. |

**Default** 1000 milliseconds

**Mode** Interface Configuration for a specified VLAN interface or a range of VLAN interfaces.

**Example** The following example changes the MLD group-specific host query message interval to 2 seconds:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 mld last-member-query-interval 2000
```

**Related commands** [ipv6 mld immediate-leave](#)

# ipv6 mld limit

**Overview** Use this command to configure a limit on the maximum number of group memberships that may be learned. The limit may be set for the device as a whole, or for a specific interface.

Once the specified group membership limit is reached, all further local-memberships will be ignored.

Optionally, an exception access-list can be configured to specify the group-address(es) that are exempted from being subject to the limit.

Use the **no** variant of this command to unset the limit and any specified exception access-list.

**Syntax** `ipv6 mld limit <limitvalue> [except <IPv6-access-list-name>]`  
`no ipv6 mld limit`

| Parameter               | Description  |
|-------------------------|--|
| <limitvalue>            | <2-512> Maximum number of group membership states.   |
| <IPv6-access-list-name> | Specify a Standard or an Extended software IPv6 access-list name that defines multicast groups, which are exempted from being subject to the configured limit. See <a href="#">IPv6 Software Access Control List (ACL) Commands</a> for supported IPv6 ACLs. |

**Default** The default limit, which is reset by the **no** variant of this command, is the same as maximum number of group membership entries that can be learned with the **ipv6 mld limit** command.

The default limit of group membership entries that can be learned is 512 entries.

**Mode** Global Configuration and Interface Configuration for a specified VLAN interface or a range of VLAN interfaces.

**Usage notes** This command applies to interfaces configured for MLD Layer-3 multicast protocols and learned by MLD Snooping.

**Examples** The following example configures an MLD limit of 100 group-memberships across all VLAN interfaces on which MLD is enabled, and excludes groups in the range `ff1e:0db8:0001::/64` from this limitation:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 access-list standard v6grp permit
ff1e:0db8:0001::/64
awplus(config)# ipv6 mld limit 100 except v6grp
```

The following example configures an MLD limit of 100 group-membership states on the VLAN interface `vlan2`:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 mld limit 100
```

The following example configures an MLD limit of 100 group-membership states on the VLAN interfaces `vlan2-vlan4`:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2-vlan4
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 mld limit 100
```

**Related commands** [ipv6 mld immediate-leave](#)  
[show ipv6 mld groups](#)

# ipv6 mld querier-timeout

**Overview** Use this command to configure the timeout period before the router takes over as the querier for the interface after the previous querier has stopped querying.

Use the **no** variant of this command to restore the default.

**Syntax** `ipv6 mld querier-timeout <seconds>`  
`no ipv6 mld querier-timeout`

| Parameter                    | Description  |
|------------------------------|--|
| <code>&lt;seconds&gt;</code> | Number of seconds that the router waits after the previous querier has stopped querying before it takes over as the querier. Valid values are from 2 to 65535 seconds. |

**Default** 255 seconds

**Mode** Interface Configuration for a specified VLAN interface or a range of VLAN interfaces.

**Usage notes** This command applies to interfaces configured for MLD Layer 3 multicast protocols.

**Example** The following example configures the router to wait 120 seconds from the time it received the last query before it takes over as the querier for the interface:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 mld querier-timeout 120
```

**Related commands** [ipv6 mld query-interval](#)

# ipv6 mld query-interval

**Overview** Use this command to configure the frequency of sending MLD host query messages.

Use the **no** variant of this command to return to the default frequency.

**Syntax** `ipv6 mld query-interval <seconds>`  
`no ipv6 mld query-interval`

| Parameter                    | Description   |
|------------------------------|---|
| <code>&lt;seconds&gt;</code> | Variable that specifies the time delay between successive MLD host query messages (in seconds). Valid values are from 1 to 18000 seconds. |

**Default** The default query interval is 125 seconds.

**Mode** Interface Configuration for a specified VLAN interface or a range of VLAN interfaces.

**Usage** This command applies to interfaces configured for MLD Layer 3 multicast protocols.

**Example** The following example changes the frequency of sending MLD host-query messages to 2 minutes:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 mld query-interval 120
```

**Related commands** [ipv6 mld querier-timeout](#)

# ipv6 mld query-max-response-time

**Overview** Use this command to configure the maximum response time advertised in MLD queries.

Use the **no** variant of with this command to restore the default.

**Syntax** `ipv6 mld query-max-response-time <seconds>`  
`no ipv6 mld query-max-response-time`

| Parameter                    | Description   |
|------------------------------|---|
| <code>&lt;seconds&gt;</code> | Maximum response time (in seconds) advertised in MLD queries. Valid values are from 1 to 240 seconds. |

**Default** 10 seconds

**Mode** Interface Configuration for a specified VLAN interface or a range of VLAN interfaces.

**Usage** This command applies to interfaces configured for MLD Layer 3 multicast protocols.

**Example** The following example configures a maximum response time of 8 seconds:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 mld query-max-response-time 8
```

# ipv6 mld robustness-variable

**Overview** Use this command to change the robustness variable value on an interface.  
Use the **no** variant of this command to return to the default on an interface.

**Syntax** `ipv6 mld robustness-variable <value>`  
`no ipv6 mld robustness-variable`

| Parameter | Description                   |
|-----------|-------------------------------|
| <value>   | Valid values are from 1 to 7. |

**Default** The default robustness variable value is 2.

**Mode** Interface Configuration for a specified VLAN interface or a range of VLAN interfaces.

**Usage** This command applies to interfaces configured for MLD Layer 3 multicast protocols.

**Example** The following example changes the robustness variable value to 3:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 mld robustness-variable 3
```

# ipv6 mld snooping

**Overview** Use this command to enable MLD Snooping. When this command is issued in the Global Configuration mode, MLD Snooping is enabled globally for the device. When this command is issued in Interface mode for a VLAN then MLD Snooping is enabled for the specified VLAN. Note that MLD Snooping is enabled on the VLAN only if it is enabled globally and on the VLAN.

Use the **no** variant of this command to globally disable MLD Snooping in Global Configuration mode, or for the specified VLAN interface in Interface mode.

**NOTE:** *There is a 100 MLD interface limit when applying MLD commands to multiple VLANs. Only the first 100 VLANs have the required multicast structures added to the interfaces that allow multicast routing.*

**Syntax** `ipv6 mld snooping`  
`no ipv6 mld snooping`

**Default** By default, MLD Snooping is enabled both globally and on all VLANs.

**Mode** Global Configuration and Interface Configuration for a specified VLAN interface or a range of VLAN interfaces.

**Usage notes** It is possible to disable MLD snooping globally or on a per-VLAN basis, using the command **no ipv6 mld snooping**. However, we recommend leaving MLD snooping enabled unless an Allied Telesis support representative tells you to disable it, even if you are not actively using the device for multicast.

For MLD Snooping to operate on particular VLAN interfaces, it must be enabled both globally by using this command in Global Configuration mode, and on individual VLAN interfaces by using this command in Interface Configuration mode (both are enabled by default).

MLD requires memory for storing data structures, as well as the hardware tables to implement hardware routing. As the number of ports, VLANs, static and dynamic groups increases then more memory is consumed. You can track the memory used for MLD with the command:

```
awplus# show memory pools nsm | grep MLD
```

Static and dynamic groups (LACP), ports and VLANs are not limited for MLD. For VLANs, this allows you to configure MLD across more VLANs with fewer ports per VLAN, or fewer VLANs with more ports per VLAN. For LACPs, you can configure MLD across more LACP groups with fewer ports per LACP, or fewer LACP groups with more ports per LACP.

**Examples** To configure MLD Snooping on the VLAN interfaces vlan2-vlan4, enter the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2-vlan4
awplus(config-if)# ipv6 mld snooping
```

To disable MLD Snooping for the VLAN interfaces vlan2-vlan4, enter the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2-vlan4
awplus(config)# no ipv6 mld snooping
```

To configure MLD Snooping globally for the device, enter the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 mld snooping
```

To disable MLD Snooping globally for the device, enter the following commands:

```
awplus# configure terminal
awplus(config)# no ipv6 mld snooping
```

# ipv6 mld snooping fast-leave

**Overview** Use this command to enable MLD Snooping fast-leave processing. Fast-leave processing is analogous to immediate-leave processing; the MLD group-membership is removed as soon as an MLD leave group message is received, without sending out a group-specific query.

Use the **no** variant of this command to disable fast-leave processing.

**Syntax** `ipv6 mld snooping fast-leave`  
`no ipv6 mld snooping fast-leave`

**Default** MLD Snooping fast-leave processing is disabled.

**Mode** Interface Configuration for a specified VLAN interface or a range of VLAN interfaces.

**Usage notes** This MLD Snooping command can only be configured on VLAN interfaces.

**Examples** This example shows how to enable fast-leave processing on the VLAN interface `vlan2`.

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 mld snooping fast-leave
```

This example shows how to enable fast-leave processing on the VLAN interface `vlan2-vlan4`.

```
awplus# configure terminal
awplus(config)# interface vlan2-vlan4
awplus(config-if)# ipv6 mld snooping fast-leave
```

# ipv6 mld snooping mrouter

**Overview** Use this command to statically configure the specified port as a Multicast Router interface for MLD Snooping within the specified VLAN.

See detailed usage notes below to configure static multicast router ports when using static IPv6 multicast routes with EPSR, and the destination VLAN is an EPSR data VLAN.

Use the **no** variant of this command to remove the static configuration of the interface as a Multicast Router interface.

**Syntax** `ipv6 mld snooping mrouter interface <port>`  
`no ipv6 mld snooping mrouter interface <port>`

| Parameter | Description                   |
|-----------|-------------------------------|
| <port>    | Specify the name of the port. |

**Mode** Interface Configuration for a specified VLAN interface or a range of VLAN interfaces.

**Usage notes** This MLD Snooping command statically configures a switch port as a Multicast Router interface.

Note that if static IPv6 multicast routing is being used with EPSR and the destination VLAN is an EPSR data VLAN, then multicast router (mrouter) ports must be statically configured. This minimizes disruption for multicast traffic in the event of ring failure or restoration.

When configuring the EPSR data VLAN, statically configure mrouter ports so that the multicast router can be reached in either direction around the EPSR ring.

For example, if port1.0.1 and port1.0.6 are ports on an EPSR data VLAN vlan101, which is the destination for a static IPv6 multicast route, then configure both ports as multicast router (mrouter) ports as shown in the example commands listed below:

Figure 33-1: Example **ipv6 mld snooping mrouter** commands when static IPv6 multicast routing is being used and the destination VLAN is an EPSR data VLAN:

```
awplus>enable
awplus#configure terminal
awplus(config)#interface vlan101
awplus(config-if)#ipv6 mld snooping mrouter interface port1.0.1
awplus(config-if)#ipv6 mld snooping mrouter interface port1.0.6
```

**Examples** This example shows how to specify the next-hop interface to the multicast router for VLAN interface `vlan2`:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 mld snooping mrouter interface
port1.0.5
```

This example shows how to specify the next-hop interface to the multicast router for VLAN interfaces `vlan2-vlan4`:

```
awplus# configure terminal
awplus(config)# interface vlan2-vlan4
awplus(config-if)# ipv6 mld snooping mrouter interface
port1.0.5
```

**Related commands** [ipv6 multicast route](#)

# ipv6 mld snooping querier

**Overview** Use this command to enable MLD querier operation on a subnet (VLAN) when no multicast routing protocol is configured in the subnet (VLAN). When enabled, the MLD Snooping querier sends out periodic MLD queries for all interfaces on that VLAN.

Use the **no** variant of this command to disable MLD querier configuration.

**Syntax** `ipv6 mld snooping querier`  
`no ipv6 mld snooping querier`

**Mode** Interface Configuration for a specified VLAN interface.

**Usage** This command can only be configured on a single VLAN interface - not on multiple VLANs.

The MLD Snooping querier uses the 0.0.0.0 Source IP address because it only masquerades as an MLD querier for faster network convergence.

The MLD Snooping querier does not start, or automatically cease, the MLD Querier operation if it detects query message(s) from a multicast router. It restarts as an MLD Snooping querier if no queries are seen within the other querier interval.

Do not enable MLD Snooping querier if you have already enabled MLD on your device.

Do not enable MLD Snooping querier on your device and then enable MLD afterwards.

**Example** `awplus# configure terminal`  
`awplus(config)# interface vlan2`  
`awplus(config-if)# ipv6 mld snooping querier`

# ipv6 mld snooping report-suppression

**Overview** Use this command to enable report suppression from hosts for Multicast Listener Discovery version 1 (MLDv1) on a VLAN in Interface Configuration mode.

Use the **no** variant of this command to disable report suppression on a VLAN in Interface Configuration mode.

**Syntax** `ipv6 mld snooping report-suppression`  
`no ipv6 mld snooping report-suppression`

**Default** Report suppression does not apply to MLDv2, and is turned on by default for MLDv1 reports.

**Mode** Interface Configuration for a specified VLAN interface or a range of VLAN interfaces.

**Usage** This MLD Snooping command can only be configured on VLAN interfaces. MLDv1 Snooping maybe configured to suppress reports from hosts. When a querier sends a query, only the first report for particular set of group(s) from a host will be forwarded to the querier by the MLD Snooping device. Similar reports (to the same set of groups) from other hosts, which would not change group memberships in the querier, will be suppressed by the MLD Snooping device to prevent 'flooding' of query responses.

**Examples** This example shows how to enable report suppression for MLD reports on VLAN interface `vlan2`:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 mld snooping report-suppression
```

This example shows how to disable report suppression for MLD reports on VLAN interface `vlan2`:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 mld snooping report-suppression
```

This example shows how to enable report suppression for MLD reports on VLAN interfaces `vlan2-vlan4`:

```
awplus# configure terminal
awplus(config)# interface vlan2-vlan4
awplus(config-if)# ipv6 mld snooping report-suppression
```

This example shows how to disable report suppression for MLD reports on VLAN interfaces `vlan2-vlan4`:

```
awplus# configure terminal
awplus(config)# interface vlan2-vlan4
awplus(config-if)# no ipv6 mld snooping report-suppression
```

# ipv6 mld ssm-map enable

**Overview** Use this command to enable the Source Specific Multicast (SSM) mapping feature on the device.

Use the **no** variant of this command to disable the SSM mapping feature on the device.

**Syntax** `ipv6 mld ssm-map enable`  
`no ipv6 mld ssm-map enable`

**Mode** Global Configuration

**Usage notes** This command enables the SSM mapping feature for group members in the defined SSM range. Configure the group member and the SSM range using the [ipv6 mld ssm-map static](#) command.

**Example** This example shows how to enable the MLD SSM mapping feature on the device.

```
awplus# configure terminal
awplus(config)# ipv6 mld ssm-map enable
```

**Related commands** [ipv6 mld ssm-map static](#)

# ipv6 mld ssm-map static

**Overview** Use this command to statically define a Source Specific Multicast (SSM) mapping. The SSM mapping statically assigns sources to MLDv1 groups to translate such (\*,G) groups' memberships to (S,G) memberships for use with PIM-SSM.

Use the **no** variant of this command to remove the SSM map association.

**Syntax** `ipv6 mld ssm-map static <access-list-name> X:X::X:X`  
`no ipv6 mld ssm-map static <access-list-name> X:X::X:X`

| Parameter                             | Description   |
|---------------------------------------|---|
| <code>&lt;access-list-name&gt;</code> | IPv6 named standard access-list.  |
| <code>X:X::X:X</code>                 | IPv6 source address that is associated with the above access-list. The IPv6 address uses the format X:X::X:X. |

**Mode** Global Configuration

**Usage notes** Use this command to configure SSM mappings after enabling SSM mapping with the `ipv6 mld ssm-map enable` command.

**Example** This example shows how to configure an SSM static mapping for the group-address ff0e::1/128.

```
awplus# configure terminal
awplus(config)# ipv6 mld ssm-map enable
awplus(config)# ipv6 access-list standard v6grp permit
ff0e::1/128
awplus(config)# ipv6 mld ssm-map static v6grp 2006::3
```

**Related commands** `ipv6 mld ssm-map enable`

# ipv6 mld static-group

**Overview** Use this command to statically configure IPv6 group membership entries on an interface. To statically add only a group membership, do not specify any parameters.

Use the **no** variant of this command to delete static group membership entries.

**Syntax** `ipv6 mld static-group <ipv6-group-address> [source <ipv6-source-address>|ssm-map] [interface <port>]`  
`no ipv6 mld static-group <ipv6-group-address> [source <ipv6-source-address>|ssm-map] [interface <port>]`

| Parameter                                | Description  |
|--|--|
| <code>&lt;ipv6-group-address&gt;</code>  | Specify a standard IPv6 Multicast group address to be configured as a static group member. The IPv6 address uses the format X:X::X:X.  |
| <code>&lt;ipv6-source-address&gt;</code> | Optional. Specify a standard IPv6 source address to be configured as a static source from where multicast packets originate. The IPv6 address uses the format X:X::X:X.  |
| <code>ssm-map</code>                     | Mode of defining SSM mapping. SSM mapping statically assigns sources to MLDv1 groups to translate these (*,G) groups' memberships to (S,G) memberships for use with PIM-SSM.   |
| <code>&lt;port&gt;</code>                | Optional. Physical interface. This parameter specifies a physical port. If this parameter is used, the static configuration is applied to just that physical interface. If this parameter is not used, the static configuration is applied on all interfaces in the group. |

**Mode** Interface Configuration for a specified VLAN interface.

**Usage notes** This command applies to MLD Snooping on a VLAN interface to statically add groups and/or source records.

**Examples** To add a static group record, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 mld static-group ff1e::10
```

To add a static group and source record, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 mld static-group ff1e::10 source
fe80::2fd:6cff:felc:b
```

To add a static group record on a specific port on vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 mld static-group ff1e::10 interface
port1.0.8
```

To add an SSM mapping record on a specific port on vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 mld static-group ff1e::10 source
ssm-map interface port1.0.8
```

# ipv6 mld version

**Overview** Use this command to set the current MLD protocol version on an interface.  
Use the **no** variant of this command to return to the default version on an interface.

**Syntax** `ipv6 mld version <version>`  
`no ipv6 mld version`

| Parameter                    | Description  |
|------------------------------|--|
| <code>&lt;version&gt;</code> | MLD protocol version number. Valid version numbers are 1 and 2 |

**Default** The default MLD protocol version number is 2.

**Mode** Interface Configuration for a specified VLAN interface.

**Usage notes** This command applies to interfaces configured for MLD Layer 3 multicast protocols and MLD Snooping.

Note this command is intended for use where there is another querier (when there is another device with MLD enabled) on the same link that can only operate with MLD version 1. Otherwise, the default MLD version 2 is recommended for performance.

**Example** To set the MLD protocol version to 1, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 mld version 1
```

# show debugging mld

**Overview** Use this command to see what debugging is turned on for MLD. MLD debugging modes are enabled with the [debug mld](#) command.

For information on filtering and saving command output, see the [“Getting\\_Started with AlliedWare Plus” Feature Overview and Configuration\\_Guide](#).

**Syntax** `show debugging mld`

**Mode** Privileged Exec

**Example** `awplus# show debugging mld`

## Output

```
show debugging mld
MLD Debugging status:
  MLD Decoder debugging is on
  MLD Encoder debugging is on
  MLD Events debugging is on
  MLD FSM debugging is on
  MLD Tree-Info-Base (TIB) debugging is on
```

**Related commands** [debug mld](#)

# show ipv6 mld groups

**Overview** Use this command to display the multicast groups that have receivers directly connected to the router and learned through MLD.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ipv6 mld groups [<ipv6-address>|<interface>] [detail]`

| Parameter      | Description  |
|----------------|--|
| <ipv6-address> | Optional. Specify Address of the multicast group in format X:X::X:X.         |
| <interface>    | Optional. Specify the Interface name for which to display local information. |

**Mode** User Exec and Privileged Exec

**Examples** The following command displays local-membership information for all interfaces:

```
awplus# show ipv6 mld groups
```

**Output** Figure 33-2: Example output for **show ipv6 mld groups**

```
awplus#show ipv6 mld groups
MLD Connected Group Membership
Group Address      Interface                Uptime   Expires   Last Reporter
ff08::1           vlan10 (port1.0.1)      00:07:27 00:03:10 fe80::200:1ff:fe20:b5ac
```

The following command displays local-membership information for all interfaces:

```
awplus# show ipv6 mld groups detail
```

Figure 33-3: Example output for **show ipv6 mld groups detail**

```
awplus# show ipv6 mld groups detail
MLD Connected Group Membership Details for port1.0.1
Interface:        port1.0.1
Group:            ff08::1
Uptime:           00:00:13
Group mode:       Include ()
Last reporter:    fe80::eecd:6dff:fe6b:4783
Group source list: (R - Remote, M - SSM Mapping, S - Static )
  Source Address      Uptime   v2 Exp   Fwd  Flags
  2001:db8::1         00:00:13 00:04:07 Yes  R
  2002:db8::3         00:00:13 00:04:07 Yes  R
```

# show ipv6 mld interface

**Overview** Use this command to display the state of MLD and MLD Snooping for a specified interface, or all interfaces.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ipv6 mld interface [<interface>]`

| Parameter   | Description     |
|-------------|-----------------|
| <interface> | Interface name. |

**Mode** User Exec and Privileged Exec

**Example** The following command displays MLD interface status on all interfaces enabled for MLD:

```
awplus# show ipv6 mld interface
```

**Output** Figure 33-4: Example output for **show ipv6 mld interface**

```
awplus#show ipv6 mld interface

Interface vlan1 (Index 301)
  MLD Enabled, Active, Querier, Version 2 (default)
  Internet address is fe80::215:77ff:fec9:7468
  MLD interface has 0 group-record states
  MLD activity: 0 joins, 0 leaves
  MLD robustness variable is 2
  MLD last member query count is 2
  MLD query interval is 125 seconds
  MLD querier timeout is 255 seconds
  MLD max query response time is 10 seconds
  Last member query response interval is 1000 milliseconds
  Group Membership interval is 260 seconds
  MLD Snooping is globally enabled
  MLD Snooping is enabled on this interface
  MLD Snooping fast-leave is not enabled
  MLD Snooping querier is enabled
  MLD Snooping report suppression is enabled
```

# show ipv6 mld snooping mrouter

**Overview** Use this command to display the multicast router interfaces, both configured and learned, in a VLAN. If you do not specify a VLAN interface then all the VLAN interfaces are displayed.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ipv6 mld snooping mrouter [<interface>]`

| Parameter   | Description  |
|-------------|--|
| <interface> | Optional. Specify the name of the VLAN interface. Note: If you do not specify a single VLAN interface, then all VLAN interfaces are shown. |

**Mode** User Exec and Privileged Exec

**Examples** The following command displays the multicast router interfaces in `vlan2`:

```
awplus# show ipv6 mld snooping mrouter vlan2
```

## Output

```
awplus#show ipv6 mld snooping mrouter vlan2
VLAN      Interface      Static/Dynamic
2         port1.0.2      Dynamically Learned
2         port1.0.3      Dynamically Learned
```

The following command displays the multicast router interfaces for all VLAN interfaces:

```
awplus# show ipv6 mld snooping mrouter
```

## Output

```
awplus#show ipv6 mld snooping mrouter
VLAN      Interface      Static/Dynamic
2         port1.0.2      Dynamically Learned
2         port1.0.3      Dynamically Learned
3         port1.0.4      Statically Assigned
3         port1.0.5      Statically Assigned
```

# show ipv6 mld snooping statistics

**Overview** Use this command to display MLD Snooping statistics data.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus”\\_Feature Overview and Configuration Guide](#).

**Syntax** `show ipv6 mld snooping statistics interface <interface>`

| Parameter                      | Description                     |
|--------------------------------|---------------------------------|
| <code>&lt;interface&gt;</code> | The name of the VLAN interface. |

**Mode** User Exec and Privileged Exec

**Example** The following command displays MLDv2 statistical information for `vlan1`:

```
awplus# show ipv6 mld snooping statistics interface vlan1
```

## Output

```
awplus#show ipv6 mld snooping statistics interface vlan1
MLD Snooping statistics for vlan1
Interface:      port1.0.1
Group:         ff08::1
Uptime:        00:02:18
Group mode:    Include ()
Last reporter: fe80::eecd:6dff:fe6b:4783
Group source list: (R - Remote, M - SSM Mapping, S - Static )
  Source Address      Uptime    v2 Exp    Fwd  Flags
  2001:db8::1         00:02:18  00:02:02 Yes  R
  2001:db8::3         00:02:18  00:02:02 Yes  R
```

# 34

# Multicast Commands

## Introduction

**Overview** This chapter provides an alphabetical reference of multicast commands for configuring:

- IPv4 and IPv6 multicast forwarding
- IPv4 and IPv6 static multicast routes
- mroutes (routes back to a multicast source)

For commands for other multicast protocols, see:

- [IGMP and IGMP Snooping Commands](#)
- [MLD and MLD Snooping Commands](#)
- [PIM-SM Commands](#)
- [PIM-SMv6 Commands](#)
- [PIM-DM Commands](#)

**NOTE:** Before using PIM-SMv6 commands, IPv6 must be enabled on an interface with the `ipv6 enable` command, IPv6 forwarding must be enabled globally for routing IPv6 with the `ipv6 forwarding` command, and IPv6 multicasting must be enabled globally with the `ipv6 multicast-routing` command.

Static IPv6 multicast routes take priority over dynamic IPv6 multicast routes. Use the `clear ipv6 mroute` command to clear static IPv6 multicast routes and ensure dynamic IPv6 multicast routes can take over from previous static IPv6 multicast routes.

The IPv6 Multicast addresses shown can be derived from IPv6 unicast prefixes as per RFC 3306. The IPv6 unicast prefix reserved for documentation is 2001:0db8::/32 as per RFC 3849. Using the base /32 prefix the IPv6 multicast prefix for 2001:0db8::/32 is ff3x:20:2001:0db8::/64. Where an RP address is 2001:0db8::1 the embedded RP multicast prefix is ff7x:120:2001:0db8::/96.

The IPv6 addresses shown use the address space 2001:0db8::/32, defined in RFC 3849 for documentation purposes. These addresses should not be used for practical

*networks (other than for testing purposes) nor should they appear on any public network.*

# clear ip mroute

**Overview** Use this command to delete one or more dynamically-added route entries from the IPv4 multicast routing table.

You need to do this if, for example, you want to create a static route instead of an existing dynamic route.

**NOTE:** If you use this command, you should also use the [clear ip igmp group](#) command to clear IGMP group membership records.

**Syntax** `clear ip mroute {*|<ipv4-group-address>  
[<ipv4-source-address>]} [pim sparse-mode]`

| Parameter             | Description  |
|-----------------------|--|
| *                     | Deletes all dynamically-learned IPv4 multicast routes.                 |
| <ipv4-group-address>  | Group IPv4 address, in dotted decimal notation in the format A.B.C.D.  |
| <ipv4-source-address> | Source IPv4 address, in dotted decimal notation in the format A.B.C.D. |
| pim sparse-mode       | Clear specified IPv4 multicast route(s) for PIM Sparse Mode only.      |

**Mode** Privileged Exec

**Usage notes** When this command is used, the Multicast Routing Information Base (MRIB) clears the specified dynamic IPv4 multicast route entries in its IPv4 multicast route table, and deletes the entries from the multicast forwarder. The MRIB also sends a "clear" message to the relevant multicast protocols.

This command does not delete static routes from the routing table or the configuration. To delete static routes, use the **no** parameter of the command [ip multicast route](#), or the command [clear ip multicast route](#).

**Examples** To delete a specific dynamic route (from 192.168.3.3 for the group 225.1.1.1), use the command:

```
awplus# clear ip mroute 225.1.1.1 192.168.3.3
```

To delete all dynamic multicast routes, use the command:

```
awplus# clear ip mroute *
```

**Related commands** [clear ip multicast route](#)  
[ip multicast route](#)  
[show ip mroute](#)

**Command changes** Version 5.4.7-1.1: VRF-lite support added SBx8100.

Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

# clear ip mroute statistics

**Overview** Use this command to delete multicast route statistics entries from the IP multicast routing table.

**Syntax** `clear ip mroute statistics {*|<ipv4-group-addr>  
[<ipv4-source-addr>]}`

| Parameter             | Description  |
|-----------------------|--|
| *                     | Deletes all dynamically-learned IPv4 multicast routes.                 |
| <ipv4-group-address>  | Group IPv4 address, in dotted decimal notation in the format A.B.C.D.  |
| <ipv4-source-address> | Source IPv4 address, in dotted decimal notation in the format A.B.C.D. |

**Mode** Privileged Exec

**Example** `awplus# clear ip mroute statistics 225.1.1.2 192.168.4.4`  
`awplus# clear ip mroute statistics *`

# clear ip multicast route

**Overview** Use this command to delete all user-added static IPv4 multicast routes.

**Syntax** `clear ip multicast route *`

| Parameter | Description                               |
|-----------|---|
| *         | Deletes all static IPv4 multicast routes. |

**Mode** Privileged Exec

**Usage notes** This command deletes all static IPv4 multicast routes from the routing table. To delete a single static route, use the **no** parameter of the command [ip multicast route](#). To delete dynamic routes, use the command [clear ip mroute](#).

**Example** To delete all static IPv4 multicast route entries, use the command:

```
awplus# clear ip multicast route *
```

**Related commands**

- [clear ip mroute](#)
- [ip multicast route](#)
- [show ip mroute](#)

# clear ipv6 mroute

**Overview** Use this command to delete one or more dynamically-added route entries from the IPv6 multicast routing table.

You need to do this if, for example, you want to create a static route instead of an existing dynamic route.

**NOTE:** *If you use this command, you should also use the [clear ipv6 mld group](#) command to clear MLD group membership records.*

**Syntax** `clear ipv6 mroute {*|<ipv6-group-address> [<ipv6-source-address>]} [pim sparse-mode]`

| Parameter             | Description  |
|-----------------------|--|
| *                     | Deletes all dynamically-learned IPv6 multicast routes.               |
| <ipv6-group-address>  | Group IPv6 address, in hexadecimal notation in the format X.X::X.X.  |
| <ipv6-source-address> | Source IPv6 address, in hexadecimal notation in the format X.X::X.X. |
| pim sparse-mode       | Clear specified IPv6 multicast route(s) for PIM Sparse Mode only.    |

**Mode** Privileged Exec

**Usage notes** When this command is used, the Multicast Routing Information Base (MRIB) clears the specified dynamic IPv6 multicast route entries in its IPv6 multicast route table, and deletes the entries from the multicast forwarder. The MRIB also sends a "clear" message to the relevant multicast protocols.

This command does not delete static routes from the routing table or the configuration. To delete static routes, use the **no** parameter of the command [ipv6 multicast route](#).

**Examples** To delete a specific dynamic route (from ff08::1 for the group 2001::2), use the command:

```
awplus# clear ipv6 mroute 2001::2 ff08::1
```

To delete all dynamic multicast routes, use the command:

```
awplus# clear ipv6 mroute *
```

**Related commands** [ipv6 multicast route](#)  
[show ipv6 mroute](#)

# clear ipv6 mroute statistics

**Overview** Use this command to delete multicast route statistics entries from the IPv6 multicast routing table.

**Syntax** `clear ipv6 mroute statistics {*|<ipv6-group-address> [<ipv6-source-address>]}`

| Parameter          | Description  |
|--------------------|--|
| *                  | All multicast route entries.   |
| <ipv6-group-addr>  | Group IPv6 address, in hexadecimal notation in the format X.X::X.X.  |
| <ipv6-source-addr> | Source IPv6 address, in hexadecimal notation in the format X.X::X.X. |

**Mode** Privileged Exec

**Examples**

```
awplus# clear ipv6 mroute statistics 2001::2 ff08::1  
awplus# clear ipv6 mroute statistics *
```

# ipv6 multicast forward-slow-path-packet

**Overview** Use this command to enable multicast packets to be forwarded to the CPU. Enabling this command will ensure that the layer L3 MTU is set correctly for each IP multicast group and will apply the value of the smallest MTU among the outgoing interfaces for the multicast group.

It will also ensure that a received packet that is larger than the MTU value will result in the generation of an ICMP Too Big message.

Use the **no** variant of this command to disable the above functionality.

**Syntax** `ipv6 multicast forward-slow-path-packet`  
`no ipv6 multicast forward-slow-path-packet`

**Default** Disabled.

**Mode** Privileged Exec

**Example** To enable the ipv6 multicast forward-slow-path-packet function, use the following commands:

```
awplus# configure terminal
awplus(config)# ip multicast forward-slow-path-packet
```

**Related commands** [show ipv6 forwarding](#)

# debug nsm

**Overview** This command specifies a set of debug options for use by Allied Telesis authorized service personnel only.

Use the **no** variant of this command to remove debug options.

**Syntax** `debug nsm [all|events|ha|kernel]`  
`no debug nsm [all|events|ha|kernel]`

| Parameter | Description   |
|-----------|---|
| all       | Enables all the nsm debugging options               |
| events    | Enables the nsm events debugging options            |
| ha        | Enables the nsm high availability debugging options |
| kernel    | Enables the nsm kernel debugging options            |

**Mode** Global Configuration, Privileged Exec

**Usage notes** This command is intended for use by Allied Telesis authorized service personnel for diagnostic purposes.

**Related commands** [show debugging nsm mcast](#)

**Command changes** Version 5.4.7-2.1 command added.

# debug nsm mcast

**Overview** Use this command to debug IPv4 events in the Multicast Routing Information Base (MRIB).

This command is intended for use by Allied Telesis authorized service personnel for diagnostic purposes.

**Syntax** `debug nsm mcast`  
{all|fib-msg|mrt|mtrace|mtrace-detail|register|stats|vif}

| Parameter     | Description                                 |
|---------------|---|
| all           | All IPv4 multicast debugging.               |
| fib-msg       | Forwarding Information Base (FIB) messages. |
| mrt           | Multicast routes.                           |
| mtrace        | Multicast traceroute.                       |
| mtrace-detail | Multicast traceroute detailed debugging.    |
| register      | Multicast PIM register messages.            |
| stats         | Multicast statistics.                       |
| vif           | Multicast interface.                        |

**Mode** Privileged Exec and Global Configuration

**Examples** To enable debugging of all multicast route events, use the commands:

```
awplus# configure terminal  
awplus(config)# debug nsm mcast all
```

To enable debugging of PIM register entries, use the commands:

```
awplus# configure terminal  
awplus(config)# debug nsm mcast register
```

**Command changes** Version 5.4.7-1.1: VRF-lite support added SBx8100.

Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

# debug nsm mcast6

**Overview** Use this command to debug IPv6 events in the Multicast Routing Information Base (MRIB).

This command is intended for use by Allied Telesis authorized service personnel for diagnostic purposes.

**Syntax** debug nsm mcast6 {all|fib-msg|mrt|register|stats|vif}  
no debug nsm mcast6 {all|fib-msg|mrt|register|stats|vif}

| Parameter | Description                                 |
|-----------|---|
| all       | All IPv6 multicast route debugging.         |
| fib-msg   | Forwarding Information Base (FIB) messages. |
| mrt       | Multicast routes.                           |
| register  | Multicast PIM register messages.            |
| stats     | Multicast statistics.                       |
| vif       | Multicast interfaces.                       |

**Mode** Privileged Exec and Global Configuration

**Examples** To enable debugging of all multicast route events, use the commands:

```
awplus# configure terminal  
awplus(config)# debug nsm mcast6 all
```

To enable debugging of PIM register entries, use the commands:

```
awplus# configure terminal  
awplus(config)# debug nsm mcast6 register
```

# ip mroute

**Overview** Use this command to inform multicast of the RPF (Reverse Path Forwarding) route to a given IPv4 multicast source.

Use the **no** variant of this command to delete a route to an IPv4 multicast source.

**Syntax**

```
ip mroute <ipv4-source-address/mask-length>  
[bgp|ospf|rip|static] <rpf-address> [<admin-distance>]  
  
no ip mroute <ipv4-source-address/mask-length>  
[bgp|ospf|rip|static]
```

| Parameter                         | Description  |
|-----------------------------------|--|
| <ipv4-source-address/mask-length> | A multicast source IPv4 address and mask length, in dotted decimal notation in the format A.B.C.D/M.   |
| bgp                               | BGP unicast routing protocol.  |
| ospf                              | OSPF unicast routing protocol.   |
| rip                               | RIP unicast routing protocol.  |
| static                            | Specifies a static route.  |
| <rpf-address>                     | A.B.C.D<br>The closest known address on the multicast route back to the specified source. This host IPv4 address can be within a directly connected subnet or within a remote subnet. In the case that the address is in a remote subnet, a lookup is done from the unicast route table to find the next hop address on the path to this host. |
| <admin-distance>                  | The administrative distance. Use this to determine whether the RPF lookup selects the unicast or multicast route. Lower distances have preference. If the multicast static route has the same distance as the other RPF sources, the multicast static route takes precedence. The default is 0 and the range available is 0-255.               |

**Mode** Global Configuration

**Usage notes** Typically, when a Layer 3 multicast routing protocol is determining the RPF (Reverse Path Forwarding) interface for the path to an IPv4 multicast source, it uses the unicast route table to find the best path to the source. However, in some networks a deliberate choice is made to send multicast via different paths to those used for unicast. In this case, the interface via which a multicast stream from a given source enters a router may not be the same as the interface that connects to the best unicast route to that source.

This command enables the user to statically configure the device with “multicast routes” back to given sources. When performing the RPF check on a stream from a given IPv4 source, the multicast routing protocol will look at these static entries as well as looking into the unicast routing table. The route with the lowest

administrative distance - whether a static "multicast route" or a route from the unicast route table - will be chosen as the RPF route to the source.

Note that in this context the term "multicast route" does not imply a route via which the current router will forward multicast; instead it refers to the route the multicast will have traversed in order to arrive at the current router.

**Examples** The following example creates a static multicast IPv4 route back to the sources in the 10.10.3.0/24 subnet. The multicast route is via the host 192.168.2.3, and has an administrative distance of 2:

```
awplus# configure terminal
awplus(config)# ip mroute 10.10.3.0/24 static 2 192.168.2.3 2
```

The following example creates a static multicast IPv4 route back to the sources in the 192.168.3.0/24 subnet. The multicast route is via the host 10.10.10.50. The administrative distance on this route has the default value of 0:

```
awplus# configure terminal
awplus(config)# ip mroute 192.168.3.0/24 10.10.10.50
```

**Validation  
Commands**

- clear ip mroute
- show ip mroute
- show ip rpf

# ip multicast allow-register-fragments

**Overview** Use this command to allow PIM to register fragmented packets. It is disabled by default.

Use the **no** variant of this command to stop PIM from registering fragmented packets.

**Syntax** `ip multicast allow-register-fragments`  
`no ip multicast allow-register-fragments`

**Default** This command is disabled by default

**Mode** Global Configuration

**Usage notes** Most multicast streams are not fragmented, and therefore this command is unnecessary. By default, when IP multicast packets are fragmented, the switch attempts to reassemble them before registering the packets. This is necessary for tasks such as network address translation, or a firewall.

However, reassembly may be difficult for switches where the CPU cannot handle a large amount of traffic. In that situation, with the CPU failing to reassemble the fragmented packets, there can be a delay in forwarding multicast streams.

We do not recommend enabling this feature if a firewall or network address translation is being used. This feature should only be enabled if multicast data is fragmented and the data rate is too high for the CPU to manage reassembly.

**Example** To allow PIM to register fragmented packets, use the commands:

```
awplus# configure terminal
awplus(config)# ip multicast allow-register-fragments
```

# ip multicast forward-first-packet

**Overview** Use this command to enable multicast to forward the first multicast packets coming to the device.

Use the **no** variant of this command to disable this feature.

**Syntax** `ip multicast forward-first-packet`  
`no ip multicast forward-first-packet`

**Default** By default, this feature is disabled.

**Mode** Global Configuration

**Usage notes** If this command is enabled, the device will forward the first packets in a multicast stream that create the multicast route, possibly causing degradation in the quality of the multicast stream, such as the pixelation of video and audio data.

**NOTE:** *If you use this command, ensure that the `ip igmp snooping` command is enabled, the default setting, otherwise the device will not process the first packets of the multicast stream correctly.*

The device will forward the first multicast packets to all interfaces which are on the same VLAN as those which asked for this multicast group.

**Examples** To enable the forwarding of the first multicast packets, use the following commands:

```
awplus# configure terminal
awplus(config)# ip multicast forward-first-packet
```

To disable the forwarding of the first multicast packets, use the following commands:

```
awplus# configure terminal
awplus(config)# no ip multicast forward-first-packet
```

# ip multicast handle-igmp-immediately

**Overview** Use this command to allow traffic to be switched as soon as an IGMP report is received.

Use the **no** variant of this command to revert to the default setting.

**Syntax** `ip multicast handle-igmp-immediately`  
`no ip multicast handle-igmp-immediately`

**Default** Turned off. This means that traffic will be switched after either a 1 second delay or if the IGMP buffer fills with 250 packets.

**Mode** Global Configuration

**Example** To turn on this feature, use the commands:

```
awplus# configure terminal
awplus(config)# ip multicast handle-igmp-immediately
```

**Related commands** [show running-config](#)

**Command changes** Supported since software version 5.4.9-2.0

# ip multicast route

**Overview** Use this command to add an IPv4 static multicast route for a specific multicast source and group IPv4 address to the multicast Routing Information Base (RIB). This IPv4 multicast route is used to forward multicast traffic from a specific source and group ingressing on an upstream interface to a single or range of downstream interfaces.

Use the **no** variant of this command to either remove an IPv4 static multicast route set with this command or to remove a specific downstream interface from an IPv4 static multicast route for a specific multicast source and group IPv4 address.

**Syntax**

```
ip multicast route <ipv4-source-addr> <ipv4-group-addr>
<upstream-interface> [<downstream-interface>]

no ip multicast route <ipv4-source-addr> <ipv4-group-addr>
[<upstream-interface> <downstream-interface>]
```

| Parameter              | Description  |
|------------------------|--|
| <ipv4-source-addr>     | Source IPv4 address, in dotted decimal notation in the format A.B.C.D.               |
| <ipv4-group-addr>      | Group IPv4 address, in dotted decimal notation in the format A.B.C.D.                |
| <upstream-interface>   | Upstream interface on which the multicast packets ingress.                           |
| <downstream-interface> | Downstream interface or range of interfaces to which the multicast packets are sent. |

**Default** By default, this feature is disabled.

**Mode** Global Configuration

**Usage notes** Only one multicast route entry per IPv4 address and multicast group can be specified. Therefore, if one entry for a static multicast route is configured, PIM will not be able to update this multicast route in any way.

If a dynamic multicast route exists you cannot create a static multicast route with the same source IPv4 address, group IPv4 address, upstream interface and downstream interfaces. An error message is displayed and logged. To add a new static multicast route, either wait for the dynamic multicast route to timeout or clear the dynamic multicast route with the [clear ip mroute](#) command.

To update an existing static multicast route entry with more or a new set of downstream interfaces, you must first remove the existing static multicast route and then add the new static multicast route with all downstream interfaces specified. If you attempt to update an existing static multicast route entry with an additional interface or interfaces, an error message is displayed and logged.

To create a blackhole or null route where packets from a specified source and group address coming from an upstream interface are dropped rather than

forwarded, do not specify the optional *<downstream-interface>* parameter when entering this command.

To remove a specific downstream interface from an existing static multicast route entry, specify the interface you want to remove with the *<downstream-interface>* parameter when entering the **no** variant of this command.

**Examples** To create a static multicast route for the multicast source IPv4 address 2.2.2.2 and group IPv4 address 224.9.10.11, specifying the upstream VLAN interface as vlan10 and the downstream VLAN interface as vlan20, use the following commands:

```
awplus# configure terminal
awplus(config)# ip multicast route 2.2.2.2 224.9.10.11 vlan10
vlan20
```

To create a blackhole route for the multicast source IPv4 address 2.2.2.2 and group IPv4 address 224.9.10.11, specifying the upstream VLAN interface as vlan10, use the following commands:

```
awplus# configure terminal
awplus(config)# ip multicast route 2.2.2.2 224.9.10.11 vlan10
```

To create an IPv4 static multicast route for the multicast source IPv4 address 2.2.2.2 and group IP address 224.9.10.11, specifying the upstream VLAN interface as vlan10 and the downstream VLAN range as vlan20-25, use the following commands:

```
awplus# configure terminal
awplus(config)# ip multicast route 2.2.2.2 224.9.10.11 vlan10
vlan20-25
```

To remove the downstream VLAN 23 from the IPv4 static multicast route created with the above command, use the following commands:

```
awplus# configure terminal
awplus(config)# no ip multicast route 2.2.2.2 224.9.10.11
vlan10 vlan23
```

To delete an IPv4 static multicast route for the multicast source IP address 2.2.2.2 and group IP address 224.9.10.11, use the following commands:

```
awplus# configure terminal
awplus(config)# no ip multicast route 2.2.2.2 224.9.10.11
```

**Related commands**

- [clear ip mroute](#)
- [clear ip multicast route](#)
- [show ip mroute](#)

# ip multicast route-limit

**Overview** Use this command to limit the number of multicast routes that can be added to an IPv4 multicast routing table.

Use the **no** variant of this command to return the IPv4 route limit to the default.

**Syntax** `ip multicast route-limit <limit> [<threshold>]`  
`no ip multicast route-limit`

| Parameter                      | Description   |
|--------------------------------|---|
| <code>&lt;limit&gt;</code>     | <code>&lt;1-2147483647&gt;</code> Number of routes.   |
| <code>&lt;threshold&gt;</code> | <code>&lt;1-2147483647&gt;</code> Threshold above which to generate a warning message. The mroute warning threshold must not exceed the mroute limit. |

**Default** The default limit and threshold value is 2147483647.

**Mode** Global Configuration

**Usage notes** This command limits the number of multicast IPv4 routes (mroutes) that can be added to a router, and generates an error message when the limit is exceeded. If the threshold parameter is set, a threshold warning message is generated when this threshold is exceeded, and the message continues to occur until the number of mroutes reaches the limit set by the limit argument.

**Examples**

```
awplus# configure terminal
awplus(config)# ip multicast route-limit 34 24
awplus# configure terminal
awplus(config)# no ip multicast route-limit
```

**Command changes** Version 5.4.7-1.1: VRF-lite support added SBx8100.  
Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

# ip multicast wrong-vif-suppression

**Overview** Use this command to prevent unwanted multicast packets received on an unexpected interface being trapped to the CPU.

Use the no variant of this command to disable wrong VIF suppression.

**Syntax** `ip ip multicast wrong-vif-suppression`  
`no ip multicast wrong-vif-suppression`

**Default** By default, this feature is disabled.

**Mode** Global Configuration

**Usage notes** Use this command if there is excessive CPU load and multicast traffic is enabled. To confirm that VIF messages are being sent to the CPU use the `debug nsm mcast6` command.

**Examples** To enable the suppression of wrong VIF packets, use the following commands:

```
awplus# configure terminal
awplus(config)# ip multicast wrong-vif-suppression
```

To disable the suppression of wrong VIF packets, use the following commands:

```
awplus# configure terminal
awplus(config)# no ip multicast wrong-vif-suppression
```

# ip multicast-routing

**Overview** Use this command to turn on/off IPv4 multicast routing on the router; when turned off the device does not perform multicast functions.

Use the **no** variant of this command to disable IPv4 multicast routing after enabling it. Note the default stated below.

**Syntax** `ip multicast-routing`  
`no ip multicast-routing`

**Default** By default, IPv4 multicast routing is off.

**Mode** Global Configuration

**Usage notes** When the **no** variant of this command is used, the Multicast Routing Information Base (MRIB) cleans up Multicast Routing Tables (MRT), stops IGMP operation, and stops relaying multicast forwarder events to multicast protocols.

When multicast routing is enabled, the MRIB starts processing any MRT addition/deletion requests, and any multicast forwarding events.

You must enable multicast routing before issuing other multicast commands.

**Example** `awplus# configure terminal`  
`awplus(config)# ip multicast-routing`

**Validation Commands** `show running-config`

**Command changes** Version 5.4.7-1.1: VRF-lite support added SBx8100.  
Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

# ipv6 mroute

**Overview** Use this command to inform multicast of the RPF (Reverse Path Forwarding) route to a given IPv6 multicast source.

Use the **no** variant of this command to delete a route to an IPv6 multicast source.

**Syntax** `ipv6 mroute <ipv6-source-address/mask-length> [<rpf-interface> [<rpf-address>] [rip|static] [<admin-distance>]`  
`no ipv6 mroute <ipv6-source-address/mask-length> [rip|static]`

| Parameter  | Description   |
|--|---|
| <code>&lt;ipv6-source-address/mask-length&gt;</code> | A multicast source IPv6 address and mask length, in hexadecimal notation in the format X.X::X.X/M.  |
| <code>rip</code>                                     | RIPng IPv6 unicast routing protocol.  |
| <code>static</code>                                  | Specifies a static route.   |
| <code>&lt;rpf-interface&gt;</code>                   | The RPF interface or the pseudo-interface <b>null</b> .   |
| <code>&lt;rpf-address&gt;</code>                     | X.X::X:X<br>The closest known address on the IPv6 multicast route back to the specified source. This host IPv6 address can be within a directly connected subnet or within a remote subnet. In the case that the address is in a remote subnet, a lookup is done from the unicast route table to find the nexthop address on the path to this host. |
| <code>&lt;admin-distance&gt;</code>                  | The administrative distance. Use this to determine whether the RPF lookup selects the unicast or multicast route. Lower distances have preference. If the multicast static route has the same distance as the other RPF sources, the multicast static route takes precedence. The default is 0 and the range available is 0-255.                    |

**Mode** Global Configuration

**Usage notes** Typically, when a Layer 3 multicast routing protocol is determining the RPF (Reverse Path Forwarding) interface for the path to a multicast source, it uses the unicast IPv6 route table to find the best path to the source. However, in some networks a deliberate choice is made to send multicast via different paths to those used for unicast. In this case, the interface via which a multicast stream from a given source enters a router may not be the same as the interface that connects to the best unicast route to that source.

This command enables the user to statically configure the switch with “multicast routes” back to given sources. When performing the RPF check on a stream from a given IPv6 source, the multicast routing protocol will look at these static entries as well as looking into the unicast routing table. The route with the lowest

administrative distance - whether a static "multicast route" or a route from the unicast route table - will be chosen as the RPF route to the source.

Note that in this context the term "multicast route" does not imply a route via which the current router will forward multicast; instead it refers to the route the multicast will have traversed in order to arrive at the current router.

**Examples** The following example creates a static multicast route back to the sources in the 2001::1/64 subnet. The multicast route is via the host 2002::2, and has an administrative distance of 2:

```
awplus# configure terminal
awplus(config)# ipv6 mroute 2001::1/64 static 2 2002::2
```

The following example creates a static multicast route back to the sources in the 2002::2/64 subnet. The multicast route is via the host 2001::1. The administrative distance on this route has the default value of 0:

```
awplus# configure terminal
awplus(config)# ipv6 mroute 2002::2/64 2001::1
```

**Validation  
Commands**

- clear ipv6 mroute
- show ipv6 mroute
- show ipv6 mroute

# ipv6 multicast route

**Overview** Use this command to add an IPv6 static multicast route for a specific multicast source and group IPv6 address to the multicast Routing Information Base (RIB). This IPv6 multicast route is used to forward IPv6 multicast traffic from a specific source and group ingressing on an upstream interface to a single or range of downstream interfaces.

See detailed usage notes below to configure static multicast router ports when using static IPv6 multicast routes with EPSR, and the destination VLAN is an EPSR data VLAN.

Use the **no** variant of this command to either remove an IPv6 static multicast route set with this command or to remove a specific downstream interface from an IPv6 static multicast route for a specific IPv6 multicast source and group address.

**Syntax**

```
ipv6 multicast route <ipv6-source-addr> <ipv6-group-addr>
<upstream-interface> [<downstream-interface>]

no ipv6 multicast route <ipv6-source-addr> <ipv6-group-addr>
[<upstream-interface> <downstream-interface>]
```

| Parameter              | Description  |
|------------------------|--|
| <ipv6-source-addr>     | Source IPv6 address, in dotted decimal notation in the format X.X::X.X.              |
| <ipv6-group-addr>      | Group IP address, in dotted decimal notation in the format X.X::X.X.                 |
| <upstream-interface>   | Upstream interface on which the multicast packets ingress.                           |
| <downstream-interface> | Downstream interface or range of interfaces to which the multicast packets are sent. |

**Default** By default, no static routes exist.

**Mode** Global Configuration

**Usage notes** Only one multicast route entry per IPv6 address and multicast group can be specified. Therefore, if one entry for an IPv6 static multicast route is configured, PIM will not be able to update this multicast route in any way.

If a dynamic multicast route exists, you cannot create a static multicast route with the same source IPv6 address and group IPv6 address. An error message is displayed and logged. To add a new static multicast route, either wait for the dynamic multicast route to time out or clear the dynamic multicast route with the [clear ipv6 mroute](#) command.

To update an existing IPv6 static multicast route entry with new or additional downstream interfaces, you must first remove the existing static multicast route and then add the new static multicast route with all downstream interfaces

specified. If you attempt to update an existing static multicast route entry with an additional interface or interfaces an error message is displayed and logged.

To create a blackhole or null route where packets from a specified source and group address coming from an upstream interface are dropped rather than forwarded, do not specify the optional *<downstream-interface>* parameter when entering this command.

To remove a specific downstream interface from an existing static multicast route entry, specify the interface you want to remove with the *<downstream-interface>* parameter when entering the **no** variant of this command.

Note that if static IPv6 multicast routing is being used with EPSR and the destination VLAN is an EPSR data VLAN, then multicast router (mrouter) ports must be statically configured. This minimizes disruption for multicast traffic in the event of ring failure or restoration.

When configuring the EPSR data VLAN, statically configure mrouter ports so that the multicast router can be reached in either direction around the EPSR ring.

For example, if port1.0.1 and port1.0.8 are ports on an EPSR data VLAN vlan101, which is the destination for a static IPv6 multicast route, then configure both ports as multicast router (mrouter) ports as shown in the example commands listed below:

```
awplus>enable
awplus#configure terminal
awplus(config)#interface vlan101
awplus(config-if)#ipv6 mld snooping mrouter interface port1.0.1
awplus(config-if)#ipv6 mld snooping mrouter interface port1.0.8
```

See [ipv6 mld snooping mrouter](#) for a command description and command examples.

**Examples** To create an IPv6 static multicast route for the multicast source IPv6 address 2001::1 and group IPv6 address ff08::1, specifying the upstream VLAN interface as vlan10 and the downstream VLAN interface as vlan20, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 multicast route 2001::1 ff08::1 vlan10
vlan20
```

To create a blackhole route for the IPv6 multicast source IP address 2001::1 and group IP address ff08::1, specifying the upstream VLAN interface as vlan10, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 multicast route 2001::1 ff08::1 vlan10
```

To create an IPv6 static multicast route for the multicast source IPv6 address 2001::1 and group IPv6 address ff08::1, specifying the upstream VLAN interface as vlan10 and the downstream VLAN range as vlan20-25, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 multicast route 2001::1 ff08::1 vlan10
vlan20-25
```

To remove the downstream VLAN 23 from the IPv6 static multicast route created with the above command, use the following commands:

```
awplus# configure terminal
awplus(config)# no ipv6 multicast route 2001::1 ff08::1 vlan10
vlan23
```

To delete an IPv6 static multicast route for the multicast source IPv6 address 2001::1 and group IPv6 address ff08::1, use the following commands:

```
awplus# configure terminal
awplus(config)# no ipv6 multicast route 2001::1 ff08::1
```

- [ipv6 mld snooping mrouter](#)

# ipv6 multicast route-limit

**Overview** Use this command to limit the number of multicast routes that can be added to an IPv6 multicast routing table.

Use the no variant of this command to return the IPv6 route limit to the default.

**Syntax** `ipv6 multicast route-limit <limit> [<threshold>]`  
`no ipv6 multicast route-limit`

| Parameter                      | Description   |
|--------------------------------|---|
| <code>&lt;limit&gt;</code>     | <code>&lt;1-2147483647&gt;</code> Number of routes.   |
| <code>&lt;threshold&gt;</code> | <code>&lt;1-2147483647&gt;</code> Threshold above which to generate a warning message. The mroute warning threshold must not exceed the mroute limit. |

**Default** The default limit and threshold value is 2147483647.

**Mode** Global Configuration

**Usage notes** This command limits the number of multicast IPv6 routes (mroutes) that can be added to a router, and generates an error message when the limit is exceeded. If the threshold parameter is set, a threshold warning message is generated when this threshold is exceeded, and the message continues to occur until the number of mroutes reaches the limit set by the limit argument.

**Examples**

```
awplus# configure terminal
awplus(config)# ipv6 multicast route-limit 34 24
awplus# configure terminal
awplus(config)# no ipv6 multicast route-limit
```

# ipv6 multicast-routing

**Overview** Use this command to turn on/off IPv6 multicast routing on the router; when turned off the device does not perform multicast functions.

Use the **no** variant of this command to disable IPv6 multicast routing after enabling it. Note the default stated below.

**Syntax** `ipv6 multicast-routing`  
`no ipv6 multicast-routing`

**Default** By default, IPv6 multicast routing is off.

**Mode** Global Configuration

**Usage** When the **no** variant of this command is used, the Multicast Routing Information Base (MRIB) cleans up Multicast Routing Tables (MRT), and stops relaying multicast forwarder events to multicast protocols.

When multicast routing is enabled, the MRIB starts processing any MRT addition/deletion requests, and any multicast forwarding events.

You must enable multicast routing before issuing other multicast commands.

**Examples** `awplus# configure terminal`  
`awplus(config)# ipv6 multicast-routing`  
`awplus# configure terminal`  
`awplus(config)# no ipv6 multicast-routing`

**Validation Commands** `show running-config`

# multicast

**Overview** Use this command to enable a device port to route multicast packets that ingress the port.

Use the **no** variant of this command to stop the device port from routing multicast packets that ingress the port. Note that this does not affect Layer 2 forwarding of multicast packets. If you enter **no multicast** on a port, multicast packets received on that port will not be forwarded to other VLANs, but ports in the same VLANs as the receiving port will still receive the multicast packets.

**CAUTION:** *We do not recommend disabling multicast routing in a live network. Some non-multicast protocols use multicast packets and will not function correctly if you disable it.*

**Syntax** multicast  
no multicast

**Default** By default, all device ports route multicast packets.

**Mode** Interface Configuration

**Examples** To disable routing of multicast packets on a port, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# no multicast
```

To re-enable routing of multicast packets on a port, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# multicast
```

**Validation Commands** `show running-config`

# platform multicast-ratelimit

**Overview** Use this command to set the maximum number of multicast packets to be forwarded to the CPU (in packets per second). Setting the value to zero disables rate limiting.

This command should be used with care. Increasing or removing the limit could make the device less responsive under heavy multicast load.

Use the **no** variant of this command to return the limit to its default.

**Syntax** `platform multicast-ratelimit <0-1000>`  
`no platform multicast-ratelimit`

**Default** 10 packets per second (pps)

**Mode** Global Configuration

**Usage notes** If you find that the CPU load on your device from multicast traffic is higher than desired, reducing this rate may reduce the CPU load.

If you need the device to process a large amount of multicast traffic, increasing this rate may improve performance.

**Example** To set the rate to 30pps, use the commands:

```
awplus# configure terminal
awplus(config)# platform multicast-ratelimit 30
```

**Command changes** Version 5.4.8-1.1: default changed to 100pps on SBx908 GEN2, SBx8100, and x930 Series switches.

# platform stop-unreg-mc-flooding

**Overview** If a multicast stream is arriving at a network device, and that network device has received no IGMP reports that request the receipt of the stream, then that stream is referred to as "unregistered". IGMP snooping actively prevents the flooding of unregistered streams to all ports in the VLAN on which the stream is received. However, there are brief moments at which this prevention is not in operation, and an unregistered stream may be briefly flooded. This command stops this flooding during even those brief periods when IGMP snooping is not explicitly preventing the flooding.

Use the **no** variant of this command to revert to default behavior and disable this feature.

**NOTE:** *This command should not be used within any IPv6 networks. IPv6 neighbor discovery operation is inhibited by this feature.*

This command does not affect the flooding of Local Network Control Block IPv4 multicast packets in the address range 224.0.0.1 to 224.0.0.255 (224.0.0/24). Such packets will continue to be uninterruptedly flooded, as they need to be.

**Syntax** `platform stop-unreg-mc-flooding`  
`no platform stop-unreg-mc-flooding`

**Default** This feature is disabled by default.

**Mode** Global Configuration

**Usage notes** This command stops the periodic flooding of unknown or unregistered multicast packets when the Group Membership interval timer expires and there are no subscribers to a multicast group. If there is multicast traffic in a VLAN without subscribers, multicast traffic temporarily floods out of the VLAN when the Group Membership interval timer expires, which happens when the switch does not get replies from Group Membership queries.

This command also stops the initial flood of multicast packets that happens when a new multicast source starts to send traffic. This flooding lasts until snooping realises that this the multicast group is arriving at the switch, and puts an entry into hardware to prevent it from being flooded.

This command is useful in networks where low-performance devices are attached. The operation of such devices can be impaired by them receiving unnecessary streams of traffic. For example, in sites where IP cameras are in use, the flooding of video streams to a whole VLAN can send enough traffic to the cameras to cause interruption of their video streaming.

Do not use this command in IPv6 networks. The following console message is displayed after entering this command to warn you of this:

```
% WARNING: IPv6 will not work with this setting enabled
% Please consult the documentation for more information
```

**Examples** To enable this feature and stop multicast packet flooding, use the following commands:

```
awplus# configure terminal  
awplus(config)# platform stop-unreg-mc-flooding
```

To disable this feature and allow multicast packet flooding, use the following commands:

```
awplus# configure terminal  
awplus(config)# no platform stop-unreg-mc-flooding
```

**Related commands** [show platform](#)

**Command changes** Version 5.4.7-2.1: command added  
Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2

# show ip mroute

**Overview** Use this command to display the contents of the IPv4 multicast routing (mroute) table.

**Syntax** `show ip mroute [<ipv4-group-addr>] [<ipv4-source-addr>]  
[dense|sparse|static] [count|summary]`

| Parameter          | Description   |
|--------------------|---|
| <ipv4-group-addr>  | Group IPv4 address, in dotted decimal notation in the format A.B.C.D.                     |
| <ipv4-source-addr> | Source IPv4 address, in dotted decimal notation in the format A.B.C.D.                    |
| dense              | Display dense IPv4 multicast routes.  |
| sparse             | Display sparse IPv4 multicast routes.   |
| static             | Display static IPv4 multicast routes.   |
| count              | Display the route and packet count from the IPv4 multicast routing (mroute) table.        |
| summary            | Display the contents of the IPv4 multicast routing (mroute) table in an abbreviated form. |

**Mode** User Exec and Privileged Exec

**Examples**

```
awplus# show ip mroute 10.10.3.34 224.1.4.3  
awplus# show ip mroute 10.10.5.24 225.2.2.2 count  
awplus# show ip mroute 10.10.1.34 summary
```

**Output** The following is a sample output of this command displaying the IPv4 multicast routing table, with and without specifying the group and source IPv4 address:

# show ip mvif

**Overview** Use this command to display the contents of the IPv4 Multicast Routing Information Base (MRIB) VIF table.

**Syntax** `show ip mvif <interface>`

| Parameter   | Description                                 |
|-------------|---|
| <interface> | The interface to display information about. |

**Mode** User Exec and Privileged Exec

**Example** `awplus# show ip mvif vlan2`

**Output** Figure 34-6: Example output from the **show ip mvif** command

| Interface | Vif Idx | Owner Module | TTL | Local Address | Remote Address | Uptime   |
|-----------|---------|--------------|-----|---------------|----------------|----------|
| vlan2     | 0       | PIM-SM       | 1   | 192.168.1.53  | 0.0.0.0        | 00:04:26 |
| Register  | 1       |              | 1   | 192.168.1.53  | 0.0.0.0        | 00:04:26 |
| vlan3     | 2       | PIM-SM       | 1   | 192.168.10.53 | 0.0.0.0        | 00:04:25 |

**Command changes** Version 5.4.7-1.1: VRF-lite support added for SBx8100.

Version 5.4.8-1.1: VRF-lite support added for x930, SBx908 GEN2.

# show ip rpf

**Overview** Use this command to display Reverse Path Forwarding (RPF) information for the specified IPv4 source address.

**Syntax** `show ip rpf <source-addr>`

| Parameter                        | Description  |
|----------------------------------|--|
| <code>&lt;source-addr&gt;</code> | Source IPv4 address, in dotted decimal notation in the format A.B.C.D. |

**Mode** User Exec and Privileged Exec

**Example** `awplus# show ip rpf 10.10.10.50`

**Command changes** Version 5.4.7-1.1: VRF-lite support added for SBx8100.  
Version 5.4.8-1.1: VRF-lite support added for x930, SBx908 GEN2.

# show ipv6 mif

**Overview** Use this command to display the contents of the IPv6 Multicast Routing Information Base (MRIB) MIF table.

**Syntax** `show ipv6 mif [<interface>]`

| Parameter   | Description                                 |
|-------------|---|
| <interface> | The interface to display information about. |

**Mode** User Exec and Privileged Exec

**Example** `awplus# show ipv6 mif`  
`awplus# show ipv6 mif vlan2`

**Output** Figure 34-7: Example output from the **show ipv6 mif** command

```
awplus#show ipv6 mif
Interface  Mif  Owner          Uptime
          Idx  Module
vlan3     0    MLD/MLD Proxy-Service 03:28:48
vlan2     1    MLD/MLD Proxy-Service 03:28:48
vlan1     2    MLD/MLD Proxy-Service 03:28:48
```

Figure 34-8: Example output from the **show ipv6 mif** command with the interface parameter specified

| Interface | Mif | Owner                 | TTL | Remote  | Uptime   |
|-----------|-----|-----------------------|-----|---------|----------|
|           | Idx | Module                |     | Address |          |
| vlan2     | 0   | MLD/MLD Proxy-Service | 1   | 0.0.0.0 | 00:05:17 |

# show ipv6 mroute

**Overview** Use this command to display the contents of the IPv6 multicast routing (mroute) table.

**Syntax** `show ipv6 mroute [<ipv6-group-addr>] [<ipv6-source-addr>] [{count|summary}]`

| Parameter                             | Description   |
|---------------------------------------|---|
| <code>&lt;ipv6-group-addr&gt;</code>  | Group IPv6 address, in hexadecimal notation in the format X.X::X.X.                       |
| <code>&lt;ipv6-source-addr&gt;</code> | Source IPv6 address, in hexadecimal notation in the format X.X::X.X.                      |
| <code>count</code>                    | Display the route and packet count from the IPv6 multicast routing (mroute) table.        |
| <code>summary</code>                  | Display the contents of the IPv6 multicast routing (mroute) table in an abbreviated form. |

**Mode** User Exec and Privileged Exec

**Examples**

```
awplus# show ipv6 mroute
awplus# show ipv6 mroute count
awplus# show ipv6 mroute summary
awplus# show ipv6 mroute 2001::2 ff08::1 count
awplus# show ipv6 mroute 2001::2 ff08::1
awplus# show ipv6 mroute 2001::2 summary
```

**Output** The following is a sample output of this command displaying the IPv6 multicast routing table for a single static IPv6 Multicast route:

Figure 34-9: Example output from the **show ipv6 mroute** command

```
awplus#show ipv6 mroute

# clear ip pim sparse-mode bsr rp-set \*

**Overview** Use this command to clear all Rendezvous Point (RP) sets learned through the PIMv2 Bootstrap Router (BSR).

**Syntax** `clear ip pim sparse-mode bsr rp-set *`

| Parameter | Description         |
|-----------|---------------------|
| *         | Clears all RP sets. |

**Mode** Privileged Exec

**Usage notes** For multicast clients, note that one router will be automatically or statically designated as the RP, and all routers must explicitly join through the RP. A Designated Router (DR) sends periodic Join/Prune messages toward a group-specific RP for each group that it has active members.

For multicast sources, note that the Designated Router (DR) unicasts Register messages to the RP encapsulating the data packets from the multicast source. The RP forwards decapsulated data packets toward group members.

**Example** `awplus# clear ip pim sparse-mode bsr rp-set *`

**Command changes** Version 5.4.7-1.1: VRF-lite support added SBx8100.

Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

# clear ip pim sparse-mode packet statistics

**Overview** Use this command to clear the PIM sparse mode packet statistics counter.

**Syntax** `clear ip pim sparse-mode packet statistics`

**Mode** Privileged Exec

**Example** The following command clears the current packet receive counts for PIM sparse-mode:

```
awplus# configure terminal
awplus(config)# clear ip pim sparse-mode statistics
```

**Output** Figure 35-1: Example output from **clear ip pim sparse-mode statistics**

```
awplus(config)#clear ip pim sparse-mode statistics
PIM-SM Receive Packet Statistics :
All PIM-SM      : Total : 0 Valid : 0
Hello          : Total : 0 Valid : 0
Register       : Total : 0 Valid : 0
Register Stop  : Total : 0 Valid : 0
Join/Prune     : Total : 0 Valid : 0
Bootstrap      : Total : 0 Valid : 0
Assert         : Total : 0 Valid : 0
Candidate-RP   : Total : 0 Valid : 0
```

**Related commands** [show ip pim sparse-mode packet statistics](#)

**Command changes** Version 5.4.7-1.1: VRF-lite support added SBx8100.  
Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

# clear ip mroute pim sparse-mode

**Overview** Use this command to clear all multicast route table entries learned through PIM-SM for a specified multicast group address, and optionally a specified multicast source address.

**Syntax** `clear ip mroute <Group-IP-address> pim sparse-mode`  
`clear ip mroute <Group-IP-address> <Source-IP-address> pim sparse-mode`

| Parameter                              | Description  |
|--|--|
| <code>&lt;Group-IP-address&gt;</code>  | Specify a multicast group IPv6 address, entered in the form A.B.C.D. |
| <code>&lt;Source-IP-address&gt;</code> | Specify a source group IP address, entered in the form A.B.C.D.      |

**Mode** Privileged Exec

**Example** `awplus# clear ip mroute pim sparse-mode 224.0.0.0`  
`awplus# clear ip mroute 192.168.7.1 pim sparse-mode 224.0.0.0`

**Command changes** Version 5.4.7-1.1: VRF-lite support added SBx8100.  
Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

# debug pim sparse-mode

**Overview** Use this command to turn on some or all PIM-SM debugging.

Use the **no** variant of this command to turn off some or all PIM-SM debugging.

**Syntax** `debug pim sparse-mode [all] [events] [mfc] [mib] [nexthop] [nsm] [packet] [state] [mtrace]`

`no debug pim sparse-mode [all] [events] [mfc] [mib] [nexthop] [nsm] [packet] [state] [mtrace]`

| Parameter | Description  |
|-----------|--|
| all       | Activates/deactivates all PIM-SM debugging.  |
| events    | Activates debug printing of events.  |
| mfc       | Activates debug printing of MFC (Multicast Forwarding Cache in kernel) add/delete/updates. |
| mib       | Activates debug printing of PIM-SM MIBs.   |
| nexthop   | Activates debug printing of PIM-SM next hop communications.                                |
| nsm       | Activates debugging of PIM-SM Network Services Module communications.                      |
| packet    | Activates debug printing of incoming and/or outgoing packets.                              |
| state     | Activates debug printing of state transition on all PIM-SM FSMs.                           |
| mtrace    | Activates debug printing of multicast traceroute.  |

**Mode** Privileged Exec and Global Configuration

**Example** `awplus# configure terminal`  
`awplus(config)# debug pim sparse-mode all`

**Related commands** [show debugging pim sparse-mode](#)

**Command changes** Version 5.4.7-1.1: VRF-lite support added SBx8100.  
Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

# debug pim sparse-mode timer

**Overview** Use this command to enable debugging for the specified PIM-SM timers. Use the **no** variants of this command to disable debugging for the specified PIM-SM timers.

**Syntax**

```
debug pim sparse-mode timer assert [at]
no debug pim sparse-mode timer assert [at]
debug pim sparse-mode timer bsr [bst|crp]
no debug pim sparse-mode timer bsr [bst|crp]
debug pim sparse-mode timer hello [ht|nlt|tht]
no debug pim sparse-mode timer hello [ht|nlt|tht]
debug pim sparse-mode timer joinprune [jt|et|ppt|kat|ot]
no debug pim sparse-mode timer joinprune [jt|et|ppt|kat|ot]
debug pim sparse-mode timer register [rst]
no debug pim sparse-mode timer register [rst]
```

| Parameter | Description   |
|-----------|---|
| assert    | Enable or disable debugging for the Assert timers.  |
| at        | Enable or disable debugging for the Assert Timer.   |
| bsr       | Enable or disable debugging for the specified Bootstrap Router timer, or all Bootstrap Router timers. |
| bst       | Enable or disable debugging for the Bootstrap Router: Bootstrap Timer.                                |
| crp       | Enable or disable debugging for the Bootstrap Router: Candidate-RP Timer.                             |
| hello     | Enable or disable debugging for the specified Hello timer, or all Hello timers.                       |
| ht        | Enable or disable debugging for the Hello timer: Hello Timer.   |
| nlt       | Enable or disable debugging for the Hello timer: Neighbor Liveness Timer.                             |
| tht       | Enable or disable debugging for the Hello timer: Triggered Hello Timer.                               |
| joinprune | Enable or disable debugging for the specified JoinPrune timer, or all JoinPrune timers.               |
| jt        | Enable or disable debugging for the JoinPrune timer: upstream Join Timer.                             |
| et        | Enable or disable debugging for the JoinPrune timer: Expiry Timer.                                    |
| ppt       | Enable or disable debugging for the JoinPrune timer: PrunePending Timer.                              |

| Parameter | Description   |
|-----------|---|
| kat       | Enable or disable debugging for the JoinPrune timer: KeepAlive Timer.         |
| ot        | Enable or disable debugging for the JoinPrune timer: Upstream Override Timer. |
| register  | Enable or disable debugging for the Register timers.                          |
| rst       | Enable or disable debugging for the Register timer: Register Stop Timer.      |

**Default** By default, all debugging is disabled.

**Mode** Privileged Exec and Global Configuration

**Examples** To enable debugging for the PIM-SM Bootstrap Router bootstrap timer, use the commands:

```
awplus(config)# debug pim sparse-mode timer bsr bst
```

To enable debugging for the PIM-SM Hello: neighbor liveness timer, use the command:

```
awplus(config)# debug pim sparse-mode timer hello ht
```

To enable debugging for the PIM-SM Joinprune expiry timer, use the command:

```
awplus# debug pim sparse-mode timer joinprune et
```

To disable debugging for the PIM-SM Register timer, use the command:

```
awplus# no debug pim sparse-mode timer register
```

**Related commands** [show debugging pim sparse-mode](#)

**Command changes** Version 5.4.7-1.1: VRF-lite support added SBx8100.

Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

# ip multicast allow-register-fragments

**Overview** Use this command to allow PIM to register fragmented packets. It is disabled by default.

Use the **no** variant of this command to stop PIM from registering fragmented packets.

**Syntax** `ip multicast allow-register-fragments`  
`no ip multicast allow-register-fragments`

**Default** This command is disabled by default

**Mode** Global Configuration

**Usage notes** Most multicast streams are not fragmented, and therefore this command is unnecessary. By default, when IP multicast packets are fragmented, the switch attempts to reassemble them before registering the packets. This is necessary for tasks such as network address translation, or a firewall.

However, reassembly may be difficult for switches where the CPU cannot handle a large amount of traffic. In that situation, with the CPU failing to reassemble the fragmented packets, there can be a delay in forwarding multicast streams.

We do not recommend enabling this feature if a firewall or network address translation is being used. This feature should only be enabled if multicast data is fragmented and the data rate is too high for the CPU to manage reassembly.

**Example** To allow PIM to register fragmented packets, use the commands:

```
awplus# configure terminal
awplus(config)# ip multicast allow-register-fragments
```

# ip pim accept-register list

**Overview** Use this command to configure the ability to filter out multicast sources specified by the given access-list at the Rendezvous Point (RP), so that the RP will accept/refuse to perform the register mechanism for the packets sent by the specified sources.

Use the **no** variant of this command to revert to default.

**Syntax** `ip pim accept-register list {<100-199>|<2000-2699>|<name>}`  
`no ip pim accept-register`

| Parameter   | Description   |
|-------------|---|
| <100-199>   | IP extended access-list, identified by number.                  |
| <2000-2699> | IP extended access list, identified by number (expanded range). |
| <name>      | IP access list, identified by name.                             |

**Default** By default, the RP accepts register packets from all multicast sources.

**Mode** Global Configuration

**Example** To create an ACL that denies packets from 100.1.1.1 to any destination, and use that ACL to filter at the RP point, use the commands:

```
awplus# configure terminal
awplus(config)# access-list 121
awplus(config-ip-ext-acl)# deny ip 100.1.1.1 0.0.0.0 any
awplus(config-ip-ext-acl)# exit
awplus(config)# ip pim accept-register list 121
```

# ip pim anycast-rp

**Overview** Use this command to configure Anycast RP (Rendezvous Point) in a RP set.  
Use the **no** variant of this command to remove the configuration.

**Syntax** `ip pim anycast-rp <anycast-rp-address> <member-rp-address>`  
`no ip pim anycast-rp <anycast-rp-address> [<member-rp-address>]`

| Parameter                               | Description  |
|---|--|
| <code>&lt;anycast-rp-address&gt;</code> | <A.B.C.D> Specify an anycast IP address to configure an Anycast RP (Rendezvous Point) in a RP set. |
| <code>&lt;member-rp-address&gt;</code>  | <A.B.C.D> Specify an Anycast RP (Rendezvous Point) address to configure an Anycast RP in a RP set. |

**Mode** Global Configuration

**Usage notes** Anycast is a network addressing and routing scheme where data is routed to the nearest or best destination as viewed by the routing topology. Compared to unicast with a one-to-one association between network address and network endpoint, and multicast with a one-to-many association between network address and network endpoint; anycast has a one-to-many association between network address and network endpoint. For anycast, each destination address identifies a set of receiver endpoints, from which only one receiver endpoint is chosen.

Anycast is often implemented using BGP to simultaneously advertise the same destination IP address range from many sources, resulting in packets address to destination addresses in this range being routed to the nearest source announcing the given destination IP address.

Use this command to specify the Anycast RP configuration in the Anycast RP set. Use the **no** variant of this command to remove the Anycast RP configuration. Note that the member RP address is optional when using the **no** parameter to remove the Anycast RP configuration. removing the anycast RP address also removes the member RP address.

**Examples** The following example shows how to configure the Anycast RP address with **ip pim anycast-rp**:

```
awplus# configure terminal
awplus(config)# ip pim anycast-rp 1.1.1.1 10.10.10.10
```

The following example shows how to remove the Anycast RP in the RP set specifying only the anycast RP address with **no ip pim anycast-rp**, but not specifying the member RP address:

```
awplus# configure terminal
awplus(config)# no ip pim anycast-rp 1.1.1.1
```

# ip pim bsr-border

**Overview** Use the **ip pim bsr-border** command to prevent Bootstrap Router (BSR) messages from being sent or received through an interface. The BSR border is the border of the PIM domain.

Use the **no** variant of this command to disable the configuration set with **ip pim bsr-border**.

**Syntax** `ip pim bsr-border`  
`no ip pim bsr-border`

**Mode** Interface Configuration for a VLAN interface.

**Usage notes** When this command is configured on an interface, no PIM version 2 BSR messages will be sent or received through the interface. Configure an interface bordering another PIM domain with this command to avoid BSR messages from being exchanged between the two PIM domains.

BSR messages should not be exchanged between different domains, because devices in one domain may elect Rendezvous Points (RPs) in the other domain, resulting in loss of isolation between the two PIM domains that would stop the PIM protocol from working as intended.

**Examples** The following example configures the VLAN interface `vlan2` to be the PIM domain border:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip pim bsr-border
```

The following example removes the VLAN interface `vlan2` from the PIM domain border:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip pim bsr-border
```

# ip pim bsr-candidate

**Overview** Use this command to give the device the candidate BSR (Bootstrap Router) status using the specified IP address mask of the interface.

Use the **no** variant of this command to withdraw the address of the interface from being offered as a BSR candidate.

**Syntax** `ip pim bsr-candidate <interface> [<hash>] [<priority>]`  
`no ip pim bsr-candidate [<interface>]`

| Parameter   | Description   |
|-------------|---|
| <interface> | The interface.  |
| <hash>      | <0-32> configure hash mask length for RP selection. The default hash value if you do not configure this parameter is 10.  |
| <priority>  | <0-255> configure priority for a BSR candidate. Note that you must also specify the <hash> (mask length) when specifying the <priority>. The default priority if you do not configure this parameter is 64. |

**Mode** Global Configuration

**Default** The default hash parameter value is 10 and the default priority parameter value is 64.

**Examples** To set the BSR candidate to the VLAN interface vlan2, with the optional mask length and BSR priority parameters, enter the commands shown below:

```
awplus# configure terminal  
awplus(config)# ip pim bsr-candidate vlan2 20 30
```

To withdraw the address of vlan2 from being offered as a BSR candidate, enter:

```
awplus# configure terminal  
awplus(config)# no ip pim bsr-candidate vlan2
```

**Command changes** Version 5.4.7-1.1: VRF-lite support added SBx8100.  
Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

# ip pim cisco-register-checksum

**Overview** Use this command to configure the option to calculate the Register checksum over the whole packet. This command is used to inter-operate with older Cisco IOS versions.

Use the **no** variant of this command to disable this option.

**Syntax** `ip pim cisco-register-checksum`  
`no ip pim cisco-register-checksum`

**Default** This command is disabled by default. By default, Register Checksum is calculated only over the header.

**Mode** Global Configuration

**Example** `awplus# configure terminal`  
`awplus(config)# ip pim cisco-register-checksum`

**Command changes** Version 5.4.7-1.1: VRF-lite support added SBx8100.  
Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

# ip pim cisco-register-checksum group-list

**Overview** Use this command to configure the option to calculate the Register checksum over the whole packet on multicast groups specified by the access-list. This command is used to inter-operate with older Cisco IOS versions.

Use the **no** variant of this command to revert to default settings.

**Syntax** `ip pim cisco-register-checksum group-list <acl>`  
`no ip pim cisco-register-checksum group-list <acl>`

| Parameter | Description                                 |
|-----------|---|
| <acl>     | The standard, expanded or named ACL to use. |

**Mode** Global Configuration

**Example** `awplus# configure terminal`  
`awplus(config)# ip pim cisco-register-checksum group-list 34`  
`awplus(config)# access-list 34 permit 224.0.1.3`

**Command changes** Version 5.4.7-1.1: VRF-lite support added SBx8100.  
Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

# ip pim crp-cisco-prefix

**Overview** Use this command to interoperate with Cisco devices that conform to an earlier draft standard. Some Cisco devices might not accept candidate RPs with a group prefix number of zero. Note that the latest BSR specification prohibits sending RP advertisements with prefix 0. RP advertisements for the default IPv4 multicast group range 224/4 are sent with a prefix of 1.

Use the **no** variant of this command to revert to the default settings.

**Syntax** `ip pim crp-cisco-prefix`  
`no ip pim crp-cisco-prefix`

**Mode** Global Configuration

**Example** `awplus# configure terminal`  
`awplus(config)# ip pim crp-cisco-prefix`  
`awplus# configure terminal`  
`awplus(config)# no ip pim crp-cisco-prefix`

**Related commands** [ip pim rp-candidate](#)

**Command changes** Version 5.4.7-1.1: VRF-lite support added SBx8100.  
Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

# ip pim dr-priority

**Overview** Use this command to set the Designated Router priority value.  
Use the **no** variant of this command to disable this function.

**Syntax** `ip pim dr-priority <priority>`  
`no ip pim dr-priority [<priority>]`

| Parameter                     | Description  |
|-------------------------------|--|
| <code>&lt;priority&gt;</code> | Specify the Designated Router priority value, in the range 0 to 4294967294. Note that a higher value has a higher preference or higher priority. |

**Default** The default is 1. The negated form of this command restores the value to the default.

**Mode** Interface Configuration for a VLAN interface.

**Examples** To set the Designated Router priority value to 11234 for the VLAN interface vlan2, apply the commands as shown below:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip pim dr-priority 11234
```

To disable the Designated Router priority value for the VLAN interface vlan2, apply the commands as shown below:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip pim dr-priority
```

**Related commands** [ip pim ignore-rp-set-priority](#)

# ip pim exclude-genid

**Overview** Use this command to exclude the GenID option from Hello packets sent out by the PIM module on a particular interface. This command is used to inter-operate with older Cisco IOS versions.

Use the **no** variant of this command to revert to default settings.

**Syntax** `ip pim exclude-genid`  
`no ip pim exclude-genid`

**Default** By default, this command is disabled; the GenID option is included.

**Mode** Interface Configuration for a VLAN interface.

**Example** To exclude the GenID option on interface vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip pim exclude-genid
```

# ip pim ext-srcs-directly-connected

**Overview** Use this command to configure PIM to treat all source traffic arriving on the interface as though it was sent from a host directly connected to the interface.

Use the **no** variant of this command to configure PIM to treat only directly connected sources as directly connected.

**Syntax** `ip pim ext-srcs-directly-connected`  
`no ip pim ext-srcs-directly-connected`

**Default** The **no** variant of this command is the default behavior.

**Mode** Interface Configuration for a VLAN interface.

**Example** To configure PIM to treat all sources as directly connected for VLAN interface vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip pim ext-srcs-directly-connected
```

To configure PIM to treat only directly connected sources as directly connected for VLAN interface vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip pim ext-srcs-directly-connected
```

## ip pim hello-holdtime (PIM-SM)

**Overview** This command configures a hello-holdtime value. You cannot configure a hello-holdtime value that is less than the current hello-interval.

Use the **no** variant of this command to return it to its default of 3.5 \* the current hello-interval.

**Syntax** `ip pim hello-holdtime <holdtime>`  
`no ip pim hello-holdtime`

| Parameter                     | Description   |
|-------------------------------|---|
| <code>&lt;holdtime&gt;</code> | <code>&lt;1-65535&gt;</code><br>The holdtime value in seconds (no fractional seconds are accepted). |

**Default** The default hello-holdtime value is 3.5 \* the current hello-interval.

**Mode** Interface Configuration for a VLAN interface.

**Usage** Each time the hello-interval is updated, the hello-holdtime is also updated, according to the following rules:

If the hello-holdtime is not configured; or if the hello-holdtime is configured and less than the current hello-interval value, it is modified to the (3.5 \* hello-interval). Otherwise, it retains the configured value.

**Example** To set the hello-hold time value on interface vlan2 use the commands

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip pim hello-holdtime 123
```

# ip pim hello-interval (PIM-SM)

**Overview** This command configures a hello-interval value.  
Use the **no** variant of this command to reset the hello-interval to the default.

**Syntax** `ip pim hello-interval <interval>`  
`no ip pim hello-interval`

| Parameter  | Description  |
|------------|--|
| <interval> | <1-65535> The value in seconds (no fractional seconds accepted). |

**Default** The default hello-interval value is 30 seconds.

**Mode** Interface Configuration for a VLAN interface.

**Usage** When the hello-interval is configured, and the hello-holdtime is not configured, or when the configured hello-holdtime value is less than the new hello-interval value; the holdtime value is modified to the (3.5 \* hello-interval). Otherwise, the hello-holdtime value is the configured value.

**Example** To set the hello-interval value on interface vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip pim hello-interval 123
```

# ip pim ignore-rp-set-priority

**Overview** Use this command to ignore the RP-SET priority value, and use only the hashing mechanism for RP selection.

This command is used to inter-operate with older Cisco IOS versions.

Use the **no** variant of this command to disable this setting.

**Syntax** `ip pim ignore-rp-set-priority`  
`no ip pim ignore-rp-set-priority`

**Mode** Global Configuration

**Example** `awplus# configure terminal`  
`awplus(config)# ip pim ignore-rp-set-priority`

# ip pim jp-timer

**Overview** Use this command to set the PIM-SM join/prune timer. Note that the value the device puts into the holdtime field of the join/prune packets it sends to its neighbors is 3.5 times the join/prune timer value set using this command.

Use the **no** variant of this command to return the PIM-SM join/prune timer to its default value of 60 seconds, which corresponds to a join/prune packet holdtime of 210 seconds.

**Syntax** `ip pim jp-timer <1-65535>`  
`no ip pim jp-timer [<1-65535>]`

| Parameter | Description  |
|-----------|--|
| <1-65535> | Specifies the join/prune timer value. The default value is 60 seconds. |

**Default** The default join/prune timer value is 60 seconds.

**Mode** Global Configuration

**Example** To set the join/prune timer value to 300 seconds, use the commands:

```
awplus# configure terminal  
awplus(config)# ip pim jp-timer 300
```

To return the join/prune timer to its default value of 60 seconds, use the commands:

```
awplus# configure terminal  
awplus(config)# no ip pim jp-timer
```

**Command changes** Version 5.4.7-1.1: VRF-lite support added SBx8100.  
Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

## ip pim neighbor-filter (PIM-SM)

**Overview** This command enables filtering of neighbors on the VLAN interface. When configuring a neighbor filter, PIM-SM will either not establish adjacency with the neighbor, or terminate adjacency with the existing neighbors if denied by the filtering access list.

Use the **no** variant of this command to disable this function.

**Syntax** `ip pim neighbor-filter {<number>|<accesslist>}`  
`no ip pim neighbor-filter {<number>|<accesslist>}`

| Parameter                       | Description                            |
|---------------------------------|--|
| <code>&lt;number&gt;</code>     | <1-99> Standard IP access-list number. |
| <code>&lt;accesslist&gt;</code> | IP access list name.                   |

**Default** By default, there is no filtering.

**Mode** Interface Configuration for a VLAN interface.

**Example** `awplus# configure terminal`  
`awplus(config)# interface vlan2`  
`awplus(config-if)# ip pim neighbor-filter 14`

# ip pim register-rate-limit

**Overview** Use this command to configure the rate of register packets sent by this DR, in units of packets per second.

Use the **no** variant of this command to remove the limit.

**Syntax** `ip pim register-rate-limit <1-65535>`  
`no ip pim register-rate-limit`

| Parameter                    | Description  |
|------------------------------|--|
| <code>&lt;1-65535&gt;</code> | Specifies the maximum number of packets that can be sent per second. |

**Mode** Global Configuration

**Example** `awplus# configure terminal`  
`awplus(config)# ip pim register-rate-limit 3444`

**Command changes** Version 5.4.7-1.1: VRF-lite support added SBx8100.  
Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

# ip pim register-rp-reachability

**Overview** Use this command to enable the RP reachability check for PIM Register processing at the DR. The default setting is no checking for RP-reachability.

Use the **no** variant of this command to disable this processing.

**Syntax** `ip pim register-rp-reachability`  
`no ip pim register-rp-reachability`

**Default** This command is disabled; by default, there is no checking for RP-reachability.

**Mode** Global Configuration

**Example** `awplus# configure terminal`  
`awplus(config)# ip pim register-rp-reachability`

**Command changes** Version 5.4.7-1.1: VRF-lite support added SBx8100.  
Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

# ip pim register-source

**Overview** Use this command to configure the source address of register packets sent by this DR, overriding the default source address, which is the address of the RPF interface toward the source host.

Use the **no** variant of this command to un-configure the source address of Register packets sent by this DR, reverting back to use the default source address that is the address of the RPF interface toward the source host.

**Syntax** `ip pim register-source [<source-address>|<interface>]`  
`no ip pim register-source`

| Parameter                           | Description  |
|-------------------------------------|--|
| <code>&lt;source-address&gt;</code> | The IP address, entered in the form A.B.C.D, to be used as the source of the register packets. |
| <code>&lt;interface&gt;</code>      | The name of the interface to be used as the source of the register packets.                    |

**Usage notes** The configured address must be a reachable address to be used by the RP to send corresponding Register-Stop messages in response. It is normally the local loopback interface address, but can also be a physical address. This address must be advertised by unicast routing protocols on the DR. The configured interface does not have to be PIM enabled.

**Mode** Global Configuration

**Example** `awplus# configure terminal`  
`awplus(config)# ip pim register-source 10.10.1.3`

**Command changes** Version 5.4.7-1.1: VRF-lite support added SBx8100.  
Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

# ip pim register-suppression

**Overview** Use this command to configure the register-suppression time, in seconds, overriding the default of 60 seconds. Configuring this value modifies register-suppression time at the DR. Configuring this value at the RP modifies the RP-keepalive-period value if the [ip pim rp-register-kat](#) command is not used.

Use the **no** variant of this command to reset the value to its default of 60 seconds.

**Syntax** `ip pim register-suppression <1-65535>`  
`no ip pim register-suppression`

**Mode** Global Configuration

**Example** `awplus# configure terminal`  
`awplus(config)# ip pim register-suppression 192`

**Command changes** Version 5.4.7-1.1: VRF-lite support added SBx8100.  
Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

# ip pim rp-address

**Overview** Use this command to statically configure the RP (Rendezvous Point) address for multicast groups.

Use the **no** variant of this command to remove a statically configured RP address for multicast groups.

**Syntax** `ip pim rp-address <ip-address> group-list <group-prefix> [override]`  
`no ip pim rp-address <ip-address> group-list <group-prefix> [override]`

| Parameter      | Description  |
|----------------|--|
| <ip-address>   | IP address of RP, entered in the form A.B.C.D.                         |
| <group-prefix> | Multicast group IP prefix address of RP, entered in the form A.B.C.D/M |
| override       | Enables statically defined RPs to override dynamically learned RPs.    |

**Mode** Global Configuration

**Usage notes** The AlliedWare Plus PIM-SM implementation supports multiple static RPs. It also supports usage of static RP and the BSR (Bootstrap Router) mechanism simultaneously. The **ip pim rp-address** command is used to statically configure the RP address for multicast groups.

You need to understand the following information before using this command.

If the RP address configured by the BSR, and the statically configured RP address are both available for a group range, then the RP address configured through the BSR is chosen over the statically configured RP address, unless the 'override' parameter is specified, in which case, the static RP will be chosen.

After configuration, the RP address is inserted into a static RP group tree based on the configured group ranges. For each group range, multiple static RPs are maintained in a linked list. This list is sorted in a descending order of IP addresses. When selecting static RPs for a group range, the first element (which is the static RP with highest IP address) is chosen.

RP address deletion is handled by removing the static RP from all the existing group ranges and recalculating the RPs for existing TIB states if required.

**NOTE:** A unique RP address may only be specified once as a static RP.

**Example**

```
awplus# configure terminal
awplus(config)# ip pim rp-address 192.0.2.10 group-list
233.252.0.0/24 override
```

Figure 35-2: Output from the **show ip pim sparse-mode rp mapping** command

```
awplus#show ip pim sp rp mapping
PIM Group-to-RP Mappings
Group(s): 233.252.0.0/24, Static
  RP: 192.0.2.10
    Uptime: 00:00:17
```

**Related  
commands**

[ip pim rp-candidate](#)

[ip pim rp-register-kat](#)

[show ip pim sparse-mode rp mapping](#)

**Command  
changes**

Version 5.4.7-1.1: VRF-lite support added SBx8100.

Version 5.4.8-0.5: Replaced <acl> parameter with <group-list> parameter.

Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

# ip pim rp-candidate

**Overview** Use this command to make the router an RP (Rendezvous Point) candidate, using the IP address of the specified interface.

Use the **no** variant of this command to remove the RP status set using the **ip pim rp-candidate** command.

**Syntax** `ip pim rp-candidate <interface> [priority <priority>] [interval <interval>] [grouplist <acl>]`  
`no ip pim rp-candidate [<interface>]`

| Parameter              | Description   |
|------------------------|---|
| <interface>            | Interface name.   |
| priority<br><priority> | The RP candidate priority for this interface on this device, from 0 to 255. The lower the priority value, the more likely this candidate is to become the RP. |
| interval<br><interval> | The advertisement interval, from 1 to 16383 seconds.  |
| grouplist <acl>        | The standard, expanded or named ACL to use.   |

**Default** The priority value for a candidate RP is 192 by default until specified using the **priority** parameter.

**Mode** Global Configuration

**Usage notes** Entering the command **ip pim rp-candidate <interface>** without one of the optional **priority**, **interval**, or **grouplist** parameters will configure the candidate RP with a priority value of 192.

**Examples** To specify a priority of 3, use the commands:

```
awplus# configure terminal
awplus(config)# ip pim rp-candidate vlan2 priority 3
```

To use the ACL numbered 3 to specify the group prefixes that are advertised in association with the RP address, use the commands:

```
awplus# configure terminal
awplus(config)# ip pim rp-candidate vlan2 group-list 3
```

To stop the device from being an RP candidate on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# no ip pim rp-candidate vlan2
```

`ip pim crp-cisco-prefix`

**Command  
changes**

Version 5.4.7-1.1: VRF-lite support added SBx8100.

Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

# ip pim rp-register-kat

**Overview** Use this command to configure the Keep Alive Time (KAT) for (S,G) states at the RP (Rendezvous Point) to monitor PIM-SM Register packets.

Use the **no** variant of this command to return the PIM-SM KAT timer to its default value of 210 seconds.

**Syntax** `ip pim rp-register-kat <1-65535>`  
`no ip pim rp-register-kat`

| Parameter | Description   |
|-----------|---|
| <1-65535> | Specify the KAT timer in seconds. The default value is 210 seconds. |

**Mode** Global Configuration

**Default** The default PIM-SM KAT timer value is 210 seconds.

**Examples**

```
awplus# configure terminal
awplus(config)# ip pim rp-register-kat 3454
awplus# configure terminal
awplus(config)# no ip pim rp-register-kat
```

**Related commands** [ip pim rp-address](#)  
[ip pim rp-candidate](#)

**Command changes** Version 5.4.7-1.1: VRF-lite support added SBx8100.  
Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

# ip pim sparse-mode

**Overview** Use this command to enable PIM-SM on an interface.  
Use the **no** variant of this command to disable PIM-SM on an interface.

**Syntax** ip pim sparse-mode  
no ip pim sparse-mode

**Mode** Interface Configuration for a VLAN interface.

**Examples** To enable PIM-SM on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip pim sparse-mode
```

To disable PIM-SM on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip pim sparse-mode
```

# ip pim sparse-mode join-prune-batching

**Overview** Use this command to enable batching of Join and Prune messages in PIM-SM. This functionality reduces the number of PIM packets that must be sent to maintain a large number of groups

Use the **no** variant of this command to disable batching of Join and Prune messages in PIM-SM.

**Syntax** `ip pim sparse-mode join-prune-batching`  
`no ip pim sparse-mode join-prune-batching`

**Default** Disabled.

**Mode** Global Configuration

**Examples** To enable Join/Prune batching for PIM-SM, use the commands:

```
awplus# configure terminal
awplus(config)# ip pim sparse-mode join-prune-batching
```

To disable Join/Prune batching for PIM-SM, use the commands:

```
awplus# configure terminal
awplus(config)# no ip pim sparse-mode join-prune-batching
```

**Related commands** [ip pim sparse-mode wrong-vif-suppression](#)

**Command changes** Version 5.4.8-2.3: command added.

# ip pim sparse-mode passive

**Overview** Use this command to enable and disable passive mode operation for local members on an interface.

Use the **no** variant of this command to disable passive mode operation for local members on an interface.

**Syntax** `ip pim sparse-mode passive`  
`no ip pim sparse-mode passive`

**Mode** Interface Configuration for a VLAN interface.

**Usage** Passive mode essentially stops PIM transactions on the interface, allowing only IGMP mechanism to be active. To turn off passive mode, use the **no ip pim sparse-mode passive** or the `ip pim sparse-mode` command. To turn off PIM activities on an interface, use the **no ip pim sparse-mode** command.

**Examples** To enable passive mode on vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip pim sparse-mode passive
```

To disable passive mode on vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip pim sparse-mode passive
```

# ip pim sparse-mode wrong-vif-suppression

**Overview** Use this command to permit or block multicast packets that arrive on the wrong interface.

Use the **no** variant of this command to disable wrong VIF suppression.

**Syntax** `ip pim sparse-mode wrong-vif-suppression`  
`no ip pim sparse-mode wrong-vif-suppression`

**Default** Disabled.

**Mode** Global Configuration

**Usage notes** This command enables wrong VIF suppression for PIM sparse-mode. Wrong VIF suppression prevents multicast packets received on the wrong upstream interface from being copied to the CPU.

**Examples** To enable wrong VIF suppression, use the commands:

```
awplus# configure terminal
awplus(config)# ip pim sparse-mode wrong-vif-suppression
```

To disable wrong VIF suppression, use the commands:

```
awplus# configure terminal
awplus(config)# no ip pim sparse-mode wrong-vif-suppression
```

**Related commands** [ip pim sparse-mode join-prune-batching](#)

**Command changes** Version 5.4.8-2.3: command added.

# ip pim spt-threshold

**Overview** This command turns on the ability for the last-hop PIM router to switch to SPT (shortest-path tree).

The **no** variant of this command turns off the ability for the last-hop PIM router to switch to SPT.

**NOTE:** *The switching to SPT happens either at the receiving of the first data packet, or not at all; it is not rate-based.*

**Syntax** ip pim spt-threshold  
no ip pim spt-threshold

**Mode** Global Configuration

**Examples** To enable the last-hop PIM-SM router to switch to SPT, use the following commands:

```
awplus# configure terminal  
awplus(config)# ip pim spt-threshold
```

To stop the last-hop PIM-SM router from being able to switch to SPT, use the following commands:

```
awplus# configure terminal  
awplus(config)# no ip pim spt-threshold
```

**Related commands** [ip pim spt-threshold group-list](#)

**Command changes** Version 5.4.7-1.1: VRF-lite support added SBx8100.  
Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

# ip pim spt-threshold group-list

**Overview** Use this command to turn on the ability for the last-hop PIM router to switch to SPT (shortest-path tree) for multicast group addresses specified by the given access-list.

The switching to SPT happens either at the receiving of the first data packet, or not at all; it is not rate-based.

Use the **no** variant of this command to turn off switching to the SPT.

**Syntax** `ip pim spt-threshold group-list <acl>`  
`no ip pim spt-threshold group-list [<acl>]`

| Parameter | Description                                 |
|-----------|---|
| <acl>     | The standard, expanded or named ACL to use. |

**Mode** Global Configuration

**Usage notes** Turn on/off the ability for the last-hop PIM router to switch to SPT for multicast group addresses specified by the given access-list.

**Example** `awplus# configure terminal`  
`awplus(config)# ip pim spt-threshold group-list 1`  
`awplus(config)# access-list 1 permit 224.0.1.3`

**Related commands** [ip pim spt-threshold](#)

**Command changes** Version 5.4.7-1.1: VRF-lite support added SBx8100.  
Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

# ip pim ssm

**Overview** Use this command to define the Source Specific Multicast (SSM) range of IP multicast addresses. The default keyword defines the SSM range as 232/8. To define the SSM range to be other than the default, use the **access-list** parameter option.

Use the **no** variant of this command to disable the SSM range.

**Syntax**

```
ip pim ssm default
ip pim ssm range {<access-list>|<named-access-list>}
no ip pim ssm
```

| Parameter           | Description                     |
|---------------------|---------------------------------|
| default             | Use 232/8 as the range for SSM. |
| <access-list>       | <1-99> Simple access-list.      |
| <named-access-list> | Named Standard Access List.     |

**Default** By default, the command is disabled.

**Mode** Global Configuration

**Usage** When an SSM range of IP multicast addresses is defined by this command, the no (\*,G) or (S,G,rpt) state will be initiated for groups in the SSM range.

The messages corresponding to these states will not be accepted or originated in the SSM range.

**Examples** To configure the SSM service for the IP address range defined by access list 10, use the commands:

```
awplus# configure terminal
awplus(config)# access-list 10 permit 225.1.1.1
awplus(config)# ip pim ssm range 10
```

To use the default address range for PIM-SSM, use the commands:

```
awplus# configure terminal
awplus(config)# ip pim ssm default
```

To disable PIM-SSM, use the commands:

```
awplus# configure terminal
awplus(config)# no ip pim ssm
```

**Command changes** Version 5.5.3-1.1: VRF-lite support added.

# service pim

**Overview** Use this command to enable PIM sparse mode services.  
Use the **no** version of the command to disable unused PIM sparse mode services.

**Syntax** `service pim`  
`no service pim`

**Default** Enabled

**Mode** Global Configuration

**Usage notes** Sometimes it may be desirable to disable unused services, in order to reduce memory use.  
Disabling the PIM services will only take effect after you save the configuration and restart the device.

**Example** To disable the PIM sparse mode service, use the commands:

```
awplus# configure terminal
awplus(config)# no service pim
```

**Output** Figure 35-3: Example output from **no service pim**

```
awplus(config)#no service pim
% Save the config and restart the device for this change to take
effect
```

**Command changes** Version 5.5.0-0.1: command added

# show debugging pim sparse-mode

**Overview** This command displays the status of the debugging of the system.  
For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show debugging pim sparse-mode`

**Mode** User Exec and Privileged Exec

**Example** To display PIM-SM debugging settings, use the command:

```
awplus# show debugging pim sparse-mode
```

Figure 35-4: Output from **show debugging pim sparse-mode**

```
Debugging status:
PIM event debugging is on
PIM Hello THT timer debugging is on
PIM event debugging is on
PIM MFC debugging is on
PIM state debugging is on
PIM packet debugging is on
PIM incoming packet debugging is on
PIM outgoing packet debugging is on
```

**Related commands** [debug pim sparse-mode](#)

**Command changes** Version 5.4.7-1.1: VRF-lite support added SBx8100.

**Table 1:** Parameters in the output from the **show ip pim sparse-mode interface** command

| Parameters                  | Description  |
|-----------------------------|--|
| Total configured interfaces | The number of configured PIM Sparse Mode interfaces.                     |
| Maximum allowed             | The maximum number of PIM Sparse Mode interfaces that can be configured. |
| Total active interfaces     | The number of active PIM Sparse Mode interfaces.                         |
| Address                     | Primary PIM-SM address.  |
| Interface                   | Name of the PIM-SM interface.  |
| VIF Index                   | The Virtual Interface index of the interface.                            |

**Table 1:** Parameters in the output from the **show ip pim sparse-mode interface** command (cont.)

| Parameters  | Description                              |
|-------------|--|
| Ver/Mode    | PIM version/Sparse mode.                 |
| Nbr Count   | Neighbor count of the PIM-SM interface.  |
| DR Priority | Designated Router priority.              |
| DR          | The IP address of the Designated Router. |

[show ip pim sparse-mode neighbor](#)

**Command changes**

Version 5.4.7-1.1: VRF-lite support added SBx8100.  
Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

# show ip pim sparse-mode interface detail

**Overview** Use this command to show detailed information on a PIM-SM interface.  
For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip pim sparse-mode interface detail`

**Mode** User Exec and Privileged Exec

**Output** Figure 35-7: Example output from the **show ip pim sparse-mode interface detail** command

```
vlan3 (vif 3):  
  Address 192.168.1.149, DR 192.168.1.149  
  Hello period 30 seconds, Next Hello in 15 seconds  
  Triggered Hello period 5 seconds  
  Neighbors:  
    192.168.1.22  
  
vlan2 (vif 0):  
  Address 10.10.11.149, DR 10.10.11.149  
  Hello period 30 seconds, Next Hello in 18 seconds  
  Triggered Hello period 5 seconds  
  Neighbors:  
    10.10.11.4
```

**Command changes** Version 5.4.7-1.1: VRF-lite support added SBx8100.

Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

# show ip pim sparse-mode local-members

**Overview** Use this command to show detailed local member information on an interface configured for PIM-SM. If you do not specify an interface then detailed local member information is shown for all interfaces configured for PIM-SM.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip pim sparse-mode local-members [<interface>]`

| Parameter   | Description                      |
|-------------|----------------------------------|
| <interface> | Optional. Specify the interface. |

**Mode** User Exec and Privileged Exec

**Example** To show detailed PIM-SM information for all PIM-SM configured interfaces, use the command:

```
awplus# show ip pim sparse-mode local-members
```

To show detailed PIM-SM information for the PIM-SM configured interface vlan1, use the command:

```
awplus# show ip pim sparse-mode local-members vlan1
```

**Output** Figure 35-8: Example output from the **show ip pim sparse-mode local-members** command

```
awplus#show ip pim sparse-mode local-members
PIM Local membership information

vlan1:
  (*, 224.0.0.4) : Include

vlan203:
  (*, 223.0.0.3) : Include
```

**Output** Figure 35-9: Example output from the **show ip pim sparse-mode local-members** command on a specific interface.

```
awplus#show ip pim sparse-mode local-members vlan1
PIM Local membership information

vlan1:
  (*, 224.0.0.4) : Include
```

**Command changes** Version 5.4.7-1.1: VRF-lite support added SBx8100.

Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

# show ip pim sparse-mode mroute

**Overview** Use this command to display the IP multicast routing table or the IP multicast routing table based on a specific address or addresses.

**Syntax**

```
show ip pim sparse-mode mroute brief
show ip pim sparse-mode mroute
show ip pim sparse-mode mroute <group-address>
show ip pim sparse-mode mroute <source-address>
show ip pim sparse-mode mroute <source-address> <group-address>
```

| Parameter        | Description   |
|------------------|---|
| brief            | Shows only a summary of the number of each type of multicast entry and the cache.                         |
| <group-address>  | Group IP address, entered in the form A.B.C.D. Output is all multicast entries belonging to that group.   |
| <source-address> | Source IP address, entered in the form A.B.C.D. Output is all multicast entries belonging to that source. |

**Mode** Privileged Exec

**Usage notes** Note that when a feature license is enabled, the output for the **show ip pim sparse-mode mroute** command will only show 32 interfaces because of the terminal display width limit. Use the **show ip pim sparse-mode mroute detail** command to display detailed entries of the IP multicast routing table.

**Example** To display the IP multicast routing table for the address 40.40.40.11, enter the command:

```
awplus# show ip pim sparse-mode mroute 40.40.40.11
```

**Output** Figure 35-10: Example output from **show ip pim sparse-mode mroute brief**

```
awplus#show ip pim sparse-mode mroute brief
IP Multicast Routing Table

(*,*,RP) Entries: 0
(*,G) Entries: 0
(S,G) Entries: 99
(S,G,rpt) Entries: 99

**Related commands** [show ip pim sparse-mode mroute detail](#)

**Command changes** Version 5.4.7-1.1: VRF-lite support added to SBx8100.  
Version 5.4.8-1.1: VRF-lite support added to x930, SBx908 GEN2.  
Version 5.4.8-2.1: **brief** parameter added.

# show ip pim sparse-mode mroute detail

**Overview** Use this command to display detailed entries of the IP multicast routing table, or detailed entries of the IP multicast routing table based on the specified address or addresses.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax**

```
show ip pim sparse-mode mroute [<group-address>] detail
show ip pim sparse-mode mroute [<source-address>] detail
show ip pim sparse-mode mroute [<group-address>
<source-address>] detail
show ip pim sparse-mode mroute [<source-address>
<group-address>] detail
```

| Parameter        | Description   |
|------------------|---|
| <group-address>  | Group IP address, entered in the form A.B.C.D. Output is all multicast entries belonging to that group.   |
| <source-address> | Source IP address, entered in the form A.B.C.D. Output is all multicast entries belonging to that source. |
| detail           | Show detailed information.  |

**Usage notes** Based on the group and source address, the output is the selected route if present in the multicast route tree.

**Mode** User Exec and Privileged Exec

**Examples** The following example commands show detailed entries for IP multicast routing tables:

```
awplus# show ip pim sparse-mode mroute detail
awplus# show ip pim sparse-mode mroute 40.40.40.11 detail
awplus# show ip pim sparse-mode mroute 224.1.1.1 detail
awplus# show ip pim sparse-mode mroute 224.1.1.1 40.40.40.11
detail
```

**Output** Figure 35-12: Example output from **show ip pim sparse-mode mroute detail**

# show ip pim sparse-mode neighbor

**Overview** Use this command to show the PIM-SM neighbor information.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip pim sparse-mode neighbor [<interface>] [<ip-address>]  
[detail]`

| Parameter    | Description   |
|--------------|---|
| <interface>  | Interface name. Show neighbors on an interface.   |
| <ip-address> | Show neighbors with a particular address on an interface. The IP address entered in the form A.B.C.D. |
| detail       | Show detailed information.  |

**Mode** Privileged Exec

**Examples** To show the neighbor information for all interfaces, use the command:

```
awplus# show ip pim sparse-mode neighbor
```

To show the neighbor information for vlan5, use the command:

```
awplus# show ip pim sparse-mode neighbor vlan5 detail
```

**Output** Figure 35-13: Example output from the **show ip pim sparse-mode neighbor** command

| Neighbor Address | Interface | Uptime/Expires    | Ver | DR Priority/ |
|------------------|-----------|-------------------|-----|--------------|
| 10.10.0.9        | vlan2     | 00:55:33/00:01:44 | v2  | 1 /          |
| 10.10.0.136      | vlan2     | 00:55:20/00:01:25 | v2  | 1 /          |
| 10.10.0.172      | vlan2     | 00:55:33/00:01:32 | v2  | 1 / DR       |
| 192.168.0.100    | vlan3     | 00:55:30/00:01:20 | v2  | N / DR       |

Figure 35-14: Example output from the **show ip pim sparse-mode neighbor interface detail** command

```
Nbr 10.10.3.180 (vlan5), DR  
Expires in 55 seconds, uptime 00:00:15  
Holdtime: 70 secs, T-bit: off, lan delay: 1, Override interval: 3  
DR priority: 100, Gen ID: 625159467,  
Secondary addresses:  
192.168.30.1
```

**Command changes** Version 5.4.7-1.1: VRF-lite support added SBx8100.  
Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

# show ip pim sparse-mode nexthop

**Overview** Use this command to see the next hop information as used by PIM-SM.  
For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#)

**Syntax** `show ip pim sparse-mode nexthop`

**Mode** User Exec and Privileged Exec

**Example** `awplus# show ip pim sparse-mode nexthop`

Figure 35-15: Example output from the **show ip pim sparse-mode nexthop** command

```
Flags: N = New, R = RP, S = Source, U = Unreachable
Destination Type Nexthop Nexthop Nexthop Nexthop Metric Pref Refcnt
              Num   Addr      Ifindex  Name
-----
10.10.0.9   .RS.  1      0.0.0.0  4      0      0      1
```

**Table 2:** Parameters in output of the **show ip pim sparse-mode nexthop** command

| Parameter       | Description  |
|-----------------|--|
| Destination     | The destination address for which PIM-SM requires next hop information.                                      |
| Type            | The type of destination, as indicated by the Flags description. N = New, R= RP, S = Source, U = Unreachable. |
| Nexthop Num     | The number of next hops to the destination. PIM-SM always uses only 1 next hop.                              |
| Nexthop Addr    | The address of the primary next hop gateway.   |
| Nexthop IfIndex | The interface on which the next hop gateway can be reached.  |
| Nexthop Name    | The name of next hop interface.  |
| Metric          | The metric of the route towards the destination.   |
| Preference      | The preference of the route towards destination.   |
| Refcnt          | Only used for debugging.   |

**Command changes** Version 5.4.7-1.1: VRF-lite support added SBx8100.

Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

# show ip pim sparse-mode packet statistics

**Overview** Use this command to display the current packet receive counts for PIM sparse-mode.

**Syntax** `show ip pim sparse-mode packet statistics`

**Mode** Privileged Exec

**Example** The following command displays the current packet receive counts for PIM sparse-mode:

```
awplus# configure terminal
awplus(config)# show ip pim sparse-mode statistics
```

**Output** Figure 35-16: Example output from **show ip pim sparse-mode statistics**

```
awplus(config)#show ip pim sparse-mode statistics
PIM-SM Receive Packet Statistics :
All PIM-SM      :   Total : 25   Valid : 25
Hello          :   Total : 14   Valid : 14
Register       :   Total : 5    Valid : 5
Register Stop  :   Total : 0    Valid : 0
Join/Prune     :   Total : 0    Valid : 0
Bootstrap     :   Total : 6    Valid : 6
Assert         :   Total : 0    Valid : 0
Candidate-RP   :   Total : 0    Valid : 0
```

**Related commands** [clear ip pim sparse-mode packet statistics](#)

**Command changes** Version 5.4.7-1.1: VRF-lite support added SBx8100.  
Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

# show ip pim sparse-mode rp-hash

**Overview** Use this command to display the Rendezvous Point (RP) to be chosen based on the group selected.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip pim sparse-mode rp-hash <group-addr>`

| Parameter                       | Description  |
|---------------------------------|--|
| <code>&lt;group-addr&gt;</code> | The group address for which to find the RP, entered in the form A.B.C.D. |

**Mode** User Exec and Privileged Exec

**Example** `awplus# show ip pim sparse-mode rp-hash 224.0.1.3`

Figure 35-17: Output from the **show ip pim sparse-mode rp-hash** command

```
RP: 10.10.11.35  
Info source: 10.10.11.35, via bootstrap
```

**Related commands** [show ip pim sparse-mode rp mapping](#)

**Command changes** Version 5.4.7-1.1: VRF-lite support added SBx8100.

# show ip pim sparse-mode rp mapping

**Overview** Use this command to show group-to-RP (Rendezvous Point) mappings, and the RP set.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip pim sparse-mode rp mapping`

**Mode** Privileged Exec

**Example** `awplus# show ip pim sparse-mode rp mapping`

**Output** Figure 35-18: Example output from **show ip pim sparse-mode rp mapping**

```
PIM Group-to-RP Mappings
Group(s): 224.0.0.0/4
  RP: 10.10.0.9
      Info source: 10.10.0.9, via bootstrap, priority 192
      Uptime: 16:52:39, expires: 00:02:50
```

**Related commands** [show ip pim sparse-mode rp-hash](#)

**Command changes** Version 5.4.7-1.1: VRF-lite support added SBx8100.

Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

# undebbug all pim sparse-mode

**Overview** Use this command to disable all PIM-SM debugging.

**Syntax** `undebbug all pim sparse-mode`

**Mode** Privileged Exec

**Example** `awplus# undebbug all pim sparse-mode`

**Related commands** [debug pim sparse-mode](#)

**Command changes** Version 5.4.7-1.1: VRF-lite support added SBx8100.  
Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

# PIM-SMv6 Commands

## Introduction

**Overview** This chapter provides an alphabetical reference of PIM-SMv6 commands. For IPv6 Multicast commands, see [Multicast Commands](#). For an overview of PIM-SMv6, see the [PIM-SMv6 Feature Overview and Configuration Guide](#).

IPv6 must be enabled on an interface with the `ipv6 enable` command, IPv6 forwarding must be enabled globally for routing IPv6 with the `ipv6 forwarding` command, and IPv6 multicasting must be enabled globally with the `ipv6 multicast-routing` command before using PIM-SMv6 commands.

Static IPv6 multicast routes take priority over dynamic IPv6 multicast routes. Use the `clear ipv6 mroute` command to clear static IPv6 multicast routes and ensure dynamic IPv6 multicast routes can take over from previous IPv6 static multicast routes.

**NOTE:** The IPv6 Multicast addresses shown can be derived from IPv6 unicast prefixes as per RFC 3306. The IPv6 unicast prefix reserved for documentation is 2001:0db8::/32 as per RFC 3849. Using the base /32 prefix the IPv6 multicast prefix for 2001:0db8::/32 is ff3x:20:2001:0db8::/64. Where an RP address is 2001:0db8::1 the embedded RP multicast prefix is ff7x:120:2001:0db8::/96. For ASM (Any-Source Multicast) the IPv6 multicast addresses allocated for documentation purposes are ff0x::0db8:0:0/96 as per RFC 6676. This is a /96 prefix so that it can be used with group IDs as per RFC 3307. These addresses should not be used for practical networks (other than for testing purposes), nor should they appear in any public network.

The IPv6 addresses shown use the address space 2001:0db8::/32, defined in RFC 3849 for documentation purposes. These addresses should not be used for practical networks (other than for testing purposes) nor should they appear on any public network.

# clear ipv6 mroute pim

**Overview** Use this command to clear all Multicast Forwarding Cache (MFC) entries in PIM-SMv6.

**NOTE:** *Static IPv6 multicast routes take priority over dynamic IPv6 multicast routes. Use the `clear ipv6 mroute` command to clear static IPv6 multicast routes and ensure dynamic IPv6 multicast routes can take over from previous static IPv6 multicast routes.*

**Syntax** `clear ipv6 mroute [*] pim sparse-mode`

| Parameter | Description  |
|-----------|--|
| *         | Clears all PIM-SMv6 multicast routes. Using this command without this optional operator only deletes the multicast router table entries. |

**Mode** Privileged Exec

**Example**  
`awplus# clear ipv6 mroute pim sparse-mode`  
`awplus# clear ipv6 mroute * pim sparse-mode`

# clear ipv6 mroute pim sparse-mode

**Overview** Use this command to clear all multicast route table entries learned through PIM-SMv6 for a specified multicast group address, and optionally a specified multicast source address.

**NOTE:** *Static IPv6 multicast routes take priority over dynamic IPv6 multicast routes. Use the `clear ipv6 mroute` command to clear static IPv6 multicast routes and ensure dynamic IPv6 multicast routes can take over from previous static IPv6 multicast routes.*

**Syntax**

```
clear ipv6 mroute <Group-IPv6-add> pim sparse-mode  
clear ipv6 mroute <Group-IPv6-add> <Source-IPv6-add> pim  
sparse-mode
```

| Parameter         | Description   |
|-------------------|---|
| <Group-IPv6-add>  | Specify a multicast group IPv6 address, entered in the form X:X::X:X. |
| <Source-IPv6-add> | Specify a source group IPv6 address, entered in the form X:X::X:X.    |

**Mode** Privileged Exec

**Example**

```
awplus# clear ipv6 mroute 2001:db8:: pim sparse-mode  
awplus# clear ipv6 mroute 2001:db8:: 2002:db8:: pim sparse-mode
```

# clear ipv6 pim sparse-mode bsr rp-set \*

**Overview** Use this command to clear all Rendezvous Point (RP) sets learned through the PIM-SMv6 Bootstrap Router (BSR).

**NOTE:** *Static IPv6 multicast routes take priority over dynamic IPv6 multicast routes. Use the `clear ipv6 mroute` command to clear static IPv6 multicast routes and ensure dynamic IPv6 multicast routes can take over from previous static IPv6 multicast routes.*

**Syntax** `clear ipv6 pim sparse-mode bsr rp-set *`

| Parameter | Description         |
|-----------|---------------------|
| *         | Clears all RP sets. |

**Mode** Privileged Exec

**Usage** For multicast clients, note that one router will be automatically or statically designated as the RP, and all routers must explicitly join through the RP. A Designated Router (DR) sends periodic Join/Prune messages toward a group-specific RP for each group that it has active members.

For multicast sources, note that the Designated Router (DR) unicasts Register messages to the RP encapsulating the data packets from the multicast source. The RP forwards decapsulated data packets toward group members.

**Example** `awplus# clear ipv6 pim sparse-mode bsr rp-set *`

# debug ipv6 pim sparse-mode

**Overview** Use this command to activate PIM-SMv6 debugging.

Use the **no** variant of this command to deactivate PIMv6 debugging.

Note that the `undebug ipv6 pim sparse-mode` command is an alias of the **no** variant of this command.

**Syntax** `debug ipv6 pim sparse-mode [all] [events] [mfc] [mib] [nexthop] [nsm] [state] [timer]`

`no debug ipv6 pim sparse-mode [all] [events] [mfc] [mib] [nexthop] [nsm] [state] [timer]`

| Parameter | Description   |
|-----------|---|
| all       | Activates/deactivates all PIM-SMv6 debugging.                                 |
| events    | Activates debug printing of PIM-SMv6 events.                                  |
| mfc       | Activates debug printing of MFC (Multicast Forwarding Cache).                 |
| mib       | Activates debug printing of PIM-SMv6 MIBs.                                    |
| nexthop   | Activates debug printing of PIM-SMv6 next hop communications.                 |
| nsm       | Activates debugging of PIM-SMv6 NSM (Network Services Module) communications. |
| state     | Activates debug printing of state transition on all PIM-SMv6 FSMs.            |
| timer     | Activates debug printing of PIM-SMv6 timers.                                  |

**Mode** Privileged Exec and Global Configuration

**Example**

```
awplus# configure terminal
awplus(config)# terminal monitor
awplus(config)# debug ipv6 pim sparse-mode all
awplus# configure terminal
awplus(config)# terminal monitor
awplus(config)# debug ipv6 pim sparse-mode events
awplus# configure terminal
awplus(config)# terminal monitor
awplus(config)# debug ipv6 pim sparse-mode nexthop
```

**Validation output** Figure 36-1: Example output from the **show debugging ipv6 pim sparse-mode** command after issuing **multiple debug ipv6 pim sparse-mode** commands

```
awplus#debug ipv6 pim sparse-mode state
awplus#debug ipv6 pim sparse-mode events
awplus#debug ipv6 pim sparse-mode packet
awplus#show debugging ipv6 pim sparse-mode
PIM-SMv6 debugging status:
  PIM event debugging is on
  PIM MFC debugging is off
  PIM state debugging is on
  PIM packet debugging is on
  PIM Hello HT timer debugging is off
  PIM Hello NLT timer debugging is off
  PIM Hello THT timer debugging is off
  PIM Join/Prune JT timer debugging is off
  PIM Join/Prune ET timer debugging is off
  PIM Join/Prune PPT timer debugging is off
  PIM Join/Prune KAT timer debugging is off
  PIM Join/Prune OT timer debugging is off
  PIM Assert AT timer debugging is off
  PIM Register RST timer debugging is off
  PIM Bootstrap BST timer debugging is off
  PIM Bootstrap CRP timer debugging is off
  PIM mib debugging is off
  PIM nsm debugging is off
  PIM nexthop debugging is off
```

**Related commands** [show debugging ipv6 pim sparse-mode](#)  
[undebug all ipv6 pim sparse-mode](#)  
[undebug ipv6 pim sparse-mode](#)

# debug ipv6 pim sparse-mode packet

**Overview** Use this command to activate PIM-SMv6 packet debugging.  
Use the no variant of this command to deactivate PIMv6 packet debugging.

**Syntax** debug ipv6 pim sparse-mode packet {in|out}  
no debug ipv6 pim sparse-mode packet {in|out}

| Parameter | Description  |
|-----------|--|
| packet    | Activates debug printing of incoming and/or outgoing IPv6 packets. |
| in        | Specify incoming packet debugging.                                 |
| out       | Specify outgoing packet debugging.                                 |

**Mode** Privileged Exec and Global Configuration

**Example**

```
awplus# configure terminal
awplus(config)# terminal monitor
awplus(config)# debug ipv6 pim sparse-mode packet in
awplus# configure terminal
awplus(config)# terminal monitor
awplus(config)# debug ipv6 pim sparse-mode packet out
awplus# configure terminal
awplus(config)# terminal monitor
awplus(config)# no debug ipv6 pim sparse-mode packet in
awplus# configure terminal
awplus(config)# terminal monitor
awplus(config)# no debug ipv6 pim sparse-mode packet out
```

# debug ipv6 pim sparse-mode timer

**Overview** Use this command to enable debugging for the specified PIM-SMv6 timers.

Use the **no** variants of this command to disable debugging for the specified PIM-SMv6 timers.

**Syntax**

```
debug ipv6 pim sparse-mode timer assert [at]
no debug ipv6 pim sparse-mode timer assert [at]
debug pim ipv6 sparse-mode timer bsr [bst|crp]
no debug pim ipv6 sparse-mode timer bsr [bst|crp]
debug pim ipv6 sparse-mode timer hello [ht|nlt|tht]
no debug pim ipv6 sparse-mode timer hello [ht|nlt|tht]
debug pim ipv6 sparse-mode timer joinprune [jt|et|ppt|kat|ot]
no debug pim ipv6 sparse-mode timer joinprune
[jt|et|ppt|kat|ot]
debug pim ipv6 sparse-mode timer register [rst]
no debug pim ipv6 sparse-mode timer register [rst]
```

| Parameter | Description   |
|-----------|---|
| assert    | Enable or disable debugging for the Assert timers.  |
| at        | Enable or disable debugging for the Assert Timer.   |
| bsr       | Enable or disable debugging for the specified Bootstrap Router timer, or all Bootstrap Router timers. |
| bst       | Enable or disable debugging for the Bootstrap Router: Bootstrap Timer.                                |
| crp       | Enable or disable debugging for the Bootstrap Router: Candidate-RP Timer.                             |
| hello     | Enable or disable debugging for the specified Hello timer, or all Hello timers.                       |
| ht        | Enable or disable debugging for the Hello timer: Hello Timer.   |
| nlt       | Enable or disable debugging for the Hello timer: Neighbor Liveness Timer.                             |
| tht       | Enable or disable debugging for the Hello timer: Triggered Hello Timer.                               |
| joinprune | Enable or disable debugging for the specified JoinPrune timer, or all JoinPrune timers.               |
| jt        | Enable or disable debugging for the JoinPrune timer: upstream Join Timer.                             |
| et        | Enable or disable debugging for the JoinPrune timer: Expiry Timer.                                    |
| ppt       | Enable or disable debugging for the JoinPrune timer: PrunePending Timer.                              |

| Parameter | Description   |
|-----------|---|
| kat       | Enable or disable debugging for the JoinPrune timer: KeepAlive Timer.         |
| ot        | Enable or disable debugging for the JoinPrune timer: Upstream Override Timer. |
| register  | Enable or disable debugging for the Register timers.                          |
| rst       | Enable or disable debugging for the Register timer: Register Stop Timer.      |

**Default** By default, all debugging is disabled.

**Mode** Privileged Exec and Global Configuration

**Examples** To enable debugging for the PIM-SMv6 Bootstrap Router bootstrap timer, use the commands:

```
awplus(config)# debug ipv6 pim sparse-mode timer bsr bst
```

To enable debugging for the PIM-SMv6 Hello: neighbor liveness timer, use the command:

```
awplus(config)# debug ipv6 pim sparse-mode timer hello ht
```

To enable debugging for the PIM-SMv6 Joinprune expiry timer, use the command:

```
awplus# debug ipv6 pim sparse-mode timer joinprune et
```

To disable debugging for the PIM-SMv6 Register timer, use the command:

```
awplus# no debug ipv6 pim sparse-mode timer register
```

**Related commands** [show debugging ipv6 pim sparse-mode](#)

# ipv6 pim accept-register

**Overview** Use this command to configure the ability to filter out multicast sources specified by the given software IPv6 access-list at the Rendezvous Point (RP), so that the RP will accept/refuse to perform the register mechanism for the packets sent by the specified sources. By default, the RP accepts register packets from all multicast sources.

Use the **no** variant of this command to revert to default.

**Syntax** `ipv6 pim accept-register list{<access-list>}`  
`no ipv6 pim accept-register`

| Parameter                        | Description  |
|----------------------------------|--|
| <code>&lt;access-list&gt;</code> | Specify a Standard or an Extended software IPv6 Access list. See <a href="#">IPv6 Software Access Control List (ACL) Commands</a> for supported IPv6 ACLs. |

**Mode** Global Configuration

**Example**

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim accept-register list G2
awplus(config)# ipv6 access-list standard G2 permit
2001:db8::/128
awplus# configure terminal
awplus(config)# no ipv6 pim accept-register
```

# ipv6 pim anycast-rp

**Overview** Use this command to configure Anycast RP (Rendezvous Point) in an RP set.  
Use the **no** variant of this command to remove the configuration.

**Syntax** `ipv6 pim anycast-rp <anycast-rp-address> <member-rp-address>`  
`no ipv6 pim anycast-rp <anycast-rp-address>`  
`[<member-rp-address>]`

| Parameter                               | Description  |
|---|--|
| <code>&lt;anycast-rp-address&gt;</code> | <code>&lt;X:X::X:X&gt;</code> Specify an Anycast IPv6 address to configure an Anycast RP (Rendezvous Point) in a RP set.   |
| <code>&lt;member-rp-address&gt;</code>  | <code>&lt;A:B::C:D&gt;</code> Specify an Anycast RP (Rendezvous Point)IPv6 address to configure an Anycast RP in a RP set. |

**Mode** Global Configuration

**Usage notes** Anycast is a network addressing and routing scheme where data is routed to the nearest or best destination as viewed by the routing topology. Compared to unicast with a one-to-one association between network address and network endpoint, and multicast with a one-to-many association between network address and network endpoint; anycast has a one-to-many association between network address and network endpoint. For anycast, each destination address identifies a set of receiver endpoints, from which only one receiver endpoint is chosen.

Use this command to specify the Anycast RP configuration in the Anycast RP set. Use the **no** variant of this command to remove the Anycast RP configuration. Note that the member RP address is optional when using the **no** parameter to remove the Anycast RP configuration. removing the anycast RP address also removes the member RP address.

**Examples** The following example shows how to configure the Anycast RP address with **ipv6 pim anycast-rp**:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim anycast-rp 2:2::2:2 20:20::20:20
```

The following example shows how to remove the Anycast RP in the RP set specifying only the anycast RP address with **no ipv6 pim anycast-rp**, but not specifying the member RP address:

```
awplus# configure terminal
awplus(config)# no ipv6 pim anycast-rp 2:2::2:2 20:20::20:20
```

# ipv6 pim bsr-border

**Overview** Use the **ipv6 pim bsr-border** command to prevent Bootstrap Router (BSR) messages from being sent or received through an interface. The BSR border is the border of the PIM-SMv6 domain.

Use the **no** variant of this command to disable the configuration set with **ipv6 pim bsr-border**.

**Syntax** `ipv6 pim bsr-border`  
`no ipv6 pim bsr-border`

**Mode** Interface Configuration for a VLAN interface.

**Usage** When this command is configured on an interface, no PIM-SMv6 BSR messages will be sent or received through the interface. Configure an interface bordering another PIM-SMv6 domain with this command to avoid BSR messages from being exchanged between the two PIM-SMv6 domains.

BSR messages should not be exchanged between different domains, because devices in one domain may elect Rendezvous Points (RPs) in the other domain, resulting in loss of isolation between the two PIM domains that would stop the PIM-SMv6 protocol from working as intended.

**Examples** The following example configures the VLAN interface `vlan2` to be the PIM-SMv6 domain border:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 pim bsr-border
```

The following example removes the VLAN interface `vlan2` from the PIM-SMv6 domain border:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 pim bsr-border
```

# ipv6 pim bsr-candidate

**Overview** Use this command to give the device the candidate BSR (Bootstrap Router) status using the specified IPv6 address mask of the interface.

Use the **no** variant of this command to withdraw the address of the interface from being offered as a BSR candidate.

**Syntax** `ipv6 pim bsr-candidate <interface> [<hash>] [<priority>]`  
`no ipv6 pim bsr-candidate [<interface>]`

| Parameter   | Description   |
|-------------|---|
| <interface> | Specify the interface.  |
| <hash>      | <0-128> configure the hash mask length used for RP selection. The default hash value if you do not configure this parameter is 126.   |
| <priority>  | <0-255> configure priority for a BSR candidate. Note that you must also specify the <hash> (mask length) when specifying the <priority>. The default priority if you do not configure this parameter is 64. |

**Mode** Global Configuration

**Default** The default hash parameter value is 126 and the default priority parameter value is 64.

**Examples** To set the BSR candidate to the VLAN interface vlan2, with the optional mask length and BSR priority parameters, enter the commands shown below:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim bsr-candidate vlan2 20 30
```

To withdraw the address of vlan2 from being offered as a BSR candidate, enter:

```
awplus# configure terminal
awplus(config)# no ipv6 pim bsr-candidate vlan2
```

# ipv6 pim cisco-register-checksum

**Overview** Use this command to configure the option to calculate the Register Checksum over the whole packet. This command is used to inter-operate with older Cisco IOS versions.

Use the **no** variant of this command to disable this option.

**Syntax** `ipv6 pim cisco-register-checksum`  
`no ipv6 pim cisco-register-checksum`

**Default** This command is disabled by default. By default, Register Checksum is calculated only over the header.

**Mode** Global Configuration

**Example**

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim cisco-register-checksum
awplus# configure terminal
awplus(config)# no ipv6 pim cisco-register-checksum
```

# ipv6 pim cisco-register-checksum group-list

**Overview** Use this command to configure the option to calculate the Register Checksum over the whole packet on multicast groups as specified by the software IPv6 access-list. This command is used to inter-operate with older Cisco IOS versions.

Use the **no** variant of this command to revert to default settings.

**Syntax** `ipv6 pim cisco-register-checksum group-list <IPv6-access-list>`  
`no ipv6 pim cisco-register-checksum group-list`  
`<IPv6-access-list>`

| Parameter                             | Description   |
|---------------------------------------|---|
| <code>&lt;IPv6-access-list&gt;</code> | Optional. Specify a Standard or Extended software IPv6 access list.<br>See <a href="#">IPv6 Software Access Control List (ACL) Commands</a> for supported IPv6 ACLs.<br>Use this parameter to configure the option to calculate the Register Checksum over the whole packet on multicast groups as specified by an IPv6 access list entered after this command. |

**Mode** Global Configuration

**Default** This command is disabled by default. By default, Register Checksum is calculated only over the header.

**Example**

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim cisco-register-checksum group-list G1
awplus(config)# ipv6 access-list standard G1 permit
ff0x::db8:0:0/96
```

# ipv6 pim crp-cisco-prefix

**Overview** Use this command to interoperate with Cisco devices that conform to an earlier draft standard. Some Cisco devices might not accept candidate RPs with a group prefix number of zero. Note that the latest BSR specification prohibits sending RP advertisements with prefix 0.

Use the **no** variant of this command to revert to the default settings.

**Syntax** `ipv6 pim crp-cisco-prefix`  
`no ipv6 pim crp-cisco-prefix`

**Mode** Global Configuration

**Example**

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim crp-cisco-prefix
awplus# configure terminal
awplus(config)# no ipv6 pim crp-cisco-prefix
```

**Related commands** [ipv6 pim rp-candidate](#)

# ipv6 pim dr-priority

**Overview** Use this command to set the Designated Router priority value.  
Use the **no** variant of this command to disable this function.

**Syntax** `ipv6 pim dr-priority <priority>`  
`no ipv6 pim dr-priority [<priority>]`

| Parameter                     | Description  |
|-------------------------------|--|
| <code>&lt;priority&gt;</code> | Specify the Designated Router priority value, in the range 0 to 4294967294. Note that a higher value has a higher preference or higher priority. |

**Default** The default value is 1. The negated form of this command restores the value to the default.

**Mode** Interface Configuration for a VLAN interface.

**Examples** To set the Designated Router priority value to 11234 for the VLAN interface vlan2, apply the commands as shown below:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 pim dr-priority 11234
```

To disable the Designated Router priority value for the VLAN interface vlan2, apply the commands as shown below:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 pim dr-priority
```

**Related commands** [ipv6 pim ignore-rp-set-priority](#)

# ipv6 pim exclude-genid

**Overview** Use this command to exclude the GenID option from Hello packets sent out by the PIM-SMv6 module on a particular interface. This command is used to inter-operate with older Cisco IOS versions.

Use the **no** variant of this command to revert to default settings.

**Syntax** `ipv6 pim exclude-genid`  
`no ipv6 pim exclude-genid`

**Default** By default, this command is disabled; the GenID option is included.

**Mode** Interface Configuration for a VLAN interface.

**Examples** To exclude the GenID option in Hello packets on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 pim exclude-genid
```

To include the GenID option in Hello packets, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 pim exclude-genid
```

# ipv6 pim ext-srcs-directly-connected

**Overview** Use this command to configure PIM-SMv6 to treat all source traffic arriving on the interface as though it was sent from a host directly connected to the interface.

Use the **no** variant of this command to configure PIM-SMv6 to treat only directly connected sources as directly connected.

**Syntax** `ipv6 pim ext-srcs-directly-connected`  
`no ipv6 pim ext-srcs-directly-connected`

**Default** The **no** variant of this command is the default behavior.

**Mode** Interface Configuration for a VLAN interface.

**Example** To configure PIM-SMv6 to treat all sources as directly connected for VLAN interface `vlan2`, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 pim ext-srcs-directly-connected
```

To configure PIM-SMv6 to treat only directly connected sources as directly connected for VLAN interface `vlan2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 pim ext-srcs-directly-connected
```

# ipv6 pim hello-holdtime

**Overview** This command configures a hello-holdtime value. You cannot configure a hello-holdtime value that is less than the current hello-interval.

Use the **no** variant of this command to return it to its default of 3.5 \* the current hello-interval.

**Syntax** `ipv6 pim hello-holdtime <holdtime>`  
`no ipv6 pim hello-holdtime`

| Parameter  | Description  |
|------------|--|
| <holdtime> | <1-65535><br>The holdtime value in seconds (no fractional seconds are accepted). |

**Default** The default hello-holdtime value is 3.5 \* the current hello-interval. The default hello-holdtime is restored using the negated form of this command.

**Mode** Interface Configuration for a VLAN interface.

**Usage** Each time the hello-interval is updated, the hello-holdtime is also updated, according to the following rules:

If the hello-holdtime is not configured; or if the hello-holdtime is configured and less than the current hello-interval value, it is modified to the (3.5 \* hello-interval). Otherwise, it retains the configured value.

**Examples** To configure a hello-holdtime of 123 seconds on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 pim hello-holdtime 123
```

To reset the hello-holdtime to default, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 pim hello-holdtime
```

# ipv6 pim hello-interval

**Overview** This command configures a hello-interval value for PIM-SMv6. Use the **no** variant of this command to reset the hello-interval for PIM-SMv6 to the default.

**Syntax** `ipv6 pim hello-interval <interval>`  
`no ipv6 pim hello-interval`

| Parameter  | Description  |
|------------|--|
| <interval> | <1-65535> The value in seconds (no fractional seconds accepted). |

**Default** The default hello-interval value is 30 seconds. The default is restored using the negated form of this command.

**Mode** Interface Configuration for a VLAN interface.

**Usage** When the hello-interval is configured, and the hello-holdtime is not configured, or when the configured hello-holdtime value is less than the new hello-interval value; the holdtime value is modified to the (3.5 \* hello-interval). Otherwise, the hello-holdtime value is the configured value.

**Example** To set the hello-interval to 123 seconds on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 pim hello-interval 123
```

To set the hello-interval to the default on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 pim hello-interval
```

# ipv6 pim ignore-rp-set-priority

**Overview** Use this command to ignore the RP-SET priority value, and use only the hashing mechanism for RP selection.

Use the **no** variant of this command to disable this setting.

**Syntax** `ipv6 pim ignore-rp-set-priority`  
`no ipv6 pim ignore-rp-set-priority`

**Mode** Global Configuration

**Usage** This command is used to inter-operate with older Cisco IOS versions.

**Example**

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim ignore-rp-set-priority
awplus# configure terminal
awplus(config)# no ipv6 pim ignore-rp-set-priority
```

## ipv6 pim jp-timer

**Overview** Use this command to set the PIM-SMv6 join/prune timer. Note that the value set by the join/prune timer is the value that the device puts into the holdtime field of the join/prune packets it sends to its neighbors.

Use the **no** variant of this command to return the PIM-SMv6 join/prune timer to its default value of 210 seconds.

**Syntax** `ipv6 pim jp-timer <1-65535>`  
`no ipv6 pim jp-timer [<1-65535>]`

| Parameter                    | Description   |
|------------------------------|---|
| <code>&lt;1-65535&gt;</code> | Specifies the Join/Prune timer value. The default value is 210 seconds. |

**Default** The default PIM-SMv6 join/prune timer value is 210 seconds.

**Mode** Global Configuration

**Example**

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim jp-timer 300
awplus# configure terminal
awplus(config)# no ipv6 pim jp-timer
```

# ipv6 pim neighbor-filter

**Overview** This command enables filtering of neighbors on the VLAN interface. When configuring a neighbor filter, PIM-SMv6 will either not establish adjacency with the neighbor, or terminate adjacency with the existing neighbors if denied by the filtering IPv6 access list.

Use the **no** variant of this command to disable this function.

**Syntax** `ipv6 pim neighbor-filter <IPv6-accesslist>`  
`no ipv6 pim neighbor-filter <IPv6-accesslist>`

| Parameter                            | Description   |
|--------------------------------------|---|
| <code>&lt;IPv6-accesslist&gt;</code> | Specify a Standard or an Extended software IPv6 access list name for the PIM-SMv6 neighbor filter.<br>See the <a href="#">IPv6 Software Access Control List (ACL) Commands</a> chapter for supported IPv6 ACLs. |

**Default** By default, there is no neighbor filtering applied to an interface.

**Mode** Interface Configuration for a VLAN interface.

**Example** To enable filtering on interface vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config)# ipv6 enable
awplus(config-if)# ipv6 pim neighbor-filter filter1
awplus(config-if)# ipv6 access-list standard filter1 deny
fe80:20e:cff:fe01:facc
awplus(config-if)# ipv6 access-list standard filter1 permit any
awplus(config-if)# exit
```

# ipv6 pim register-rate-limit

**Overview** Use this command to configure the rate of register packets sent by this DR, in units of packets per second. The configured rate is per (S, G) state, and is not a system wide rate.

Use the **no** variant of this command to remove the limit and reset to the default rate limit.

**Syntax** `ipv6 pim register-rate-limit <1-65535>`  
`no ipv6 pim register-rate-limit`

| Parameter | Description  |
|-----------|--|
| <1-65535> | Specifies the maximum number of packets that can be sent per second. |

**Mode** Global Configuration

**Default** The default is 0, as reset with the **no** variant, which also specifies an unlimited rate limit.

**Examples**

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim register-rate-limit 3444
awplus# configure terminal
awplus(config)# no ipv6 pim register-rate-limit 3444
```

# ipv6 pim register-rp-reachability

**Overview** Use this command to enable the RP reachability check for PIMv6 Register processing at the DR. The default setting is no checking for RP-reachability.

Use the **no** variant of this command to disable this processing.

**Syntax** `ipv6 pim register-rp-reachability`  
`no ipv6 pim register-rp-reachability`

**Default** This command is disabled; by default, there is no checking for RP-reachability.

**Mode** Global Configuration

**Examples**

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim register-rp-reachability
awplus# configure terminal
awplus(config)# no ipv6 pim register-rp-reachability
```

# ipv6 pim register-source

**Overview** Use this command to configure the source IPv6 address of register packets sent by this DR, overriding the default source IPv6 address, which is the IPv6 address of the RPF interface toward the source host.

Use the **no** variant of this command to remove the IPv6 source address of Register packets sent by this DR, reverting back to use the default IPv6 source address that is the address of the RPF interface toward the source host.

**Syntax** `ipv6 pim register-source [<source-IPv6-address>|<interface>]`  
`no ipv6 pim register-source`

| Parameter                                | Description   |
|--|---|
| <code>&lt;source-IPv6-address&gt;</code> | The IPv6 address, entered in the form X::X:X, to be used as the source of the register packets. |
| <code>&lt;interface&gt;</code>           | The name of the interface to be used as the source of the register packets.                     |

**Usage** The configured address must be a reachable address to be used by the RP to send corresponding Register-Stop messages in response. It is normally the local loopback IPv6 interface address, but can also be a physical IPv6 address. This IPv6 address must be advertised by unicast routing protocols on the DR. The configured interface does not have to be PIM-SMv6 enabled.

**Mode** Global Configuration

**Examples** To configure the register source as 3ffe::24:2, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim register-source 3ffe::24:2
```

To configure the register source as vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim register-source vlan2
```

To change back to the default, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# no ipv6 pim register-source
```

# ipv6 pim register-suppression

**Overview** Use this command to configure the register-suppression time, in seconds, overriding the default of 60 seconds.

Use the **no** variant of this command to reset the value to its default of 60 seconds.

**Syntax** `ipv6 pim register-suppression <1-65535>`  
`no ipv6 pim register-suppression`

| Parameter | Description                              |
|-----------|--|
| <1-65535> | Register suppression on time in seconds. |

**Mode** Global Configuration

**Default** The default PIM-SMv6 register suppression time is 60 seconds, and is restored with the no variant of this command.

**Usage** Configuring this value modifies register-suppression time at the DR. Configuring this value at the RP modifies the RP-keepalive-period value if the [ipv6 pim rp-register-kat](#) command is not used.

**Examples**

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim register-suppression 192
awplus# configure terminal
awplus(config)# no ipv6 pim register-suppression
```

# ipv6 pim rp-address

**Overview** Use this command to statically configure RP (Rendezvous Point) address for IPv6 multicast groups.

Use the **no** variant of this command to remove a statically configured RP (Rendezvous Point) address for IPv6 multicast groups.

**Syntax** `ipv6 pimv6 rp-address <IPv6-address> [<IPv6-access-list>]  
[override]`  
`no ipv6 pim rp-address <IPv6-address> [<IPv6-access-list>]  
[override]`

| Parameter          | Description  |
|--------------------|--|
| <IPv6-address>     | Specify the IPv6 address of the Rendezvous Point, entered in the form X:X::X:X.  |
| <IPv6-access-list> | Specify a Standard or an Extended software IPv6 access-list name.<br>See <a href="#">IPv6 Software Access Control List (ACL) Commands</a> for supported IPv6 ACLs. |
| override           | Specify this optional parameter keyword to enable any statically defined RPs to override dynamically learned RPs.  |

**Mode** Global Configuration

**Usage notes** The AlliedWare Plus™ PIM-SMv6 implementation supports multiple static RPs. It also supports usage of static-RP and BSR mechanism simultaneously. The **ipv6 pim rp-address** command is used to statically configure the RP address for IPv6 multicast groups.

You need to understand the following information before using this command.

If the RP-address that is configured by the BSR, and the RP-address that is configured statically, are both available for a group range, then the RP-address configured through BSR is chosen over the statically configured RP-address.

A single static-RP can be configured for multiple group ranges using software IPv6 access- lists (ACLs). However, configuring multiple static RPs (using **ipv6 pim rp-address** command) with the same RP address is not allowed. The static-RP can either be configured for the whole multicast group range `ff00::/8` (without using IPv6 ACLs) or for specific group ranges (when using IPv6 ACLs).

For example, configuring **ipv6 pim rp-address 3ffe:10:10:5::153** will configure static-RP `3ffe:10:10:5::153` for the default group range `ff00::/8`. Configuring **ipv6 pim rp-address 3fee:20:20:5::153 grp-list** will configure static-RP `3ffe:20:20:5::153` for all the group ranges represented by permit filters in the defined named **grp-list** ACL.

If multiple static-RPs are available for a group range, then one with the highest IPv6 address is chosen.

Only `permit` filters in IPv6 ACL are considered as valid group ranges. The default `permit filter ::/0` is converted to the default multicast filter `ff00::/8`.

After configuration, the RP-address is inserted into a static-RP group tree based on the configured group ranges. For each group range, multiple static-RPs are maintained in a list. This list is sorted in a descending order of IPv6 addresses. When selecting static-RPs for a group range, the first element (which is the static-RP with highest IPv6 address) is chosen.

RP-address deletion is handled by removing the static-RP from all the existing group ranges and recalculating the RPs for existing TIB states if required.

Group mode and RP address mappings learned through BSR take precedence over mappings statistically defined by the `ipv6 pim rp-address` command. Commands with the `override` keyword take precedence over dynamically learned mappings.

**Examples**

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 access-list standard G2 permit
2001:db8::/128
awplus(config)# ipv6 pim rp-address 3ffe:30:30:5::153 G2
awplus# configure terminal
awplus(config)# no ipv6 pim rp-address 3ffe:30:30:5::153 G2
```

**Related commands**

- [ipv6 pim rp-candidate](#)
- [ipv6 pim rp-register-kat](#)

# ipv6 pim rp-candidate

**Overview** Use this command to make the device an RP (Rendezvous Point) candidate, using the IPv6 address of the specified interface.

Use the **no** variant of this command to stop the device from being an RP candidate.

**Syntax** `ipv6 pim rp-candidate <interface> [priority <priority>|interval <interval>|grouplist <accesslist>]`  
`no ipv6 pim rp-candidate [<interface>]`

| Parameter                 | Description   |
|---------------------------|---|
| <interface>               | The interface name.   |
| priority<br><priority>    | The RP candidate priority for this interface on this device, from 0 to 255. The lower the priority value, the more likely this candidate is to become the RP.       |
| interval<br><interval>    | The advertisement interval, from 1 to 16383 seconds.  |
| grouplist<br><accesslist> | A Standard or an Extended software IPv6 access list name. See the <a href="#">IPv6 Software Access Control List (ACL) Commands</a> chapter for supported IPv6 ACLs. |

**Default** The priority value for a candidate RP is 192 by default until specified using the **priority** parameter.

**Mode** Global Configuration

**Usage notes** Note that issuing the command **ipv6 pim rp-candidate <interface>** without optional **priority**, **interval**, or **grouplist** parameters will configure the candidate RP with a priority value of 192.

**Examples** To specify a priority of 3, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim rp-candidate vlan2 priority 3
```

To stop the device from being an RP candidate on vlan2 , use the following commands:

```
awplus# configure terminal
awplus(config)# no ipv6 pim rp-candidate vlan2
```

To use the ACL named G2 to specify the group prefixes that are advertised in association with the RP address, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 access-list standard G2 permit
2001:db8::/128
awplus(config)# ipv6 pim rp-candidate vlan2 group-list G2
```

**Related commands**

- [ipv6 pim rp-address](#)
- [ipv6 pim rp-register-kat](#)

# ipv6 pim rp embedded

**Overview** Use this command to configure and enable embedded RP (Rendezvous Point) in PIM-SMv6.

This command only applies to the embedded RP group range **ff7x::/12** and **fffx::/12**.

Use the **no** variant of this command to disable embedded RP support. Since embedded RP support is enabled by default, use the **no** variant of this command to disable the default.

**Syntax** `ipv6 pim rp embedded`  
`no ipv6 pim rp embedded`

**Mode** Global Configuration

**Default** Embedded RP is enabled by default in the AlliedWare Plus implementation of PIM-SMv6.

**Examples** The following example re-enables embedded RP support, the default state in PIM-SMv6:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim rp embedded
```

The following example disables embedded RP support, which is enabled by default in PIM-SMv6:

```
awplus# configure terminal
awplus(config)# no ipv6 pim rp embedded
```

# ipv6 pim rp-register-kat

**Overview** Use this command to configure the Keep Alive Time (KAT) for (S,G) states at the RP (Rendezvous Point) to monitor PIM-SMv6 Register packets.

Use the **no** variant of this command to return the PIM-SMv6 KAT timer to its default value of 210 seconds.

**Syntax** `ipv6 pim rp-register-kat <1-65535>`  
`no ipv6 pim rp-register-kat`

| Parameter                    | Description   |
|------------------------------|---|
| <code>&lt;1-65536&gt;</code> | Specify the KAT timer in seconds. The default value is 210 seconds. |

**Mode** Global Configuration

**Default** The default PIM-SMv6 KAT timer value is 210 seconds.

**Examples**

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim rp-register-kat 3454
awplus# configure terminal
awplus(config)# no ipv6 pim rp-register-kat
```

**Related commands** [ipv6 pim rp-address](#)  
[ipv6 pim rp-candidate](#)

# ipv6 pim sparse-mode

**Overview** Use this command to enable PIM-SMv6 on an interface.  
Use the **no** variant of this command to disable PIM-SMv6 on an interface.

**Syntax** `ipv6 pim sparse-mode`  
`no ipv6 pim sparse-mode`

**Mode** Interface Configuration for a VLAN interface.

**Examples** To enable PIM-SMv6 on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 pim sparse-mode
```

To disable PIM-SMv6 on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 pim sparse-mode
```

# ipv6 pim sparse-mode passive

**Overview** Use this command to enable and disable PIM-SMv6 passive mode operation for local members on an interface.

Use the **no** variant of this command to disable PIM-SMv6 passive mode operation for local members on an interface.

**Syntax** `ipv6 pim sparse-mode passive`  
`no ipv6 pim sparse-mode passive`

**Mode** Interface Configuration for a VLAN interface.

**Usage** Passive mode essentially stops PIM-SMv6 transactions on the interface, allowing only the MLD mechanism to be active.

**Examples** To enable passive mode on vlan2, use the commands

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 pim sparse-mode passive
```

To disable passive mode on vlan2, use the commands

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 pim sparse-mode passive
```

# ipv6 pim spt-threshold

**Overview** This command turns on the ability for the last-hop PIM-SMv6 router to switch to SPT (shortest-path tree).

The **no** variant of this command turns off the ability for the last-hop PIM-SMv6 router to switch to SPT.

**NOTE:** *The switching to SPT happens either at the receiving of the first data packet, or not at all; it is not rate-based.*

**Syntax** `ipv6 pim spt-threshold`  
`no ipv6 pim spt-threshold`

**Mode** Global Configuration

**Examples** To enable the last-hop PIM-SMv6 router to switch to SPT, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim spt-threshold
```

To stop the last-hop PIM-SMv6 router from being able to switch to SPT, use the following commands:

```
awplus# configure terminal
awplus(config)# no ipv6 pim spt-threshold
```

**Related commands** [ipv6 pim spt-threshold group-list](#)

# ipv6 pim spt-threshold group-list

**Overview** Use this command to turn on/off the ability for the last-hop PIM-SMv6 router to switch to SPT (shortest-path tree) for multicast group addresses as specified by the given software IPv6 access-list.

Use the **no** variant of this command to turn off switching to the SPT.

**NOTE:** *The switching to SPT happens either at the receiving of the first data packet, or not at all; it is not rate-based.*

**Syntax**

```
ipv6 pim spt-threshold group-list <IPv6-access-list>  
no ipv6 pim spt-threshold group-list <IPv6-access-list>
```

| Parameter          | Description  |
|--------------------|--|
| <IPv6-access-list> | Specify a Standard or an Extended software IPv6 access-list name.<br>See the <a href="#">IPv6 Software Access Control List (ACL) Commands</a> chapter for supported IPv6 ACLs. |

**Mode** Global Configuration

**Examples** To enable the last-hop PIM-SMv6 router to switch to SPT for groups specified by the ACL named G1, use the following commands:

```
awplus# configure terminal  
awplus(config)# ipv6 forwarding  
awplus(config)# ipv6 multicast-routing  
awplus(config)# ipv6 pim spt-threshold group-list G1  
awplus(config)# ipv6 access-list standard G1 permit  
2001:db8::/128
```

To stop the last-hop PIM-SMv6 router from being able to switch to SPT for groups specified by the ACL named G1, use the following commands:

```
awplus# configure terminal  
awplus(config)# no ipv6 pim spt-threshold group-list G1
```

**Related commands** [ipv6 pim spt-threshold](#)

# ipv6 pim ssm

**Overview** Use this command to define the Source Specific Multicast (SSM) range of IPv6 multicast addresses. PIM-SMv6 routers will only install (S,G) entries for multicast groups (addresses) residing in the SSM range.

Use the **no** variant of this command to disable the SSM range.

**Syntax** `ipv6 pim ssm {default|range <named-access-list>}`  
`no ipv6 pim ssm`

| Parameter           | Description  |
|---------------------|--|
| default             | Use FF3x::/32 as the range for SSM.                |
| range               | Specify an ACL for group range to be used for SSM. |
| <named-access-list> | Specify a named standard access list.              |

**Default** By default, the command is disabled.

**Mode** Global Configuration

**Usage** Any (\*,G) or (S,G,rpt) joins received for multicast groups (addresses) within the range are not installed in PIM-SMv6 mroute table.

**Examples** To configure the SSM service for the IPv6 address range defined by IPv6 access list 'IPv6-PIM-SSM-RANGE', use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list standard IPv6-PIM-SSM-RANGE
permit ff3e::/32
awplus(config)# ipv6 pim ssm range IPv6-PIM-SSM-RANGE
```

To use the default address range for PIM-SSM, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 pim ssm default
```

To disable PIM-SSM, use the commands:

```
awplus# configure terminal
awplus(config)# no ipv6 pim ssm
```

# ipv6 pim unicast-bsm

**Overview** Use this command to enable support for the sending and receiving of unicast Boot Strap Messages (BSM) on an interface.

Use the **no** variant of this command to disable the sending and receiving of unicast BSM on an interface.

**Syntax** `ipv6 pim unicast-bsm`  
`no ipv6 pim unicast-bsm`

**Mode** Interface Configuration for a VLAN interface.

**Default** Unicast BSM is disabled by default on an interface.

**Usage** This command provides backward compatibility with older versions of the Boot Strap Router (BSR) specification, which directs unicast BSM to refresh the state of new or restarting neighbors. The current BSR specification defines a No Forward BSM to achieve the same result.

**Examples** To enable BSM messages on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 pim unicast-bsm
```

To disable BSM messages on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 pim unicast-bsm
```

# service pim6

**Overview** Use this command to enable IPv6 PIM sparse mode services.

Use the **no** version of the command to disable unused IPv6 PIM sparse mode services.

**Syntax** `service pim6`  
`no service pim6`

**Default** Enabled

**Mode** Global Configuration

**Usage notes** Sometimes it may be desirable to disable unused services, in order to reduce memory use.

Disabling the PIM services will only take effect after you save the configuration and restart the device.

**Example** To disable the IPv6 PIM sparse mode service, use the commands:

```
awplus# configure terminal
awplus(config)# no service pim6
```

**Output** Figure 36-2: Example output from **no service pim6**

```
awplus(config)#no service pim6
% Save the config and restart the device for this change to take
effect
```

**Command changes** Version 5.5.0-0.1: command added

# show debugging ipv6 pim sparse-mode

**Overview** Use this command to see what debugging is turned on for PIM-SMv6.

For information on filtering and saving command output, see the [“Getting\\_Started with AlliedWare Plus” Feature Overview and Configuration\\_Guide](#).

**Syntax** `show debugging ipv6 pim sparse-mode`

**Mode** User Exec and Privileged Exec

**Example** To display PIM-SMv6 debugging settings, use the command:

```
awplus# show debugging ipv6 pim sparse-mode
```

Figure 36-3: Example output from the **show debugging ipv6 pim sparse-mode** command

```
awplus#show debugging ipv6 pim sparse-mode

# show ipv6 pim sparse-mode bsr-router

**Overview** Use this command to show the PIM-SMv6 Bootstrap Router (BSR) IPv6 address. For information on filtering and saving command output, see the [“Getting\\_Started with AlliedWare Plus” Feature Overview and Configuration\\_Guide](#).

**Syntax** `show ipv6 pim sparse-mode bsr-router`

**Mode** User Exec and Privileged Exec

**Example** To display the BSR IPv6 address, use the command:

```
awplus# show ipv6 pim sparse-mode bsr-router
```

**Output** Figure 36-4: Example output from the **show ipv6 pim sparse-mode bsr-router** command

```
awplus#show ipv6 pim sparse-mode bsr-router
PIM6v2 Bootstrap information
  BSR address: 2001:203::213 (?)
  Uptime:      00:36:25, BSR Priority: 64, Hash mask length: 126
  Expires:     00:01:46
  Role: Candidate BSR
  State: Candidate BSR

Candidate RP: 2001:5::211(vlan5)
  Advertisement interval 60 seconds
  Next C-RP advertisement in 00:00:43
```

```

# show ipv6 pim sparse-mode local-members

**Overview** Use this command to show detailed local member information on an interface configured for PIM-SMv6. If you do not specify an interface then detailed local member information is shown for all interfaces configured for PIM-SMv6.

For information on filtering and saving command output, see the [“Getting\\_Started with AlliedWare Plus” Feature Overview and Configuration\\_Guide](#).

**Syntax** `show ipv6 pim sparse-mode local-members [<interface>]`

| Parameter   | Description                     |
|-------------|---------------------------------|
| <interface> | Optional Specify the interface. |

**Mode** User Exec and Privileged Exec

**Example** To show detailed PIM-SMv6 information for all PIM-SMv6 configured interfaces, use the command:

```
awplus# show ipv6 pim sparse-mode local-members
```

**Output** Figure 36-6: Example output from the **show ipv6 pim sparse-mode local-members** command

```
awplus#show ipv6 pim sparse-mode local-members
PIM Local membership information

vlan1:

  (*, ff02::1:ff6b:4783) : Include

vlan203:

  (*, ff0e:1::4) : Include
```

**Output** Figure 36-7: Example output from the **show ipv6 pim sparse-mode local-members vlan1** command

```
awplus#show ipv6 pim sparse-mode local-members vlan1
PIM Local membership information

vlan1:

  (*, ff02::1:ff6b:4783) : Include
```

# show ipv6 pim sparse-mode mroute

**Overview** Use this command to display the IPv6 multicast routing table, or the IPv6 multicast routing table based on the specified IPv6 address or addresses.

Two group IPv6 addresses cannot be entered simultaneously; two source IPv6 addresses cannot be entered simultaneously.

For information on filtering and saving command output, see the [“Getting\\_Started with AlliedWare Plus” Feature Overview and Configuration\\_Guide](#).

**Syntax**

```
show ipv6 pim sparse-mode mroute
show ipv6 pim sparse-mode mroute <group-IPv6-address>
show ipv6 pim sparse-mode mroute <source-IPv6-address>
show ipv6 pim sparse-mode mroute <group-IPv6-address>
<source-IPv6-address>
show ipv6 pim sparse-mode mroute <source-IPv6-address>
<group-IPv6-address>
show ipv6 pim sparse-mode mroute brief
```

| Parameter                          | Description   |
|------------------------------------|---|
| <i>&lt;group-IPv6-address&gt;</i>  | Group IPv6 address, entered in the form X:X::X:X. Based on the group and source IPv6 address, the output is the selected route if present in the multicast route tree.  |
| <i>&lt;source-IPv6-address&gt;</i> | Source IPv6 address, entered in the form X:X::X:X. Based on the source and group IPv6 address, the output is the selected route if present in the multicast route tree. |
| brief                              | Brief display.  |

**Mode** User Exec and Privileged Exec

**Usage notes** Note that when a feature license is enabled, the output for the [show ipv6 pim sparse-mode mroute](#) command will only show 100 interfaces because of the terminal display width limit. Use the [show ipv6 pim sparse-mode mroute detail](#) command to display detailed entries of the IPv6 multicast routing table.

**Examples**

```
awplus# show ipv6 pim sparse-mode mroute
awplus# show ipv6 pim sparse-mode mroute 2001:db8::
awplus# show ipv6 pim sparse-mode mroute 2001:db8:: 2002:db8::
awplus# show ipv6 pim sparse-mode mroute brief
```

Figure 36-8: Example output from the **show ipv6 pim sparse-mode mroute** command

```
awplus#show ipv6 pim sparse-mode mroute

# show ipv6 pim sparse-mode mroute detail

**Overview** Use this command to display detailed entries of the IPv6 multicast routing table, or detailed entries of the IPv6 multicast routing table based on the specified IPv6 address or addresses.

Two group IPv6 addresses cannot be used simultaneously; two IPv6 source addresses cannot be used simultaneously.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax**

```
show ipv6 pim sparse-mode mroute  
[<group-IPv6-address>|<source-IPv6-address>] detail  
  
show ipv6 pim sparse-mode mroute [<group-IPv6-address>  
<source-IPv6-address>] detail  
  
show ipv6 pim sparse-mode mroute [<source-IPv6-address>  
<group-IPv6-address>] detail
```

| Parameter             | Description  |
|-----------------------|--|
| <group-IPv6-address>  | Group IPv6 address, entered in the form X:X::X:X. Output is all multicast entries belonging to that group.   |
| <source-IPv6-address> | Source IPv6 address, entered in the form X:X::X:X. Output is all multicast entries belonging to that source. |
| detail                | Show detailed information.   |

**Usage notes** Based on the group and source IPv6 address, the output is the selected route if present in the multicast route tree.

**Mode** User Exec and Privileged Exec

**Examples**

```
awplus# show ipv6 pim sparse-mode mroute detail  
awplus# show ipv6 pim sparse-mode mroute 2001:db8:: detail  
awplus# show ipv6 pim sparse-mode mroute 2001:db8:: 2002:db8::  
detail

# show ipv6 pim sparse-mode neighbor

**Overview** Use this command to show the PIM-SMv6 neighbor information.

For information on filtering and saving command output, see the [“Getting\\_Started with AlliedWare Plus” Feature Overview and Configuration\\_Guide](#).

**Syntax** `show ipv6 pim sparse-mode neighbor [<interface>]  
[<IPv6-address>] [detail]`

| Parameter      | Description  |
|----------------|--|
| <interface>    | Interface name. Show neighbors on an interface.  |
| <IPv6-address> | Show neighbors with a particular address on an interface. The IPv6 address entered in the form X:X::X:X. |
| detail         | Show detailed information.   |

**Mode** User Exec and Privileged Exec

**Examples** `awplus# show ipv6 pim sparse-mode neighbor`  
`awplus# show ipv6 pim sparse-mode neighbor vlan5 detail`

Figure 36-11: Example output from the **show ipv6 pim sparse-mode neighbor** command

```
awplus#show ipv6 pim sparse-mode neighbor
Neighbor Address          Interface    Uptime/Expires          DR
                               Pri/Mode

Secondary addresses:
3ffe:10:10:10:3::180
```

# show ipv6 pim sparse-mode nexthop

**Overview** Use this command to see the next hop information as used by PIM-SMv6.

For information on filtering and saving command output, see the [“Getting\\_Started with AlliedWare Plus” Feature Overview and Configuration\\_Guide](#).

**Syntax** show ipv6 pim sparse-mode nexthop

**Mode** User Exec and Privileged Exec

**Example** awplus# show ipv6 pim sparse-mode nexthop

Figure 36-13: Example output from the **show ipv6 pim sparse-mode nexthop** command

```
awplus#show ipv6 pim sparse-mode nexthop
Flags: N = New, R = RP, S = Source, U = Unreachable
Destination          Type  Nexthop Nexthop Nexthop  Nexthop Metric   Pref  Refcnt
                   Num   Addr    Iindex  Name
-----
3ffe:10:10:5::153   .RS.  1       fe80::20e:cff:fe01:facc  2    30   110   1
```

**Table 2:** Parameters in output of the **show ipv6 pim sparse-mode nexthop** command

| Parameter       | Description  |
|-----------------|--|
| Destination     | The destination address for which PIM-SMv6 requires next hop information.                                    |
| Type            | The type of destination, as indicated by the Flags description. N = New, R= RP, S = Source, U = Unreachable. |
| Nexthop Num     | The number of next hops to the destination. PIM-SMv6 always uses only 1 next hop.                            |
| Nexthop Addr    | The address of the primary next hop gateway.   |
| Nexthop IfIndex | The interface on which the next hop gateway can be reached.  |
| Nexthop Name    | The name of next hop interface.  |
| Metric          | The metric of the route towards the destination.   |
| Preference      | The preference of the route towards destination.   |
| Refcnt          | Only used for debugging.   |

# show ipv6 pim sparse-mode rp-hash

**Overview** Use this command to display the Rendezvous Point (RP) to be chosen based on the IPv6 group address selected.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ipv6 pim sparse-mode rp-hash <IPv6-group-addr>`

| Parameter                            | Description   |
|--------------------------------------|---|
| <code>&lt;IPv6-group-addr&gt;</code> | The IPv6 group address used to find the RP, entered in the form X:X::X:X. |

**Mode** User Exec and Privileged Exec

**Example** `awplus# show ipv6 pim sparse-mode rp-hash ff04:10`

Figure 36-14: Output from the **show ipv6 pim sparse-mode rp-hash** command:

```
awplus#show ipv6 pim sparse-mode rp-hash ff04::10
RP: 3ffe:10:10:5::153
Info source: 3ffe:10:10:5::153, via bootstrap
```

**Related commands** [show ipv6 pim sparse-mode rp mapping](#)

# show ipv6 pim sparse-mode rp mapping

**Overview** Use this command to show group-to-RP (Rendezvous Point) mappings, and the RP set.

For information on filtering and saving command output, see the [“Getting\\_Started with AlliedWare Plus” Feature Overview and Configuration\\_Guide](#).

**Syntax** `show ipv6 pim sparse-mode rp mapping`

**Mode** User Exec and Privileged Exec

**Example** `awplus# show ipv6 pim sparse-mode rp mapping`

Figure 36-15: Output from the **show ipv6 pim sparse-mode rp mapping** command

```
awplus#show ipv6 pim sparse-mode rp mapping
PIM Group-to-RP Mappings
Group(s): ff00::/8
  RP: 3ffe:10:10:5::153
    Info source: 3ffe:10:10:5::153, via bootstrap, priority 192
    Uptime: 05:36:40
```

**Related commands** [show ipv6 pim sparse-mode rp-hash](#)

# show ipv6 pim sparse-mode rp nexthop

**Overview** Use this command to display the RP (Rendezvous Point) next hop information used by PIM-SMv6.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ipv6 pim sparse-mode rp nexthop <RP-group-addr>`

| Parameter                          | Description   |
|------------------------------------|---|
| <code>&lt;RP-group-addr&gt;</code> | Specify the RP group address used to display next hop RP information, entered in the form X:X::X:X. |

**Mode** User Exec and Privileged Exec

**Example** `awplus# show ipv6 pim sparse-mode rp nexthop 3ffe:10:10:5::153`

Figure 36-16: Example output from the **show ipv6 pim sparse-mode rp nexthop** command

```
awplus#show ipv6 pim sparse-mode rp nexthop 3ffe:10:10:5::153
Flags: N = New, R = RP, S = Source, U = Unreachable
Destination          Type  Nexthop Nexthop Nexthop  Nexthop Metric   Pref  Refcnt
                   Num   Addr    Ifindex Name
-----
3ffe:10:10:5::153   .RS.  1       fe80::20e:cff:fe01:facc 2    30    110    1
```

**Table 3:** Parameters in output of the **show ipv6 pim sparse-mode rp nexthop** command

| Parameter       | Description  |
|-----------------|--|
| Destination     | The destination address for which PIM-SMv6 requires next hop information.                                    |
| Type            | The type of destination, as indicated by the Flags description. N = New, R= RP, S = Source, U = Unreachable. |
| Nexthop Num     | The number of next hops to the destination. PIM-SMv6 always uses only 1 next hop.                            |
| Nexthop Addr    | The address of the primary next hop gateway.   |
| Nexthop IfIndex | The interface on which the next hop gateway can be reached.  |
| Nexthop Name    | The name of next hop interface.  |

**Table 3:** Parameters in output of the **show ipv6 pim sparse-mode rp nexthop** command (cont.)

| Parameter  | Description                                      |
|------------|--|
| Metric     | The metric of the route towards the destination. |
| Preference | The preference of the route towards destination. |
| Refcnt     | Only used for debugging.                         |

# undebbug all ipv6 pim sparse-mode

**Overview** Use this command to disable all PIM-SMv6 debugging.

**Syntax** `undebbug all ipv6 pim sparse-mode`

**Mode** Privileged Exec

**Example** `awplus# undebbug all ipv6 pim sparse-mode`

**Related commands** [debug ipv6 pim sparse-mode](#)

# undebbug ipv6 pim sparse-mode

**Overview** Use this command to deactivate PIM-SMv6 debugging. Note that this command is an alias of the no variant of the [debug ipv6 pim sparse-mode](#) command.

**Syntax** `undebbug ipv6 pim sparse-mode [all] [events] [mfc] [mib] [nexthop] [nsm] [state] [timer]`

| Parameter | Description   |
|-----------|---|
| all       | Deactivates all PIM-SMv6 debugging.   |
| events    | Deactivates debug printing of PIM-SMv6 events.                                  |
| mfc       | Deactivates debug printing of MFC (Multicast Forwarding Cache).                 |
| mib       | Deactivates debug printing of PIM-SMv6 MIBs.                                    |
| nexthop   | Deactivates debug printing of PIM-SMv6 next hop communications.                 |
| nsm       | Deactivates debugging of PIM-SMv6 NSM (Network Services Module) communications. |
| state     | Deactivates debug printing of state transition on all PIM-SMv6 FSMs.            |
| timer     | Deactivates debug printing of PIM-SMv6 timers.                                  |

**Mode** Privileged Exec and Global Configuration

**Example**

```
awplus# configure terminal
awplus(config)# terminal monitor
awplus(config)# undebbug ipv6 pim sparse-mode all
awplus# configure terminal
awplus(config)# terminal monitor
awplus(config)# undebbug ipv6 pim sparse-mode events
awplus# configure terminal
awplus(config)# terminal monitor
awplus(config)# undebbug ipv6 pim sparse-mode nexthop
```

**Validation Output** Figure 36-17: Example output from the **show debugging ipv6 pim sparse-mode** command after issuing the **undebug ipv6 pim sparse-mode all** command

```
awplus#undebug ipv6 pim sparse-mode all
awplus#show debugging ipv6 pim sparse-mode
PIM-SMv6 debugging status:
  PIM event debugging is off

# PIM-DM Commands

## Introduction

**Overview** This chapter provides an alphabetical reference of PIM-DM commands. For commands common to PIM-SM and PIM-DM, see [Multicast Commands](#).

- Command List**
- “debug pim dense-mode all” on page 1914
  - “debug pim dense-mode context” on page 1915
  - “debug pim dense-mode decode” on page 1916
  - “debug pim dense-mode encode” on page 1917
  - “debug pim dense-mode fsm” on page 1918
  - “debug pim dense-mode mrt” on page 1919
  - “debug pim dense-mode nexthop” on page 1920
  - “debug pim dense-mode nsm” on page 1921
  - “debug pim dense-mode vif” on page 1922
  - “ip pim dense-mode” on page 1923
  - “ip pim dense-mode passive” on page 1924
  - “ip pim dense-mode wrong-vif-suppression” on page 1925
  - “ip pim ext-srcs-directly-connected” on page 1926
  - “ip pim hello-holdtime (PIM-DM)” on page 1927
  - “ip pim hello-interval (PIM-DM)” on page 1928
  - “ip pim max-graft-retries” on page 1929
  - “ip pim neighbor-filter (PIM-DM)” on page 1931
  - “ip pim propagation-delay” on page 1932
  - “ip pim state-refresh origination-interval” on page 1933
  - “service pdm” on page 1934

- “show debugging pim dense-mode” on page 1935
- “show ip pim dense-mode interface” on page 1936
- “show ip pim dense-mode interface detail” on page 1938
- “show ip pim dense-mode mroute” on page 1939
- “show ip pim dense-mode neighbor” on page 1940
- “show ip pim dense-mode neighbor detail” on page 1941
- “show ip pim dense-mode nexthop” on page 1942
- “undebug all pim dense-mode” on page 1943

# debug pim dense-mode all

**Overview** This command enables PIM-DM debugging.  
The **no** variant of this command disables PIM-DM debugging.

**Syntax** `debug pim dense-mode all`  
`no debug pim dense-mode all`

**Mode** Privileged Exec and Global Configuration

**Example** `awplus# configure terminal`  
`awplus(config)# debug pim dense-mode all`

**Output** Figure 37-1: Example output from the **debug pim dense-mode all** command

```
PIM event debugging is on
PIM MFC debugging is on
PIM state debugging is on
PIM packet debugging is on
PIM incoming packet debugging is on
PIM outgoing packet debugging is on
```

**Validation Commands** `show debugging pim dense-mode`

**Related commands** `debug pim dense-mode context`  
`debug pim dense-mode decode`  
`debug pim dense-mode encode`  
`debug pim dense-mode fsm`  
`debug pim dense-mode mrt`  
`debug pim dense-mode nexthop`  
`debug pim dense-mode nsm`  
`debug pim dense-mode vif`

# debug pim dense-mode context

**Overview** This command enables debugging of general configuration context.  
The **no** variant of this command disables debugging of general configuration context.

**Syntax** `debug pim dense-mode context`  
`no debug pim dense-mode context`

**Mode** Privileged Exec and Global Configuration

**Example** `awplus# configure terminal`  
`awplus(config)# debug pim dense-mode context`

**Related commands** `debug pim dense-mode all`  
`debug pim dense-mode decode`  
`debug pim dense-mode encode`  
`debug pim dense-mode fsm`  
`debug pim dense-mode mrt`  
`debug pim dense-mode nexthop`  
`debug pim dense-mode nsm`  
`debug pim dense-mode vif`

# debug pim dense-mode decode

**Overview** This command enables debugging of the PIM-DM message decoder. The **no** variant of this command disables debugging of the PIM-DM message decoder.

**Syntax** debug pim dense-mode decode  
no debug pim dense-mode decode

**Mode** Privileged Exec and Global Configuration

**Example** awplus# configure terminal  
awplus(config)# debug pim dense-mode decoder

**Related commands** debug pim dense-mode all  
debug pim dense-mode context  
debug pim dense-mode encode  
debug pim dense-mode fsm  
debug pim dense-mode mrt  
debug pim dense-mode nexthop  
debug pim dense-mode nsm  
debug pim dense-mode vif

# debug pim dense-mode encode

**Overview** This command enables debugging of the PIM-DM message encoder. The **no** variant of this command disables debugging of the PIM-DM message encoder.

**Syntax** `debug pim dense-mode encode`  
`no debug pim dense-mode encode`

**Mode** Privileged Exec and Global Configuration

**Example** `awplus# configure terminal`  
`awplus(config)# debug pim dense-mode encoder`

**Related commands** `debug pim dense-mode all`  
`debug pim dense-mode context`  
`debug pim dense-mode decode`  
`debug pim dense-mode fsm`  
`debug pim dense-mode mrt`  
`debug pim dense-mode nexthop`  
`debug pim dense-mode nsm`  
`debug pim dense-mode vif`

# debug pim dense-mode fsm

**Overview** This command enables debugging of Finite-State Machine (FSM) specific information of all Multicast Routing Table (MRT) and MRT Virtual Multicast Interface (MRT-VIF) entries.

The **no** variant of this command disables debugging of Finite-State Machine (FSM) specific information of all Multicast Routing Table (MRT) and MRT Virtual Multicast Interface (MRT-VIF) entries.

**Syntax** `debug pim dense-mode fsm`  
`no debug pim dense-mode fsm`

**Mode** Privileged Exec and Global Configuration

**Example** `awplus# configure terminal`  
`awplus(config)# debug pim dense-mode fsm`

**Related commands** `debug pim dense-mode all`  
`debug pim dense-mode context`  
`debug pim dense-mode decode`  
`debug pim dense-mode encode`  
`debug pim dense-mode mrt`  
`debug pim dense-mode nexthop`  
`debug pim dense-mode nsm`  
`debug pim dense-mode vif`

# debug pim dense-mode mrt

**Overview** This command enables debugging of MRT and MRT-VIF entry handling (for example, creation and deletion of).

The **no** variant of this command disables debugging of MRT and MRT-VIF entry handling.

**Syntax** `debug pim dense-mode mrt`  
`no debug pim dense-mode mrt`

**Mode** Privileged Exec and Global Configuration

**Example** `awplus# configure terminal`  
`awplus(config)# debug pim dense-mode mrt`

**Related commands** [debug pim dense-mode all](#)  
[debug pim dense-mode context](#)  
[debug pim dense-mode decode](#)  
[debug pim dense-mode encode](#)  
[debug pim dense-mode fsm](#)  
[debug pim dense-mode nexthop](#)  
[debug pim dense-mode nsm](#)  
[debug pim dense-mode vif](#)

# debug pim dense-mode nexthop

**Overview** This command enables debugging of Reverse Path Forwarding (RPF) neighbor next hop cache handling.

The **no** variant of this command disables debugging of Reverse Path Forwarding (RPF) neighbor next hop cache handling.

**Syntax** `debug pim dense-mode nexthop`  
`no debug pim dense-mode nexthop`

**Mode** Privileged Exec and Global Configuration

**Example** `awplus# configure terminal`  
`awplus(config)# debug pim dense-mode nexthop`

**Related commands** `debug pim dense-mode all`  
`debug pim dense-mode context`  
`debug pim dense-mode decode`  
`debug pim dense-mode encode`  
`debug pim dense-mode fsm`  
`debug pim dense-mode mrt`  
`debug pim dense-mode nsm`  
`debug pim dense-mode vif`

# debug pim dense-mode nsm

**Overview** This command enables debugging of PIM-DM interface with NSM.  
The **no** variant of this command disables debugging of PIM-DM interface with NSM.

**Syntax** `debug pim dense-mode nsm`  
`no debug pim dense-mode nsm`

**Mode** Privileged Exec and Global Configuration

**Example** `awplus# configure terminal`  
`awplus(config)# debug pim dense-mode nsm`

**Related commands** `debug pim dense-mode all`  
`debug pim dense-mode context`  
`debug pim dense-mode decode`  
`debug pim dense-mode encode`  
`debug pim dense-mode fsm`  
`debug pim dense-mode mrt`  
`debug pim dense-mode nexthop`  
`debug pim dense-mode vif`

# debug pim dense-mode vif

**Overview** This command enables debugging of VIF handling.  
The **no** variant of this command disables debugging of VIF handling.

**Syntax** `debug pim dense-mode vif`  
`no debug pim dense-mode vif`

**Mode** Privileged Exec and Global Configuration

**Example** `awplus# configure terminal`  
`awplus(config)# debug pim dense-mode vif`

**Related commands**

- `debug pim dense-mode all`
- `debug pim dense-mode context`
- `debug pim dense-mode decode`
- `debug pim dense-mode encode`
- `debug pim dense-mode fsm`
- `debug pim dense-mode mrt`
- `debug pim dense-mode nexthop`
- `debug pim dense-mode nsm`

# ip pim dense-mode

**Overview** This command enables or disables PIM-DM operation from Interface mode on the current VLAN interface. This command also disables passive mode on the VLAN interface if passive mode has been enabled using an [ip pim dense-mode passive](#) command.

The **no** variant of this command disables all PIM-DM activities on the interface.

**Syntax** `ip pim dense-mode`  
`no ip pim dense-mode`

**Mode** Interface Configuration for a VLAN interface.

**Example**

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip pim dense-mode
```

# ip pim dense-mode passive

**Overview** This command enables PIM-DM passive mode operation from Interface mode on the current VLAN interface.

The **no** variant of this command disables passive mode.

**Syntax** `ip pim dense-mode passive`  
`no ip pim dense-mode passive`

**Mode** Interface Configuration for a VLAN interface.

**Usage** Configuring a VLAN interface as a passive PIM-DM interface indicates that the VLAN interface is connected to a stub network (i.e. a network that does not contain any PIM Routers). So, multicast streams that arrive on other PIM-DM interfaces can be routed to hosts on the passive PIM-DM interface, but no PIM neighbor relationships will be formed on the passive PIM-DM interface.

**Example**

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip pim dense-mode passive
```

# ip pim dense-mode wrong-vif-suppression

**Overview** Use this command to permit or block packets that arrive on the wrong VLAN Interface (VIF) for PIM dense-mode.

Use the **no** variant of this command to disable dense-mode wrong VIF suppression

**Syntax** `ip pim dense-mode wrong-vif-suppression`  
`no ip pim dense-mode wrong-vif-suppression`

**Default** Disabled.

**Mode** Global Configuration

**Usage notes** This command enables wrong VIF suppression for PIM dense-mode. Wrong VIF suppression prevents multicast packets received on the wrong upstream interface from being copied to the CPU.

**Examples** To enable wrong VIF suppression, use the commands:

```
awplus# configure terminal
awplus(config)# ip pim dense-mode wrong-vif-suppression
```

To disable wrong VIF suppression, use the commands:

```
awplus# configure terminal
awplus(config)# no ip pim dense-mode wrong-vif-suppression
```

**Command changes** Version 5.4.8-2.3: command added.

# ip pim ext-srcs-directly-connected

**Overview** Use this command to configure PIM to treat all source traffic arriving on the interface as though it was sent from a host directly connected to the interface.

Use the **no** variant of this command to configure PIM to treat only directly connected sources as directly connected.

**Syntax** `ip pim ext-srcs-directly-connected`  
`no ip pim ext-srcs-directly-connected`

**Default** The **no** variant of this command is the default behavior.

**Mode** Interface Configuration for a VLAN interface.

**Example** To configure PIM to treat all sources as directly connected for VLAN interface `vlan2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip pim ext-srcs-directly-connected
```

To configure PIM to treat only directly connected sources as directly connected for VLAN interface `vlan2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip pim ext-srcs-directly-connected
```

# ip pim hello-holdtime (PIM-DM)

**Overview** This command configures a **hello-holdtime**. The PIM **hello-holdtime** on a VLAN interface is the period which the router will wait to receive a hello from neighbors on that interface. If the router does not receive a hello from a given neighbor within that period, then it will decide that the neighbor is no longer an active PIM Router, and will terminate the neighbor relationship.

You cannot configure a **hello-holdtime** value that is less than the current **hello-interval**. Each time the **hello-interval** is updated, the **hello-holdtime** is also updated, according to the following rules:

- If the **hello-holdtime** is not configured; or if the hello holdtime is configured and less than the current **hello-interval** value, it is modified to 3.5 times the **hello-interval** value.
- Otherwise, it retains the configured value.

Use the **no** variant of this command to return the hello-holdtime value to its default of 3.5 times the current hello-interval value.

**Syntax** `ip pim hello-holdtime <holdtime>`  
`no ip pim hello-holdtime`

| Parameter                     | Description   |
|-------------------------------|---|
| <code>&lt;holdtime&gt;</code> | <code>&lt;1-65535&gt;</code><br>The holdtime value in seconds (no fractional seconds are accepted). |

**Mode** Interface Configuration for a VLAN interface.

**Example** `awplus# configure terminal`  
`awplus(config)# interface vlan2`  
`awplus(config-if)# ip pim hello-holdtime 123`

## ip pim hello-interval (PIM-DM)

**Overview** This command configures a PIM **hello-interval** value. The PIM **hello-interval** on a VLAN interface is the period at which the router will transmit PIM hello messages on that interface.

When the **hello-interval** is configured, and the **hello-holdtime** is not configured, or when the configured **hello-holdtime** value is less than the new **hello-interval** value; the **hello-holdtime** value is modified to 3.5 times the **hello-interval** value. Otherwise, the **hello-holdtime** value is the configured value. The default is 30 seconds.

Use the **no** variant of this command to reset the **hello-interval** to the default.

**Syntax** `ip pim hello-interval <interval>`  
`no ip pim hello-interval`

| Parameter                     | Description   |
|-------------------------------|---|
| <code>&lt;interval&gt;</code> | <code>&lt;1-65535&gt;</code> The value in seconds (no fractional seconds accepted). |

**Mode** Interface Configuration for a VLAN interface.

**Example**

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip pim hello-interval 123
```

# ip pim max-graft-retries

**Overview** This command configures PIM-DM to send a limited number of Graft message retries, after which time the device will remove all information regarding the particular (Source, Group), or until the device receives an acknowledgment, whichever occurs first.

The **no** variant of this command configures PIM-DM to send Graft message retries until the device receives an acknowledgment, which is the default behavior.

**Syntax** `ip pim max-graft-retries <1-65535>`  
`no pim max-graft-retries`

| Parameter         | Description   |
|-------------------|---|
| no                | Negate a command or set its defaults.                       |
| ip                | Internet Protocol (IP).                                     |
| pim               | PIM Interface commands.                                     |
| max-graft-retries | PIM Graft message retries.                                  |
| <1-65535>         | Graft message retries before ceasing Graft message retries. |

**Default** By default, Graft retries are sent by PIM-DM until the device receives an acknowledgment.

**Mode** Interface Configuration for a VLAN interface.

**Usage** Graft messages are used to reduce the join latency when a previously pruned branch of the source tree must be grafted back, when a member joins the group after the PIM-DM device has sent a Prune message to prune unwanted traffic. Graft messages are the only PIM-DM messages that receive an acknowledgment.

If Graft messages were not used, then the member waiting for pruned off traffic would have to wait up to 3 minutes for the periodic re-flooding to occur to begin receiving multicast traffic again. By using Grafts, the Prune can be reversed much faster than waiting for periodic re-flooding to begin receiving multicast traffic again.

**Examples** To configure PIM-DM on the VLAN interface vlan2 to send a maximum of 10 Graft message retries, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip pim max-graft-retries 10
```

To configure PIM-DM on the VLAN interface vlan2 to send Graft message retries forever, which is the default behavior, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip pim max-graft-retries
```

**Validation  
Commands**

- show ip mroute
- show ip pim dense-mode mroute
- show running-config

## ip pim neighbor-filter (PIM-DM)

**Overview** Enables filtering of neighbors on the VLAN interface. When configuring a neighbor filter, PIM-DM will either not establish adjacency with the neighbor, or terminate adjacency with the existing neighbors if denied by the filtering access list.

Use the **no** variant of this command to disable this function.

**Syntax** `ip pim neighbor-filter [<number>|<accesslist>]`  
`no ip pim neighbor-filter [<number>|<accesslist>]`

| Parameter    | Description                            |
|--------------|--|
| <number>     | <1-99> Standard IP access list number. |
| <accesslist> | IP access list name.                   |

**Default** By default, there is no filtering.

**Mode** Interface Configuration for a VLAN interface.

**Example**

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip pim neighbor-filter 14
```

# ip pim propagation-delay

**Overview** This command configures the PIM **propagation-delay** value. The PIM **propagation-delay** is the expected delay in the transfer of PIM messages across the VLAN interface that it is attached to.

Use the **no** variant of this command to return the **propagation-delay** to the default (1000 milliseconds).

**Syntax** `ip pim propagation-delay <delay>`  
`no ip pim propagation-delay`

| Parameter                  | Description  |
|----------------------------|--|
| <code>&lt;delay&gt;</code> | <code>&lt;1000-5000&gt;</code> The value in milliseconds.<br>The default is 1000 milliseconds. |

**Default** The propagation-delay is set to 1000 milliseconds by default.

**Mode** Interface Configuration for a VLAN interface.

**Examples**

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip pim propagation-delay 2000
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip pim propagation-delay
```

# ip pim state-refresh origination-interval

**Overview** This command configures a PIM **state-refresh origination-interval** value. The origination interval is the number of seconds between PIM state refresh control messages. The default is 60 seconds.

Use the **no** variant of this command to return the origination interval to the default.

**Syntax** `ip pim state-refresh origination-interval <interval>`  
`no ip pim state-refresh origination-interval`

| Parameter                     | Description  |
|-------------------------------|--|
| <code>&lt;interval&gt;</code> | <code>&lt;1-100&gt;</code> The integer value in seconds (no fractional seconds accepted). The default <b>state-refresh origination-interval</b> value is 60. |

**Default** The state-refresh origination-interval is set to 60 seconds by default, and is reset using negation.

**Mode** Interface Configuration for a VLAN interface.

**Example** `awplus# configure terminal`  
`awplus(config)# interface vlan2`  
`awplus(config-if)# ip pim state-refresh origination-interval 65`

# service pdm

**Overview** Use this command to enable PIM dense mode services.  
Use the **no** version of the command to disable unused PIM dense mode services.

**Syntax** `service pdm`  
`no service pdm`

**Default** Enabled

**Mode** Global Configuration

**Usage notes** Sometimes it may be desirable to disable unused services, in order to reduce memory use.  
Disabling the PIM services will only take effect after you save the configuration and restart the device.

**Example** To disable the PIM dense mode service, use the commands:

```
awplus# configure terminal  
awplus(config)# no service pdm
```

**Output** Figure 37-2: Example output from **no service pdm**

```
awplus(config)#no service pdm  
% Save the config and restart the device for this change to take  
effect
```

**Command changes** Version 5.5.0-0.1: command added

# show debugging pim dense-mode

**Overview** This command displays the status of the debugging of the system.  
For information on filtering and saving command output, see the [“Getting\\_Started with AlliedWare Plus” Feature Overview and Configuration\\_Guide](#).

**Syntax** `show debugging pim dense-mode`

**Mode** User Exec and Privileged Exec

**Output** Figure 37-3: Example output from the show debugging pim dense-mode command

```
PIM-DM Debugging status:
PIM-DM Decoder debugging is off
PIM-DM Encoder debugging is off
PIM-DM FSM debugging is off
PIM-DM MRT debugging is off
PIM-DM NHOP debugging is off
PIM-DM NSM debugging is off
PIM-DM VIF debugging is off
```

**Related commands** [debug pim dense-mode all](#)

# show ip pim dense-mode interface

**Overview** This command displays the PIM-DM interface information.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip pim dense-mode interface`

**Mode** User Exec and Privileged Exec

**Example** To display information about the PIM-DM interfaces, use the command:

```
awplus# show ip pim dense-mode interface
```

## Output

```
Total configured interfaces: 24   Maximum allowed: 32
Total active interfaces:      22

Address          Interface VIFIndex Ver/   Nbr
                Mode     Count
192.168.1.53/24  vlan2    0       v2/D   2
192.168.2.1     vlan3    2       v2/D   0
...
Note that this screen has been edited to remove any additional
interfaces.
```

**Table 1:** Parameters in the output of the `show ip pim dense-mode interface` command

| Parameter                   | Description   |
|-----------------------------|---|
| Total configured interfaces | The number of configured PIM Dense Mode interfaces.                     |
| Maximum allowed             | The maximum number of PIM Dense Mode interfaces that can be configured. |
| Total active interfaces     | The number of active PIM Dense Mode interfaces.                         |
| Address                     | Primary PIM-DM address.   |
| Interface                   | Name of the PIM-DM interface.   |
| VIF Index                   | The Virtual Interface index of the VLAN.                                |
| Ver/Mode                    | PIM version/Dense mode.   |
| Nbr Count                   | Neighbor count of the PIM-DM interface.                                 |

**Related commands** `ip pim dense-mode`  
`show ip pim dense-mode neighbor`

# show ip pim dense-mode interface detail

**Overview** This command displays detailed information on a PIM-DM interface.  
For information on filtering and saving command output, see the [“Getting\\_Started with AlliedWare Plus” Feature Overview and Configuration\\_Guide](#).

**Syntax** `show ip pim dense-mode interface detail`

**Mode** User Exec and Privileged Exec

**Example** `awplus# show ip pim dense-mode interface detail`

**Output** Figure 37-4: Example output from the **show ip pim dense-mode interface detail** command

```
vlan2 (vif-id: 0):  
  
Address 192.168.1.53/24  
Hello period 30 seconds, Next Hello in 30 seconds  
  
Neighbors:  
 192.168.1.152/32  
 192.168.1.149/32  
vlan3 (vif-id: 2):  
Address 192.168.10.53/24  
Hello period 30 seconds, Next Hello in 8 seconds  
Neighbors: none
```

# show ip pim dense-mode mroute

**Overview** Use this command to display the IP PIM-DM multicast routing table.  
For information on filtering and saving command output, see the [“Getting\\_Started with AlliedWare Plus” Feature Overview and Configuration\\_Guide](#).

**Syntax** `show ip pim dense-mode mroute`

**Mode** User Exec and Privileged Exec

**Example** `awplus# show ip pim dense-mode mroute`

**Output** Figure 37-5: Example output from the **show ip pim dense-mode mroute** command

```
PIM-DM Multicast Routing Table
(192.168.10.52, 224.1.1.1)
Source directly connected on vlan3
State-Refresh Originator State: Originator
Upstream IF: vlan3, State: Forwarding
Downstream IF List:
vlan2, in 'olist':
Downstream State: NoInfo
Assert State: NoInfo
```

# show ip pim dense-mode neighbor

**Overview** This command displays PIM-DM neighbor information.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip pim dense-mode neighbor`

**Mode** User Exec and Privileged Exec

**Usage notes** The total number of PIM-DM neighbors is restricted to 500 PIM-DM neighbors.

When the 500 PIM-DM neighbor limit is reached, as a result of receiving hello packets from new PIM-DM neighbors, a log entry will be issued to the log file in the below format:

```
<date> <time> <facility>.<severity> <program[<pid>]>: <message>
-----
2008 Dec 10 00:58:39 user.err x908 PIM-DM[1150]: [VIF] Nbr
Create: Cannot create more than 500 neighbours - ignoring
neighbour 100.0.1.247/32 on vlan100
```

**Example** `awplus# show ip pim dense-mode neighbor`

**Output** Figure 37-6: Example output from the **show ip pim dense-mode neighbor** command

```
Total number of neighbors: 500
Neighbor-Address  Interface          Uptime/Expires    Ver
192.168.1.152     vlan2              17:15:42/00:01:28 v2
192.168.1.149     vlan2              17:15:34/00:01:34 v2
```

# show ip pim dense-mode neighbor detail

**Overview** This command displays detailed PIM-DM neighbor information.  
For information on filtering and saving command output, see the [“Getting\\_Started with AlliedWare Plus” Feature Overview and Configuration\\_Guide](#).

**Syntax** `show ip pim dense-mode neighbor detail`

**Mode** User Exec and Privileged Exec

**Example** `awplus# show ip pim dense-mode neighbor detail`

**Output** Figure 37-7: Example output from the **show ip pim dense-mode neighbor detail** command

```
Neighbor 192.168.1.152 (vlan2)
Up since 17:16:20, Expires in 00:01:20
Neighbor 192.168.1.149 (vlan2)
Up since 17:16:12, Expires in 00:01:26
```

# show ip pim dense-mode nexthop

**Overview** This command displays the next hop information as used by PIM-DM. In the context of PIM-DM, the term ' **next hop** ' refers to the next hop router on the path back to the source address of a multicast stream.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip pim dense-mode nexthop`

**Mode** User Exec and Privileged Exec

**Example** `awplus# show ip pim dense-mode nexthop`

**Output** Figure 37-8: Example output from the **show ip pim dense-mode neighbor nexthop** command

| Destination   | Nexthop Num | Nexthop Addr | Nexthop Interface | Metric | Pref |
|---------------|-------------|--------------|-------------------|--------|------|
| 192.168.10.52 | 1           | 0.0.0.0      | vlan2             | 3      | 1    |

**Table 2:** Parameters in the output of the **show ip pim dense-mode neighbor nexthop** command

| Parameter         | Description  |
|-------------------|--|
| Destination       | Destination address for which PIM-DM requires next hop information.    |
| Nexthop Num       | Number of next hops to the destination. PIM can only use one next hop. |
| Nexthop Addr      | Address of the current next hop gateway.                               |
| Nexthop Interface | Name of the next hop interface.  |
| Metric            | Metric of the route towards the destination.                           |
| Preference        | Preference of the route towards the destination.                       |

# undebbug all pim dense-mode

**Overview** Use this command from the Global Configuration mode to disable all PIM-DM debugging.

**Syntax** `undebbug all pim dense-mode`

**Mode** Global Configuration

**Example**  
`awplus# configure terminal`  
`awplus(config)# undebbug all pim dense-mode`

**Related commands**

- `debug pim dense-mode all`
- `debug pim dense-mode context`
- `debug pim dense-mode decode`
- `debug pim dense-mode encode`
- `debug pim dense-mode fsm`
- `debug pim dense-mode mrt`
- `debug pim dense-mode nexthop`
- `debug pim dense-mode nsm`
- `debug pim dense-mode vif`

# Part 5: Access and Security

# IPv4 Hardware Access Control List (ACL) Commands

## Introduction

**Overview** This chapter provides an alphabetical reference of IPv4 Hardware Access Control List (ACL) commands. It contains detailed command information and command examples about IPv4 hardware ACLs, which you can apply directly to interfaces using the `access-group` command.

To apply ACLs to an LACP channel group, apply it to all the individual switch ports in the channel group. To apply ACLs to a static channel group, apply it to the static channel group itself.

Most ACL command titles include information in parentheses:

- When the command title ends with words in parentheses, these words indicate usage instead of keywords to enter into the CLI. For example, the title **access-list (numbered hardware ACL for ICMP)** indicates that the command is used to create an ACL with the syntax:

```
access-list <3000-3699> <action> icmp <source-ip> <dest-ip>  
[icmp-type <number>] [vlan <1-4094>]
```

- When the command title is completely surrounded by parentheses, the title indicates the type of ACL filter instead of keywords to enter into the CLI. For example, the title **(named hardware ACL: ICMP entry)** represents a command with the syntax:

```
[<sequence-number>] <action> icmp <source-ip> <dest-ip>  
[icmp-type <number>] [vlan <1-4094>]
```

Hardware ACLs will **permit** access unless **explicitly denied** by an ACL action.

**Sub-modes** Many of the ACL commands operate from sub-modes that are specific to particular ACL types. The following table shows the CLI prompts at which ACL commands are entered.

Table 38-1: IPv4 Hardware Access List Commands and Prompts

| Command Name  | Command Mode                    | Prompt                          |
|---|---------------------------------|---------------------------------|
| show interface access-group                           | Privileged Exec                 | awplus#                         |
| show access-list (IPv4 Hardware ACLs)                 | Privileged Exec                 | awplus#                         |
| show acl-group ip address                             | Privileged Exec                 | awplus#                         |
| show acl-group ip port                                | Privileged Exec                 | awplus#                         |
| show interface access-group                           | Privileged Exec                 | awplus#                         |
| access-list (numbered hardware ACL for IP packets)    | Global Configuration            | awplus (config) #               |

# access-group

**Overview** This command adds or removes a hardware-based access-list to or from a switch port interface or interfaces. The number of hardware numbered and named access-lists that can be added to a switch port interface is determined by the available memory in hardware-based packet classification tables.

This command works in Interface Configuration mode to apply hardware access-lists to selected switch port interfaces.

The **no** variant of this command removes the selected access-list from an interface.

**Syntax**

```
access-group  
[<3000-3699>|<4000-4699>|<hardware-access-list-name>]  
  
no access-group  
[<3000-3699>|<4000-4699>|<hardware-access-list-name>]
```

| Parameter                   | Description                    |
|-----------------------------|--------------------------------|
| <3000-3699>                 | Hardware IP access-list.       |
| <4000-4699>                 | Hardware MAC access-list.      |
| <hardware-access-list-name> | The hardware access-list name. |

**Mode** Interface Configuration for a switch port interface or interfaces

**Default** Any traffic on an interface controlled by a hardware ACL that does not explicitly match a filter is permitted.

**Usage notes** First create an IP access-list that applies the appropriate permit/deny requirements with the [access-list \(numbered hardware ACL for IP packets\)](#) command, the [access-list \(numbered hardware ACL for MAC addresses\)](#) command or the [access-list hardware \(named hardware ACL\)](#) command. Then use this command to apply this hardware access-list to a specific port or port range. Note that this command will apply the access-list only to incoming data packets.

To apply ACLs to an LACP aggregated link, apply it to all the individual switch ports in the aggregated group. To apply ACLs to a static channel group, apply it to the static channel group itself. An ACL can even be applied to a static aggregated link that spans more than one switch instance ([Link Aggregation Commands](#)).

Note that you cannot apply software numbered ACLs to switch port interfaces with the access-group command. This command will only apply hardware ACLs.

**NOTE:** Hardware ACLs will **permit** access unless **explicitly denied** by an ACL action.

**Examples** To add the numbered hardware access-list 3005 to switch port interface port1.0.1, enter the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# access-group 3005
```

To add the named hardware access-list "hw-acl" to switch port interface port1.0.2, enter the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# access-group hw-acl
```

To apply an ACL to static channel group 2 containing switch port1.0.3 and port1.0.4, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.3-port1.0.4
awplus(config-if)# static-channel-group 2
awplus(config)# interface sa2
awplus(config-if)# access-group 3000
```

[access-list \(numbered hardware ACL for MAC addresses\)](#)  
[show interface access-group](#)

# access-list (numbered hardware ACL for ICMP)

**Overview** This command creates an access-list for use with hardware classification. The access-list will match on ICMP packets that have the specified source and destination IP addresses and, optionally, ICMP type. You can use the value **any** instead of source or destination address if an address does not matter.

Once you have configured the ACL, you can use the [access-group](#) or the [match access-group](#) command to apply this ACL to a port, VLAN or QoS class-map.

The optional **vlan** parameter can be used to match tagged (802.1q) packets.

The **no** variant of this command removes the previously specified access-list.

Hardware ACLs will **permit** access unless **explicitly denied** by an ACL action.

**CAUTION:** Specifying a “send” action enables you to use ACLs to redirect packets from their original destination. Use such ACLs with caution. They could prevent control packets from reaching the correct destination, such as EPSR healthcheck messages and AMF messages.

**Syntax** `access-list <3000-3699> <action> icmp <source-ip> <dest-ip> [icmp-type <number>] [vlan <1-4094>]`  
`no access-list <3000-3699>`

The following actions are available for hardware ACLs:

| Values for the <action> parameter                     |  |
|---|--|
| deny  | Reject packets that match the source and destination filtering specified with this command.  |
| permit  | Permit packets that match the source and destination filtering specified with this command.  |
| copy-to-cpu   | Send a copy of matching packets to the CPU.  |
| copy-to-mirror  | Send a copy of matching packets to the mirror port. Use the <b>mirror interface</b> command to configure the mirror port.          |
| send-to-mirror  | Send matching packets to the mirror port. Use the <b>mirror interface</b> command to configure the mirror port.                    |
| send-to-vlan-port<br>vlan <vid> port<br><port-number> | Send matching packets to the specified port, tagged with the specified VLAN. The specified port must belong to the specified VLAN. |
| send-to-cpu   | Send matching packets to the CPU.  |

| Parameter                   | Description   |
|-----------------------------|---|
| <3000-3699>                 | An ID number for this hardware IP access-list.  |
| <action>                    | The action that the switch will take on matching packets. See the table above for valid values.   |
| icmp                        | Match against ICMP packets  |
| <source-ip>                 | The source addresses to match against. You can specify a single host, a subnet, or all source addresses. The following are the valid formats for specifying the source:   |
| any                         | Match any source IP address.  |
| host <ip-addr>              | Match a single source host with the IP address given by <ip-addr> in dotted decimal notation.   |
| <ip-addr>/<prefix>          | Match any source IP address within the specified subnet. Specify the subnet by entering the IPv4 address, then a forward slash, then the prefix length.   |
| <ip-addr><br><reverse-mask> | Match any source IP address within the specified subnet. Specify the subnet by entering a reverse mask in dotted decimal format. For example, entering "192.168.1.1 0.0.0.255" is the same as entering 192.168.1.1/24.      |
| <dest-ip>                   | The destination addresses to match against. You can specify a single host, a subnet, or all destination addresses. The following are the valid formats for specifying the destination:                                      |
| any                         | Match any destination IP address.   |
| host <ip-addr>              | Match a single destination host with the IP address given by <ip-addr> in dotted decimal notation.  |
| <ip-addr>/<prefix>          | Match any destination IP address within the specified subnet. Specify the subnet by entering the IPv4 address, then a forward slash, then the prefix length.  |
| <ip-addr><br><reverse-mask> | Match any destination IP address within the specified subnet. Specify the subnet by entering a reverse mask in dotted decimal format. For example, entering "192.168.1.1 0.0.0.255" is the same as entering 192.168.1.1/24. |
| icmp-type<br><number>       | The type of ICMP message to match against, as defined in RFC792 and RFC950. Values include:   |
| 0                           | Echo replies.   |

| Parameter     | Description  |
|---------------|--|
|               | 3 Destination unreachable messages.  |
|               | 4 Source quench messages.  |
|               | 5 Redirect (change route) messages.  |
|               | 8 Echo requests.   |
|               | 11 Time exceeded messages.   |
|               | 12 Parameter problem messages.   |
|               | 13 Timestamp requests.   |
|               | 14 Timestamp replies.  |
|               | 15 Information requests.   |
|               | 16 Information replies.  |
|               | 17 Address mask requests.  |
|               | 18 Address mask replies.   |
| vlan <1-4094> | The VLAN to match against. The ACL will match against the specified ID in the packet's VLAN tag. |

**Mode** Global Configuration

**Default** On an interface controlled by a hardware ACL, any traffic that does not explicitly match a filter is permitted.

**Usage notes** This command creates an ACL for use with hardware classification. Once you have configured the ACL, use the [access-group](#) or the [match access-group](#) command to apply this ACL to a port, VLAN or QoS class-map.

ACLs numbered in the range 3000-3699 match on packets that have the specified source and destination IP addresses.

ICMP ACLs will match any ICMP packet that has the specified source and destination IP addresses and ICMP type. The ICMP type is an optional parameter.

**Examples** To create an access-list that will permit ICMP packets with a source address of 192.168.1.0/24 with any destination address and an ICMP type of 5 enter the following commands:

```
awplus# configure terminal
awplus(config)# access-list 3000 permit icmp 192.168.1.0/24 any
icmp-type 5
```

To destroy the access-list with an access-list identity of 3000 enter the following commands:

```
awplus# configure terminal
awplus(config)# no access-list 3000
```

# access-list (numbered hardware ACL for IP packets)

**Overview** This command creates an access-list for use with hardware classification. The access-list will match on packets that have the specified source and destination IP addresses. You can use the value **any** instead of source or destination address if an address does not matter.

Once you have configured the ACL, you can use the [access-group](#) or the [match access-group](#) command to apply this ACL to a port, VLAN or QoS class-map.

The optional **vlan** parameter can be used to match tagged (802.1q) packets.

The **no** variant of this command removes the previously specified IP hardware access-list.

Hardware ACLs will **permit** access unless **explicitly denied** by an ACL action.

**CAUTION:** Specifying a "send" action enables you to use ACLs to redirect packets from their original destination. Use such ACLs with caution. They could prevent control packets from reaching the correct destination, such as EPSR healthcheck messages and AMF messages.

**Syntax** `access-list <3000-3699> <action> ip <source-ip> <dest-ip> [vlan <1-4094>]`

`no access-list <3000-3699>`

The following actions are available for hardware ACLs:

| Values for the <action> parameter                     |  |
|---|--|
| deny  | Reject packets that match the source and destination filtering specified with this command.  |
| permit  | Permit packets that match the source and destination filtering specified with this command.  |
| copy-to-cpu   | Send a copy of matching packets to the CPU.  |
| copy-to-mirror  | Send a copy of matching packets to the mirror port. Use the <b>mirror interface</b> command to configure the mirror port.          |
| send-to-mirror  | Send matching packets to the mirror port. Use the <b>mirror interface</b> command to configure the mirror port.                    |
| send-to-vlan-port<br>vlan <vid> port<br><port-number> | Send matching packets to the specified port, tagged with the specified VLAN. The specified port must belong to the specified VLAN. |
| send-to-cpu   | Send matching packets to the CPU.  |

Table 38-2: IP and ICMP parameters in **access-list (hardware IP numbered)**

| Parameter                   | Description   |
|-----------------------------|---|
| <3000-3699>                 | An ID number for this hardware IP access-list.  |
| <action>                    | The action that the switch will take on matching packets. See the table above for valid values.   |
| ip                          | Match against IP packets  |
| <source-ip>                 | The source addresses to match against. You can specify a single host, a subnet, or all source addresses. The following are the valid formats for specifying the source:   |
| any                         | Match any source IP address.  |
| host <ip-addr>              | Match a single source host with the IP address given by <ip-addr> in dotted decimal notation.   |
| <ip-addr>/<prefix>          | Match any source IP address within the specified subnet. Specify the subnet by entering the IPv4 address, then a forward slash, then the prefix length.   |
| <ip-addr><br><reverse-mask> | Match any source IP address within the specified subnet. Specify the subnet by entering a reverse mask in dotted decimal format. For example, entering "192.168.1.1 0.0.0.255" is the same as entering 192.168.1.1/24.      |
| <dest-ip>                   | The destination addresses to match against. You can specify a single host, a subnet, or all destination addresses. The following are the valid formats for specifying the destination:                                      |
| any                         | Match any destination IP address.   |
| host <ip-addr>              | Match a single destination host with the IP address given by <ip-addr> in dotted decimal notation.  |
| <ip-addr>/<prefix>          | Match any destination IP address within the specified subnet. Specify the subnet by entering the IPv4 address, then a forward slash, then the prefix length.  |
| <ip-addr><br><reverse-mask> | Match any destination IP address within the specified subnet. Specify the subnet by entering a reverse mask in dotted decimal format. For example, entering "192.168.1.1 0.0.0.255" is the same as entering 192.168.1.1/24. |
| vlan <1-4094>               | The VLAN to match against. The ACL will match against the specified ID in the packet's VLAN tag.  |

**Mode** Global Configuration

**Default** On an interface controlled by a hardware ACL, any traffic that does not explicitly match a filter is permitted.

**Usage notes** This command creates an ACL for use with hardware classification. Once you have configured the ACL, use the [access-group](#) or the [match access-group](#) command to apply this ACL to a port, VLAN or QoS class-map.

ACLs numbered in the range 3000-3699 match on packets that have the specified source and destination IP addresses.

**Examples** To create an access-list that will permit IP packets with a source address of 192.168.1.1 and any destination address, enter the commands:

```
awplus# configure terminal
awplus(config)# access-list 3000 permit ip 192.168.1.1/32 any
```

To destroy the access-list with an access-list identity of 3000 enter the following commands:

```
awplus# configure terminal
awplus(config)# no access-list 3000
```

# access-list (numbered hardware ACL for IP protocols)

**Overview** This command creates an access-list for use with hardware classification. The access-list will match on packets that have the specified source and destination IP addresses and IP protocol number. You can use the value **any** instead of source or destination address if an address does not matter.

Once you have configured the ACL, you can use the [access-group](#) or the [match access-group](#) command to apply this ACL to a port, VLAN or QoS class-map.

The optional **vlan** parameter can be used to match tagged (802.1q) packets.

The **no** variant of this command removes the previously specified IP hardware access-list.

Hardware ACLs will **permit** access unless **explicitly denied** by an ACL action.

**CAUTION:** Specifying a "send" action enables you to use ACLs to redirect packets from their original destination. Use such ACLs with caution. They could prevent control packets from reaching the correct destination, such as EPSR healthcheck messages and AMF messages.

**Syntax** `access-list <3000-3699> <action> proto <1-255> <source-ip> <dest-ip> [vlan <1-4094>]`  
`no access-list <3000-3699>`

The following actions are available for hardware ACLs:

| Values for the <action> parameter                     |  |
|---|--|
| deny  | Reject packets that match the source and destination filtering specified with this command.  |
| permit  | Permit packets that match the source and destination filtering specified with this command.  |
| copy-to-cpu   | Send a copy of matching packets to the CPU.  |
| copy-to-mirror  | Send a copy of matching packets to the mirror port. Use the <b>mirror interface</b> command to configure the mirror port.          |
| send-to-mirror  | Send matching packets to the mirror port. Use the <b>mirror interface</b> command to configure the mirror port.                    |
| send-to-vlan-port<br>vlan <vid> port<br><port-number> | Send matching packets to the specified port, tagged with the specified VLAN. The specified port must belong to the specified VLAN. |
| send-to-cpu   | Send matching packets to the CPU.  |

Table 38-3: Parameters in **access-list (hardware IP numbered)**

| Parameter                   | Description   |
|-----------------------------|---|
| <3000-3699>                 | An ID number for this hardware IP access-list.  |
| <action>                    | The action that the switch will take on matching packets. See the table above for valid values.   |
| proto <1-255>               | The IP protocol number to match against, as defined by IANA (Internet Assigned Numbers Authority) <a href="http://www.iana.org/assignments/protocol-numbers">www.iana.org/assignments/protocol-numbers</a><br>See below for a list of IP protocol numbers and their descriptions. |
| <source-ip>                 | The source addresses to match against. You can specify a single host, a subnet, or all source addresses. The following are the valid formats for specifying the source:   |
| any                         | Match any source IP address.  |
| host <ip-addr>              | Match a single source host with the IP address given by <ip-addr> in dotted decimal notation.   |
| <ip-addr>/<prefix>          | Match any source IP address within the specified subnet. Specify the subnet by entering the IPv4 address, then a forward slash, then the prefix length.   |
| <ip-addr><br><reverse-mask> | Match any source IP address within the specified subnet. Specify the subnet by entering a reverse mask in dotted decimal format. For example, entering "192.168.1.1 0.0.0.255" is the same as entering 192.168.1.1/24.  |
| <dest-ip>                   | The destination addresses to match against. You can specify a single host, a subnet, or all destination addresses. The following are the valid formats for specifying the destination:  |
| any                         | Match any destination IP address.   |
| host <ip-addr>              | Match a single destination host with the IP address given by <ip-addr> in dotted decimal notation.  |
| <ip-addr>/<prefix>          | Match any destination IP address within the specified subnet. Specify the subnet by entering the IPv4 address, then a forward slash, then the prefix length.  |

Table 38-3: Parameters in **access-list (hardware IP numbered)** (cont.)

| Parameter   | Description   |
|---|---|
| <i>&lt;ip-addr&gt;</i><br><i>&lt;reverse-mask&gt;</i> | Match any destination IP address within the specified subnet. Specify the subnet by entering a reverse mask in dotted decimal format. For example, entering "192.168.1.1 0.0.0.255" is the same as entering 192.168.1.1/24. |
| vlan <i>&lt;1-4094&gt;</i>                            | The VLAN to match against. The ACL will match against the specified ID in the packet's VLAN tag.  |

Table 38-4: IP protocol number and description

| Protocol Number | Protocol Description [RFC]                             |
|-----------------|--|
| 1               | Internet Control Message [RFC792]                      |
| 2               | Internet Group Management [RFC1112]                    |

**Mode** Global Configuration

**Default** On an interface controlled by a hardware ACL, any traffic that does not explicitly match a filter is permitted.

**Usage notes** This command creates an ACL for use with hardware classification. Once you have configured the ACL, use the [access-group](#) or the [match access-group](#) command to apply this ACL to a port, VLAN or QoS class-map.

ACLs numbered in the range 3000-3699 match on packets that have the specified source and destination IP addresses.

**Examples** To create an access-list that will deny all IGMP packets (IP protocol 2) from the 192.168.0.0 network, enter the commands:

```
awplus# configure terminal
awplus(config)# access-list 3000 deny proto 2 192.168.0.0/16
any
```

To destroy the access-list with an access-list identity of 3000 enter the following commands:

```
awplus# configure terminal
awplus(config)# no access-list 3000
```

**Related commands** [access-group](#)

`match access-group`

`show running-config`

`show access-list (IPv4 Hardware ACLs)`

**Command changes** Version 5.5.3-0.1: **deny-and-not-cpu** action parameter added on x230, x550, x930, x950, SBx908 GEN2 Series switches

Version 5.5.3-0.1: **log** parameter added on x220, x320, x530, x550, x950, SBx908 GEN2 Series switches

Version 5.4.7-2.1: **send-to-vlan-port** action parameter added on GS900MX, GS980MX, XS900MX, SBx8100, SBx908 GEN2, x950 Series switches

Version 5.4.6-2.1: **send-to-vlan-port** action parameter added on IX5, x230, x310, x510, x930 Series switches

# access-list (numbered hardware ACL for MAC addresses)

**Overview** This command creates an access-list for use with hardware classification. The access-list will match on packets that have the specified source and destination MAC addresses. You can use the value **any** instead of source or destination address if an address does not matter.

Once you have configured the ACL, you can use the [access-group](#) or the [match access-group](#) command to apply this ACL to a port, VLAN or QoS class-map.

The **no** variant of this command removes the specified MAC hardware filter access-list.

Hardware ACLs will **permit** access unless **explicitly denied** by an ACL action.

**CAUTION:** Specifying a "send" action enables you to use ACLs to redirect packets from their original destination. Use such ACLs with caution. They could prevent control packets from reaching the correct destination, such as EPSR healthcheck messages and AMF messages.

**Syntax**

```
access-list <4000-4699> <action> {<source-mac>|any}  
{<dest-mac>|any} [vlan <1-4094>] [inner-vlan  
<1-4094>]  
  
no access-list <4000-4699>
```

The following actions are available for hardware ACLs:

| Values for the <action> parameter                     |  |
|---|--|
| deny  | Reject packets that match the source and destination filtering specified with this command.  |
| permit  | Permit packets that match the source and destination filtering specified with this command.  |
| copy-to-cpu   | Send a copy of matching packets to the CPU.  |
| copy-to-mirror  | Send a copy of matching packets to the mirror port. Use the <b>mirror interface</b> command to configure the mirror port.          |
| send-to-mirror  | Send matching packets to the mirror port. Use the <b>mirror interface</b> command to configure the mirror port.                    |
| send-to-vlan-port<br>vlan <vid> port<br><port-number> | Send matching packets to the specified port, tagged with the specified VLAN. The specified port must belong to the specified VLAN. |
| send-to-cpu   | Send matching packets to the CPU.  |

| Parameter           | Description  |
|---------------------|--|
| <4000-4699>         | An ID number for this hardware IP access-list.   |
| <action>            | The action that the switch will take on matching packets. See the table above for valid values.  |
| <source-mac>        | The source MAC address to match against, followed by the mask. Enter the address in the format <HHHH.HHHH.HHHH>, where each <i>H</i> is a hexadecimal number. Enter the mask in the format <HHHH.HHHH.HHHH>, where each <i>H</i> is a hexadecimal number. For a mask, each value is either 0 or F, where FF = Ignore, and 00 = Match.      |
| any                 | Match against any source MAC address.  |
| <dest-mac>          | The destination MAC address to match against, followed by the mask. Enter the address in the format <HHHH.HHHH.HHHH>, where each <i>H</i> is a hexadecimal number. Enter the mask in the format <HHHH.HHHH.HHHH>, where each <i>H</i> is a hexadecimal number. For a mask, each value is either 0 or F, where FF = Ignore, and 00 = Match. |
| any                 | Match against any destination MAC address.   |
| vlan <1-4094>       | Match against the specified ID in the packet's VLAN tag.   |
| inner-vlan <1-4094> | Match against the inner VLAN tag (VID). This parameter is used within double-tagged VLANs. It is sometimes referred to as the C-TAG (Customer VLAN TAG), where the vlan VID tag is referred to as the S-TAG (Service VLAN TAG).  |

**Mode** Global Configuration

**Default** On an interface controlled by a hardware ACL, any traffic that does not explicitly match a filter is permitted.

**Usage notes** This command creates an ACL for use with hardware classification. Once you have configured the ACL, use the [access-group](#) or the [match access-group](#) command to apply this ACL to a port, VLAN or QoS class-map.

ACLs numbered in the range 4000-4699 match on packets that have the specified source and destination MAC addresses.

**Examples** To create an access-list that will permit packets with a source MAC address of 0000.00ab.1234 and any destination address, use the commands:

```
awplus# configure terminal
awplus(config)# access-list 4000 permit 0000.00ab.1234
0000.0000.0000 any
```

To create an access-list that will permit packets if their source MAC address starts with 0000.00ab, use the commands:

```
awplus# configure terminal
awplus(config)# access-list 4001 permit 0000.00ab.1234
0000.0000.FFFF any
```

To create an access-list that will send a copy of packets to the mirror port if their source MAC address starts with 0000.00ab, use the commands:

```
awplus# configure terminal
awplus(config)# access-list 4001 copy-to-mirror 0000.00ab.1234
0000.0000.FFFF any
```

You also need to configure the mirror port with the [mirror interface](#) command.

To destroy the access-list with an access-list identity of 4000 enter the commands:

```
awplus# configure terminal
awplus(config)# no access-list 4000
```

**Related

# access-list (numbered hardware ACL for TCP or UDP)

**Overview** This command creates an access-list for use with hardware classification. The access-list will match on TCP or UDP packets that have the specified source and destination IP addresses and optionally, port values. You can use the value **any** instead of source or destination IP address if an address does not matter.

Once you have configured the ACL, you can use the [access-group](#) or the [match access-group](#) command to apply this ACL to a port, VLAN or QoS class-map.

You can use the optional **vlan** parameter to match tagged (802.1q) packets.

The **no** variant of this command removes the specified IP hardware access-list.

Hardware ACLs will **permit** access unless **explicitly denied** by an ACL action.

**CAUTION:** Specifying a "send" action enables you to use ACLs to redirect packets from their original destination. Use such ACLs with caution. They could prevent control packets from reaching the correct destination, such as EPSR healthcheck messages and AMF messages.

**Syntax**

```
access-list <3000-3699> <action> {tcp|udp} <source-ip>
[<source-ports>] <dest-ip> [<dest-ports>] [vlan <1-4094>]
no access-list <3000-3699>
```

The following actions are available for hardware ACLs:

| Values for the <action> parameter                     |  |
|---|--|
| deny  | Reject packets that match the source and destination filtering specified with this command.  |
| permit  | Permit packets that match the source and destination filtering specified with this command.  |
| copy-to-cpu   | Send a copy of matching packets to the CPU.  |
| copy-to-mirror  | Send a copy of matching packets to the mirror port. Use the <b>mirror interface</b> command to configure the mirror port.          |
| send-to-mirror  | Send matching packets to the mirror port. Use the <b>mirror interface</b> command to configure the mirror port.                    |
| send-to-vlan-port<br>vlan <vid> port<br><port-number> | Send matching packets to the specified port, tagged with the specified VLAN. The specified port must belong to the specified VLAN. |
| send-to-cpu   | Send matching packets to the CPU.  |

| Parameter                        | Description  |
|----------------------------------|--|
| <3000-3699>                      | An ID number for this hardware IP access-list.   |
| <action>                         | The action that the switch will take on matching packets. See the table above for valid values.  |
| tcp                              | Match against TCP packets.   |
| udp                              | Match against UDP packets.   |
| <source-ip>                      | The source addresses to match against. You can specify a single host, a subnet, or all source addresses. The following are the valid formats for specifying the source:  |
| any                              | Match any source IP address.   |
| host <ip-addr>                   | Match a single source host with the IP address given by <ip-addr> in dotted decimal notation.  |
| <ip-addr>/<prefix>               | Match any source IP address within the specified subnet. Specify the subnet by entering the IPv4 address, then a forward slash, then the prefix length.  |
| <ip-addr><br><reverse-mask>      | Match any source IP address within the specified subnet. Specify the subnet by entering a reverse mask in dotted decimal format. For example, entering "192.168.1.1 0.0.0.255" is the same as entering 192.168.1.1/24. |
| <source-ports>                   | Match source TCP or UDP port numbers. Port numbers are specified as integers between 0 and 65535. You can specify one or more port numbers as follows:   |
| eq <0-65535>                     | Match a single port number.  |
| lt <0-65535>                     | Match all port numbers that are less than the specified port number.   |
| gt <0-65535>                     | Match all port numbers that are greater than the specified port number.  |
| ne <0-65535>                     | Match all port numbers except the specified port number.   |
| range <start-port><br><end-port> | Match a range of port numbers.   |
| <dest-ip>                        | The destination addresses to match against. You can specify a single host, a subnet, or all destination addresses. The following are the valid formats for specifying the destination:                                 |
| any                              | Match any destination IP address.  |
| host <ip-addr>                   | Match a single destination host with the IP address given by <ip-addr> in dotted decimal notation.   |

| Parameter  | Description   |
|--|---|
|  | <p><code>&lt;ip-addr&gt;/&lt;prefix&gt;</code> Match any destination IP address within the specified subnet. Specify the subnet by entering the IPv4 address, then a forward slash, then the prefix length.</p>   |
|  | <p><code>&lt;ip-addr&gt;</code><br/><code>&lt;reverse-mask&gt;</code> Match any destination IP address within the specified subnet. Specify the subnet by entering a reverse mask in dotted decimal format. For example, entering "192.168.1.1 0.0.0.255" is the same as entering 192.168.1.1/24.</p> |
| <code>&lt;dest-ports&gt;</code>  | Match destination TCP or UDP port numbers. Port numbers are specified as integers between 0 and 65535. You can specify one or more port numbers as follows:   |
| <code>eq &lt;0-65535&gt;</code>  | Match a single port number.   |
| <code>lt &lt;0-65535&gt;</code>  | Match all port numbers that are less than the specified port number.  |
| <code>gt &lt;0-65535&gt;</code>  | Match all port numbers that are greater than the specified port number.   |
| <code>ne &lt;0-65535&gt;</code>  | Match all port numbers except the specified port number.  |
| <code>range &lt;start-port&gt;</code><br><code>&lt;end-port&gt;</code> | Match a range of port numbers.  |
| <code>vlan &lt;1-4094&gt;</code>                                       | The VLAN to match against. The ACL will match against the specified ID in the packet's VLAN tag.  |

**Mode** Global Configuration

**Default** On an interface controlled by a hardware ACL, any traffic that does not explicitly match a filter is permitted.

**Usage notes** This command creates an ACL for use with hardware classification. Once you have configured the ACL, use the [access-group](#) or the [match access-group](#) command to apply this ACL to a port, VLAN or QoS class-map.

ACLs numbered in the range 3000-3699 match on packets that have the specified source and destination IP addresses.

**Examples** To create an access-list that will permit TCP packets with a destination address of 192.168.1.1, a destination port of 80, and any source address and source port, enter the commands:

```
awplus# configure terminal
awplus(config)# access-list 3000 permit tcp any 192.168.1.1/32
eq 80
```

To create an access-list that will copy TCP packets to the mirror port, if they have a destination address of 192.168.1.1, a destination port of 80, and any source address and source port, enter the commands:

```
awplus# configure terminal
awplus(config)# access-list 3000 copy-to-mirror tcp any
192.168.1.1/32 eq 80
```

You also need to configure the mirror port with the [mirror interface](#) command.

**Related  
commands**

[match access-group](#)  
[show running-config](#)  
[show access-list \(IPv4 Hardware ACLs\)](#)

**Command  
changes**

Version 5.5.3-0.1: **deny-and-not-cpu** action parameter added on x230, x550, x930, x950, SBx908 GEN2 Series switches

Version 5.5.3-0.1: **log** parameter added on x220, x320, x530, x550, x950, SBx908 GEN2 Series switches

Version 5.4.7-2.1: **send-to-vlan-port** action parameter added on GS900MX, GS980MX, XS900MX, SBx8100, SBx908 GEN2, x950 Series switches

Version 5.4.6-2.1: **send-to-vlan-port** action parameter added on IX5, x230, x310, x510, x930 Series switches

# access-list hardware (named hardware ACL)

**Overview** This command creates a named hardware access-list and puts you into IPv4 Hardware ACL Configuration mode, where you can add filter entries to the ACL. Once you have configured the ACL, you can use the [access-group](#) or the [match access-group](#) command to apply this ACL to a port, VLAN or QoS class-map. The **no** variant of this command removes the specified named hardware ACL.

**Syntax** `access-list hardware <name>`  
`no access-list hardware <name>`

| Parameter | Description                          |
|-----------|--------------------------------------|
| <name>    | Specify a name for the hardware ACL. |

**Mode** Global Configuration

**Default** Any traffic on an interface controlled by a hardware ACL that does not explicitly match a filter is permitted.

**Usage notes** Use this command to name a hardware ACL and enter the IPv4 Hardware ACL Configuration mode. If the named hardware ACL does not exist, it will be created after entry. If the named hardware ACL already exists, then this command puts you into IPv4 Hardware ACL Configuration mode for that existing ACL.

Entering this command moves you to the IPv4 Hardware ACL Configuration mode (config-ip-hw-acl prompt), so you can enter ACL filters with sequence numbers. From this prompt, configure the filters for the ACL. See the [ACL Feature Overview and Configuration Guide](#) for complete examples of configured sequenced numbered ACLs.

**NOTE:** Hardware ACLs will **permit** access unless **explicitly denied** by an ACL action.

**Examples** To create the hardware access-list named "ACL-1" and enter the IPv4 Hardware ACL Configuration mode to specify the ACL filter entry, use the commands:

```
awplus# configure terminal
awplus(config)# access-list hardware ACL-1
awplus(config-ip-hw-acl)#
```

To remove the hardware access-list named "ACL-1", use the commands:

```
awplus# configure terminal
awplus(config)# no access-list hardware ACL-1
```

**Related commands**

# acl-group ip address

**Overview** Use this command to create a new named IPv4 ACL group that contains one or more IPv4 host or subnets.

This command creates a named IPv4 ACL group and enters the ACL Host Group config mode. IPv4 hosts or subnets can be added to or removed from this group. This host group can be used as a source or destination match for any hardware ACL to simplify large ACL configs with lots of IPv4 hosts.

Use the **no** variant of this command to delete an IPv4 ACL group.

**Syntax** `acl-group ip address <group>`  
`no acl-group ip address <group>`

| Parameter | Description                     |
|-----------|---------------------------------|
| <group>   | The name of the IPv4 ACL group. |

**Default** No ACL groups exist by default.

**Mode** Global Configuration

**Example** To create an IPv4 ACL group named IPV4\_GROUP1, use the commands:

```
awplus# configure terminal
awplus(config)# acl-group ip address IPV4_GROUP1
awplus(config-ip-host-group)#
```

To delete an IPv4 ACL group named IPV4\_GROUP1, use the commands:

```
awplus# configure terminal
awplus(config)# no acl-group ip address IPV4_GROUP1
```

**Related commands** [ip \(ip-host-group\)](#)

**Command changes** Version 5.5.0-1.1: command added

# acl-group ip port

**Overview** Use this command to create a new named port ACL group that contains one or more port rules for an ACL.

This command creates a named port ACL group and enters the ACL Port Group config mode. Port matching rules can be added to or removed from this group. This host group can be used to match on source or destination ports when used with an ACL.

Use the **no** variant of this command to delete a port ACL group.

**Syntax** `acl-group ip port <group>`  
`no acl-group ip port <group>`

| Parameter | Description                     |
|-----------|---------------------------------|
| <group>   | The name of the port ACL group. |

**Default** No ACL groups exist by default.

**Mode** Global Configuration

**Example** To create a port ACL group named PORT\_GROUP1, use the commands:

```
awplus# configure terminal
awplus(config)# acl-group ip port PORT_GROUP1
awplus(config-ip-port-group)#
```

To delete a port ACL group named PORT\_GROUP1, use the commands:

```
awplus# configure terminal
awplus(config)# no acl-group ip port PORT_GROUP1
```

[show acl-group ip port](#)

**Command changes** Version 5.5.0-1.1: command added

# (acl-group ip port range)

**Overview** Use this command to add one or more protocol port rules on a port ACL group. These port matching rules are used to simplify large ACL configs where many ACLs block or permit on the same service ports.

Use the **no** variant of this command to remove a rule match on protocol ports.

**Syntax**

```
eq <0-65535>  
lt <0-65535>  
gt <0-65535>  
ne <0-65535>  
range <0-65535> <0-65535>  
no eq <0-65535>  
no lt <0-65535>  
no gt <0-65535>  
no ne <0-65535>  
no range <0-65535> <0-65535>
```

| Parameter | Description  |
|-----------|--|
| eq        | The protocol port matches if equal to this number.     |
| lt        | The protocol port matches if less than this number.    |
| gt        | The protocol port matches if greater than this number. |
| ne        | The protocol port matches if not equal to this number. |
| range     | The protocol port matches if it is in this range.      |
| <0-65535> | The port number.                                       |

**Default** The port ACL group will match on all ports by default.

**Mode** IP ACL Port Group Configuration

**Example** To add the rule match on protocol ports equal to 20 on a port ACL group, use the commands:

```
awplus# configure terminal  
awplus(config)# acl-group ip port PORT_GROUP1  
awplus(config-ip-port-group)# eq 20
```

To add the rule match on protocol ports between 20 and 50 on a port ACL group, use the commands:

```
awplus# configure terminal
awplus(config)# acl-group ip port PORT_GROUP1
awplus(config-ip-port-group)# range 20 50
```

To add the rule match on protocol ports greater than 20 except 30 on a port ACL group, use the commands:

```
awplus# configure terminal
awplus(config)# acl-group ip port PORT_GROUP1
awplus(config-ip-port-group)# gt 20
awplus(config-ip-port-group)# ne 30
```

To remove the rule match on protocol ports between 20 and 50 on a port ACL group, use the commands:

```
awplus# configure terminal
awplus(config)# acl-group ip port PORT_GROUP1
awplus(config-ip-port-group)# no range 20 50
```

**Related commands** [acl-group ip port](#)  
[show acl-group ip port](#)

**Command changes** Version 5.5.0-1.1: command added

# clear access-list counters

**Overview** Use this command to reset the hardware access-list counters to zero. The access-list counters show the number of packets that match your hardware ACLs. Every time a hardware ACL allows or drops a packet, its counter increments.

**Syntax** `clear access-list counters [<acl>]`

| Parameter | Description  |
|-----------|--|
| <acl>     | Clear the counters for only the specified ACL. You can enter the ACL name or number. |

**Mode** Privileged Exec

**Usage notes** To view the counter values, use the command [show access-list counters](#).

**Example** To clear the counters for the ACL named ACL-1, use the command:

```
awplus# clear access-list counters ACL-1
```

**Related commands** [show access-list counters](#)

**Command changes** Version 5.5.2-2.1: command added

## commit (IPv4)

**Overview** Use this command to commit the IPv4 ACL filter configuration entered at the console to the hardware immediately without exiting the IPv4 Hardware ACL Configuration mode.

This command forces the associated hardware and software IPv4 ACLs to synchronize.

**Syntax** `commit`

**Mode** IPv4 Hardware ACL Configuration

**Usage notes** Normally, when an IPv4 hardware ACL is edited, the new configuration state of the IPv4 ACL is not written to hardware until you exit IPv4 Hardware ACL Configuration mode. By entering this command you can ensure that the current state of a hardware access-list that is being edited is written to hardware immediately.

Scripts typically do not include the `exit` command to exit configuration modes, potentially leading to IPv4 ACL filters in hardware not being correctly updated. Using this **commit** command in a configuration script after specifying an IPv4 hardware ACL filter ensures that it is updated in the hardware immediately.

**Example** To update the hardware with the IPv4 ACL filter configuration, use the command:

```
awplus# configure terminal
awplus(config)# access-list hardware my-hw-list
awplus(config-ip-hw-acl)# commit
```

**Related commands** [access-list hardware \(named hardware ACL\)](#)

# ip (ip-host-group)

**Overview** Use this command to add an IPv4 host or subnet to an IPv4 ACL group. Adding IPv4 hosts and subnets to an ACL group allows you to simplify ACL config when the same IP addresses are required for many ACLs.

Use the **no** variant of this command to remove an IPv4 host or subnet from an IPv4 ACL group.

**Syntax** ip {any|<match-ip>}  
no ip {any|<match-ip>}

| Parameter                   | Description   |
|-----------------------------|---|
| any                         | Match any IP address.   |
| <match-ip>                  | The addresses to match against. You can specify a single host or a subnet. The following are the valid formats for specifying the addresses:  |
| <ip-addr>                   | Match a single host with the IP address given by <ip-addr> in dotted decimal notation.  |
| <ip-addr>/<prefix>          | Match any IP address within the specified subnet. Specify the subnet by entering the IPv4 address, then a forward slash, then the prefix length.  |
| <ip-addr><br><reverse-mask> | Match any IP address within the specified subnet. Specify the subnet by entering a reverse mask in dotted decimal format. For example, entering "192.168.1.1 0.0.0.255" is the same as entering 192.168.1.1/24. |

**Default** No hosts or subnets are in an IPv4 ACL group by default.

**Mode** IP ACL Host Group Configuration

**Example** To add the subnet 192.168.1.0/24 to an IPv4 ACL group IPV4\_GROUP1, use the commands:

```
awplus# configure terminal
awplus(config)# acl-group ip address IPV4_GROUP1
awplus(config-ip-host-group)# ip 192.168.1.0/24
```

To remove the subnet 192.168.1.0/24 from an IPv4 ACL group IPV4\_GROUP1, use the commands:

```
awplus# configure terminal
awplus(config)# acl-group ip address IPV4_GROUP1
awplus(config-ip-host-group)# no ip 192.168.1.0/24
```

**Command  
changes**

Version 5.5.0-1.1: command added

## (named hardware ACL entry for ICMP)

**Overview** Use this command to add a new ICMP filter entry to the current hardware access-list. The filter will match on any ICMP packet that has the specified source and destination IP addresses and (optionally) ICMP type. You can specify the value **any** if source or destination address does not matter.

If you specify a sequence number, the switch inserts the new filter at the specified location. Otherwise, the switch adds the new filter to the end of the access-list.

The **no** variant of this command removes an ICMP filter entry from the current hardware access-list. You can specify the ICMP filter entry for removal by entering either its sequence number (e.g. **no 100**), or by entering its ICMP filter profile without specifying its sequence number (e.g. **no permit icmp 192.168.1.0/24 any icmp-type 11**).

You can find the sequence number by running the [show access-list \(IPv4 Hardware ACLs\)](#) command.

Hardware ACLs will **permit** access unless **explicitly denied** by an ACL action.

**CAUTION:** Specifying a “send” action enables you to use ACLs to redirect packets from their original destination. Use such ACLs with caution. They could prevent control packets from reaching the correct destination, such as EPSR healthcheck messages and AMF messages.

**Syntax** [`<sequence-number>`] `<action>` icmp `<source-ip>` `<dest-ip>`  
[icmp-type `<number>`] [vlan `<1-4094>`]  
  
no `<sequence-number>`  
  
no `<action>` icmp `<source-ip>` `<dest-ip>` [icmp-type `<number>`]  
[vlan `<1-4094>`]

The following actions are available for hardware ACLs:

| Values for the <code>&lt;action&gt;</code> parameter |   |
|--|---|
| deny   | Reject packets that match the source and destination filtering specified with this command.                               |
| permit   | Permit packets that match the source and destination filtering specified with this command.                               |
| copy-to-cpu  | Send a copy of matching packets to the CPU.   |
| copy-to-mirror                                       | Send a copy of matching packets to the mirror port. Use the <b>mirror interface</b> command to configure the mirror port. |
| send-to-mirror                                       | Send matching packets to the mirror port. Use the <b>mirror interface</b> command to configure the mirror port.           |

| Values for the <action> parameter                     |  |
|---|--|
| send-to-vlan-port<br>vlan <vid> port<br><port-number> | Send matching packets to the specified port, tagged with the specified VLAN. The specified port must belong to the specified VLAN. |
| send-to-cpu   | Send matching packets to the CPU.  |

| Parameter                   | Description  |     |                                   |                |  |                    |   |                             |  |
|-----------------------------|--|-----|-----------------------------------|----------------|--|--------------------|---|-----------------------------|--|
| <sequence-number>           | The sequence number for the filter entry of the selected access control list, in the range 1-65535. If you do not specify a sequence number, the switch puts the entry at the end of the ACL and assigns it the next available multiple of 4 as its sequence number.   |     |                                   |                |  |                    |   |                             |  |
| <action>                    | The action that the switch will take on matching packets. See the table above for valid values.  |     |                                   |                |  |                    |   |                             |  |
| icmp                        | Match against ICMP packets   |     |                                   |                |  |                    |   |                             |  |
| <source-ip>                 | The source addresses to match against. You can specify a single host, a subnet, or all source addresses. The following are the valid formats for specifying the source: <table border="1" data-bbox="699 1032 1426 1624"> <tbody> <tr> <td>any</td> <td>Match any source IP address.</td> </tr> <tr> <td>host &lt;ip-addr&gt;</td> <td>Match a single source host with the IP address given by &lt;ip-addr&gt; in dotted decimal notation.</td> </tr> <tr> <td>&lt;ip-addr&gt;/&lt;prefix&gt;</td> <td>Match any source IP address within the specified subnet. Specify the subnet by entering the IPv4 address, then a forward slash, then the prefix length.</td> </tr> <tr> <td>&lt;ip-addr&gt;<br/>&lt;reverse-mask&gt;</td> <td>Match any source IP address within the specified subnet. Specify the subnet by entering a reverse mask in dotted decimal format. For example, entering "192.168.1.1 0.0.0.255" is the same as entering 192.168.1.1/24.</td> </tr> </tbody> </table> | any | Match any source IP address.      | host <ip-addr> | Match a single source host with the IP address given by <ip-addr> in dotted decimal notation.      | <ip-addr>/<prefix> | Match any source IP address within the specified subnet. Specify the subnet by entering the IPv4 address, then a forward slash, then the prefix length. | <ip-addr><br><reverse-mask> | Match any source IP address within the specified subnet. Specify the subnet by entering a reverse mask in dotted decimal format. For example, entering "192.168.1.1 0.0.0.255" is the same as entering 192.168.1.1/24. |
| any                         | Match any source IP address.   |     |                                   |                |  |                    |   |                             |  |
| host <ip-addr>              | Match a single source host with the IP address given by <ip-addr> in dotted decimal notation.  |     |                                   |                |  |                    |   |                             |  |
| <ip-addr>/<prefix>          | Match any source IP address within the specified subnet. **Mode** IPv4 Hardware ACL Configuration (accessed by running the command `access-list hardware (named hardware ACL)`)

**Default** On an interface controlled by a hardware ACL, any traffic that does not explicitly match a filter is permitted.

**Usage notes** To use this command, first run the command `access-list hardware (named hardware ACL)` and enter the desired access-list name. This changes the prompt to:

```
awplus(config-ip-hw-acl) #
```

Then use this command (and the other "named hardware ACL: entry" commands) to add filter entries. You can add multiple filter entries to an ACL. You can insert a

new filter entry into the middle of an existing list by specifying the appropriate sequence number. If you do not specify a sequence number, the switch puts the entry at the end of the ACL and assigns it the next available multiple of 4 as its sequence number.

Then use the [access-group](#) or the [match access-group](#) command to apply this ACL to a port, VLAN or QoS class-map. Note that the ACL will only apply to incoming data packets.

**Examples** To add an access-list filter entry with a sequence number of 100 to the access-list named "my-list" that will permit ICMP packets with a source address of 192.168.1.0/24, any destination address and an ICMP type of 5, use the commands:

```
awplus# configure terminal
awplus(config)# access-list hardware my-list
awplus(config-ip-hw-acl)# 100 permit icmp 192.168.1.0/24 any
icmp-type 5
```

To remove an access-list filter entry with a sequence number of 100 from the access-list named "my-list", use the commands:

```
awplus# configure terminal
awplus(config)# access-list hardware my-list
awplus(config-ip-hw-acl)# no 100
```

**Related commands**

[access-group](#)  
[access-list hardware \(named hardware ACL\)](#)  
[match access-group](#)  
[show running-config](#)  
[show access-list \(IPv4 Hardware ACLs\)](#)

**Command changes**

Version 5.5.3-0.1: **deny-and-not-cpu** action parameter added on x230, x550, x930, x950, SBx908 GEN2 Series switches

Version 5.5.3-0.1: **log** parameter added on x220, x320, x530, x550, x950, SBx908 GEN2 Series switches

Version 5.4.7-2.1: **send-to-vlan-port** action parameter added on GS900MX, GS980MX, XS900MX, SBx8100, SBx908 GEN2, x950 Series switches

Version 5.4.6-2.1: **send-to-vlan-port** action parameter added on IX5, x230, x310, x510, x930 Series switches

## (named hardware ACL entry for IP packets)

**Overview** Use this command to add an IP packet filter entry to the current hardware access-list. The filter will match on IP packets that have the specified IP and/or MAC addresses. You can use the value **any** instead of source or destination IP or MAC address if an address does not matter.

If you specify a sequence number, the switch inserts the new filter at the specified location. Otherwise, the switch adds the new filter to the end of the access-list.

The **no** variant of this command removes a filter entry from the current hardware access-list. You can specify the filter entry for removal by entering either its sequence number (e.g. **no 100**), or by entering its filter profile without specifying its sequence number (e.g. **no deny ip 192.168.0.0/16 any**).

You can find the sequence number by running the [show access-list \(IPv4 Hardware ACLs\)](#) command.

Hardware ACLs will **permit** access unless **explicitly denied** by an ACL action.

**CAUTION:** Specifying a "send" action enables you to use ACLs to redirect packets from their original destination. Use such ACLs with caution. They could prevent control packets from reaching the correct destination, such as EPSR healthcheck messages and AMF messages.

**Syntax** [`<sequence-number>`] `<action>` ip `<source-ip>` `<dest-ip>`  
[`<source-mac>` `<dest-mac>`] [`vlan <1-4094>`]  
  
no `<sequence-number>`  
  
no `<action>` ip `<source-ip>` `<dest-ip>` [`<source-mac>` `<dest-mac>`]  
[`vlan <1-4094>`]

The following actions are available for hardware ACLs:

| Values for the <code>&lt;action&gt;</code> parameter  |  |
|---|--|
| deny  | Reject packets that match the source and destination filtering specified with this command.  |
| permit  | Permit packets that match the source and destination filtering specified with this command.  |
| copy-to-cpu   | Send a copy of matching packets to the CPU.  |
| copy-to-mirror  | Send a copy of matching packets to the mirror port. Use the <b>mirror interface</b> command to configure the mirror port.          |
| send-to-mirror  | Send matching packets to the mirror port. Use the <b>mirror interface</b> command to configure the mirror port.                    |
| send-to-vlan-port<br>vlan <code>&lt;vid&gt;</code> port<br><code>&lt;port-number&gt;</code> | Send matching packets to the specified port, tagged with the specified VLAN. The specified port must belong to the specified VLAN. |
| send-to-cpu   | Send matching packets to the CPU.  |

| Parameter   | Description  |
|---|--|
| <code>&lt;sequence-number&gt;</code>                  | The sequence number for the filter entry of the selected access control list, in the range 1-65535. If you do not specify a sequence number, the switch puts the entry at the end of the ACL and assigns it the next available multiple of 4 as its sequence number. |
| <code>&lt;action&gt;</code>                           | The action that the switch will take on matching packets. See the table above for valid values.  |
| <code>ip</code>                                       | Match against IP packets   |
| <code>&lt;source-ip&gt;</code>                        | The source addresses to match against. You can specify a single host, a subnet, or all source addresses. The following are the valid formats for specifying the source:  |
| <code>any</code>                                      | Match any source IP address.   |
| <code>dhcp snooping</code>                            | Match the source address learned from the DHCP Snooping binding database.  |
| <code>host &lt;ip-addr&gt;</code>                     | Match a single source host with the IP address given by <code>&lt;ip-addr&gt;</code> in dotted decimal notation.   |
| <code>&lt;ip-addr&gt;/&lt;prefix&gt;</code>           | Match any source IP address within the specified subnet. Specify the subnet by entering the IPv4 address, then a forward slash, then the prefix length.  |
| <code>&lt;ip-addr&gt;<br/>&lt;reverse-mask&gt;</code> | Match any source IP address within the specified subnet. Specify the subnet by entering a reverse mask in dotted decimal format. For example, entering "192.168.1.1 0.0.0.255" is the same as entering 192.168.1.1/24.   |
| <code>&lt;dest-ip&gt;</code>                          | The destination addresses to match against. You can specify a single host, a subnet, or all destination addresses. The following are the valid formats for specifying the destination:   |
| <code>any</code>                                      | Match any destination IP address.  |
| <code>host &lt;ip-addr&gt;</code>                     | Match a single destination host with the IP address given by <code>&lt;ip-addr&gt;</code> in dotted decimal notation.  |
| <code>&lt;ip-addr&gt;/&lt;prefix&gt;</code>           | Match any destination IP address within the specified subnet. Specify the subnet by entering the IPv4 address, then a forward slash, then the prefix length.   |

| Parameter                  | Description   |
|----------------------------|---|
|                            | <p><i>&lt;ip-addr&gt;</i><br/><i>&lt;reverse-mask&gt;</i></p> <p>Match any destination IP address within the specified subnet. Specify the subnet by entering a reverse mask in dotted decimal format. For example, entering "192.168.1.1 0.0.0.255" is the same as entering 192.168.1.1/24.</p>  |
| <i>&lt;source-mac&gt;</i>  | <p>The source MAC address to match against. You can specify a single MAC address, a range (through a mask), the address learned from DHCP snooping, or any:</p>   |
| any                        | Match against any source MAC address.   |
| <i>&lt;source-mac&gt;</i>  | <p>The source MAC address to match against, followed by the mask. Enter the address in the format &lt;HHHH.HHHH.HHHH&gt;, where each <i>H</i> is a hexadecimal number. Enter the mask in the format &lt;HHHH.HHHH.HHHH&gt;, where each <i>H</i> is a hexadecimal number. For a mask, each value is either 0 or F, where FF = Ignore, and 00 = Match.</p>      |
| dhcp snooping              | Match the source address learned from the DHCP Snooping binding database.   |
| <i>&lt;dest-mac&gt;</i>    | <p>The destination MAC address to match against. You can specify a single MAC address, a range (through a mask), or any:</p>  |
| any                        | Match against any destination MAC address.  |
| <i>&lt;dest-mac&gt;</i>    | <p>The destination MAC address to match against, followed by the mask. Enter the address in the format &lt;HHHH.HHHH.HHHH&gt;, where each <i>H</i> is a hexadecimal number. Enter the mask in the format &lt;HHHH.HHHH.HHHH&gt;, where each <i>H</i> is a hexadecimal number. For a mask, each value is either 0 or F, where FF = Ignore, and 00 = Match.</p> |
| vlan <i>&lt;1-4094&gt;</i> | The VLAN to match against. The ACL will match against the specified ID in the packet's VLAN tag.  |

**Mode** IPv4 Hardware ACL Configuration (accessed by running the command `access-list hardware (named hardware ACL)`)

**Default** On an interface controlled by a hardware ACL, any traffic that does not explicitly match a filter is permitted.

**Usage notes** To use this command, first run the command [access-list hardware \(named hardware ACL\)](#) and enter the desired access-list name. This changes the prompt to:

```
awplus(config-ip-hw-acl)#
```

Then use this command (and the other “named hardware ACL: entry” commands) to add filter entries. You can add multiple filter entries to an ACL. You can insert a new filter entry into the middle of an existing list by specifying the appropriate sequence number. If you do not specify a sequence number, the switch puts the entry at the end of the ACL and assigns it the next available multiple of 4 as its sequence number.

Then use the [access-group](#) or the [match access-group](#) command to apply this ACL to a port, VLAN or QoS class-map. Note that the ACL will only apply to incoming data packets.

**Examples** To add a filter entry to the access-list named “my-list” that will permit any IP packet with a source address of 192.168.1.1, use the commands:

```
awplus# configure terminal
awplus(config)# access-list hardware my-list
awplus(config-ip-hw-acl)# permit ip 192.168.1.1/32 any
```

To add a filter entry to the access-list named “my-list” that will permit any IP packet with a source address of 192.168.1.1 and a MAC source address of ffee.ddcc.bbaa, use the commands:

```
awplus# configure terminal
awplus(config)# access-list hardware my-list
awplus(config-ip-hw-acl)# permit ip 192.168.1.1/32 any mac
ffee.ddcc.bbaa 0000.0000.0000 any
```

To add a filter entry to the access-list named “my-list” that will deny all IP packets on vlan 2, use the commands:

```
awplus# enable
awplus(config)# configure terminal
awplus(config)# access-list hardware my-list
awplus(config-ip-hw-acl)# deny ip any any vlan 2
```

**Related commands**

- [access-list hardware \(named hardware ACL\)](#)
- [match access-group](#)
- [show running-config](#)
- [show access-list \(IPv4 Hardware ACLs\)](#)

**Command changes** Version 5.5.3-0.1: **deny-and-not-cpu** action parameter added on x230, x550, x930, x950, SBx908 GEN2 Series switches

Version 5.5.3-0.1: **log** parameter added on x220, x320, x530, x550, x950, SBx908 GEN2 Series switches

Version 5.4.7-2.1: **send-to-vlan-port** action parameter added on GS900MX, GS980MX, XS900MX, SBx8100, SBx908 GEN2, x950 Series switches

Version 5.4.6-2.1: **send-to-vlan-port** action parameter added on IX5, x230, x310, x510, x930 Series switches

# (named hardware ACL entry for IP protocols)

**Overview** Use this command to add an IP protocol type filter entry to the current hardware access-list. The filter will match on IP packets that have the specified IP protocol number, and the specified IP and/or MAC addresses. You can use the value **any** instead of source or destination IP or MAC address if an address does not matter.

If you specify a sequence number, the switch inserts the new filter at the specified location. Otherwise, the switch adds the new filter to the end of the access-list.

The **no** variant of this command removes a filter entry from the current hardware access-list. You can specify the filter entry for removal by entering either its sequence number (e.g. **no 100**), or by entering its filter profile without specifying its sequence number (e.g. **no deny proto 2 192.168.0.0/16 any**).

You can find the sequence number by running the [show access-list \(IPv4 Hardware ACLs\)](#) command.

Hardware ACLs will **permit** access unless **explicitly denied** by an ACL action.

**CAUTION:** Specifying a "send" action enables you to use ACLs to redirect packets from their original destination. Use such ACLs with caution. They could prevent control packets from reaching the correct destination, such as EPSR healthcheck messages and AMF messages.

**Syntax** [`<sequence-number>`] `<action>` proto `<1-255>` `<source-ip>`  
`<dest-ip>` [`<source-mac>` `<dest-mac>`] [`vlan <1-4094>`]  
`no <sequence-number>`  
`no <action>` proto `<1-255>` `<source-ip>` `<dest-ip>` [`<source-mac>`  
`<dest-mac>`] [`vlan <1-4094>`]

The following actions are available for hardware ACLs:

| Values for the <code>&lt;action&gt;</code> parameter  |  |
|---|--|
| deny  | Reject packets that match the source and destination filtering specified with this command.  |
| permit  | Permit packets that match the source and destination filtering specified with this command.  |
| copy-to-cpu   | Send a copy of matching packets to the CPU.  |
| copy-to-mirror  | Send a copy of matching packets to the mirror port. Use the <b>mirror interface</b> command to configure the mirror port.          |
| send-to-mirror  | Send matching packets to the mirror port. Use the <b>mirror interface</b> command to configure the mirror port.                    |
| send-to-vlan-port<br>vlan <code>&lt;vid&gt;</code> port<br><code>&lt;port-number&gt;</code> | Send matching packets to the specified port, tagged with the specified VLAN. The specified port must belong to the specified VLAN. |
| send-to-cpu   | Send matching packets to the CPU.  |

Table 38-5: Parameters in IP protocol ACL entries

| Parameter   | Description  |
|---|--|
| <code>&lt;sequence-number&gt;</code>                  | The sequence number for the filter entry of the selected access control list, in the range 1-65535. If you do not specify a sequence number, the switch puts the entry at the end of the ACL and assigns it the next available multiple of 4 as its sequence number.               |
| <code>&lt;action&gt;</code>                           | The action that the switch will take on matching packets. See the table above for valid values.  |
| <code>proto &lt;1-255&gt;</code>                      | The IP protocol number to match against, as defined by IANA (Internet Assigned Numbers Authority <a href="http://www.iana.org/assignments/protocol-numbers">www.iana.org/assignments/protocol-numbers</a> )<br>See below for a list of IP protocol numbers and their descriptions. |
| <code>&lt;source-ip&gt;</code>                        | The source addresses to match against. You can specify a single host, a subnet, or all source addresses. The following are the valid formats for specifying the source:  |
| <code>any</code>                                      | Match any source IP address.   |
| <code>dhcpsnooping</code>                             | Match the source address learned from the DHCP Snooping binding database.  |
| <code>host &lt;ip-addr&gt;</code>                     | Match a single source host with the IP address given by <code>&lt;ip-addr&gt;</code> in dotted decimal notation.   |
| <code>&lt;ip-addr&gt;/&lt;prefix&gt;</code>           | Match any source IP address within the specified subnet. Specify the subnet by entering the IPv4 address, then a forward slash, then the prefix length.  |
| <code>&lt;ip-addr&gt;<br/>&lt;reverse-mask&gt;</code> | Match any source IP address within the specified subnet. Specify the subnet by entering a reverse mask in dotted decimal format. For example, entering "192.168.1.1 0.0.0.255" is the same as entering 192.168.1.1/24.   |
| <code>&lt;dest-ip&gt;</code>                          | The destination addresses to match against. You can specify a single host, a subnet, or all destination addresses. The following are the valid formats for specifying the destination:   |
| <code>any</code>                                      | Match any destination IP address.  |
| <code>host &lt;ip-addr&gt;</code>                     | Match a single destination host with the IP address given by <code>&lt;ip-addr&gt;</code> in dotted decimal notation.  |
| <code>&lt;ip-addr&gt;/&lt;prefix&gt;</code>           | Match any destination IP address within the specified subnet. Specify the subnet by entering the IPv4 address, then a forward slash, then the prefix length.   |

Table 38-5: Parameters in IP protocol ACL entries (cont.)

| Parameter   | Description  |
|---|--|
| <i>&lt;ip-addr&gt;</i><br><i>&lt;reverse-mask&gt;</i> | Match any destination IP address within the specified subnet. Specify the subnet by entering a reverse mask in dotted decimal format. For example, entering "192.168.1.1 0.0.0.255" is the same as entering 192.168.1.1/24.  |
| <i>&lt;source-mac&gt;</i>                             | The source MAC address to match against. You can specify a single MAC address, a range (through a mask), the address learned from DHCP snooping, or any:   |
| any   | Match against any source MAC address.  |
| <i>&lt;source-mac&gt;</i>                             | The source MAC address to match against, followed by the mask. Enter the address in the format <HHHH.HHHH.HHHH>, where each <i>H</i> is a hexadecimal number. Enter the mask in the format <HHHH.HHHH.HHHH>, where each <i>H</i> is a hexadecimal number. For a mask, each value is either 0 or F, where FF = Ignore, and 00 = Match.      |
| dhcpsnooping  | Match the source address learned from the DHCP Snooping binding database.  |
| <i>&lt;dest-mac&gt;</i>                               | The destination MAC address to match against. You can specify a single MAC address, a range (through a mask), or any:  |
| any   | Match against any destination MAC address.   |
| <i>&lt;dest-mac&gt;</i>                               | The destination MAC address to match against, followed by the mask. Enter the address in the format <HHHH.HHHH.HHHH>, where each <i>H</i> is a hexadecimal number. Enter the mask in the format <HHHH.HHHH.HHHH>, where each <i>H</i> is a hexadecimal number. For a mask, each value is either 0 or F, where FF = Ignore, and 00 = Match. |
| vlan <i>&lt;1-4094&gt;</i>                            | The VLAN to match against. The ACL will match against the specified ID in the packet's VLAN tag.   |

Table 38-6: IP protocol number and description

| Protocol Number | Protocol Description [RFC]                             |
|-----------------|--|
| 1               | Internet Control Message [RFC792]                      |
| 2               | Internet Group Management [RFC1112]                    |

| 50              | ESP (Encap Security Payload) [RFC2406]                 |
| 51              | AH (Authentication Header) [RFC2402]                   |
| 54              | NARP (NBMA Address Resolution Protocol) [RFC1735]      |
| 58              | ICMP for IPv6 [RFC1883]                                |
| 59              | No Next Header for IPv6 [RFC1883]                      |
| 60              | Destination Options for IPv6 [RFC1883]                 |
| 88              | EIGRP (Enhanced Interior Gateway Routing Protocol)     |
| 89              | OSPFv2 [RFC1583]                                       |
| 97              | Ethernet-within-IP Encapsulation / RFC3378             |
| 98              | Encapsulation Header / RFC1241                         |
| 108             | IP Payload Compression Protocol / RFC2393              |
| 112             | Virtual Router Redundancy Protocol / RFC3768           |
| 134             | RSVP-E2E-IGNORE / RFC3175                              |
| 135             | Mobility Header / RFC3775                              |
| 136             | UDPLite / RFC3828                                      |

Table 38-6: IP protocol number and description (cont.)

| Protocol Number | Protocol Description [RFC]                    |
|-----------------|---|
| 137             | MPLS-in-IP / RFC4023                          |
| 138             | MANET Protocols / RFC-ietf-manet-iana-07.txt  |
| 139-252         | Unassigned / IANA                             |
| 253             | Use for experimentation and testing / RFC3692 |
| 254             | Use for experimentation and testing / RFC3692 |
| 255             | Reserved / IANA                               |

**Mode** IPv4 Hardware ACL Configuration (accessed by running the command [access-list hardware \(named hardware ACL\)](#))

**Default** On an interface controlled by a hardware ACL, any traffic that does not explicitly match a filter is permitted.

**Usage notes** To use this command, run the command [access-list hardware \(named hardware ACL\)](#) and enter the desired access-list name. This changes the prompt to:

```
awplus(config-ip-hw-acl)#
```

Then use this command (and the other “named hardware ACL: entry” commands) to add filter entries. You can add multiple filter entries to an ACL. You can insert a new filter entry into the middle of an existing list by specifying the appropriate sequence number. If you do not specify a sequence number, the switch puts the entry at the end of the ACL and assigns it the next available multiple of 4 as its sequence number.

Then use the [access-group](#) or the [match access-group](#) command to apply this ACL to a port, VLAN or QoS class-map. Note that the ACL will only apply to incoming data packets.

**Examples** To add a filter entry to the access-list named “my-list” that will deny all IGMP packets (protocol 2) from the 192.168.0.0 subnet, and give it a sequence number of 50, use the commands:

```
awplus# configure terminal
awplus(config)# access-list hardware my-list
awplus(config-ip-hw-acl)# 50 deny proto 2 192.168.0.0/16 any
```

- [show access-list \(IPv4 Hardware ACLs\)](#)

**Command changes** Version 5.5.3-0.1: **deny-and-not-cpu** action parameter added on x230, x550, x930, x950, SBx908 GEN2 Series switches

Version 5.5.3-0.1: **log** parameter added on x220, x320, x530, x550, x950, SBx908 GEN2 Series switches

Version 5.4.7-2.1: **send-to-vlan-port** action parameter added on GS900MX, GS980MX, XS900MX, SBx8100, SBx908 GEN2, x950 Series switches

Version 5.4.6-2.1: **send-to-vlan-port** action parameter added on IX5, x230, x310, x510, x930 Series switches

# (named hardware ACL entry for MAC addresses)

**Overview** Use this command to add a MAC address filter entry to the current hardware access-list. The access-list will match on packets that have the specified source and destination MAC addresses. You can use the value **any** instead of source or destination MAC address if an address does not matter.

If you specify a sequence number, the switch inserts the new filter at the specified location. Otherwise, the switch adds the new filter to the end of the access-list.

The **no** variant of this command removes a filter entry from the current hardware access-list. You can specify the filter entry for removal by entering either its sequence number (e.g. **no 100**), or by entering its filter profile without specifying its sequence number (e.g. **no permit mac aaaa.bbbb.cccc 0000.0000.0000 any**).

You can find the sequence number by running the [show access-list \(IPv4 Hardware ACLs\)](#) command.

Hardware ACLs will **permit** access unless **explicitly denied** by an ACL action.

**CAUTION:** Specifying a “send” action enables you to use ACLs to redirect packets from their original destination. Use such ACLs with caution. They could prevent control packets from reaching the correct destination, such as EPSR healthcheck messages and AMF messages.

**Syntax** [`<sequence-number>`] `<action>` mac {`<source-mac>`|any} {`<dest-mac>`|any} [vlan `<1-4094>`] [inner-vlan `<1-4094>`]  
`no <sequence-number>`  
`no <action>` mac {`<source-mac>`|any} {`<dest-mac>`|any} [vlan `<1-4094>`] [inner-vlan `<1-4094>`]

The following actions are available for hardware ACLs:

| Values for the <code>&lt;action&gt;</code> parameter |   |
|--|---|
| deny   | Reject packets that match the source and destination filtering specified with this command.                               |
| permit   | Permit packets that match the source and destination filtering specified with this command.                               |
| copy-to-cpu  | Send a copy of matching packets to the CPU.   |
| copy-to-mirror                                       | Send a copy of matching packets to the mirror port. Use the <b>mirror interface</b> command to configure the mirror port. |
| send-to-mirror                                       | Send matching packets to the mirror port. Use the <b>mirror interface</b> command to configure the mirror port.           |

| Values for the <action> parameter                     |  |
|---|--|
| send-to-vlan-port<br>vlan <vid> port<br><port-number> | Send matching packets to the specified port, tagged with the specified VLAN. The specified port must belong to the specified VLAN. |
| send-to-cpu   | Send matching packets to the CPU.  |

| Parameter              | Description  |
|------------------------|--|
| <sequence-number>      | The sequence number for the filter entry of the selected access control list, in the range 1-65535. If you do not specify a sequence number, the switch puts the entry at the end of the ACL and assigns it the next available multiple of 4 as its sequence number.   |
| <action>               | The action that the switch will take on matching packets. See the table above for valid values.  |
| mac                    | Match against MAC address  |
| <source-mac>           | The source MAC address to match against, followed by the mask.<br>Enter the address in the format <HHHH.HHHH.HHHH>, where each <i>H</i> is a hexadecimal number.<br>Enter the mask in the format <HHHH.HHHH.HHHH>, where each <i>H</i> is a hexadecimal number. For a mask, each value is either 0 or F, where FF = Ignore, and 00 = Match.      |
| any                    | Match against any source MAC address.  |
| <dest-mac>             | The destination MAC address to match against, followed by the mask.<br>Enter the address in the format <HHHH.HHHH.HHHH>, where each <i>H</i> is a hexadecimal number.<br>Enter the mask in the format <HHHH.HHHH.HHHH>, where each <i>H</i> is a hexadecimal number. For a mask, each value is either 0 or F, where FF = Ignore, and 00 = Match. |
| any                    | Match against any destination MAC address.   |
| vlan <1-4094>          | Match against the specified ID in the packet's VLAN tag.   |
| inner-vlan<br><1-4094> | Match against the inner VLAN tag (VID). This parameter is used within double-tagged VLANs. It is sometimes referred to as the C-TAG (Customer VLAN TAG), and the vlan VID tag is referred to as the S-TAG (Service VLAN TAG).  |

**Mode** IPv4 Hardware ACL Configuration (accessed by running the command [access-list hardware \(named hardware ACL\)](#))

**Default** On an interface controlled by a hardware ACL, any traffic that does not explicitly match a filter is permitted.

**Usage notes** To use this command, first run the command [access-list hardware \(named hardware ACL\)](#) and enter the desired access-list name. This changes the prompt to:

```
awplus(config-ip-hw-acl)#
```

Then use this command (and the other “named hardware ACL: entry” commands) to add filter entries. You can add multiple filter entries to an ACL. You can insert a new filter entry into the middle of an existing list by specifying the appropriate sequence number. If you do not specify a sequence number, the switch puts the entry at the end of the ACL and assigns it the next available multiple of 4 as its sequence number.

Then use the [access-group](#) or the [match access-group](#) command to apply this ACL to a port, VLAN or QoS class-map. Note that the ACL will only apply to incoming data packets.

**Examples** To add a filter entry to the access-list named “my-list” that will permit packets with a source MAC address of 0000.00ab.1234 and any destination MAC address, use the commands:

```
awplus# configure terminal
awplus(config)# access-list hardware my-list
awplus(config-ip-hw-acl)# permit mac 0000.00ab.1234
0000.0000.0000 any
```

To remove a filter entry that permit packets with a source MAC address of 0000.00ab.1234 and any destination MAC address, use the commands:

```
awplus# configure terminal
awplus(config)# access-list hardware my-list
awplus(config-ip-hw-acl)# no permit mac 0000.00ab.1234
0000.0000.0000 any
```

**Command changes**

Version 5.5.3-0.1: **deny-and-not-cpu** action parameter added on x230, x550, x930, x950, SBx908 GEN2 Series switches

Version 5.4.7-2.1: **send-to-vlan-port** action parameter added on GS900MX, GS980MX, XS900MX, SBx8100, SBx908 GEN2, x950 Series switches

Version 5.4.6-2.1: **send-to-vlan-port** action parameter added on IX5, x230, x310, x510, x930 Series switches

# (named hardware ACL entry for TCP or UDP)

**Overview** Use this command to add a TCP or UDP filter entry to the current hardware access-list. The access-list will match on TCP or UDP packets that have the specified source and destination IP addresses and optionally, port values. You can use the value **any** instead of source or destination IP address if an address does not matter.

If you specify a sequence number, the switch inserts the new filter at the specified location. Otherwise, the switch adds the new filter to the end of the access-list.

The **no** variant of this command removes a filter entry from the current hardware access-list. You can specify the filter entry for removal by entering either its sequence number (e.g. **no 100**), or by entering its filter profile without specifying its sequence number (e.g. **no permit udp 192.168.0.0/16 any**).

You can find the sequence number by running the [show access-list \(IPv4 Hardware ACLs\)](#) command.

Hardware ACLs will **permit** access unless **explicitly denied** by an ACL action.

**CAUTION:** Specifying a "send" action enables you to use ACLs to redirect packets from their original destination. Use such ACLs with caution. They could prevent control packets from reaching the correct destination, such as EPSR healthcheck messages and AMF messages.

**Syntax**

```
[<sequence-number>] <action> {tcp|udp} <source-ip>  
[<source-ports>] <dest-ip> [<dest-ports>] [vlan <1-4094>]  
  
no <sequence-number>  
  
no <action> {tcp|udp} <source-ip> [<source-ports>] <dest-ip>  
[<dest-ports>] [vlan <1-4094>]
```

The following actions are available for hardware ACLs:

| Values for the <action> parameter                     |  |
|---|--|
| deny  | Reject packets that match the source and destination filtering specified with this command.  |
| permit  | Permit packets that match the source and destination filtering specified with this command.  |
| copy-to-cpu   | Send a copy of matching packets to the CPU.  |
| copy-to-mirror  | Send a copy of matching packets to the mirror port. Use the <b>mirror interface</b> command to configure the mirror port.          |
| send-to-mirror  | Send matching packets to the mirror port. Use the <b>mirror interface</b> command to configure the mirror port.                    |
| send-to-vlan-port<br>vlan <vid> port<br><port-number> | Send matching packets to the specified port, tagged with the specified VLAN. The specified port must belong to the specified VLAN. |
| send-to-cpu   | Send matching packets to the CPU.  |

| Parameter  | Description  |
|--|--|
| <code>&lt;sequence-number&gt;</code>                                   | The sequence number for the filter entry of the selected access control list, in the range 1-65535. If you do not specify a sequence number, the switch puts the entry at the end of the ACL and assigns it the next available multiple of 4 as its sequence number. |
| <code>&lt;action&gt;</code>  | The action that the switch will take on matching packets. See the table above for valid values.  |
| tcp  | Match against TCP packets.   |
| udp  | Match against UDP packets.   |
| <code>&lt;source-ip&gt;</code>   | The source addresses to match against. You can specify a single host, a subnet, or all source addresses. The following are the valid formats for specifying the source:  |
| any  | Match any source IP address.   |
| host <code>&lt;ip-addr&gt;</code>                                      | Match a single source host with the IP address given by <code>&lt;ip-addr&gt;</code> in dotted decimal notation.   |
| <code>&lt;ip-addr&gt;/&lt;prefix&gt;</code>                            | Match any source IP address within the specified subnet. Specify the subnet by entering the IPv4 address, then a forward slash, then the prefix length.  |
| <code>&lt;ip-addr&gt;</code><br><code>&lt;reverse-mask&gt;</code>      | Match any source IP address within the specified subnet. Specify the subnet by entering a reverse mask in dotted decimal format. For example, entering "192.168.1.1 0.0.0.255" is the same as entering 192.168.1.1/24.   |
| <code>&lt;source-ports&gt;</code>                                      | Match source TCP or UDP port numbers. Port numbers are specified as integers between 0 and 65535. You can specify one or more port numbers as follows:   |
| eq <code>&lt;0-65535&gt;</code>  | Match a single port number.  |
| lt <code>&lt;0-65535&gt;</code>  | Match all port numbers that are less than the specified port number.   |
| gt <code>&lt;0-65535&gt;</code>  | Match all port numbers that are greater than the specified port number.  |
| ne <code>&lt;0-65535&gt;</code>  | Match all port numbers except the specified port number.   |
| range <code>&lt;start-port&gt;</code><br><code>&lt;end-port&gt;</code> | Match a range of port numbers.   |
| <code>&lt;dest-ip&gt;</code>   | The destination addresses to match against. You can specify a single host, a subnet, or all destination addresses. The following are the valid formats for specifying the destination:   |

| Parameter  | Description   |
|--|---|
| <code>any</code>   | Match any destination IP address.   |
| <code>host &lt;ip-addr&gt;</code>                          | Match a single destination host with the IP address given by <code>&lt;ip-addr&gt;</code> in dotted decimal notation.   |
| <code>&lt;ip-addr&gt;/&lt;prefix&gt;</code>                | Match any destination IP address within the specified subnet. Specify the subnet by entering the IPv4 address, then a forward slash, then the prefix length.  |
| <code>&lt;ip-addr&gt;<br/>&lt;reverse-mask&gt;</code>      | Match any destination IP address within the specified subnet. Specify the subnet by entering a reverse mask in dotted decimal format. For example, entering "192.168.1.1 0.0.0.255" is the same as entering 192.168.1.1/24. |
| <code>&lt;dest-ports&gt;</code>                            | Match destination TCP or UDP port numbers. Port numbers are specified as integers between 0 and 65535. You can specify one or more port numbers as follows:   |
| <code>eq &lt;0-65535&gt;</code>                            | Match a single port number.   |
| <code>lt &lt;0-65535&gt;</code>                            | Match all port numbers that are less than the specified port number.  |
| <code>gt &lt;0-65535&gt;</code>                            | Match all port numbers that are greater than the specified port number.   |
| <code>ne &lt;0-65535&gt;</code>                            | Match all port numbers except the specified port number.  |
| <code>range &lt;start-port&gt;<br/>&lt;end-port&gt;</code> | Match a range of port numbers.  |
| <code>vlan &lt;1-4094&gt;</code>                           | The VLAN to match against. The ACL will match against the specified ID in the packet's VLAN tag.  |

**Mode** IPv4 Hardware ACL Configuration (accessed by running the command `access-list hardware (named hardware ACL)`)

**Default** On an interface controlled by a hardware ACL, any traffic that does not explicitly match a filter is permitted.

**Usage notes** To use this command, first run the command `access-list hardware (named hardware ACL)` and enter the desired access-list name. This changes the prompt to:

```
awplus(config-ip-hw-acl)#
```

Then use this command (and the other "named hardware ACL: entry" commands) to add filter entries. You can add multiple filter entries to an ACL. You can insert a new filter entry into the middle of an existing list by specifying the appropriate sequence number. If you do not specify a sequence number, the switch puts the

entry at the end of the ACL and assigns it the next available multiple of 4 as its sequence number.

Then use the [access-group](#) or the [match access-group](#) command to apply this ACL to a port, VLAN or QoS class-map. Note that the ACL will only apply to incoming data packets.

**Example** To add a filter entry to access-list named "my-list" that will permit TCP packets with a destination address of 192.168.1.1, a destination port of 80, from any source, use the commands:

```
awplus# configure terminal
awplus(config)# access-list hardware my-list
awplus(config-ip-hw-acl)# permit tcp any 192.168.1.1/32 eq 80
```

**Related commands**

[access-group](#)  
[access-list hardware \(named hardware ACL\)](#)  
[match access-group](#)  
[show running-config](#)  
[show access-list \(IPv4 Hardware ACLs\)](#)

**Command changes**

Version 5.5.3-0.1: **deny-and-not-cpu** action parameter added on x230, x550, x930, x950, SBx908 GEN2 Series switches

Version 5.5.3-0.1: **log** parameter added on x220, x320, x530, x550, x950, SBx908 GEN2 Series switches

Version 5.4.7-2.1: **send-to-vlan-port** action parameter added on GS900MX, GS980MX, XS900MX, SBx8100, SBx908 GEN2, x950 Series switches

Version 5.4.6-2.1: **send-to-vlan-port** action parameter added on IX5, x230, x310, x510, x930 Series switches

# show access-list (IPv4 Hardware ACLs)

**Overview** Use this command to display the specified access-list, or all access-lists if none have been specified. Note that only defined access-lists are displayed. An error message is displayed for an undefined access-list.

**Syntax** `show access-list`  
[<1-99>|<100-199>|<1300-1999>|<2000-2699>|<3000-3699>|  
<4000-4499>|<access-list-name>]

| Parameter          | Description  |
|--------------------|--|
| <1-99>             | IP standard access-list.                             |
| <100-199>          | IP extended access-list.                             |
| <1300-1999>        | IP standard access-list (standard - expanded range). |
| <2000-2699>        | IP extended access-list (extended - expanded range). |
| <3000-3699>        | Hardware IP access-list.                             |
| <4000-4499>        | Hardware MAC access-list.                            |
| <access-list-name> | IP named access-list.                                |

**Mode** User Exec and Privileged Exec

**Examples** To show all access-lists configured on the switch:

```
awplus# show access-list
```

```
Standard IP access list 1
  deny 172.16.2.0, wildcard bits 0.0.0.255
Standard IP access list 20
  deny 192.168.10.0, wildcard bits 0.0.0.255
  deny 192.168.12.0, wildcard bits 0.0.0.255
Hardware IP access list 3001
  permit ip 192.168.20.0 255.255.255.0 any
Hardware IP access list 3020
  permit tcp any 192.0.2.0/24
```

To show the access-list with an ID of 20:

```
awplus# show access-list 20
```

```
Standard IP access-list 20
  deny 192.168.10.0, wildcard bits 0.0.0.255
  deny 192.168.12.0, wildcard bits 0.0.0.255
```

The following error message is displayed if you try to show an undefined access-list.

```
awplus# show access-list 2
```

```
% Can't find access-list 2
```

**Related  
commands**

[access-list extended \(named\)](#)

[access-list \(numbered hardware ACL for MAC addresses\)](#)

[access-list hardware \(named hardware ACL\)](#)

# show access-list counters

**Overview** Use this command to show the number of packets that match one or all of your hardware ACLs. Every time a hardware ACL allows or drops a packet, its counter increments. This lets you check your ACL configuration.

**Syntax** `show access-list counters [<acl>]`

| Parameter | Description  |
|-----------|--|
| <acl>     | Display the number of packets that match only the specified ACL. You can enter the ACL name or number. |

**Mode** User Exec and Privileged Exec

**Usage notes** This command displays the counter values since the last time they were cleared. To clear the counter values, enter the command [clear access-list counters](#).

To accurately measure the number of packet hits per ACL, you need to read the counters for all ACLs frequently.

**Example** To show the number of packets that match all hardware ACLs, use the following command:

```
awplus# show access-list counters
```

**Output** Figure 38-1: Example output from **show access-list counters**

```
awplus#show access-list counters
Hardware ACL Packet Counters

ACL-1
Packet Hits: 17
ACL-2
Packet Hits: 0
ACL-3
Packet Hits: 1
```

**Output** Figure 38-2: Example output from **show access-list counters ACL-1**

```
awplus#show access-list counters ACL-1
Hardware ACL Packet Counters

ACL-1
Packet Hits: 17
```

Table 38-7: Parameters in the output from **show access-list counters**

| Parameter   | Description  |
|-------------|--|
| Packet Hits | The number of packets that match the ACL. The count includes both dropped and allowed packets. |

**Related commands** [clear access-list counters](#)  
[show interface access-group](#)

**Command changes** Version 5.5.2-2.1: reading the counters no longer clears them  
Version 5.5.1-2.1: command added

# show acl-group ip address

**Overview** Use this command to show the hosts and subnets in a named IPv4 ACL group.

**Syntax** `show acl-group ip address <group>`

| Parameter                  | Description                     |
|----------------------------|---------------------------------|
| <code>&lt;group&gt;</code> | The name of the IPv4 ACL group. |

**Mode** Privileged Exec

**Example** To show all hosts and subnets in an IPv4 ACL group IPV4\_GROUP1, use the command:

```
awplus# show acl-group ip address IPV4_GROUP1
```

**Output** Figure 38-3: Example output from **show acl-group ip address IPV4\_GROUP1**

```
awplus#show acl-group ip address IPV4_GROUP1
Host Group: IPV4_GROUP1

192.168.1.2/32
192.168.2.5/32
10.0.0.0/8
```

**Related commands** [acl-group ip address](#)  
[ip \(ip-host-group\)](#)

**Command changes** Version 5.5.0-1.1: command added

# show acl-group ip port

**Overview** Use this command to show the port rules in a named port ACL group.

**Syntax** `show acl-group ip port <group>`

| Parameter                  | Description                     |
|----------------------------|---------------------------------|
| <code>&lt;group&gt;</code> | The name of the port ACL group. |

**Mode** Privileged Exec

**Example** To show all port rules in a port ACL group PORT\_GROUP1, use the command:

```
awplus# show acl-group ip port PORT_GROUP1
```

**Output** Figure 38-4: Example output from **show acl-group ip port PORT\_GROUP1**

```
awplus#show acl-group ip port PORT_GROUP1
Port Group: PORT_GROUP1

eq 11
gt 20
lt 503
ne 500
```

**Related commands** [\(acl-group ip port range\)](#)  
[acl-group ip port](#)

**Command changes** Version 5.5.0-1.1: command added

# show interface access-group

**Overview** Use this command to display the access groups attached to a port. If an access group is specified, then the output only includes the ports that the specified access group is attached to. If no access group is specified then this command displays all access groups that are attached to the ports that are specified with <port-list>.

Note that **access group** is the term given for an access-list when it is applied to an interface.

**Syntax** `show interface <port-list> access-group  
[<3000-3699>|<4000-4699>]`

| Parameter    | Description   |
|--------------|---|
| <port-list>  | Specify the ports to display information. A port-list can be either: <ul style="list-style-type: none"><li>• a switch port (e.g. port1.0.6) a static channel group (e.g. sa2) or a dynamic (LACP) channel group (e.g. po2)</li><li>• a continuous range of ports separated by a hyphen, e.g. port1.0.1-1.0.6 or port1.0.1-port1.0.6 or po1-po2</li><li>• a comma-separated list of ports and port ranges, e.g. port1.0.1,port1.0.3-1.0.6. Do not mix switch ports, static channel groups, and LACP channel groups in the same list.</li></ul> |
| access group | Select the access group whose details you want to show.   |
| <3000-3699>  | Specifies the Hardware IP access-list.  |
| <4000-4699>  | Specifies the Hardware MAC access-list.   |

**Mode** User Exec and Privileged Exec

**Example** To show all access-lists attached to port1.0.1, use the command:

```
awplus# show interface port1.0.1 access-group
```

**Output** Figure 38-5: Example output from the **show interface access-group** command

```
Interface port1.0.1  
  access-group 3000  
  access-group 3002  
  access-group 3001
```

**Related commands** [access-group](#)

# IPv4 Software Access Control List (ACL) Commands

## Introduction

**Overview** This chapter provides an alphabetical reference for the IPv4 Software Access Control List (ACL) commands, and contains detailed command information and command examples about IPv4 software ACLs as applied to Routing and Multicasting, which are not applied to interfaces.

For information about ACLs, see the [ACL Feature Overview and Configuration Guide](#).

To apply ACLs to an LACP channel group, apply it to all the individual switch ports in the channel group. To apply ACLs to a static channel group, apply it to the static channel group itself. For more information on link aggregation see the following references:

- the [Link Aggregation Feature Overview\\_and\\_Configuration\\_Guide](#).
- [Link Aggregation Commands](#)

**NOTE:** Text in parenthesis in command names indicates usage not keyword entry. For example, **access-list hardware (named)** indicates named IPv4 hardware ACLs entered as `access-list hardware <name>` where <name> is a placeholder not a keyword.

Parenthesis surrounding ACL filters indicates the type of ACL filter not the keyword entry in the CLI, such as **(access-list standard numbered filter)** represents command entry in the format shown in the syntax:

```
[<sequence-number>] {deny|permit} {<source-address>|host  
<host-address>|any}
```

**NOTE:** Software ACLs will **deny** access unless **explicitly permitted** by an ACL action.

**Sub-modes** Many of the ACL commands operate from sub-modes that are specific to particular ACL types. The following table shows the CLI prompts at which ACL commands are entered.

Table 39-1: IPv4 Software Access List Commands and Prompts

| Command Name                              | Command Mode                    | Prompt                       |
|---|---------------------------------|------------------------------|
| clear ip prefix-list                      | Privileged Exec                 | awplus#                      |
| show ip access-list                       | Privileged Exec                 | awplus#                      |
| show ip prefix-list                       | Privileged Exec                 | awplus#                      |
| access-group                              | Global Configuration            | awplus (config) #            |
| access-list (extended named)              | Global Configuration            | awplus (config) #            |
| access-list (extended numbered)           | Global Configuration            | awplus (config) #            |
| access-list (standard named)              | Global Configuration            | awplus (config) #            |
| access-list (standard numbered)           | Global Configuration            | awplus (config) #            |
| ip prefix-list                            | Global Configuration            | awplus (config) #            |
| maximum-access-list                       | Global Configuration            | awplus (config) #            |
| (access-list extended ICMP filter)        | IPv4 Extended ACL Configuration | awplus (config-ip-ext-acl) # |
| (access-list extended IP filter)          | IPv4 Extended ACL Configuration | awplus (config-ip-ext-acl) # |
| (access-list extended IP protocol filter) | IPv4 Extended ACL Configuration | awplus (config-ip-ext-acl) # |
| (access-list extended TCP UDP filter)     | IPv4 Extended ACL Configuration | awplus (config-ip-ext-acl) # |
| (access-list standard named filter)       | IPv4 Standard ACL Configuration | awplus (config-ip-std-acl) # |
| (access-list standard numbered filter)    | IPv4 Standard ACL Configuration | awplus (config-ip-std-acl) # |

# access-list extended (named)

**Overview** This command configures an extended named access-list that permits or denies packets from specific source and destination IP addresses. You can:

- use this command to enter a new or existing ACL name and enter the IPv4 Extended ACL Configuration mode. Once in that mode, you can create an ACL filter entry. This approach lets you give the entry a sequence number.
- or, use this command to create an ACL and an ACL filter entry at the same time. With this approach, you cannot give the entry a sequence number, so the entry will go after any existing entries.

The **no** variant of this command removes a specified extended named access-list.

**Syntax [to enter the sub-mode]**

```
access-list extended <list-name>  
no access-list extended <list-name>
```

| Parameter   | Description                             |
|-------------|---|
| <list-name> | A user-defined name for the access-list |

**Syntax [icmp]**

```
access-list extended <list-name> {deny|permit} icmp <source>  
<destination> [icmp-type <type-number>] [log]  
no access-list extended <list-name> {deny|permit} icmp <source>  
<destination> [icmp-type <type-number>] [log]
```

Table 39-2: Parameters in the access-list extended (named) command - icmp

| Parameter   | Description   |
|-------------|---|
| <list-name> | A user-defined name for the access-list.  |
| deny        | The access-list rejects packets that match the type, source, and destination filtering specified with this command. |
| permit      | The access-list permits packets that match the type, source, and destination filtering specified with this command. |
| icmp        | The access-list matches only ICMP packets.  |
| icmp-type   | Matches only a specified type of ICMP messages. This is valid only when the filtering is set to match ICMP packets. |

Table 39-2: Parameters in the access-list extended (named) command - icmp

| Parameter                                       | Description   |
|---|---|
| <i>&lt;source&gt;</i>                           | The source address of the packets. You can specify a single host, a subnet, or all sources. The following are the valid formats for specifying the source:                |
| <i>any</i>                                      | Matches any source IP address.  |
| <i>host &lt;ip-addr&gt;</i>                     | Matches a single source host with the IP address given by <i>&lt;ip-addr&gt;</i> in dotted decimal notation.  |
| <i>&lt;ip-addr&gt;/<br/>&lt;prefix&gt;</i>      | An IPv4 address, followed by a forward slash, then the prefix length. This matches any source IP address within the specified subnet.                                     |
| <i>&lt;ip-addr&gt;<br/>&lt;reverse-mask&gt;</i> | Alternatively, you can enter a reverse mask in dotted decimal format. For example, entering 192.168.1.10.0.0.255 is the same as entering 192.168.1.1/24.                  |
| <i>&lt;destination&gt;</i>                      | The destination address of the packets. You can specify a single host, a subnet, or all destinations. The following are the valid formats for specifying the destination: |
| <i>any</i>                                      | Matches any destination IP address.   |
| <i>host &lt;ip-addr&gt;</i>                     | Matches a single destination host with the IP address given by <i>&lt;ip-addr&gt;</i> in dotted decimal notation.   |
| <i>&lt;ip-addr&gt;/<br/>&lt;prefix&gt;</i>      | An IPv4 address, followed by a forward slash, then the prefix length. This matches any destination IP address within the specified subnet.                                |
| <i>&lt;ip-addr&gt;<br/>&lt;reverse-mask&gt;</i> | Alternatively, you can enter a reverse mask in dotted decimal format. For example, entering 192.168.1.10.0.0.255 is the same as entering 192.168.1.1/24.                  |

Table 39-2: Parameters in the access-list extended (named) command - icmp

| Parameter     | Description   |
|---------------|---|
| <type-number> | The ICMP type, as defined in RFC792 and RFC950. Specify one of the following integers to create a filter for the ICMP message type: |
| 0             | Echo replies.   |
| 3             | Destination unreachable messages.   |
| 4             | Source quench messages.   |
| 5             | Redirect (change route) messages.   |
| 8             | Echo requests.  |
| 11            | Time exceeded messages.   |
| 12            | Parameter problem messages.   |
| 13            | Timestamp requests.   |
| 14            | Timestamp replies.  |
| 15            | Information requests.   |
| 16            | Information replies.  |
| 17            | Address mask requests.  |
| 18            | Address mask replies.   |
| log           | Logs the results.   |

**Syntax [tcp|udp]** access-list extended <list-name> {deny|permit} {tcp|udp} <source> [eq <sourceport>|lt <sourceport>|gt <sourceport>|ne <sourceport>] <destination> [eq <destport>|lt <destport>|gt <destport>|ne <destport>] [log]

no access-list extended <list-name> {deny|permit} {tcp|udp} <source> [eq <sourceport>|lt <sourceport>|gt <sourceport>|ne <sourceport>] <destination> [eq <destport> |lt <destport>|gt <destport>|ne <destport>] [log]

Table 39-3: Parameters in the access-list extended (named) command - tcp|udp

| Parameter   | Description   |
|-------------|---|
| <list-name> | A user-defined name for the access-list.  |
| deny        | The access-list rejects packets that match the type, source, and destination filtering specified with this command. |
| permit      | The access-list permits packets that match the type, source, and destination filtering specified with this command. |
| tcp         | The access-list matches only TCP packets.   |
| udp         | The access-list matches only UDP packets.   |

Table 39-3: Parameters in the access-list extended (named) command - tcp|udp

| Parameter                                       | Description   |
|---|---|
| <i>&lt;source&gt;</i>                           | The source address of the packets. You can specify a single host, a subnet, or all sources. The following are the valid formats for specifying the source:                |
| any   | Matches any source IP address.  |
| host <i>&lt;ip-addr&gt;</i>                     | Matches a single source host with the IP address given by <i>&lt;ip-addr&gt;</i> in dotted decimal notation.  |
| <i>&lt;ip-addr&gt;/<br/>&lt;prefix&gt;</i>      | An IPv4 address, followed by a forward slash, then the prefix length. This matches any source IP address within the specified subnet.                                     |
| <i>&lt;ip-addr&gt;<br/>&lt;reverse-mask&gt;</i> | Alternatively, you can enter a reverse mask in dotted decimal format. For example, entering 192.168.1.10.0.0.255 is the same as entering 192.168.1.1/24.                  |
| <i>&lt;destination&gt;</i>                      | The destination address of the packets. You can specify a single host, a subnet, or all destinations. The following are the valid formats for specifying the destination: |
| any   | Matches any destination IP address.   |
| host <i>&lt;ip-addr&gt;</i>                     | Matches a single destination host with the IP address given by <i>&lt;ip-addr&gt;</i> in dotted decimal notation.   |
| <i>&lt;ip-addr&gt;/<br/>&lt;prefix&gt;</i>      | An IPv4 address, followed by a forward slash, then the prefix length. This matches any destination IP address within the specified subnet.                                |
| <i>&lt;ip-addr&gt;<br/>&lt;reverse-mask&gt;</i> | Alternatively, you can enter a reverse mask in dotted decimal format. For example, entering 192.168.1.10.0.0.255 is the same as entering 192.168.1.1/24.                  |
| <i>&lt;sourceport&gt;</i>                       | The source port number, specified as an integer between 0 and 65535.  |
| <i>&lt;destport&gt;</i>                         | The destination port number, specified as an integer between 0 and 65535.   |
| eq  | Matches port numbers equal to the port number specified immediately after this parameter.   |
| lt  | Matches port numbers less than the port number specified immediately after this parameter.  |
| gt  | Matches port numbers greater than the port number specified immediately after this parameter.   |

Table 39-3: Parameters in the access-list extended (named) command - tcp|udp

| Parameter | Description   |
|-----------|---|
| ne        | Matches port numbers not equal to the port number specified immediately after this parameter. |
| log       | Log the results.  |

**Syntax**  
**[proto|any ip]**

```
access-list extended <list-name> {deny|permit} {proto
<ip-protocol>|any|ip} {<source>} {<destination>} [log]
no access-list extended <list-name>{deny|permit} {proto
<ip-protocol>|any|ip}{<source>}{<destination>} [log]
```

Table 39-4: Parameters in the access-list extended (named) command - proto|ip|any

| Parameter   | Description  |   |
|-------------|--|---|
| <list-name> | A user-defined name for the access-list.   |   |
| deny        | The access-list rejects packets that match the type, source, and destination filtering specified with this command.  |   |
| permit      | The access-list permits packets that match the type, source, and destination filtering specified with this command.  |   |
| proto       | Matches only a specified type of IP Protocol.  |   |
| any         | The access-list matches any type of IP packet.   |   |
| ip          | The access-list matches only IP packets.   |   |
| <source>    | The source address of the packets. You can specify a single host, a subnet, or all sources. The following are the valid formats for specifying the source: |   |
|             | any  | Matches any source IP address.  |
|             | host <ip-addr>   | Matches a single source host with the IP address given by <ip-addr> in dotted decimal notation.   |
|             | <ip-addr>/<br><prefix>   | An IPv4 address, followed by a forward slash, then the prefix length. This matches any source IP address within the specified subnet.                     |
|             | <ip-addr><br><reverse-mask>  | Alternatively, you can enter a reverse mask in dotted decimal format. For example, entering 192.168.1.1 0.0.0.255 is the same as entering 192.168.1.1/24. |

Table 39-4: Parameters in the access-list extended (named) command - proto|ip|any (cont.)

| Parameter                                       | Description   |
|---|---|
| <i>&lt;destination&gt;</i>                      | The destination address of the packets. You can specify a single host, a subnet, or all destinations. The following are the valid formats for specifying the destination:   |
| any   | Matches any destination IP address.   |
| host <i>&lt;ip-addr&gt;</i>                     | Matches a single destination host with the IP address given by <i>&lt;ip-addr&gt;</i> in dotted decimal notation.   |
| <i>&lt;ip-addr&gt;/<br/>&lt;prefix&gt;</i>      | An IPv4 address, followed by a forward slash, then the prefix length. This matches any destination IP address within the specified subnet.  |
| <i>&lt;ip-addr&gt;<br/>&lt;reverse-mask&gt;</i> | Alternatively, you can enter a reverse mask in dotted decimal format. For example, entering 192.168.1.1 0.0.0.255 is the same as entering 192.168.1.1/24.   |
| log   | Logs the results.   |
| <i>&lt;ip-protocol&gt;</i>                      | The IP protocol number, as defined by IANA (Internet Assigned Numbers Authority)<br><a href="http://www.iana.org/assignments/protocol-numbers">www.iana.org/assignments/protocol-numbers</a><br>See below for a list of IP protocol numbers and their descriptions. |

Table 39-5: IP protocol number and description

| Protocol Number | Protocol Description [RFC]                             |
|-----------------|--|
| 1               | Internet Control Message [RFC792]                      |
| 2               | Internet Group Management [RFC1112]                    |
| 3               | Gateway-to-Gateway [RFC823]                            |
| 4               | IP in IP [RFC2003]                                     |
| 5               | Stream [RFC1190] [RFC1819]                             |
| 6               | TCP (Transmission Control Protocol) [RFC793]           |
| 8               | EGP (Exterior Gateway Protocol) [RFC888]               |
| 9               | IGP (Interior Gateway Protocol) [IANA]                 |
| 11              | Network Voice Protocol [RFC741]                        |
| 17              | UDP (User Datagram Protocol) [RFC768]                  |
| 20              | Host monitoring [RFC869]                               |
| 27              | RDP (Reliable Data Protocol) [RFC908]                  |
| 28              | IRTP (Internet Reliable Transaction Protocol) [RFC938] |

Table 39-5: IP protocol number and description (cont.)

| Protocol Number | Protocol Description [RFC]                            |
|-----------------|---|
| 29              | ISO-TP4 (ISO Transport Protocol Class 4) [RFC905]     |
| 30              | Bulk Data Transfer Protocol [RFC969]                  |
| 33              | DCCP (Datagram Congestion Control Protocol) [RFC4340] |
| 48              | DSR (Dynamic Source Routing Protocol) [RFC4728]       |
| 50              | ESP (Encap Security Payload) [RFC2406]                |
| 51              | AH (Authentication Header) [RFC2402]                  |
| 54              | NARP (NBMA Address Resolution Protocol) [RFC1735]     |
| 58              | ICMP for IPv6 [RFC1883]                               |
| 59              | No Next Header for IPv6 [RFC1883]                     |
| 60              | Destination Options for IPv6 [RFC1883]                |
| 88              | EIGRP (Enhanced Interior Gateway Routing Protocol)    |
| 89              | OSPFv2 [RFC1583]                                      |
| 97              | Ethernet-within-IP Encapsulation / RFC3378            |
| 98              | Encapsulation Header / RFC1241                        |
| 108             | IP Payload Compression Protocol / RFC2393             |
| 112             | Virtual Router Redundancy Protocol / RFC3768          |
| 134             | RSVP-E2E-IGNORE / RFC3175                             |
| 135             | Mobility Header / RFC3775                             |
| 136             | UDPLite / RFC3828                                     |
| 137             | MPLS-in-IP / RFC4023                                  |
| 138             | MANET Protocols / RFC-ietf-manet-iana-07.txt          |
| 139-252         | Unassigned / IANA                                     |
| 253             | Use for experimentation and testing / RFC3692         |
| 254             | Use for experimentation and testing / RFC3692         |
| 255             | Reserved / IANA                                       |

**Mode** Global Configuration

**Default** Any traffic controlled by a software ACL that does not explicitly match a filter is denied.

**Usage** Use this command when configuring access-lists for filtering IP software packets.

You can either create access-lists from within this command, or you can enter **access-list extended** followed by only the name. Entering only the name moves you to the IPv4 Extended ACL Configuration mode for the selected access-list.

From there you can configure your access-lists by using the commands ([access-list extended ICMP filter](#)), ([access-list extended IP filter](#)), and ([access-list extended IP protocol filter](#)).

Note that packets must match both the source and the destination details.

**NOTE:** Software ACLs will **deny** access unless **explicitly permitted** by an ACL action.

**Examples** You can enter the extended named ACL in the Global Configuration mode together with the ACL filter entry on the same line, as shown below:

```
awplus# configure terminal
awplus(config)# access-list extended TK deny tcp 2.2.2.3/24 eq
14 3.3.3.4/24 eq 12 log
```

Alternatively, you can enter the extended named ACL in Global Configuration mode before specifying the ACL filter entry in the IPv4 Extended ACL Configuration mode, as shown below:

```
awplus# configure terminal
awplus(config)# access-list extended TK
awplus(config-ip-ext-acl)# deny tcp 2.2.2.3/24 eq 14 3.3.3.4/24
eq 12 log
```

**Related commands** ([access-list extended ICMP filter](#))  
([access-list extended IP filter](#))

([access-list extended TCP UDP filter](#))

[show interface access-group](#)

[show ip access-list](#)

[show running-config](#)

# access-list (extended numbered)

**Overview** This command configures an extended numbered access-list that permits or denies packets from specific source and destination IP addresses. You can:

- use this command to enter a new or existing ACL number and enter the IPv4 Extended ACL Configuration mode. Once in that mode, you can create an ACL filter entry. This approach lets you give the entry a sequence number.
- or, use this command to create an ACL and an ACL filter entry at the same time. With this approach, you cannot give the entry a sequence number, so the entry will go after any existing entries.

The **no** variant of this command removes a specified extended named access-list.

**Syntax [to enter the sub-mode]**

```
access-list {<100-199>|<2000-2699>}
no access-list {<100-199>|<2000-2699>}
```

**Syntax [to create an ACL entry]**

```
access-list {<100-199>|<2000-2699>} {deny|permit} ip <source>
<destination>
no access-list {<100-199>|<2000-2699>} {deny|permit} ip
<source> <destination>
```

| Parameter                   | Description  |
|-----------------------------|--|
| <100-199>                   | IP extended access-list.   |
| <2000-2699>                 | IP extended access-list (expanded range).  |
| deny                        | Access-list rejects packets that match the source and destination filtering specified with this command.   |
| permit                      | Access-list permits packets that match the source and destination filtering specified with this command.   |
| <source>                    | The source address of the packets. You can specify a single host, a subnet, or all sources. The following are the valid formats for specifying the source:   |
| any                         | Matches any source IP address.   |
| host <ip-addr>              | Matches a single source host with the IP address given by <ip-addr> in dotted decimal notation.  |
| <ip-addr><br><reverse-mask> | An IPv4 address, followed by a reverse mask in dotted decimal format. For example, entering 192.168.1.10.0.0.255 is the same as entering 192.168.1.1/24. This matches any source IP address within the specified subnet. |
| <destination>               | The destination address of the packets. You can specify a single host, a subnet, or all destinations. The following are the valid formats for specifying the destination:  |

| Parameter                   | Description  |
|-----------------------------|--|
| any                         | Matches any destination IP address.  |
| host <ip-addr>              | Matches a single destination host with the IP address given by <ip-addr> in dotted decimal notation.   |
| <ip-addr><br><reverse-mask> | An IPv4 address, followed by a reverse mask in dotted decimal format. For example, entering 192.168.1.1 0.0.0.255 is the same as entering 192.168.1.1/24. This matches any destination IP address within the specified subnet. |

**Mode** Global Configuration

**Default** Any traffic controlled by a software ACL that does not explicitly match a filter is denied.

**Usage notes** Use this command when configuring access-list for filtering IP software packets.

You can either create access-lists from within this command, or you can enter **access-list** followed by only the number. Entering only the number moves you to the IPv4 Extended ACL Configuration mode for the selected access-list. From there you can configure your access-lists by using the commands ([access-list extended ICMP filter](#)), ([access-list extended IP filter](#)), and ([access-list extended IP protocol filter](#)).

Note that packets must match both the source and the destination details.

**NOTE:** Software ACLs will **deny** access unless **explicitly permitted** by an ACL action.

**Examples** You can enter the extended ACL in the Global Configuration mode together with the ACL filter entry on the same line, as shown below:

```
awplus# configure terminal
awplus(config)# access-list 101 deny ip 172.16.10.0 0.0.0.255
any
```

Alternatively, you can enter the extended ACL in Global Configuration mode before specifying the ACL filter entry in the IPv4 Extended ACL Configuration mode, as shown below:

```
awplus# configure terminal
awplus(config)# access-list 101
awplus(config-ip-ext-acl)# deny ip 172.16.10.0 0.0.0.255 any
```

**Related commands** (access-list extended ICMP filter)

show running-config

## (access-list extended ICMP filter)

**Overview** Use this ACL filter to add a new ICMP filter entry to the current extended access-list. If the sequence number is specified, the new filter is inserted at the specified location. Otherwise, the new filter is added at the end of the access-list.

The **no** variant of this command removes an ICMP filter entry from the current extended access-list. You can specify the ICMP filter entry for removal by entering either its sequence number (e.g. **no 10**), or by entering its ICMP filter profile without specifying its sequence number.

Note that the sequence number can be found by running the [show access-list \(IPv4 Software ACLs\)](#) command.

**Syntax [icmp]** [*<sequence-number>*] {deny|permit} icmp *<source>* *<destination>*  
[icmp-type *<icmp-value>*] [log]

no {deny|permit} icmp *<source>* *<destination>*[icmp-type  
*<icmp-value>*] [log]

no *<sequence-number>*

| Parameter                                  | Description   |  |  |     |                                     |
|--|---|--|--|-----|-------------------------------------|
| <i>&lt;sequence-number&gt;</i>             | <1-65535><br>The sequence number for the filter entry of the selected access control list.  |  |  |     |                                     |
| deny                                       | Access-list rejects packets that match the source and destination filtering specified with this command.  |  |  |     |                                     |
| permit                                     | Access-list permits packets that match the source and destination filtering specified with this command.  |  |  |     |                                     |
| icmp                                       | ICMP packet type.   |  |  |     |                                     |
| <i>&lt;source&gt;</i>                      | The source address of the packets. You can specify a single host, a subnet, or all sources. The following are the valid formats for specifying the source: <table border="1" data-bbox="667 1503 1420 1697"> <tbody> <tr> <td><i>&lt;ip-addr&gt;/<br/>&lt;prefix&gt;</i></td> <td>An IPv4 address, followed by a forward slash, then the prefix length. This matches any source IP address within the specified subnet.</td> </tr> <tr> <td>any</td> <td>Matches any source IP address.</td> </tr> </tbody> </table>                          | <i>&lt;ip-addr&gt;/<br/>&lt;prefix&gt;</i> | An IPv4 address, followed by a forward slash, then the prefix length. This matches any source IP address within the specified subnet.      | any | Matches any source IP address.      |
| <i>&lt;ip-addr&gt;/<br/>&lt;prefix&gt;</i> | An IPv4 address, followed by a forward slash, then the prefix length. This matches any source IP address within the specified subnet.   |  |  |     |                                     |
| any  | Matches any source IP address.  |  |  |     |                                     |
| <i>&lt;destination&gt;</i>                 | The destination address of the packets. You can specify a single host, a subnet, or all destinations. The following are the valid formats for specifying the destination: <table border="1" data-bbox="667 1816 1420 2011"> <tbody> <tr> <td><i>&lt;ip-addr&gt;/<br/>&lt;prefix&gt;</i></td> <td>An IPv4 address, followed by a forward slash, then the prefix length. This matches any destination IP address within the specified subnet.</td> </tr> <tr> <td>any</td> <td>Matches any destination IP address.</td> </tr> </tbody> </table> | <i>&lt;ip-addr&gt;/<br/>&lt;prefix&gt;</i> | An IPv4 address, followed by a forward slash, then the prefix length. This matches any destination IP address within the specified subnet. | any | Matches any destination IP address. |
| <i>&lt;ip-addr&gt;/<br/>&lt;prefix&gt;</i> | An IPv4 address, followed by a forward slash, then the prefix length. This matches any destination IP address within the specified subnet.  |  |  |     |                                     |
| any  | Matches any destination IP address.   |  |  |     |                                     |

| Parameter    | Description                 |
|--------------|-----------------------------|
| icmp-type    | The ICMP type.              |
| <icmp-value> | The value of the ICMP type. |
| log          | Log the results.            |

**Mode** IPv4 Extended ACL Configuration

**Default** Any traffic controlled by a software ACL that does not explicitly match a filter is denied.

**Usage notes** An ACL can be configured with multiple ACL filters using sequence numbers. If the sequence number is omitted, the next available multiple of 4 will be used as the sequence number for the new filter. A new ACL filter can be inserted into the middle of an existing list by specifying the appropriate sequence number.

**NOTE:** The access control list being configured is selected by running the *access-list (extended numbered)* command or the *access-list extended (named)* command, with the required access control list number, or name - but with no further parameters selected.

Software ACLs will **deny** access unless **explicitly permitted** by an ACL action.

**Examples** To add a new entry in access-list called 'my-list' that will reject ICMP packets from 10.0.0.1 to 192.168.1.1, use the commands:

```
awplus# configure terminal
awplus(config)# access-list extended my-list
awplus(config-ip-ext-acl)# deny icmp 10.0.0.1/32 192.168.1.1/32
```

Use the following commands to add a new filter at sequence number 5 position of the access-list called 'my-list'. The filter will accept the ICMP type 8 packets from 10.1.1.0/24 network, to 192.168.1.0 network:

```
awplus# configure terminal
awplus(config)# access-list extended my-list
awplus(config-ip-ext-acl)# 5 permit icmp 10.1.1.0/24
192.168.1.0/24 icmp-type 8
```

## (access-list extended IP filter)

**Overview** Use this ACL filter to add a new IP filter entry to the current extended access-list. If the sequence number is specified, the new filter is inserted at the specified location. Otherwise, the new filter is added at the end of the access-list.

The **no** variant of this command removes an IP filter entry from the current extended access-list. You can specify the IP filter entry for removal by entering either its sequence number (e.g. **no 10**), or by entering its IP filter profile without specifying its sequence number.

Note that the sequence number can be found by running the [show access-list \(IPv4 Software ACLs\)](#) command.

**Syntax [ip]** [*<sequence-number>*] {deny|permit} ip *<source>* *<destination>*  
no {deny|permit} ip *<source>* *<destination>*  
no *<sequence-number>*

| Parameter   | Description  |     |                                |                             |  |   |   |
|---|--|-----|--------------------------------|-----------------------------|--|---|---|
| <i>&lt;sequence-number&gt;</i>                        | <i>&lt;1-65535&gt;</i><br>The sequence number for the filter entry of the selected access control list.  |     |                                |                             |  |   |   |
| deny  | Access-list rejects packets that match the source and destination filtering specified with this command.   |     |                                |                             |  |   |   |
| permit  | Access-list permits packets that match the source and destination filtering specified with this command.   |     |                                |                             |  |   |   |
| <i>&lt;source&gt;</i>                                 | The source address of the packets. You can specify a single host, a subnet, or all sources. The following are the valid formats for specifying the source: <table border="1"><tbody><tr><td>any</td><td>Matches any source IP address.</td></tr><tr><td>host <i>&lt;ip-addr&gt;</i></td><td>Matches a single source host with the IP address given by <i>&lt;ip-addr&gt;</i> in dotted decimal notation.</td></tr><tr><td><i>&lt;ip-addr&gt;</i><br/><i>&lt;reverse-mask&gt;</i></td><td>Alternatively, enter an IPv4 address followed by a reverse mask in dotted decimal format. For example, enter 192.168.1.1 0.0.0.255.</td></tr></tbody></table> | any | Matches any source IP address. | host <i>&lt;ip-addr&gt;</i> | Matches a single source host with the IP address given by <i>&lt;ip-addr&gt;</i> in dotted decimal notation. | <i>&lt;ip-addr&gt;</i><br><i>&lt;reverse-mask&gt;</i> | Alternatively, enter an IPv4 address followed by a reverse mask in dotted decimal format. For example, enter 192.168.1.1 0.0.0.255. |
| any   | Matches any source IP address.   |     |                                |                             |  |   |   |
| host <i>&lt;ip-addr&gt;</i>                           | Matches a single source host with the IP address given by <i>&lt;ip-addr&gt;</i> in dotted decimal notation.   |     |                                |                             |  |   |   |
| <i>&lt;ip-addr&gt;</i><br><i>&lt;reverse-mask&gt;</i> | Alternatively, enter an IPv4 address followed by a reverse mask in dotted decimal format. For example, enter 192.168.1.1 0.0.0.255.  |     |                                |                             |  |   |   |

| Parameter                   | Description   |
|-----------------------------|---|
| <destination>               | The destination address of the packets. You can specify a single host, a subnet, or all destinations. The following are the valid formats for specifying the destination: |
| any                         | Matches any destination IP address.   |
| host <ip-addr>              | Matches a single destination host with the IP address given by <ip-addr> in dotted decimal notation.  |
| <ip-addr><br><reverse-mask> | Alternatively, enter an IPv4 address followed by a reverse mask in dotted decimal format. For example, enter 192.168.1.1 0.0.0.255.                                       |

**Mode** Extended ACL Configuration

**Default** Any traffic controlled by a software ACL that does not explicitly match a filter is denied.

**Usage notes** An ACL can be configured with multiple ACL filters using sequence numbers. If the sequence number is omitted, the next available multiple of 4 will be used as the sequence number for the new filter. A new ACL filter can be inserted into the middle of an existing list by specifying the appropriate sequence number.

**NOTE:** The access control list being configured is selected by running the *access-list (extended numbered)* command or the *access-list extended (named)* command, with the required access control list number, or name - but with no further parameters selected.

Software ACLs will **deny** access unless **explicitly permitted** by an ACL action.

**Example 1 [list-number]** First use the following commands to enter the IPv4 Extended ACL Configuration mode and define a numbered extended access-list 101:

```
awplus# configure terminal
awplus(config)# access-list 101
awplus(config-ip-ext-acl)#
```

Then use the following commands to add a new entry to the numbered extended access-list 101 that will reject packets from 10.0.0.1 to 192.168.1.1:

```
awplus(config-ip-ext-acl)# deny ip host 10.0.0.1 host
192.168.1.1
awplus(config-ip-ext-acl)# 20 permit ip any any
```

**Example 2 [list-name]** First use the following commands to enter the IPv4 Extended ACL Configuration mode and define a named access-list called 'my-acl':

```
awplus# configure terminal
awplus(config)# access-list extended my-acl
awplus(config-ip-ext-acl)#
```

Then use the following commands to add a new entry to the named access-list 'my-acl' that will reject packets from 10.0.0.1 to 192.168.1.1:

```
awplus(config-ip-ext-acl)# deny ip host 10.0.0.1 host  
192.168.1.1  
awplus(config-ip-ext-acl)# 20 permit ip any any
```

**Example 3** Use the following commands to remove the access-list filter entry with sequence  
**[list-number]** number 20 from extended numbered access-list 101.

```
awplus# configure terminal  
awplus(config)# access-list 101  
awplus(config-ip-ext-acl)# no 20
```

**Example 4** Use the following commands to remove the access-list filter entry with sequence  
**[list-name]** number 20 from extended named access-list my-acl:

```
awplus# configure terminal  
awplus(config)# access-list extended my-acl  
awplus(config-ip-ext-acl)# no 20
```

**Related  
commands**

## (access-list extended IP protocol filter)

**Overview** Use this ACL filter to add a new IP protocol type filter entry to the current extended access-list. If the sequence number is specified, the new filter is inserted at the specified location. Otherwise, the new filter is added at the end of the access-list.

The **no** variant of this command removes an IP protocol filter entry from the current extended access-list. You can specify the IP filter entry for removal by entering either its sequence number (e.g. **no 10**), or by entering its IP filter profile without specifying its sequence number.

Note that the sequence number can be found by running the [show access-list \(IPv4 Software ACLs\)](#) command.

**Syntax [proto]** [*<sequence-number>*] {deny|permit} proto *<ip-protocol>* *<source>* *<destination>* [log]  
no {deny|permit} proto *<ip-protocol>* *<source>* *<destination>* [log]  
no *<sequence-number>*

| Parameter                                  | Description   |  |   |     |                                |
|--|---|--|---|-----|--------------------------------|

**Mode** IPv4 Extended ACL Configuration

**Default** Any traffic controlled by a software ACL that does not explicitly match a filter is denied.

**Usage notes** An ACL can be configured with multiple ACL filters using sequence numbers. If the sequence number is omitted, the next available multiple of 4 will be used as the sequence number for the new filter. A new ACL filter can be inserted into the middle of an existing list by specifying the appropriate sequence number.

**NOTE:** The access control list being configured is selected by running the *access-list (extended numbered)* command or the *access-list extended (named)* command, with the required access control list number, or name - but with no further parameters selected.

Software ACLs will **deny** access unless **explicitly permitted** by an ACL action.

**Example 1 [creating a list]** Use the following commands to add a new access-list filter entry to the access-list named 'my-list' that will reject IP packets from source address 10.10.1.1/32 to destination address 192.68.1.1/32:

```
awplus# configure terminal
awplus(config)# access-list extended my-list
awplus(config-ip-ext-acl)# deny ip 10.10.1.1/32 192.168.1.1/32
```

**Example 2** Use the following commands to add a new access-list filter entry at sequence  
**[adding to a list]** position 5 in the access-list named 'my-list' that will accept packets from source  
address 10.10.1.1/24 to destination address 192.68.1.1/24:

```
awplus# configure terminal
awplus(config)# access-list extended my-list
awplus(config-ip-ext-acl)# 5 permit ip 10.10.1.1/24
192.168.1.1/24
```

**Related commands**

- [access-list \(extended numbered\)](#)
- [show interface access-group](#)
- [show ip access-list](#)
- [show running-config](#)

# (access-list extended TCP UDP filter)

**Overview** Use this ACL filter to add a new TCP or UDP filter entry to the current extended access-list. If the sequence number is specified, the new filter is inserted at the specified location. Otherwise, the new filter is added at the end of the access-list.

The **no** variant of this command removes a TCP or UDP filter entry from the current extended access-list. You can specify the TCP or UDP filter entry for removal by entering either its sequence number (e.g. **no 10**), or by entering its TCP or UDP filter profile without specifying its sequence number.

Note that the sequence number can be found by running the [show access-list \(IPv4 Software ACLs\)](#) command.

**Syntax [tcp|udp]** [*<sequence-number>*] {deny|permit} {tcp|udp} <source> {eq <sourceport> |lt <sourceport>|gt <sourceport>|ne <sourceport>} <destination> [eq <destport>|lt <destport>|gt <destport>|ne <destport>] [log]

no [*<sequence-number>*] {deny|permit} {tcp|udp} <source> {eq <sourceport> |lt <sourceport>|gt <sourceport>|ne <sourceport>} <destination> [eq <destport>|lt <destport>|gt <destport>|ne <destport>] [log]

no <sequence-number>

| Parameter                             | Description   |                                       |   |     |                                |
|---------------------------------------|---|---------------------------------------|---|-----|--------------------------------|
| <i>&lt;sequence-number&gt;</i>        | <1-65535><br>The sequence number for the filter entry of the selected access control list.  |                                       |   |     |                                |
| deny                                  | Access-list rejects packets that match the source and destination filtering specified with this command.  |                                       |   |     |                                |
| permit                                | Access-list permits packets that match the source and destination filtering specified with this command.  |                                       |   |     |                                |
| tcp                                   | The access-list matches only TCP packets.   |                                       |   |     |                                |
| udp                                   | The access-list matches only UDP packets.   |                                       |   |     |                                |
| <i>&lt;source&gt;</i>                 | The source address of the packets. You can specify a single host, a subnet, or all sources. The following are the valid formats for specifying the source: <table border="1" data-bbox="667 1682 1420 1877"> <tbody> <tr> <td><i>&lt;ip-addr&gt;/&lt;prefix&gt;</i></td> <td>An IPv4 address, followed by a forward slash, then the prefix length. This matches any source IP address within the specified subnet.</td> </tr> <tr> <td>any</td> <td>Matches any source IP address.</td> </tr> </tbody> </table> | <i>&lt;ip-addr&gt;/&lt;prefix&gt;</i> | An IPv4 address, followed by a forward slash, then the prefix length. This matches any source IP address within the specified subnet. | any | Matches any source IP address. |
| <i>&lt;ip-addr&gt;/&lt;prefix&gt;</i> | An IPv4 address, followed by a forward slash, then the prefix length. This matches any source IP address within the specified subnet.   |                                       |   |     |                                |
| any                                   | Matches any source IP address.  |                                       |   |     |                                |
| <i>&lt;sourceport&gt;</i>             | The source port number, specified as an integer between 0 and 65535.  |                                       |   |     |                                |

| Parameter              | Description   |
|------------------------|---|
| <destination>          | The destination address of the packets. You can specify a single host, a subnet, or all destinations. The following are the valid formats for specifying the destination: |
| <ip-addr>/<br><prefix> | An IPv4 address, followed by a forward slash, then the prefix length. This matches any destination IP address within the specified subnet.                                |
| any                    | Matches any destination IP address.   |
| <destport>             | The destination port number, specified as an integer between 0 and 65535.   |
| eq                     | Matches port numbers equal to the port number specified immediately after this parameter.   |
| lt                     | Matches port numbers less than the port number specified immediately after this parameter.  |
| gt                     | Matches port numbers greater than the port number specified immediately after this parameter.   |
| ne                     | Matches port numbers not equal to the port number specified immediately after this parameter.   |
| log                    | Log the results.  |

**Mode** IPv4 Extended ACL Configuration

**Default** Any traffic controlled by a software ACL that does not explicitly match a filter is denied.

**Usage** An ACL can be configured with multiple ACL filters using sequence numbers. If the sequence number is omitted, the next available multiple of 4 will be used as the sequence number for the new filter. A new ACL filter can be inserted into the middle of an existing list by specifying the appropriate sequence number.

**NOTE:** The access control list being configured is selected by running the *access-list (extended numbered)* command or the *access-list extended (named)* command, with the required access control list number, or name - but with no further parameters selected.

Software ACLs will **deny** access unless **explicitly permitted** by an ACL action.

**Example 1 [creating a list]** To add a new entry to the access-list named 'my-list' that will reject TCP packets from 10.0.0.1 on TCP port 10 to 192.168.1.1 on TCP port 20, use the commands:

```
awplus# configure terminal
awplus(config)# access-list extended my-list
awplus(config-ip-ext-acl)# deny tcp 10.0.0.1/32 eq 10
192.168.1.1/32 eq 20
```

**Example 2** To insert a new entry with sequence number 5 into the access-list named 'my-list' **[adding to a list]** that will accept UDP packets from 10.1.1.0/24 network to 192.168.1.0/24 network on UDP port 80, use the commands:

```
awplus# configure terminal
awplus(config)# access-list extended my-list
awplus(config-ip-ext-acl)# 5 permit udp 10.1.1.0/24
192.168.1.0/24 eq 80
```

**Related commands**

- [show interface access-group](#)
- [show ip access-list](#)
- [show running-config](#)

# access-list standard (named)

- Overview** This command configures a standard named access-list that permits or denies packets from a specific source IP address. You can:
- use this command to enter a new or existing ACL name and enter the IPv4 Standard ACL Configuration mode. Once in that mode, you can create an ACL filter entry using the command ([access-list standard named filter](#)). This approach lets you give the entry a sequence number.
  - or, use this command to create an ACL and an ACL filter entry at the same time. With this approach, you cannot give the entry a sequence number, so the entry will go after any existing entries.

The **no** variant of this command removes a specified standard named access-list.

**Syntax [to enter the sub-mode]**

```
access-list standard <standard-acl-name>  
no access-list standard <standard-acl-name>
```

**Syntax [to create an ACL entry]**

```
access-list standard <standard-acl-name> {deny|permit}  
{any|<ip-addr>/<prefix>}  
no access-list standard <standard-acl-name> {deny|permit}  
{any|<ip-addr>/<prefix>}
```

| Parameter           | Description  |
|---------------------|--|
| <standard-acl-name> | Specify a name for the standard access-list.   |
| deny                | The access-list rejects packets that match the source filtering specified with this command.   |
| permit              | The access-list permits packets that match the source filtering specified with this command.   |
| any                 | Match any source IP address.   |
| <ip-addr>/<prefix>  | Match the source address of the packets. Specify an IPv4 address in dotted decimal format, followed by a forward slash, then the prefix length. This matches any destination IP address within the specified subnet. |

**Mode** Global Configuration

**Default** Any traffic controlled by a software ACL that does not explicitly match a filter is denied.

**Usage notes** Use this command when configuring a standard named access-list for filtering IP software packets.

You can either create access-lists from within this command, or you can enter **access-list standard** followed by only the name. Entering only the name moves you to the IPv4 Standard ACL Configuration mode for the selected access-list. From

there you can configure your access-lists by using the command ([access-list standard named filter](#)).

**NOTE:** Software ACLs will **deny** access unless **explicitly permitted** by an ACL action.

**Examples** To define a standard access-list named 'my-list' and deny any packets from any source, use the commands:

```
awplus# configure terminal
awplus(config)# access-list standard my-list deny any
```

Alternatively, to define a standard access-list named 'my-list' and enter the IPv4 Standard ACL Configuration mode, and then create ACL entry 5 to deny any packets from any source, use the commands:

```
awplus# configure terminal
awplus(config)# access-list standard my-list
awplus(config-ip-std-acl)# 5 deny any
```

**Related commands** ([access-list standard named filter](#))  
[show interface access-group](#)  
[show ip access-list](#)  
[show running-config](#)

# access-list (standard numbered)

**Overview** This command configures a standard numbered access-list that permits or denies packets from a specific source IP address. You can:

- use this command to enter a new or existing ACL number and enter the IPv4 Standard ACL Configuration mode. Once in that mode, you can create an ACL filter entry using the command ([access-list standard numbered filter](#)). This approach lets you give the entry a sequence number.
- or, use this command to create an ACL and an ACL filter entry at the same time. With this approach, you cannot give the entry a sequence number, so the entry will go after any existing entries.

The **no** variant of this command removes a specified standard numbered access-list.

**Syntax [to enter the sub-mode]**

```
access-list {<1-99>|<1300-1999>}  
no access-list {<1-99>|<1300-1999>}
```

**Syntax [to create an ACL entry]**

```
access-list {<1-99>|<1300-1999>} {deny|permit} <source>  
no access-list {<1-99>|<1300-1999>} {deny|permit} <source>
```

| Parameter                   | Description   |                             |  |           |   |                |   |     |                     |
|-----------------------------|---|-----------------------------|--|-----------|---|----------------|---|-----|---------------------|
| <1-99>                      | IP standard access-list.  |                             |  |           |   |                |   |     |                     |
| <1300-1999>                 | IP standard access-list (expanded range).   |                             |  |           |   |                |   |     |                     |
| deny                        | Access-list rejects packets from the specified source.  |                             |  |           |   |                |   |     |                     |
| permit                      | Access-list accepts packets from the specified source.  |                             |  |           |   |                |   |     |                     |
| <source>                    | The source address of the packets. The following are the valid formats for specifying the source:<br><table border="1"><tbody><tr><td>&lt;ip-addr&gt;<br/>&lt;reverse-mask&gt;</td><td>A source subnet, specified by entering the address and a reverse mask in dotted decimal format. For example, 192.168.1.0 0.0.0.255 (equivalent to 192.168.1.0/24).</td></tr><tr><td>&lt;ip-addr&gt;</td><td>A single source address to match. The source address is specified in dotted decimal format.</td></tr><tr><td>host &lt;ip-addr&gt;</td><td>A single source address to match. The source address is specified in dotted decimal format.</td></tr><tr><td>any</td><td>Any source address.</td></tr></tbody></table> | <ip-addr><br><reverse-mask> | A source subnet, specified by entering the address and a reverse mask in dotted decimal format. For example, 192.168.1.0 0.0.0.255 (equivalent to 192.168.1.0/24). | <ip-addr> | A single source address to match. The source address is specified in dotted decimal format. | host <ip-addr> | A single source address to match. The source address is specified in dotted decimal format. | any | Any source address. |
| <ip-addr><br><reverse-mask> | A source subnet, specified by entering the address and a reverse mask in dotted decimal format. For example, 192.168.1.0 0.0.0.255 (equivalent to 192.168.1.0/24).  |                             |  |           |   |                |   |     |                     |
| <ip-addr>                   | A single source address to match. The source address is specified in dotted decimal format.   |                             |  |           |   |                |   |     |                     |
| host <ip-addr>              | A single source address to match. The source address is specified in dotted decimal format.   |                             |  |           |   |                |   |     |                     |
| any                         | Any source address.   |                             |  |           |   |                |   |     |                     |

**Mode** Global Configuration

**Default** Any traffic controlled by a software ACL that does not explicitly match a filter is denied.

**Usage notes** Use this command when configuring a standard numbered access-list for filtering IP software packets.

You can either create access-lists from within this command, or you can enter **access-list** followed by only the number. Entering only the number moves you to the IPv4 Standard ACL Configuration mode for the selected access-list. From there you can configure your access-lists by using the command ([access-list standard numbered filter](#)).

**NOTE:** Software ACLs will **deny** access unless **explicitly permitted** by an ACL action.

**Examples** To create ACL number 67 that will deny packets from subnet 172.16.10.0, use the commands:

```
awplus# configure terminal
awplus(config)# access-list 67 deny 172.16.10.0 0.0.0.255
```

Alternatively, to define ACL number 67 and enter the IPv4 Standard ACL Configuration mode, and then create ACL entry 5 to deny any packets from subnet 172.16.10.0, use the commands:

```
awplus# configure terminal
awplus(config)# access-list 67
awplus(config-ip-std-acl)# 5 deny 172.16.10.0 0.0.0.255
```

**Related commands** ([access-list standard numbered filter](#))  
[show interface access-group](#)  
[show ip access-list](#)  
[show running-config](#)

## (access-list standard named filter)

**Overview** This ACL filter adds a source IP address filter entry to a current named standard access-list. If the sequence number is specified, the new filter entry is inserted at the specified location. Otherwise, the new entry is added at the end of the access-list.

The **no** variant of this command removes a source IP address filter entry from the current named standard access-list. You can specify the source IP address filter entry for removal by entering either its sequence number (e.g. **no 10**), or by entering its source IP address filter profile without specifying its sequence number (e.g. **no deny any**).

Note that you can find the sequence number by running the [show access-list \(IPv4 Software ACLs\)](#) command.

**Syntax** [*<sequence-number>*] {deny|permit} {any|*<ip-addr>/<prefix>*  
[exact-match] }  
no *<sequence-number>*  
no {deny|permit} {any|*<ip-addr>/<prefix>* [exact-match] }

| Parameter                             | Description  |
|---------------------------------------|--|
| <i>&lt;sequence-number&gt;</i>        | <1-65535><br>The sequence number for the filter entry of the selected access control list.   |
| deny                                  | Access-list rejects packets of the source filtering specified.   |
| permit                                | Access-list allows packets of the source filtering specified   |
| any                                   | Match any source IP address.   |
| <i>&lt;ip-addr&gt;/&lt;prefix&gt;</i> | Match the source address of the packets. Specify an IPv4 address in dotted decimal format, followed by a forward slash, then the prefix length. This matches any destination IP address within the specified subnet. |
| exact-match                           | Specify an exact IP prefix to match on.  |

**Mode** IPv4 Standard ACL Configuration

**Default** Any traffic controlled by a software ACL that does not explicitly match a filter is denied.

**Usage notes** An ACL can be configured with multiple ACL filters using sequence numbers. If the sequence number is omitted, the next available multiple of 4 will be used as the sequence number for the new filter. A new ACL filter can be inserted into the middle of an existing list by specifying the appropriate sequence number.

**NOTE:** The access control list being configured is selected by running the *access-list standard (named)* command with the required access control list name, but with no further parameters selected.

Software ACLs will **deny** access unless **explicitly permitted** by an ACL action.

**Examples** Use the following commands to add a new filter entry to access-list 'my-list' that will reject IP address 10.1.1.1:

```
awplus# configure terminal
awplus(config)# access-list standard my-list
awplus(config-ip-std-acl)# deny 10.1.1.1/32
```

Use the following commands to insert a new filter entry into access-list 'my-list' at sequence position number 15 that will accept IP network 10.1.2.0:

```
awplus# configure terminal
awplus(config)# access-list standard my-list
awplus(config-ip-std-acl)# 15 permit 10.1.2.0/24
```

**Related commands**

- [access-list standard \(named\)](#)
- [show interface access-group](#)
- [show ip access-list](#)
- [show running-config](#)

## (access-list standard numbered filter)

**Overview** This ACL filter adds a source IP address filter entry to a current standard numbered access-list. If a sequence number is specified, the new filter entry is inserted at the specified location. Otherwise, the new filter entry is added at the end of the access-list.

The **no** variant of this command removes a source IP address filter entry from the current standard numbered access-list. You can specify the source IP address filter entry for removal by entering either its sequence number (e.g. **no 10**), or by entering its source IP address filter profile without specifying its sequence number.

Note that the sequence number can be found by running the [show access-list \(IPv4 Software ACLs\)](#) command.

**Syntax** [*<sequence-number>*] {deny|permit} *<source>*  
no {deny|permit} *<source>*  
no *<sequence-number>*

| Parameter   | Description   |   |  |                        |   |                             |   |     |                     |
|---|---|---|--|------------------------|---|-----------------------------|---|-----|---------------------|
| <i>&lt;sequence-number&gt;</i>                        | <i>&lt;1-65535&gt;</i><br>The sequence number for the filter entry of the selected access control list.   |   |  |                        |   |                             |   |     |                     |
| deny  | Access-list rejects packets of the type specified.  |   |  |                        |   |                             |   |     |                     |
| permit  | Access-list allows packets of the type specified  |   |  |                        |   |                             |   |     |                     |
| <i>&lt;source&gt;</i>                                 | The source address of the packets. The following are the valid formats for specifying the source:<br><table border="1"><tbody><tr><td><i>&lt;ip-addr&gt;</i><br/><i>&lt;reverse-mask&gt;</i></td><td>A source subnet, specified by entering the address and a reverse mask in dotted decimal format. For example, 192.168.1.0 0.0.0.255 (equivalent to 192.168.1.0/24).</td></tr><tr><td><i>&lt;ip-addr&gt;</i></td><td>A single source address to match. The source address is specified in dotted decimal format.</td></tr><tr><td>host <i>&lt;ip-addr&gt;</i></td><td>A single source address to match. The source address is specified in dotted decimal format.</td></tr><tr><td>any</td><td>Any source address.</td></tr></tbody></table> | <i>&lt;ip-addr&gt;</i><br><i>&lt;reverse-mask&gt;</i> | A source subnet, specified by entering the address and a reverse mask in dotted decimal format. For example, 192.168.1.0 0.0.0.255 (equivalent to 192.168.1.0/24). | <i>&lt;ip-addr&gt;</i> | A single source address to match. The source address is specified in dotted decimal format. | host <i>&lt;ip-addr&gt;</i> | A single source address to match. The source address is specified in dotted decimal format. | any | Any source address. |
| <i>&lt;ip-addr&gt;</i><br><i>&lt;reverse-mask&gt;</i> | A source subnet, specified by entering the address and a reverse mask in dotted decimal format. For example, 192.168.1.0 0.0.0.255 (equivalent to 192.168.1.0/24).  |   |  |                        |   |                             |   |     |                     |
| <i>&lt;ip-addr&gt;</i>                                | A single source address to match. The source address is specified in dotted decimal format.   |   |  |                        |   |                             |   |     |                     |
| host <i>&lt;ip-addr&gt;</i>                           | A single source address to match. The source address is specified in dotted decimal format.   |   |  |                        |   |                             |   |     |                     |
| any   | Any source address.   |   |  |                        |   |                             |   |     |                     |

**Mode** IPv4 Standard ACL Configuration

**Default** Any traffic controlled by a software ACL that does not explicitly match a filter is denied.

**Usage notes** An ACL can be configured with multiple ACL filters using sequence numbers. If the sequence number is omitted, the next available multiple of 4 will be used as the sequence number for the new filter. A new ACL filter can be inserted into the middle of an existing list by specifying the appropriate sequence number.

**NOTE:** The access control list being configured is selected by running the *access-list (standard numbered)* command with the required access control list number but with no further parameters selected.

Software ACLs will **deny** access unless **explicitly permitted** by an ACL action.

**Example** To add a new entry accepting the IP network 10.1.1.0/24 at the sequence number 15 position, use the commands:

```
awplus# configure terminal
awplus(config)# access-list 99
awplus(config-ip-std-acl)# 15 permit 10.1.2.0 0.0.0.255
```

**Related commands**

- [access-list \(standard numbered\)](#)
- [show interface access-group](#)
- [show ip access-list](#)
- [show running-config](#)

# clear ip prefix-list

**Overview** Use this command to reset the hit count to zero in the prefix-list entries.

**Syntax** `clear ip prefix-list [<list-name>] [<ip-address>/<mask>]`

| Parameter           | Description                  |
|---------------------|------------------------------|
| <list-name>         | The name of the prefix-list. |
| <ip-address>/<mask> | The IP prefix and length.    |

**Mode** Privileged Exec

**Example** To clear a prefix-list named List1:

```
awplus# clear ip prefix-list List1
```

# dos

**Overview** Use this command to configure Denial-of-Service (DoS) protection features for a port. Six different DoS attacks can be detected: IP Options, Land, Ping-of-Death, Smurf, Synflood and Teardrop.

When the attack is detected, three different actions are available:

- Shutdown the port for one minute
- Cause an SNMP trap.
- Send traffic to the mirror port

**Syntax** `dos {ipoptions|land|ping-of-death|smurf broadcast <ip-address>|synflood|teardrop} action {shutdown|trap|mirror}`

| Parameter     | Description                  |
|---------------|------------------------------|
| dos           | Denial-Of-Service.           |
| ipoptions     | IP Options attack.           |
| land          | Land attack.                 |
| ping-of-death | Large ping attack.           |
| smurf         | Ping to broadcast address.   |
| broadcast     | Broadcast.                   |
| <ip-address>  | Local IP Broadcast Address.  |
| synflood      | SYN flood attack.            |
| teardrop      | IP fragmentation attack.     |
| action        | Action.                      |
| shutdown      | Shutdown port.               |
| trap          | Trap to SNMP.                |
| mirror        | Send packets to mirror port. |

**Mode** Interface Configuration for a switch port interface.

**Default** DoS attack detection is not configured by default on any switch port interface.

**Usage notes** See the below table for more information about the DoS attacks recognized by this command:

| Type of DoS attack | Description   |
|--------------------|---|
| ipoptions          | <p>This type of attack occurs when an attacker sends packets containing bad IP options to a victim node. There are many different types of IP options attacks and this software does not try to distinguish between them. Rather, if this defense is activated, the number of ingress IP packets containing IP options is counted. If the number exceeds 20 packets per second, the switch considers this a possible IP options attack. This defense does not require the CPU to monitor packets, so does not put extra load on the switch's CPU.</p>   |
| land               | <p>This type of attack occurs when the Source IP and Destination IP address are the same. This can cause a target host to be confused. Since packets with the same source and destination addresses should never occur, these packets are dropped when this attack is enabled.</p> <p>This defense does not require the CPU to monitor packets, so does not put extra load on the switch's CPU.</p>   |
| ping-of-death      | <p>This type of attack results from a fragmented packet which, when reassembled, would exceed the maximum size of a valid IP datagram. To detect this attack, the final fragment of ICMP packets has to be sent to the CPU for inspection. This defense can therefore load the CPU.</p> <p>Note that the extra CPU load will not affect normal traffic switching between ports, but other protocols such as IGMP and STP may be affected. This defense is not recommended where a large number of fragmented packets are expected.</p>  |
| smurf              | <p>This type of attack is an ICMP ping packet to a broadcast address. Although routers should not forward packets to local broadcast addresses anymore (see RFC2644), the Smurf attack can still be explicitly discarded with this command. In order for the Smurf attack to work, the broadcast IP address is required. Any ICMP Ping packet with this destination address is considered an attack.</p> <p>This defense does not require the CPU to monitor packets, so does not put extra load on the switch's CPU.</p>   |
| synflood           | <p>In this type of attack, an attacker, seeking to overwhelm a victim with TCP connection requests, sends a large number of TCP SYN packets with bogus source addresses to the victim. The victim responds with SYN ACK packets, but since the original source addresses are bogus, the victim node does not receive any replies. If the attacker sends enough requests in a short enough period, the victim may freeze operations once the requests exceed the capacity of its connections queue.</p> <p>To defend against this form of attack, a switch port monitors the number of ingress TCP-SYN packets it receives. An attack is recorded if a port receives more 60 TCP-SYN packets per second.</p> |
| teardrop           | <p>In this DoS attack, an attacker sends a packet in several fragments with a bogus offset value, used to reconstruct the packet, in one of the fragments to a victim. This results in the victim being unable to reassemble the packet, possibly causing it to freeze operations.</p>  |

**Examples** To configure **smurf** DoS detection on port1.0.1, and shutdown the interface if an attack is detected, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# dos smurf broadcast 192.168.1.0 action
shutdown
```

To configure **land** DoS detection on port1.0.1, and shutdown the interface if an attack is detected, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# dos land action shutdown
```

To configure **ipoptions** DoS detection on port1.0.1, and shutdown the interface if an attack is detected, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# dos ipoptions action shutdown
```

To configure **ping-of-death** DoS detection on port1.0.1, and shutdown the interface if an attack is detected, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# dos ping-of-death action shutdown
```

To configure **synflood** DoS detection on port1.0.1, and shutdown the interface if an attack is detected, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# dos synflood action shutdown
```

To configure **teardrop** DoS detection on port1.0.1, and shutdown the interface if an attack is detected, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# dos teardrop action shutdown
```

**Related commands** [show dos interface](#)

# ip prefix-list

**Overview** Use this command to create an entry for an IPv4 prefix list.

Use the **no** variant of this command to delete the IPv4 prefix-list entry.

**Syntax**

```
ip prefix-list <list-name> [seq <1-429496725>] {deny|permit}
{any|<ip-prefix>} [ge <0-32>] [le <0-32>]

ip prefix-list <list-name> description <text>

ip prefix-list sequence-number

no ip prefix-list <list-name> [seq <1-429496725>]

no ip prefix-list <list-name> [description <text>]

no ip prefix-list sequence-number
```

| Parameter         | Description  |
|-------------------|--|
| <list-name>       | Specifies the name of a prefix list.   |
| seq <1-429496725> | Sequence number of the prefix list entry.  |
| deny              | Specifies that the prefixes are excluded from the list.  |
| permit            | Specifies that the prefixes are included in the list.  |
| <ip-prefix>       | Specifies the IPv4 address and length of the network mask in dotted decimal in the format A.B.C.D/M. |
| any               | Any prefix match. Same as <b>0.0.0.0 le 32</b> .   |
| ge<0-32>          | Specifies the minimum prefix length to be matched.   |
| le<0-32>          | Specifies the maximum prefix length to be matched.   |
| <text>            | Text description of the prefix list.   |
| sequence-number   | Specify sequence numbers included or excluded in prefix list.  |

**Mode** Global Configuration

**Usage notes** When the device processes a prefix list, it starts to match prefixes from the top of the prefix list, and stops whenever a permit or deny occurs. To promote efficiency, use the **seq** parameter and place common permits or denials towards the top of the list. If you do not use the **seq** parameter, the sequence values are generated in a sequence of 5.

The parameters **ge** and **le** specify the range of the prefix lengths to be matched. When setting these parameters, set the **le** value to be less than 32, and the **ge** value to be less than or equal to the **le** value and greater than the ip-prefix mask length.

Prefix lists implicitly exclude prefixes that are not explicitly permitted in the prefix list. This means if a prefix that is being checked against the prefix list reaches the end of the prefix list without matching a permit or deny, this prefix will be denied.

**Example** In the following sample configuration, the last **ip prefix-list** command in the below list matches all, and the first **ip prefix-list** command denies the IP network 76.2.2.0:

```
awplus(config)# router bgp 100
awplus(config-router)# network 172.1.1.0
awplus(config-router)# network 172.1.2.0
awplus(config-router)# neighbor 10.6.5.3 remote-as 300
awplus(config-router)# neighbor 10.6.5.3 prefix-list mylist out
awplus(config-router)# exit
awplus(config)# ip prefix-list mylist seq 5 deny 76.2.2.0/24
awplus(config)# ip prefix-list mylist seq 100 permit any
```

To deny the IP addresses between 10.0.0.0/14 (10.0.0.0 255.252.0.0) and 10.0.0.0/22 (10.0.0.0 255.255.252.0) within the 10.0.0.0/8 (10.0.0.0 255.0.0.0) addressing range, enter the following commands:

```
awplus# configure terminal
awplus(config)# ip prefix-list mylist seq 12345 deny 10.0.0.0/8
ge 14 le 22
```

**Related commands**

- [clear ip prefix-list](#)
- [match route-type](#)
- [show ip prefix-list](#)

## maximum-access-list (deleted)

**Overview** This command has been removed from version 5.5.1-01 onwards. There is no alternative command.

# show access-list (IPv4 Software ACLs)

**Overview** Use this command to display the specified access-list, or all access-lists if none have been specified. Note that only defined access-lists are displayed. An error message is displayed for an undefined access-list

**Syntax** `show access-list`  
[<1-99>|<100-199>|<1300-1999>|<2000-2699>|<3000-3699>|  
<4000-4499>|<access-list-name>]

| Parameter          | Description  |
|--------------------|--|
| <1-99>             | IP standard access-list.                             |
| <100-199>          | IP extended access-list.                             |
| <1300-1999>        | IP standard access-list (standard - expanded range). |
| <2000-2699>        | IP extended access-list (extended - expanded range). |
| <3000-3699>        | Hardware IP access-list.                             |
| <4000-4499>        | Hardware MAC access-list.                            |
| <access-list-name> | IP named access-list.                                |

**Mode** User Exec and Privileged Exec

**Examples** To show all access-lists configured on the switch:

```
awplus# show access-list
```

```
Standard IP access list 1
  deny 172.16.2.0, wildcard bits 0.0.0.255
Standard IP access list 20
  deny 192.168.10.0, wildcard bits 0.0.0.255
  deny 192.168.12.0, wildcard bits 0.0.0.255
Hardware IP access list 3001
  permit ip 192.168.20.0 255.255.255.0 any
Hardware IP access list 3020
  permit tcp any 192.0.2.0/24
awplus#show access-list 20
```

To show the access-list with an ID of 20:

```
awplus# show access-list 20
```

```
Standard IP access-list 20
deny 192.168.10.0, wildcard bits 0.0.0.255
deny 192.168.12.0, wildcard bits 0.0.0.255
```

Note the following error message is displayed if you attempt to show an undefined access-list:

```
awplus# show access-list 2
```

```
% Can't find access-list 2
```

[access-list \(extended numbered\)](#)

# show dos interface

**Overview** Use this command to display the Denial-of-Service (DoS) features configured on a switch port interface from the `dos` command. See the `dos` command for descriptions of DoS attack types.

**Syntax** `show dos interface {<port-list>}`

| Parameter                      | Description  |
|--------------------------------|--|
| <code>&lt;port-list&gt;</code> | Specify the switch port or port list to display DoS configuration options set with the <code>dos</code> command. |

**Mode** Privileged Exec

**Output** Figure 39-1: Example output from the **show dos interface** command prior to a DoS attack

```
awplus#configure terminal
Enter configuration commands, one per line. End with CTNTRL/Z.
awplus(config)#interface port1.0.1
awplus(config-if)#dos synflood action shutdown
awplus(config-if)#exit
awplus(config)#exit
awplus#show dos interface port1.0.1

```

**Table 40:** Parameters in the **show dos interface** command output:

| Type of DoS attack | Description  |
|--------------------|--|
| Port status        | Displays Enabled when the port is configured as being administratively up after issuing the <b>no shutdown</b> command. Displays Disabled when the port is configured as being administratively down with the <b>shutdown</b> command.   |
| ipoptions          | Displays Enabled when the <b>ipoptions</b> parameter is configured with the <b>dos</b> command, plus the action (Shutdown port, Mirror port, or Trap port) and the number of instances of any <b>ipoptions</b> DoS attacks that have occurred on the interface. Displays Disabled when the <b>ipoptions</b> parameter is not configured with the <b>dos</b> command.             |
| land               | Displays Enabled when the <b>land</b> parameter is configured with the <b>dos</b> command, plus the action (Shutdown port, Mirror port, or Trap port) and the number of instances of any <b>land</b> DoS attacks that have occurred on the interface. Displays Disabled when the <b>land</b> parameter is not configured with the <b>dos</b> command.                            |
| ping-of-death      | Displays Enabled when the <b>ping-of-death</b> parameter is configured with the <b>dos</b> command, plus the action (Shutdown port, Mirror port, or Trap port) and the number of instances of any <b>ping-of-death</b> DoS attacks that have occurred on the interface. Displays Disabled when the <b>ping-of-death</b> parameter is not configured with the <b>dos</b> command. |

**Table 40:** Parameters in the **show dos interface** command output: (cont.)

| Type of DoS attack | Description   |
|--------------------|---|
| smurf              | Displays Enabled when the <b>smurf</b> parameter is configured with the <b>dos</b> command, plus the action (Shutdown port, Mirror port, or Trap port) and the number of instances of any <b>smurf</b> DoS attacks that have occurred on the interface. Displays Disabled when the <b>smurf</b> parameter is not configured with the <b>dos</b> command.          |
| synflood           | Displays Enabled when the <b>synflood</b> parameter is configured with the <b>dos</b> command, plus the action (Shutdown port, Mirror port, or Trap port) and the number of instances of any <b>synflood</b> DoS attacks that have occurred on the interface. Displays Disabled when the <b>synflood</b> parameter is not configured with the <b>dos</b> command. |
| teardrop           | Displays Enabled when the <b>teardrop</b> parameter is configured with the <b>dos</b> command, plus the action (Shutdown port, Mirror port, or Trap port) and the number of instances of any <b>teardrop</b> DoS attacks that have occurred on the interface. Displays Disabled when the <b>teardrop</b> parameter is not configured with the <b>dos</b> command. |

**Related commands**    dos

# show ip access-list

**Overview** Use this command to display IP access-lists.

**Syntax** `show ip access-list`  
`[<1-99>|<100-199>|<1300-1999>|<2000-2699>|<access-list-name>]`

| Parameter          | Description                               |
|--------------------|---|
| <1-99>             | IP standard access-list.                  |
| <100-199>          | IP extended access-list.                  |
| <1300-1999>        | IP standard access-list (expanded range). |
| <2000-2699>        | IP extended access-list (expanded range). |
| <access-list-name> | IP named access-list.                     |

**Mode** User Exec and Privileged Exec

**Example** `awplus# show ip access-list`

**Output** Figure 39-3: Example output from the **show ip access-list** command

```
Standard IP access-list 1
  permit 172.168.6.0, wildcard bits 0.0.0.255
  permit 192.168.6.0, wildcard bits 0.0.0.255
```

# show ip prefix-list

**Overview** Use this command to display the IPv4 prefix-list entries.  
Note that this command is valid for RIP and BGP routing protocols only.

**Syntax** `show ip prefix-list [<name>|detail|summary]`

| Parameter | Description   |
|-----------|---|
| <name>    | Specify the name of a prefix list in this placeholder.                    |
| detail    | Specify this parameter to show detailed output for all IPv4 prefix lists. |
| summary   | Specify this parameter to show summary output for all IPv4 prefix lists.  |

**Mode** User Exec and Privileged Exec

**Example**

```
awplus# show ip prefix-list

## vty access-class (numbered)

**Overview** For IPv4, use this command to set a standard numbered software access list to be the management ACL. This is then applied to all available VTY lines for controlling remote access by Telnet and SSH. This command allows or denies packets containing the IP addresses included in the ACL to create a connection to your device.

ACLs that are attached using this command have an implicit deny-all filter as the final entry in the ACL. So a typical configuration would be to permit a specific address, or range of addresses, and rely on the deny-all filter to block all other access.

Use the **no** variant of this command to remove the access list.

**Syntax** `vty access-class {<1-99>|<1300-1999>}`  
`no vty access-class [<1-99>|<1300-1999>]`

| Parameter   | Description                                       |
|-------------|---|
| <1-99>      | IPv4 standard access-list number                  |
| <1300-1999> | IPv4 standard access-list number (expanded range) |

**Mode** Global Configuration

**Examples** To set access-list 4 to be the management ACL, use the following commands:

```
awplus# configure terminal  
awplus(config)# vty access-class 4
```

To remove access-list 4 from the management ACL, use the following commands:

```
awplus# configure terminal  
awplus(config)# no vty access-class 4
```

**Output** Figure 39-4: Example output from the **show running-config** command

```
awplus#show running-config|grep access-class  
vty access-class 4
```

# IPv6 Hardware Access Control List (ACL) Commands

## Introduction

**Overview** This chapter provides an alphabetical reference for the IPv6 Hardware Access Control List (ACL) commands, and contains detailed command information and command examples about IPv6 hardware ACLs, which are applied directly to interfaces using the [ipv6 traffic-filter](#) command.

For information about ACLs, see the [ACL Feature Overview and Configuration Guide](#).

To apply ACLs to an LACP channel group, apply it to all the individual switch ports in the channel group. To apply ACLs to a static channel group, apply it to the static channel group itself. For more information on link aggregation see the following references:

- [Link Aggregation Feature Overview\\_and\\_Configuration\\_Guide](#).
- [Link Aggregation Commands](#)

Most ACL command titles include usage information in parentheses. When the command title is completely surrounded by parentheses, the title indicates the type of ACL filter instead of keywords to enter into the CLI. For example, the title **(named IPv6 hardware ACL: IP protocol entry)** represents a command with the syntax:

```
[<sequence-number>] <action> proto <1-255> <source-addr>  
<dest-addr> [vlan <1-4094>]
```

Hardware ACLs will **permit** access unless **explicitly denied** by an ACL action.

**Sub-modes** Many of the ACL commands operate from sub-modes that are specific to particular ACL types. The following table shows the CLI prompts at which ACL commands are entered.

Table 40-1: IPv6 Hardware Access List Commands and Prompts

| Command Name                                 | Command Mode                      | Prompt                            |
|--|-----------------------------------|-----------------------------------|
| show acl-group ipv6 address                  | Privileged Exec                   | awplus#                           |
| show ipv6 access-list (IPv6 Hardware ACLs)   | Privileged Exec                   | awplus#                           |
| acl-group ipv6 address                       | Global Configuration              | awplus (config) #                 |

# acl-group ipv6 address

**Overview** Use this command to create a new named IPv6 ACL group that contains one or more IPv6 host or subnets.

This command creates a named IPv6 ACL group and enters the ACL Host Group config mode. IPv6 hosts or subnets can be added to or removed from this group. This host group can be used as a source or destination match for any hardware ACL to simplify large ACL configs with lots of IPv6 hosts.

Use the **no** variant of this command to delete an IPv6 ACL group.

**Syntax** `acl-group ipv6 address <group>`  
`no acl-group ipv6 address <group>`

| Parameter                  | Description                     |
|----------------------------|---------------------------------|
| <code>&lt;group&gt;</code> | The name of the IPv6 ACL group. |

**Default** No ACL groups exist by default.

**Mode** Global Configuration

**Example** To create an IPv6 ACL group named IPV6\_GROUP1, use the commands:

```
awplus# configure terminal
awplus(config)# acl-group ipv6 address IPV6_GROUP1
awplus(config-ip-host-group)#
```

To delete an IPv6 ACL group named IPV6\_GROUP1, use the commands:

```
awplus# configure terminal
awplus(config)# no acl-group ipv6 address IPV6_GROUP1
```

**Related commands** [ipv6 \(ipv6-host-group\)](#)  
[show acl-group ipv6 address](#)

**Command changes** Version 5.5.0-1.1: command added

# clear access-list counters

**Overview** Use this command to reset the hardware access-list counters to zero. The access-list counters show the number of packets that match your hardware ACLs. Every time a hardware ACL allows or drops a packet, its counter increments.

**Syntax** `clear access-list counters [<acl>]`

| Parameter | Description  |
|-----------|--|
| <acl>     | Clear the counters for only the specified ACL. You can enter the ACL name or number. |

**Mode** Privileged Exec

**Usage notes** To view the counter values, use the command [show access-list counters](#).

**Example** To clear the counters for the ACL named ACL-1, use the command:

```
awplus# clear access-list counters ACL-1
```

**Related commands** [show access-list counters](#)

**Command changes** Version 5.5.2-2.1: command added

## commit (IPv6)

**Overview** Use this command to commit the IPv6 ACL filter configuration entered at the console to the hardware immediately without exiting the IPv6 Hardware ACL Configuration mode.

This command forces the associated hardware and software IPv6 ACLs to synchronize.

**Syntax** `commit`

**Mode** IPv6 Hardware ACL Configuration

**Usage notes** Normally, when an IPv6 hardware ACL is edited, the new configuration state of the IPv6 ACL is not written to hardware until you exit IPv6 Hardware ACL Configuration mode. By entering this command you can ensure that the current state of a hardware access-list that is being edited is written to hardware immediately.

Scripts typically do not include the `exit` command to exit configuration modes, potentially leading to IPv6 ACL filters in hardware not being correctly updated. Using this **commit** command in a configuration script after specifying an IPv6 hardware ACL filter ensures that it is updated in the hardware.

**Example** To update the hardware with the IPv6 ACL filter configuration, use the command:

```
awplus# configure terminal
awplus(config)# ipv6 access-list my-ipv6-acl
awplus(config-ipv6-hw-acl)# commit
```

**Related commands** [ipv6 access-list \(named IPv6 hardware ACL\)](#)

# ipv6 (ipv6-host-group)

**Overview** Use this command to add an IPv6 host or subnet to an IPv6 ACL group. Adding IPv6 hosts and subnets to an ACL group allows you to simplify ACL config when the same IP addresses are required for many ACLs.

Use the **no** variant of this command to remove an IPv6 host or subnet from an IPv6 ACL group.

**Syntax** `ipv6 {any|<match-ip>}`  
`no ipv6 {any|<match-ip>}`

| Parameter                     | Description   |
|-------------------------------|---|
| any                           | Match any IP address.   |
| <match-ip>                    | The addresses to match against. You can specify a single host or a subnet. The following are the valid formats for specifying the addresses:                                  |
| <ipv6-addr>                   | Specifies a single host address. The IPv6 address uses the format X:X::X:X.   |
| <ipv6-addr>/<prefix>          | Specifies an address and prefix length. The IPv6 address prefix uses the format X:X::/prefix-length. The prefix-length is usually set between 0 and 64, or has the value 128. |
| <ipv6-addr><br><reverse-mask> | An IPv6 host and a reverse mask in format X:X::X:X.   |

**Default** No hosts or subnets are in an IPv6 ACL group by default.

**Mode** IPv6 ACL Host Group Configuration

**Example** To add the subnet 2001:DB8::/32 to an IPv6 ACL group IPV6\_GROUP1, use the commands:

```
awplus# configure terminal
awplus(config)# acl-group ipv6 address IPV6_GROUP1
awplus(config-ipv6-host-group)# ipv6 2001:DB8::/32
```

To remove the subnet 2001:DB8::/32 from an IPv6 ACL group IPV6\_GROUP1, use the commands:

```
awplus# configure terminal
awplus(config)# acl-group ipv6 address IPV6_GROUP1
awplus(config-ipv6-host-group)# no ipv6 2001:DB8::/32
```

**Related commands** [acl-group ipv6 address](#)  
[show acl-group ipv6 address](#)

**Command changes** Version 5.5.0-1.1: command added

# ipv6 access-list (named IPv6 hardware ACL)

**Overview** Use this command to either create a new IPv6 hardware access-list, or to select an existing IPv6 hardware access-list in order to apply a filter entry to it.

Use the **no** variant of this command to delete an existing IPv6 hardware access-list.

**NOTE:** Before you can delete an access-list, you must first remove it from any interface it is assigned to.

**Syntax** `ipv6 access-list <ipv6-access-list-name>`  
`no ipv6 access-list <ipv6-access-list-name>`

| Parameter                                  | Description                       |
|--|-----------------------------------|
| <code>&lt;ipv6-access-list-name&gt;</code> | Specify an IPv6 access-list name. |

**Mode** Global Configuration

**Default** Any traffic on an interface controlled by a hardware ACL that does not explicitly match a filter is permitted.

**Usage notes** Use IPv6 hardware named access-lists to control the transmission of IPv6 packets on an interface, and restrict the content of routing updates. The switch stops checking the IPv6 hardware named access-list when a match is encountered.

This command moves you to the (config-ipv6-hw-acl) prompt for the selected IPv6 hardware named access-list number. From there you can configure the filters for this selected IPv6 hardware named access-list.

Once you have configured the ACL, use the [ipv6 traffic-filter](#) or the [match access-group](#) command to apply this ACL to a port, VLAN or QoS class-map. Note that the ACL will only apply to incoming data packets.

Hardware ACLs will **permit** access unless **explicitly denied** by an ACL action.

**Examples** To create an IPv6 access-list named "my-ipv6-acl", use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list my-ipv6-acl
awplus(config-ipv6-hw-acl)#
```

To delete the IPv6 access-list named "my-ipv6-acl", use the commands:

```
awplus# configure terminal
awplus(config)# no ipv6 access-list my-ipv6-acl
```

**Related commands** ([named IPv6 hardware ACL: ICMP entry](#))

(named IPv6 hardware ACL: IPv6 packet entry)

(named IPv6 hardware ACL: IP protocol entry)

(named IPv6 hardware ACL: TCP or UDP entry)

ipv6 traffic-filter

match access-group

show ipv6 access-list (IPv6 Hardware ACLs)

# ipv6 traffic-filter

**Overview** This command adds an IPv6 hardware-based access-list to an interface. The number of access-lists that can be added is determined by the amount of available space in the hardware-based packet classification tables.

Use the **no** variant of this command to remove an IPv6 hardware-based access-list from an interface.

**Syntax** `ipv6 traffic-filter <ipv6-access-list-name>`  
`no ipv6 traffic-filter <ipv6-access-list-name>`

| Parameter                                  | Description                     |
|--|---------------------------------|
| <code>&lt;ipv6-access-list-name&gt;</code> | Hardware IPv6 access-list name. |

**Mode** Interface Configuration (to apply an IPv6 hardware ACL to a specific switch port).

**Usage notes** This command adds an IPv6 hardware-based access-list to an interface. The number of access-lists that can be added is determined by the amount of available space in the hardware-based packet classification tables.

**Examples** To add access-list "acl1" as a traffic-filter to interface port1.0.1, enter the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# ipv6 traffic-filter acl1
```

To remove access-list "acl1" as a traffic-filter from interface port1.0.1, enter the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# no ipv6 traffic-filter acl1
```

**Related commands**

- [ipv6 access-list \(named IPv6 hardware ACL\)](#)
- [\(named IPv6 hardware ACL: ICMP entry\)](#)
- [\(named IPv6 hardware ACL: IPv6 packet entry\)](#)
- [\(named IPv6 hardware ACL: IP protocol entry\)](#)
- [\(named IPv6 hardware ACL: TCP or UDP entry\)](#)
- [show ipv6 access-list \(IPv6 Hardware ACLs\)](#)

## (named IPv6 hardware ACL: ICMP entry)

**Overview** Use this command to add a new ICMP filter entry to the current IPv6 hardware access-list. The filter will match on any ICMP packet that has the specified IPv6 source and destination IP addresses and (optionally) ICMP type. You can specify the value **any** if source or destination address does not matter.

The **no** variant of this command removes a filter entry from the current IPv6 hardware access-list. You can specify the filter entry for removal by entering either its sequence number (e.g. **no 100**), or by entering its filter profile without specifying its sequence number (e.g. **no deny icmp 2001:0db8::0/64 any**).

You can find the sequence number by running the [show ipv6 access-list \(IPv6 Hardware ACLs\)](#) command.

Hardware ACLs will **permit** access unless **explicitly denied** by an ACL action.

**CAUTION:** Specifying a "send" action enables you to use ACLs to redirect packets from their original destination. Use such ACLs with caution. They could prevent control packets from reaching the correct destination, such as EPSR healthcheck messages and AMF messages.

**Syntax** [`<sequence-number>`] `<action>` icmp `<source-addr>` `<dest-addr>`  
[icmp-type `<number>`] [vlan `<1-4094>`]  
  
`no <sequence-number>`  
  
`no <action>` icmp `<source-addr>` `<dest-addr>` [icmp-type `<number>`]  
[vlan `<1-4094>`]

The following actions are available for hardware ACLs:

| Values for the <code>&lt;action&gt;</code> parameter  |  |
|---|--|
| deny  | Reject packets that match the source and destination filtering specified with this command.  |
| permit  | Permit packets that match the source and destination filtering specified with this command.  |
| copy-to-cpu   | Send a copy of matching packets to the CPU.  |
| copy-to-mirror  | Send a copy of matching packets to the mirror port. Use the <b>mirror interface</b> command to configure the mirror port.          |
| send-to-mirror  | Send matching packets to the mirror port. Use the <b>mirror interface</b> command to configure the mirror port.                    |
| send-to-vlan-port<br>vlan <code>&lt;vid&gt;</code> port<br><code>&lt;port-number&gt;</code> | Send matching packets to the specified port, tagged with the specified VLAN. The specified port must belong to the specified VLAN. |
| send-to-cpu   | Send matching packets to the CPU.  |

| Parameter   | Description  |
|---|--|
| <i>&lt;sequence-number&gt;</i>  | The sequence number for the filter entry of the selected access control list, in the range 1-65535.  |
| <i>&lt;action&gt;</i>   | The action that the switch will take on matching packets. See the table above for valid values.  |
| icmp  | Match against ICMP packets.  |
| <i>&lt;source-addr&gt;</i>  | The source addresses to match against. You can specify a single host, a range, or all source addresses. The following are the valid formats for specifying the source:                             |
| any   | Match any source host.   |
| <i>&lt;ipv6-src-address/prefix-length&gt;</i>                         | Match the specified source address and prefix length. The IPv6 address prefix uses the format X:X::/prefix-length. The prefix-length is usually set between 0 and 64.                              |
| <i>&lt;ipv6-src-address&gt;</i><br><i>&lt;ipv6-src-wildcard&gt;</i>   | Match the specified IPv6 source address, masked using wildcard bits. The IPv6 address uses the format X:X::X:X. In the wildcard bits, 1 represents bits to ignore, and 0 represents bits to match. |
| host<br><i>&lt;ipv6-source-host&gt;</i>                               | Match a single source host address. The IPv6 address uses the format X:X::X:X.   |
| <i>&lt;dest-addr&gt;</i>  | The destination addresses to match against. You can specify a single host, a range, or all destination addresses. The following are the valid formats for specifying the destination:              |
| any   | Match any destination host.  |
| <i>&lt;ipv6-dest-address/prefix-length&gt;</i>                        | Match the specified destination address and prefix length. The IPv6 address prefix uses the format X:X::/prefix-length. The prefix-length is usually set between 0 and 64.                         |
| <i>&lt;ipv6-dest-address&gt;</i><br><i>&lt;ipv6-dest-wildcard&gt;</i> | Match the specified destination address, masked using wildcard bits. The IPv6 address uses the format X:X::X:X. In the wildcard bits, 1 represents bits to ignore, and 0 represents bits to match. |

| Parameter  | Description   |   |               |   |                                   |   |                         |   |                                   |   |                |    |                         |    |                             |    |                     |    |                    |    |                       |    |                      |    |                        |    |                       |
|--|---|---|---------------|---|-----------------------------------|---|-------------------------|---|-----------------------------------|---|----------------|----|-------------------------|----|-----------------------------|----|---------------------|----|--------------------|----|-----------------------|----|----------------------|----|------------------------|----|-----------------------|
| <code>host</code><br><code>&lt;ipv6-dest-host&gt;</code> | Match a single destination host address.<br>The IPv6 address uses the format X::X:X.  |   |               |   |                                   |   |                         |   |                                   |   |                |    |                         |    |                             |    |                     |    |                    |    |                       |    |                      |    |                        |    |                       |
| <code>icmp-type</code><br><code>&lt;number&gt;</code>    | The type of ICMP message to match against, as defined in RFC792 and RFC950. Values include: <table border="1"> <tbody> <tr> <td>0</td> <td>Echo replies.</td> </tr> <tr> <td>3</td> <td>Destination unreachable messages.</td> </tr> <tr> <td>4</td> <td>Source quench messages.</td> </tr> <tr> <td>5</td> <td>Redirect (change route) messages.</td> </tr> <tr> <td>8</td> <td>Echo requests.</td> </tr> <tr> <td>11</td> <td>Time exceeded messages.</td> </tr> <tr> <td>12</td> <td>Parameter problem messages.</td> </tr> <tr> <td>13</td> <td>Timestamp requests.</td> </tr> <tr> <td>14</td> <td>Timestamp replies.</td> </tr> <tr> <td>15</td> <td>Information requests.</td> </tr> <tr> <td>16</td> <td>Information replies.</td> </tr> <tr> <td>17</td> <td>Address mask requests.</td> </tr> <tr> <td>18</td> <td>Address mask replies.</td> </tr> </tbody> </table> | 0 | Echo replies. | 3 | Destination unreachable messages. | 4 | Source quench messages. | 5 | Redirect (change route) messages. | 8 | Echo requests. | 11 | Time exceeded messages. | 12 | Parameter problem messages. | 13 | Timestamp requests. | 14 | Timestamp replies. | 15 | Information requests. | 16 | Information replies. | 17 | Address mask requests. | 18 | Address mask replies. |
| 0  | Echo replies.   |   |               |   |                                   |   |                         |   |                                   |   |                |    |                         |    |                             |    |                     |    |                    |    |                       |    |                      |    |                        |    |                       |

| 17   | Address mask requests.  |   |               |   |                                   |   |                         |   |                                   |   |                |    |                         |    |                             |    |                     |    |                    |    |                       |    |                      |    |                        |    |                       |
| 18   | Address mask replies.   |   |               |   |                                   |   |                         |   |                                   |   |                |    |                         |    |                             |    |                     |    |                    |    |                       |    |                      |    |                        |    |                       |
| <code>vlan</code> <code>&lt;1-4094&gt;</code>            | The VLAN to match against. The ACL will match against the specified ID in the packet's VLAN tag.  |   |               |   |                                   |   |                         |   |                                   |   |                |    |                         |    |                             |    |                     |    |                    |    |                       |    |                      |    |                        |    |                       |

**Mode** IPv6 Hardware ACL Configuration (accessed by running the command `ipv6 access-list` (named IPv6 hardware ACL))

**Default** On an interface controlled by a hardware ACL, any traffic that does not explicitly match a filter is permitted.

**Usage notes** To use this command, first run the command `ipv6 access-list` (named IPv6 hardware ACL) and enter the desired access-list name. This changes the prompt to:

```
awplus (config-ipv6-hw-acl) #
```

Then use this command (and the other "named IPv6 hardware ACL: entry" commands) to add filter entries. You can add multiple filter entries to an ACL.

If you specify a sequence number, the new entry is inserted at the specified location. If you do not specify a sequence number, the switch puts the entry at the end of the ACL and assigns it the next available multiple of 4 as its sequence number.

Once you have configured the ACL, use the `ipv6 traffic-filter` or the `match access-group` command to apply this ACL to a port, VLAN or QoS class-map. Note that the ACL will only apply to incoming data packets.

**Examples** To add a filter entry to the ACL named “my-acl”, to block ICMP packets sent from network 2001:0db8::0/64 , use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list my-acl
awplus(config-ipv6-hw-acl)# deny icmp 2001:0db8::0/64 any
```

To remove a filter entry from the ACL named “my-acl” that blocks all ICMP packets sent from network 2001:0db8::0/ 64 , use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list my-acl
awplus(config-ipv6-hw-acl)# no deny icmp 2001:0db8::0/64 any
```

To specify an ACL named “my-acl1” and add a filter entry that blocks all ICMP6 echo requests, enter the commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list my-acl1
awplus(config-ipv6-hw-acl)# deny icmp any any icmp-type 128
```

To specify an ACL named “my-acl2” and add a filter entry that blocks all ICMP6 echo requests on the default VLAN (vlan1), enter the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list my-acl2
awplus(config-ipv6-hw-acl)# deny icmp any any icmp-type 128
vlan 1
```

To remove a filter entry that blocks all ICMP6 echo requests from the ACL named “my-acl1”, enter the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list my-acl1
awplus(config-ipv6-hw-acl)# no deny icmp any any icmp-type 128
```

**Related commands**

- [ipv6 traffic-filter](#)
- [match access-group](#)
- [show ipv6 access-list \(IPv6 Hardware ACLs\)](#)

**Command changes**

- Version 5.5.3-0.1: **deny-and-not-cpu** action parameter added on x230, x550, x930, x950, SBx908 GEN2 Series switches
- Version 5.5.3-0.1: **log** parameter added on x220, x320, x530, x550, x950, SBx908 GEN2 Series switches
- Version 5.4.7-2.1: **send-to-vlan-port** action parameter added on GS900MX, GS980MX, XS900MX, SBx8100, SBx908 GEN2, x950 Series switches
- Version 5.4.6-2.1: **send-to-vlan-port** action parameter added on IX5, x230, x310, x510, x930 Series switches

# (named IPv6 hardware ACL: IPv6 packet entry)

**Overview** Use this command to add an IPv6 packet filter entry to the current hardware access-list. The filter will match on IPv6 packets that have the specified source and destination IPv6 address and (optionally) prefix. You can use the value **any** instead of source or destination IPv6 address if an address does not matter.

The **no** variant of this command removes a filter entry from the current hardware access-list. You can specify the filter entry for removal by entering either its sequence number (e.g. **no 100**), or by entering its filter profile without specifying its sequence number (e.g. **no deny ipv6 2001:0db8::0/64 any**).

You can find the sequence number by running the [show ipv6 access-list \(IPv6 Hardware ACLs\)](#) command.

Hardware ACLs will **permit** access unless **explicitly denied** by an ACL action.

**CAUTION:** Specifying a "send" action enables you to use ACLs to redirect packets from their original destination. Use such ACLs with caution. They could prevent control packets from reaching the correct destination, such as EPSR healthcheck messages and AMF messages.

**Syntax** [`<sequence-number>`] `<action>` ipv6 `<source-addr>` `<dest-addr>`  
[vlan `<1-4094>`]  
`no <sequence-number>`  
`no <action>` ipv6 `<source-addr>` `<dest-addr>` [vlan `<1-4094>`]

The following actions are available for hardware ACLs:

| Values for the <code>&lt;action&gt;</code> parameter  |  |
|---|--|
| deny  | Reject packets that match the source and destination filtering specified with this command.  |
| permit  | Permit packets that match the source and destination filtering specified with this command.  |
| copy-to-cpu   | Send a copy of matching packets to the CPU.  |
| copy-to-mirror  | Send a copy of matching packets to the mirror port. Use the <b>mirror interface</b> command to configure the mirror port.          |
| send-to-mirror  | Send matching packets to the mirror port. Use the <b>mirror interface</b> command to configure the mirror port.                    |
| send-to-vlan-port<br>vlan <code>&lt;vid&gt;</code> port<br><code>&lt;port-number&gt;</code> | Send matching packets to the specified port, tagged with the specified VLAN. The specified port must belong to the specified VLAN. |
| send-to-cpu   | Send matching packets to the CPU.  |

| Parameter   | Description  |
|---|--|
| <i>&lt;sequence-number&gt;</i>  | The sequence number for the filter entry of the selected access control list, in the range 1-65535.  |
| <i>&lt;action&gt;</i>   | The action that the switch will take on matching packets. See the table above for valid values.  |
| ipv6  | Match against IPv6 packets   |
| <i>&lt;source-addr&gt;</i>  | The source addresses to match against. You can specify a single host, a range, or all source addresses. The following are the valid formats for specifying the source:                             |
| any   | Match any source host.   |
| <i>&lt;ipv6-src-address/prefix-length&gt;</i>                         | Match the specified source address and prefix length. The IPv6 address prefix uses the format X:X::/prefix-length. The prefix-length is usually set between 0 and 64.                              |
| <i>&lt;ipv6-src-address&gt;</i><br><i>&lt;ipv6-src-wildcard&gt;</i>   | Match the specified IPv6 source address, masked using wildcard bits. The IPv6 address uses the format X:X::X:X. In the wildcard bits, 1 represents bits to ignore, and 0 represents bits to match. |
| host<br><i>&lt;ipv6-source-host&gt;</i>                               | Match a single source host address. The IPv6 address uses the format X:X::X:X.   |
| <i>&lt;dest-addr&gt;</i>  | The destination addresses to match against. You can specify a single host, a range, or all destination addresses. The following are the valid formats for specifying the destination:              |
| any   | Match any destination host.  |
| <i>&lt;ipv6-dest-address/prefix-length&gt;</i>                        | Match the specified destination address and prefix length. The IPv6 address prefix uses the format X:X::/prefix-length. The prefix-length is usually set between 0 and 64.                         |
| <i>&lt;ipv6-dest-address&gt;</i><br><i>&lt;ipv6-dest-wildcard&gt;</i> | Match the specified destination address, masked using wildcard bits. The IPv6 address uses the format X:X::X:X. In the wildcard bits, 1 represents bits to ignore, and 0 represents bits to match. |

| Parameter  | Description  |
|--|--|
| <code>host</code><br><code>&lt;ipv6-dest-host&gt;</code> | Match a single destination host address.<br>The IPv6 address uses the format X::X:X.             |
| <code>vlan &lt;1-4094&gt;</code>                         | The VLAN to match against. The ACL will match against the specified ID in the packet's VLAN tag. |

**Mode** IPv6 Hardware ACL Configuration (accessed by running the command `ipv6 access-list (named IPv6 hardware ACL)`)

**Default** On an interface controlled by a hardware ACL, any traffic that does not explicitly match a filter is permitted.

**Usage notes** To use this command, first run the command `ipv6 access-list (named IPv6 hardware ACL)` and enter the desired access-list name. This changes the prompt to:

```
awplus(config-ipv6-hw-acl)#
```

Then use this command (and the other "named IPv6 hardware ACL: entry" commands) to add filter entries. You can add multiple filter entries to an ACL.

If you specify a sequence number, the new entry is inserted at the specified location. If you do not specify a sequence number, the switch puts the entry at the end of the ACL and assigns it the next available multiple of 4 as its sequence number.

Once you have configured the ACL, use the `ipv6 traffic-filter` or the `match access-group` command to apply this ACL to a port, VLAN or QoS class-map. Note that the ACL will only apply to incoming data packets.

**Examples** To add a filter entry to the ACL named "my-acl" to block IPv6 traffic sent from network 2001:0db8::0/64, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list my-acl
awplus(config-ipv6-hw-acl)# deny ipv6 2001:0db8::0/64 any
```

To remove a filter entry from the ACL named "my-acl" that blocks all IPv6 traffic sent from network 2001:0db8::0/64, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list my-acl
awplus(config-ipv6-hw-acl)# no deny ipv6 2001:0db8::0/64 any
```

**Related commands**

- `ipv6 access-list (named IPv6 hardware ACL)`
- `ipv6 traffic-filter`
- `match access-group`
- `show ipv6 access-list (IPv6 Hardware ACLs)`

**Command changes** Version 5.5.3-0.1: **deny-and-not-cpu** action parameter added on x230, x550, x930, x950, SBx908 GEN2 Series switches

Version 5.5.3-0.1: **log** parameter added on x220, x320, x530, x550, x950, SBx908 GEN2 Series switches

Version 5.4.7-2.1: **send-to-vlan-port** action parameter added on GS900MX, GS980MX, XS900MX, SBx8100, SBx908 GEN2, x950 Series switches

Version 5.4.6-2.1: **send-to-vlan-port** action parameter added on IX5, x230, x310, x510, x930 Series switches

# (named IPv6 hardware ACL: IP protocol entry)

**Overview** Use this command to add an IP protocol type filter entry to the current IPv6 hardware access-list. The filter will match on IPv6 packets that have the specified IP protocol number, and the specified IPv6 addresses. You can use the value **any** instead of source or destination IPv6 address if an address does not matter.

The **no** variant of this command removes a filter entry from the current hardware access-list. You can specify the filter entry for removal by entering either its sequence number (e.g. **no 100**), or by entering its filter profile without specifying its sequence number (e.g. **no deny proto 2 2001:0db8::0/64 any**).

You can find the sequence number by running the [show ipv6 access-list \(IPv6 Hardware ACLs\)](#) command.

Hardware ACLs will **permit** access unless **explicitly denied** by an ACL action.

**CAUTION:** Specifying a "send" action enables you to use ACLs to redirect packets from their original destination. Use such ACLs with caution. They could prevent control packets from reaching the correct destination, such as EPSR healthcheck messages and AMF messages.

**Syntax** [`<sequence-number>`] `<action>` proto `<1-255>` `<source-addr>`  
`<dest-addr>` [`vlan <1-4094>`]  
`no <sequence-number>`  
`no <action>` proto `<1-255>` `<source-addr>` `<dest-addr>` [`vlan <1-4094>`]

The following actions are available for hardware ACLs:

| Values for the <code>&lt;action&gt;</code> parameter  |  |
|---|--|
| deny  | Reject packets that match the source and destination filtering specified with this command.  |
| permit  | Permit packets that match the source and destination filtering specified with this command.  |
| copy-to-cpu   | Send a copy of matching packets to the CPU.  |
| copy-to-mirror  | Send a copy of matching packets to the mirror port. Use the <b>mirror interface</b> command to configure the mirror port.          |
| send-to-mirror  | Send matching packets to the mirror port. Use the <b>mirror interface</b> command to configure the mirror port.                    |
| send-to-vlan-port<br>vlan <code>&lt;vid&gt;</code> port<br><code>&lt;port-number&gt;</code> | Send matching packets to the specified port, tagged with the specified VLAN. The specified port must belong to the specified VLAN. |
| send-to-cpu   | Send matching packets to the CPU.  |

Table 40-2: Parameters in IP protocol ACL entries

| Parameter   | Description  |                  |                             |  |  |   |  |  |  |
|---|--|------------------|-----------------------------|--|--|---|--|--|--|
| <code>&lt;sequence-number&gt;</code>  | The sequence number for the filter entry of the selected access control list, in the range 1-65535.  |                  |                             |  |  |   |  |  |  |
| <code>&lt;action&gt;</code>   | The action that the switch will take on matching packets. See the table above for valid values.  |                  |                             |  |  |   |  |  |  |
| <code>proto &lt;1-255&gt;</code>  | The IP protocol number to match against, as defined by IANA (Internet Assigned Numbers Authority <a href="http://www.iana.org/assignments/protocol-numbers">www.iana.org/assignments/protocol-numbers</a> )<br>See below for a list of IP protocol numbers and their descriptions.   |                  |                             |  |  |   |  |  |  |
| <code>&lt;source-addr&gt;</code>  | The source addresses to match against. You can specify a single host, a range, or all source addresses. The following are the valid formats for specifying the source: <table border="1" data-bbox="662 795 1423 1478"> <tbody> <tr> <td><code>any</code></td> <td>Match any source host.</td> </tr> <tr> <td><code>&lt;ipv6-src-address/prefix-length&gt;</code></td> <td>Match the specified source address and prefix length. The IPv6 address prefix uses the format X:X::/prefix-length. The prefix-length is usually set between 0 and 64.</td> </tr> <tr> <td><code>&lt;ipv6-src-address&gt;</code><br/><code>&lt;ipv6-src-wildcard&gt;</code></td> <td>Match the specified IPv6 source address, masked using wildcard bits. The IPv6 address uses the format X:X::X:X. In the wildcard bits, 1 represents bits to ignore, and 0 represents bits to match.</td> </tr> <tr> <td><code>host</code><br/><code>&lt;ipv6-source-host&gt;</code></td> <td>Match a single source host address. The IPv6 address uses the format X:X::X:X.</td> </tr> </tbody> </table> | <code>any</code> | Match any source host.      | <code>&lt;ipv6-src-address/prefix-length&gt;</code>  | Match the specified source address and prefix length. The IPv6 address prefix uses the format X:X::/prefix-length. The prefix-length is usually set between 0 and 64.      | <code>&lt;ipv6-src-address&gt;</code><br><code>&lt;ipv6-src-wildcard&gt;</code> | Match the specified IPv6 source address, masked using wildcard bits. The IPv6 address uses the format X:X::X:X. In the wildcard bits, 1 represents bits to ignore, and 0 represents bits to match. | <code>host</code><br><code>&lt;ipv6-source-host&gt;</code> | Match a single source host address. The IPv6 address uses the format X:X::X:X. |
| <code>any</code>  | Match any source host.   |                  |                             |  |  |   |  |  |  |
| <code>&lt;ipv6-src-address/prefix-length&gt;</code>                             | Match the specified source address and prefix length. The IPv6 address prefix uses the format X:X::/prefix-length. The prefix-length is usually set between 0 and 64.  |                  |                             |  |  |   |  |  |  |
| <code>&lt;ipv6-src-address&gt;</code><br><code>&lt;ipv6-src-wildcard&gt;</code> | Match the specified IPv6 source address, masked using wildcard bits. The IPv6 address uses the format X:X::X:X. In the wildcard bits, 1 represents bits to ignore, and 0 represents bits to match.   |                  |                             |  |  |   |  |  |  |
| <code>host</code><br><code>&lt;ipv6-source-host&gt;</code>                      | Match a single source host address. The IPv6 address uses the format X:X::X:X.   |                  |                             |  |  |   |  |  |  |
| <code>&lt;dest-addr&gt;</code>  | The destination addresses to match against. You can specify a single host, a range, or all destination addresses. The following are the valid formats for specifying the destination: <table border="1" data-bbox="662 1601 1423 1856"> <tbody> <tr> <td><code>any</code></td> <td>Match any destination host.</td> </tr> <tr> <td><code>&lt;ipv6-dest-address/prefix-length&gt;</code></td> <td>Match the specified destination address and prefix length. The IPv6 address prefix uses the format X:X::/prefix-length. The prefix-length is usually set between 0 and 64.</td> </tr> </tbody> </table>   | <code>any</code> | Match any destination host. | <code>&lt;ipv6-dest-address/prefix-length&gt;</code> | Match the specified destination address and prefix length. The IPv6 address prefix uses the format X:X::/prefix-length. The prefix-length is usually set between 0 and 64. |   |  |  |  |
| <code>any</code>  | Match any destination host.  |                  |                             |  |  |   |  |  |  |
| <code>&lt;ipv6-dest-address/prefix-length&gt;</code>                            | Match the specified destination address and prefix length. The IPv6 address prefix uses the format X:X::/prefix-length. The prefix-length is usually set between 0 and 64.   |                  |                             |  |  |   |  |  |  |

Table 40-2: Parameters in IP protocol ACL entries (cont.)

| Parameter   | Description  |
|---|--|
| <i>&lt;ipv6-dest-address&gt;</i><br><i>&lt;ipv6-dest-wildcard&gt;</i> | Match the specified destination address, masked using wildcard bits.<br>The IPv6 address uses the format X:X::X:X.<br>In the wildcard bits, 1 represents bits to ignore, and 0 represents bits to match. |
| host<br><i>&lt;ipv6-dest-host&gt;</i>                                 | Match a single destination host address.<br>The IPv6 address uses the format X:X::X:X.   |
| vlan <i>&lt;1-4094&gt;</i>  | The VLAN to match against. The ACL will match against the specified ID in the packet's VLAN tag.   |

Table 40-3: IP protocol number and description

| Protocol Number | Protocol Description [RFC]                             |
|-----------------|--|
| 1               | Internet Control Message [RFC792]                      |

**Mode** IPv6 Hardware ACL Configuration (accessed by running the command `ipv6 access-list (named IPv6 hardware ACL)`)

**Default** On an interface controlled by a hardware ACL, any traffic that does not explicitly match a filter is permitted.

**Usage notes** To use this command, first run the command `ipv6 access-list (named IPv6 hardware ACL)` and enter the desired access-list name. This changes the prompt to:

```
awplus(config-ipv6-hw-acl)#
```

Then use this command (and the other “named IPv6 hardware ACL: entry” commands) to add filter entries. You can add multiple filter entries to an ACL.

If you specify a sequence number, the new entry is inserted at the specified location. If you do not specify a sequence number, the switch puts the entry at the end of the ACL and assigns it the next available multiple of 4 as its sequence number.

Once you have configured the ACL, use the [ipv6 traffic-filter](#) or the [match access-group](#) command to apply this ACL to a port, VLAN or QoS class-map. Note that the ACL will only apply to incoming data packets.

**Examples** To add a filter entry to the ACL named "my-acl" to deny IGMP packets from 2001:0db8::0/64, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list my-acl
awplus(config-ipv6-hw-acl)# deny proto 2 2001:0db8::0/64 any
```

To remove a filter entry that blocks IGMP packets from network 2001:0db8::0/64 from the ACL named "my-acl", use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list my-acl
awplus(config-ipv6-hw-acl)# no deny proto 2 2001:0db8::0/64 any
```

**Related commands**

- [ipv6 access-list \(named IPv6 hardware ACL\)](#)
- [ipv6 traffic-filter](#)
- [match access-group](#)
- [show ipv6 access-list \(IPv6 Hardware ACLs\)](#)

**Command changes** Version 5.5.3-0.1: **deny-and-not-cpu** action parameter added on x230, x550, x930, x950, SBx908 GEN2 Series switches

Version 5.5.3-0.1: **log** parameter added on x220, x320, x530, x550, x950, SBx908 GEN2 Series switches

Version 5.4.7-2.1: **send-to-vlan-port** action parameter added on GS900MX, GS980MX, XS900MX, SBx8100, SBx908 GEN2, x950 Series switches

Version 5.4.6-2.1: **send-to-vlan-port** action parameter added on IX5, x230, x310, x510, x930 Series switches

# (named IPv6 hardware ACL: TCP or UDP entry)

**Overview** Use this command to add a TCP or UDP filter entry to the current IPv6 hardware access-list. The access-list will match on TCP or UDP packets that have the specified source and destination IP addresses and optionally, port values. You can use the value **any** instead of source or destination IP address if an address does not matter.

The **no** variant of this command removes a filter entry from the current hardware access-list. You can specify the filter entry for removal by entering either its sequence number (e.g. **no 100**), or by entering its filter profile without specifying its sequence number (e.g. **no deny tcp 2001:0db8::0/64 any**).

You can find the sequence number by running the [show ipv6 access-list \(IPv6 Hardware ACLs\)](#) command.

Hardware ACLs will **permit** access unless **explicitly denied** by an ACL action.

**CAUTION:** Specifying a "send" action enables you to use ACLs to redirect packets from their original destination. Use such ACLs with caution. They could prevent control packets from reaching the correct destination, such as EPSR healthcheck messages and AMF messages.

**Syntax** [`<sequence-number>`] `<action>` {tcp|udp} `<source-addr>`  
[`<source-ports>`] `<dest-addr>` [`<dest-ports>`] [vlan `<1-4094>`]  
`no <sequence-number>`  
`no <action>` {tcp|udp} `<source-addr>` [`<source-ports>`]  
`<dest-addr>` [`<dest-ports>`] [vlan `<1-4094>`]

The following actions are available for hardware ACLs:

| Values for the <action> parameter   |  |
|---|--|
| deny  | Reject packets that match the source and destination filtering specified with this command.  |
| permit  | Permit packets that match the source and destination filtering specified with this command.  |
| copy-to-cpu   | Send a copy of matching packets to the CPU.  |
| copy-to-mirror  | Send a copy of matching packets to the mirror port. Use the <b>mirror interface</b> command to configure the mirror port.          |
| send-to-mirror  | Send matching packets to the mirror port. Use the <b>mirror interface</b> command to configure the mirror port.                    |
| send-to-vlan-port<br>vlan <code>&lt;vid&gt;</code> port<br><code>&lt;port-number&gt;</code> | Send matching packets to the specified port, tagged with the specified VLAN. The specified port must belong to the specified VLAN. |
| send-to-cpu   | Send matching packets to the CPU.  |

| Parameter  | Description  |
|--|--|
| <i>&lt;sequence-number&gt;</i>                       | The sequence number for the filter entry of the selected access control list, in the range 1-65535. If you do not specify a sequence number, the switch puts the entry at the end of the ACL and assigns it the next available multiple of 4 as its sequence number. |
| <i>&lt;action&gt;</i>                                | The action that the switch will take on matching packets. See the table above for valid values.  |
| tcp  | Match against TCP packets.   |
| udp  | Match against UDP packets.   |
| <i>&lt;source-addr&gt;</i>                           | The source addresses to match against. You can specify a single host, a subnet, or all source addresses. The following are the valid formats for specifying the source:  |
| any  | Match any source IP address.   |
| host <i>&lt;ip-addr&gt;</i>                          | Match a single source host with the IP address given by <i>&lt;ip-addr&gt;</i> in dotted decimal notation.   |
| <i>&lt;ip-addr&gt;/<br/>&lt;prefix&gt;</i>           | Match any source IP address within the specified subnet. Specify the subnet by entering the IPv4 address, then a forward slash, then the prefix length.  |
| <i>&lt;ip-addr&gt;<br/>&lt;reverse-mask&gt;</i>      | Match any source IP address within the specified subnet. Specify the subnet by entering a reverse mask in dotted decimal format. For example, entering "192.168.1.1 0.0.0.255" is the same as entering 192.168.1.1/24.   |
| <i>&lt;source-ports&gt;</i>                          | Match source TCP or UDP port numbers. Port numbers are specified as integers between 0 and 65535. You can specify one or more port numbers as follows:   |
| eq <i>&lt;0-65535&gt;</i>                            | Match a single port number.  |
| lt <i>&lt;0-65535&gt;</i>                            | Match all port numbers that are less than the specified port number.   |
| gt <i>&lt;0-65535&gt;</i>                            | Match all port numbers that are greater than the specified port number.  |
| ne <i>&lt;0-65535&gt;</i>                            | Match all port numbers except the specified port number.   |
| range <i>&lt;start-port&gt;<br/>&lt;end-port&gt;</i> | Match a range of port numbers.   |
| <i>&lt;dest-addr&gt;</i>                             | The destination addresses to match against. You can specify a single host, a subnet, or all destination addresses. The following are the valid formats for specifying the destination:   |

| Parameter  | Description   |
|--|---|
| <code>any</code>   | Match any destination IP address.   |
| <code>host &lt;ip-addr&gt;</code>                          | Match a single destination host with the IP address given by <code>&lt;ip-addr&gt;</code> in dotted decimal notation.   |
| <code>&lt;ip-addr&gt;/<br/>&lt;prefix&gt;</code>           | Match any destination IP address within the specified subnet. Specify the subnet by entering the IPv4 address, then a forward slash, then the prefix length.  |
| <code>&lt;ip-addr&gt;<br/>&lt;reverse-mask&gt;</code>      | Match any destination IP address within the specified subnet. Specify the subnet by entering a reverse mask in dotted decimal format. For example, entering "192.168.1.1 0.0.0.255" is the same as entering 192.168.1.1/24. |
| <code>&lt;dest-ports&gt;</code>                            | Match destination TCP or UDP port numbers. Port numbers are specified as integers between 0 and 65535. You can specify one or more port numbers as follows:   |
| <code>eq &lt;0-65535&gt;</code>                            | Match a single port number.   |
| <code>lt &lt;0-65535&gt;</code>                            | Match all port numbers that are less than the specified port number.  |
| <code>gt &lt;0-65535&gt;</code>                            | Match all port numbers that are greater than the specified port number.   |
| <code>ne &lt;0-65535&gt;</code>                            | Match all port numbers except the specified port number.  |
| <code>range &lt;start-port&gt;<br/>&lt;end-port&gt;</code> | Match a range of port numbers.  |
| <code>vlan &lt;1-4094&gt;</code>                           | The VLAN to match against. The ACL will match against the specified ID in the packet's VLAN tag.  |

**Mode** IPv6 Hardware ACL Configuration (accessed by running the command `ipv6 access-list (named IPv6 hardware ACL)`)

**Default** On an interface controlled by a hardware ACL, any traffic that does not explicitly match a filter is permitted.

**Usage notes** To use this command, first run the command `ipv6 access-list (named IPv6 hardware ACL)` and enter the desired access-list name. This changes the prompt to:

```
awplus(config-ipv6-hw-acl)#
```

Then use this command (and the other "named IPv6 hardware ACL: entry" commands) to add filter entries. You can add multiple filter entries to an ACL.

If you specify a sequence number, the new entry is inserted at the specified location. If you do not specify a sequence number, the switch puts the entry at the

end of the ACL and assigns it the next available multiple of 4 as its sequence number.

Once you have configured the ACL, use the [ipv6 traffic-filter](#) or the [match access-group](#) command to apply this ACL to a port, VLAN or QoS class-map. Note that the ACL will only apply to incoming data packets.

**Examples** To add a filter entry that blocks all SSH traffic from network 2001:0db8::0/64 to the hardware IPv6 access-list named "my-acl", use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list my-acl
awplus(config-ipv6-hw-acl)# deny tcp 2001:0db8::0/64 any eq 22
```

To add a filter entry that blocks all SSH traffic from network 2001:0db8::0/64 on the default VLAN (vlan1) to the hardware IPv6 access-list named "my-acl", use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list my-acl
awplus(config-ipv6-hw-acl)# deny tcp 2001:0db8::0/64 any eq 22
vlan 1
```

To remove an ACL filter entry that blocks all SSH traffic from network 2001:0db8::0/64 from the hardware IPv6 access-list named "my-acl", use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list my-acl
awplus(config-ipv6-hw-acl)# no deny tcp 2001:0db8::0/64 any eq 22
```

**Related commands** [ipv6 access-list \(named IPv6 hardware ACL\)](#)  
[ipv6 traffic-filter](#)  
[match access-group](#)  
[show ipv6 access-list \(IPv6 Hardware ACLs\)](#)

**Command changes** Version 5.5.3-0.1: **deny-and-not-cpu** action parameter added on x230, x550, x930, x950, SBx908 GEN2 Series switches

Version 5.5.3-0.1: **log** parameter added on x220, x320, x530, x550, x950, SBx908 GEN2 Series switches

Version 5.4.7-2.1: **send-to-vlan-port** action parameter added on GS900MX, GS980MX, XS900MX, SBx8100, SBx908 GEN2, x950 Series switches

Version 5.4.6-2.1: **send-to-vlan-port** action parameter added on IX5, x230, x310, x510, x930 Series switches

# platform hwfilter-size

**Overview** You can use this command to control the configuration of hardware Access Control Lists (ACLs), which determines the total available number and functionality of hardware ACLs.

For this command to take effect, you need to reboot the affected service.

You cannot attach an IPv6 ACL to a port if the ACL contains a specified source or destination IPv6 address or both and the **hw-filter size** setting is **ipv4-limited-ipv6**. If you do so, a diagnostic message will be generated.

**Syntax** `platform hwfilter-size {ipv4-limited-ipv6|ipv4-full-ipv6}`

| Parameter                      | Description  |
|--------------------------------|--|
| <code>hwfilter-size</code>     | Configure hardware ACLs command.   |
| <code>ipv4-full-ipv6</code>    | Configure hardware ACLs to filter IPv4 traffic, MAC addresses and IPv6 traffic, including filtering on source or destination IPv6 addresses, or both; however, this will reduce the total number of filters available in the hardware table. |
| <code>ipv4-limited-ipv6</code> | Configure hardware ACLs to filter IPv4 traffic, MAC addresses and IPv6 traffic. Source or destination IPv6 addresses or both are not filtered.   |

**Default** The default mode is **ipv4-limited-ipv6**.

**Mode** Global Configuration

**Example** To configure hardware ACLs to filter IPv4 and IPv6 traffic, use the following commands:

```
awplus# configure terminal
awplus(config)# platform hwfilter-size ipv4-full-ipv6
```

**Related commands** [show platform](#)  
[ipv6 access-list \(named IPv6 hardware ACL\)](#)

# show access-list counters

**Overview** Use this command to show the number of packets that match one or all of your hardware ACLs. Every time a hardware ACL allows or drops a packet, its counter increments. This lets you check your ACL configuration.

**Syntax** `show access-list counters [<acl>]`

| Parameter | Description  |
|-----------|--|
| <acl>     | Display the number of packets that match only the specified ACL. You can enter the ACL name or number. |

**Mode** User Exec and Privileged Exec

**Usage notes** This command displays the counter values since the last time they were cleared. To clear the counter values, enter the command [clear access-list counters](#).

To accurately measure the number of packet hits per ACL, you need to read the counters for all ACLs frequently.

**Example** To show the number of packets that match all hardware ACLs, use the following command:

```
awplus# show access-list counters
```

**Output** Figure 40-1: Example output from **show access-list counters**

```
awplus#show access-list counters
Hardware ACL Packet Counters

ACL-1
Packet Hits: 17
ACL-2
Packet Hits: 0
ACL-3
Packet Hits: 1
```

**Output** Figure 40-2: Example output from **show access-list counters ACL-1**

```
awplus#show access-list counters ACL-1
Hardware ACL Packet Counters

ACL-1
Packet Hits: 17
```

Table 40-4: Parameters in the output from **show access-list counters**

| Parameter   | Description  |
|-------------|--|
| Packet Hits | The number of packets that match the ACL. The count includes both dropped and allowed packets. |

**Related commands** [clear access-list counters](#)  
[show interface access-group](#)

**Command changes** Version 5.5.2-2.1: reading the counters no longer clears them  
Version 5.5.1-2.1: command added

# show acl-group ipv6 address

**Overview** Use this command to show the hosts and subnets in a named IPv6 ACL group.

**Syntax** `show acl-group ipv6 address <group>`

| Parameter                  | Description                     |
|----------------------------|---------------------------------|
| <code>&lt;group&gt;</code> | The name of the IPv6 ACL group. |

**Mode** Privileged Exec

**Example** To show all hosts and subnets in an IPv6 ACL group IPV6\_GROUP1, use the command:

```
awplus# show acl-group ipv6 address IPV6_GROUP1
```

**Output** Figure 40-3: Example output from **show acl-group ipv6 address IPV6\_GROUP1**

```
awplus#show acl-group ipv6 address IPV6_GROUP1
Host Group: IPV6_GROUP1

2001:DB8::/32
2001:DB9::1/128
```

**Related commands** [acl-group ipv6 address](#)  
[ipv6 \(ipv6-host-group\)](#)

**Command changes** Version 5.5.0-1.1: command added

# show ipv6 access-list (IPv6 Hardware ACLs)

**Overview** Use this command to display all configured hardware IPv6 access-lists or the IPv6 access-list specified by name. Omitting the optional name parameter will display all IPv6 ACLs.

**Syntax** `show ipv6 access-list [<name>]`

| Parameter | Description                     |
|-----------|---------------------------------|
| <name>    | Hardware IPv6 access-list name. |

**Mode** User Exec and Privileged Exec

**Example** To show all configured IPv6 access-lists use the command:

```
awplus# show ipv6 access-list
```

**Output** Figure 40-4: Example output from the **show ipv6 access-list** command

```
IPv6 access-list deny_ssh  
deny tcp abcd::0/64 any eq 22
```

# 41

# IPv6 Software Access Control List (ACL) Commands

## Introduction

**Overview** This chapter provides an alphabetical reference for the IPv6 Software Access Control List (ACL) commands, and contains detailed command information and command examples about IPv6 software ACLs as applied to Routing and Multicasting, which are not applied to interfaces.

For information about ACLs, see the [ACL Feature Overview and Configuration Guide](#).

To apply ACLs to an LACP channel group, apply it to all the individual switch ports in the channel group. To apply ACLs to a static channel group, apply it to the static channel group itself. For more information on link aggregation see the following references:

- the [Link Aggregation Feature Overview\\_and\\_Configuration\\_Guide](#).
- [Link Aggregation Commands](#)

Note that text in parenthesis in command names indicates usage not keyword entry. For example, **ipv6-access-list (named)** indicates named IPv6 ACLs entered as:

```
ipv6-access-list <name>
```

where <name> is a placeholder not a keyword.

Note also that parenthesis surrounding ACL filters indicates the type of ACL filter not the keyword entry in the CLI. For example, **(ipv6 access-list standard IPv6 filter)** represents command entry in the format shown in the syntax:

```
[<sequence-number>] {deny|permit}  
{<source-ipv6-address/prefix-length>|any}
```

**NOTE:** Software ACLs will **deny** access unless **explicitly permitted** by an ACL action.

**Sub-modes** Many of the ACL commands operate from sub-modes that are specific to particular ACL types. The following table shows the CLI prompts at which ACL commands are entered.

Table 41-1: IPv6 Software Access List Commands and Prompts

| Command Name                                   | Command Mode                    | Prompt                         |
|--|---------------------------------|--------------------------------|
| show ipv6 access-list (IPv6 Software ACLs)     | Privileged Exec                 | awplus#                        |
| ipv6 access-list extended (named)              | Global Configuration            | awplus (config) #              |
| ipv6 access-list standard (named)              | Global Configuration            | awplus (config) #              |
| (ipv6 access-list extended IP protocol filter) | IPv6 Extended ACL Configuration | awplus (config-ipv6-ext-acl) # |
| (ipv6 access-list extended TCP UDP filter)     | IPv6 Extended ACL Configuration | awplus (config-ipv6-ext-acl) # |
| (ipv6 access-list standard filter)             | IPv6 Standard ACL Configuration | awplus (config-ipv6-std-acl) # |

# ipv6 access-list extended (named)

**Overview** Use this command when configuring an IPv6 extended access-list for filtering frames that permit or deny IP, ICMP, TCP, UDP packets or ICMP packets with a specific value based on the source or destination.

The **no** variant of this command removes a specified IPv6 extended access-list.

**Syntax**  
**[list-name]** `ipv6 access-list extended <list-name>`  
`no ipv6 access-list extended <list-name>`

| Parameter                      | Description   |
|--------------------------------|---|
| <code>&lt;list-name&gt;</code> | A user-defined name for the IPv6 software extended access-list. |

**Syntax**  
**[any|icmp|ip]** `ipv6 access-list extended <list-name> {deny|permit}`  
`{any|icmp|ip} {<ipv6-source-address/prefix-length>|any}`  
`{<ipv6-destination-address/prefix-length>|any} [<icmp-type`  
`<icmp-type>] [log]`

`no ipv6 access-list extended <list-name> {deny|permit}`  
`{any|icmp|ip} {<ipv6-source-address/prefix-length>|any}`  
`{<ipv6-destination-address/prefix-length>|any} [<icmp-type`  
`<icmp-type>] [log]`

**Syntax [tcp|udp]** `ipv6 access-list extended <list-name> {deny|permit} {tcp|udp}`  
`{<ipv6-source-address/prefix-length>|any} {eq <sourceport>|lt`  
`<sourceport>|gt <sourceport>|ne`  
`<sourceport>}{<ipv6-destination-address/prefix-length>|any}`  
`{eq <destport>|lt <destport>|gt <destport>|ne <destport>} [log]`  
`no ipv6 access-list extended <list-name> {deny|permit}`  
`{tcp|udp} {<ipv6-source-address/prefix-length>|any} {eq`  
`<sourceport>|lt <sourceport>|gt <sourceport>|ne`  
`<sourceport>}{<ipv6-destination-addr/prefix-length>|any} {eq`  
`<destport>|lt <destport>|gt <destport>|ne <destport>} [log]`

| Parameter                      | Description  |
|--------------------------------|--|
| <code>&lt;list-name&gt;</code> | A user-defined name for the IPv6 software extended access-list.  |
| <code>deny</code>              | The IPv6 software extended access-list rejects packets that match the type, source, and destination filtering specified with this command. |
| <code>permit</code>            | The IPv6 software extended access-list permits packets that match the type, source, and destination filtering specified with this command. |

| Parameter   | Description  |
|---|--|
| any   | For ICMP IP<br>The IPv6 software extended access-list matches any type of packet.  |
| ip  | For ICMP IP<br>The IPv6 software extended access-list matches only IP packets.   |
| icmp  | For ICMP IP<br>The IPv6 software extended access-list matches only ICMP packets.   |
| tcp   | For TCP/UDP<br>The IPv6 software extended access-list matches only TCP packets.  |
| udp   | For TCP/UDP<br>The IPv6 software extended access-list matches only UDP packets.  |
| <i>&lt;ipv6-source-address/prefix-length&gt;</i>      | Specifies a source address and prefix length. The IPv6 address prefix uses the format X:X::/prefix-length. The prefix-length is usually set between 0 and 64.  |
| <i>&lt;ipv6-destination-address/prefix-length&gt;</i> | Specifies a destination address and prefix length. The IPv6 address uses the format X:X::X/X/Prefix-Length. The prefix-length is usually set between 0 and 64. |
| any   | Matches any IPv6 address.  |
| <i>&lt;sourceport&gt;</i>                             | For TCP/UDP<br>The source port number, specified as an integer between 0 and 65535.  |
| <i>&lt;destport&gt;</i>                               | For TCP/UDP<br>The destination port number, specified as an integer between 0 and 65535.   |
| icmp-type   | For ICMP IP<br>Matches only a specified type of ICMP messages. This is valid only when the filtering is set to match ICMP packets.                             |
| eq  | For TCP/UDP<br>Matches port numbers equal to the port number specified immediately after this parameter.   |
| lt  | For TCP/UDP<br>Matches port numbers less than the port number specified immediately after this parameter.  |
| gt  | For TCP/UDP<br>Matches port numbers greater than the port number specified immediately after this parameter.   |
| ne  | For TCP/UDP<br>Matches port numbers not equal to the port number specified immediately after this parameter.   |

| Parameter                      | Description  |
|--------------------------------|--|
| <code>&lt;icmp-type&gt;</code> | For ICMP IP<br>The ICMP type, as defined in RFC792 and RFC950. Specify one of the following integers to create a filter for the ICMP message type: |
|                                | 0 Echo replies.  |
|                                | 3 Destination unreachable messages.  |
|                                | 4 Source quench messages.  |
|                                | 5 Redirect (change route) messages.  |
|                                | 8 Echo requests.   |
|                                | 11 Time exceeded messages.   |
|                                | 12 Parameter problem messages.   |
|                                | 13 Timestamp requests.   |
|                                | 14 Timestamp replies.  |
|                                | 15 Information requests.   |
|                                | 16 Information replies.  |
|                                | 17 Address mask requests.  |
|                                | 18 Address mask replies.   |
| <code>log</code>               | Logs the results.  |

**Mode** Global Configuration

**Default** Any traffic controlled by a software ACL that does not explicitly match a filter is denied.

**Usage notes** Use IPv6 extended access-lists to control the transmission of IPv6 packets on an interface, and restrict the content of routing updates. The switch stops checking the IPv6 extended access-list when a match is encountered.

For backwards compatibility you can either create IPv6 extended access-lists from within this command, or you can enter `ipv6 access-list extended` followed by only the IPv6 extended access-list name. This latter (and preferred) method moves you to the `(config-ipv6-ext-acl)` prompt for the selected IPv6 extended access-list number, and from here you can configure the filters for this selected access-list.

**NOTE:** Software ACLs will **deny** access unless **explicitly permitted** by an ACL action.

**Example 1 [creating a list]** To add a new filter to the access-list named `my-list` that will reject incoming ICMP packets from `2001:0db8::0/64` to `2001:0db8::f/64`, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list extended my-list
awplus(config-ipv6-ext-acl)# icmp 2001:0db8::0/64
2001:0db8::f/64
```

**Example 2 [adding to a list]** To insert a new filter at sequence number 5 of the access-list named `my-list` that will accept ICMP type 8 packets from the `2001:0db8::0/64` network to the `2001:0db8::f/64` network, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list extended my-list
awplus(config-ipv6-ext-acl)# 5 icmp 2001:0db8::0/64
2001:0db8::f/64
```

**Example 3 [list with filter]** To create the access-list named TK to deny TCP protocols, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list extended TK deny tcp any eq 14
any lt 12 log
```

**Related commands**

**Command changes**

Version 5.5.1-0.1: Support for the **no** variant added

# ipv6 access-list extended proto

**Overview** Use this command when configuring an IPv6 extended access-list for filtering frames that permit or deny packets with a specific value based on the IP protocol number specified.

The **no** variant of this command removes a specified IPv6 extended access-list with an IP protocol number.

**Syntax** `ipv6 access-list extended <list-name> {deny|permit} proto <ip-protocol> {<ipv6-source-address/prefix>|any} {<ipv6-destination-address/prefix>|any} [log]`  
`no ipv6 access-list extended <list-name> {deny|permit} proto <ip-protocol> {<ipv6-source-address/prefix>|any} {<ipv6-destination-address/prefix>|any} [log]`

| Parameter                         | Description  |
|-----------------------------------|--|
| <list-name>                       | A user-defined name for the IPv6 software extended access- list.   |
| deny                              | Specifies the packets to reject.   |
| permit                            | Specifies the packets to accept.   |
| proto                             | The IP Protocol type specified by its protocol number in the range 1 to 255.   |
| <ip-protocol>                     | The IP protocol number, as defined by IANA (Internet Assigned Numbers Authority <a href="http://www.iana.org/assignments/protocol-numbers">www.iana.org/assignments/protocol-numbers</a> ) See below for a list of IP protocol numbers and their descriptions. |
| <ipv6-source-address/prefix>      | IPv6 source address, or local address. The IPv6 address uses the format X:X::X:Prefix-Length. The prefix-length is usually set between 0 and 64.   |
| any                               | Any source address or local address.   |
| <ipv6-destination-address/prefix> | IPv6 destination address, or local address. The IPv6 address uses the format X:X::X:Prefix-Length. The prefix-length is usually set between 0 and 64.  |
| any                               | Any destination address or remote address.   |
| log                               | Log the results.   |

Table 41-2: IP protocol number and description

| Protocol Number | Protocol Description [RFC]          |
|-----------------|-------------------------------------|
| 1               | Internet Control Message [RFC792]   |

Table 41-2: IP protocol number and description (cont.)

| Protocol Number | Protocol Description [RFC]                    |
|-----------------|---|
| 139-252         | Unassigned / IANA                             |
| 253             | Use for experimentation and testing / RFC3692 |
| 254             | Use for experimentation and testing / RFC3692 |
| 255             | Reserved / IANA                               |

**Mode** Global Configuration

**Default** Any traffic controlled by a software ACL that does not explicitly match a filter is denied.

**Usage notes** Use IPv6 extended access-lists to control the transmission of IPv6 packets on an interface, and restrict the content of routing updates. The switch stops checking the IPv6 extended access-list when a match is encountered.

The filter entry will match on any IP protocol type packet that has the specified source and destination IPv6 addresses and the specified IP protocol type. The parameter *any* may be specified if an address does not matter.

**NOTE:** Software ACLs will **deny** access unless **explicitly permitted** by an ACL action.

**Examples** To create the IPv6 access-list named ACL-1 to deny IP protocol 9 packets from 2001:0db8:1::1/128 to 2001:0db8:f::1/128, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list extended ACL-1 deny proto 9
2001:0db8:1::1/128 2001:0db8:f::1/128
```

To remove the IPv6 access-list named ACL-1 to deny IP protocol 9 packets from 2001:0db8:1::1/128 to 2001:0db8:f::1/128, use the commands:

```
awplus# configure terminal
awplus(config)# no ipv6 access-list extended ACL-1 deny proto
10 2001:0db8:1::1/128 2001:0db8:f::1/128
```

**Related commands**

- ipv6 access-list extended (named)
- (ipv6 access-list extended IP protocol filter)
- show ipv6 access-list (IPv6 Software ACLs)
- show running-config

# (ipv6 access-list extended IP protocol filter)

**Overview** Use this ACL filter to add a filter entry for an IPv6 source and destination address and prefix, with or without an IP protocol specified, to the current extended IPv6 access-list. If a sequence is specified, the new entry is inserted at the specified location. Otherwise, the new entry is added at the end of the access-list.

The **no** variant of this command removes a filter entry for an IPv6 source and destination address and prefix, with or without an IP protocol filter entry, from the current extended IPv6 access-list. You can specify the ACL filter entry by entering either its sequence number, or its filter entry profile.

**Syntax [ip|proto]** [*<sequence-number>*] {deny|permit} {ip|any|proto *<ip-protocol>*} {*<ipv6-source-address/prefix>*|any} {*<ipv6-destination-address/prefix>*|any} [log]

no {deny|permit} {ip|any|proto *<ip-protocol>*} {*<ipv6-source-address/prefix>*|any} {*<ipv6-destination-address/prefix>*|any} [log]

no [*<sequence-number>*]

| Parameter                                      | Description   |
|--|---|
| <i>&lt;sequence-number&gt;</i>                 | <i>&lt;1-65535&gt;</i><br>The sequence number for the filter entry of the selected access control list.   |
| deny   | Specifies the packets to reject.  |
| permit   | Specifies the packets to accept.  |
| ip   | IP packet.  |
| any  | Any packet.   |
| proto <i>&lt;ip-protocol&gt;</i>               | <i>&lt;1-255&gt;</i><br>Specify IP protocol number, as defined by IANA (Internet Assigned Numbers Authority <a href="http://www.iana.org/assignments/protocol-numbers">www.iana.org/assignments/protocol-numbers</a> )<br>See below for a list of IP protocol numbers and their descriptions. |
| <i>&lt;ipv6-source-address/prefix&gt;</i>      | IPv6 source address, or local address.<br>The IPv6 address uses the format X:X::X:X/Prefix-Length. The prefix-length is usually set between 0 and 64.   |
| any  | Any source address or local address.  |
| <i>&lt;ipv6-destination-address/prefix&gt;</i> | IPv6 destination address, or local address.<br>The IPv6 address uses the format X:X::X:X/Prefix-Length. The prefix-length is usually set between 0 and 64.  |
| any  | Any destination address or remote address.  |
| log  | Log the results.  |

| 139-252         | Unassigned / IANA                             |
| 253             | Use for experimentation and testing / RFC3692 |
| 254             | Use for experimentation and testing / RFC3692 |
| 255             | Reserved / IANA                               |

**Mode** IPv6 Extended ACL Configuration

**Default** Any traffic controlled by a software ACL that does not explicitly match a filter is denied.

**Usage notes** The filter entry will match on any IP protocol type packet that has the specified source and destination IPv6 addresses and the specified IP protocol type. The parameter `any` may be specified if an address does not matter.

**NOTE:** Software ACLs will **deny** access unless **explicitly permitted** by an ACL action.

**Examples** To add a new ACL filter entry to the extended IPv6 access-list named `my-list` with sequence number 5 rejecting the IPv6 packet from `2001:db8:1:1:1` to `2001:db8:f:1:1`, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list extended my-list
awplus(config-ipv6-ext-acl)# 5 deny ip 2001:db8:1::1/128
2001:db8:f::1/128
```

To remove the ACL filter entry to the extended IPv6 access-list named `my-list` with sequence number 5, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list extended my-list
awplus(config-ipv6-ext-acl)# no 5
```

**Related commands**

- [ipv6 access-list extended \(named\)](#)
- [show ipv6 access-list \(IPv6 Software ACLs\)](#)
- [show running-config](#)

# (ipv6 access-list extended TCP UDP filter)

**Overview** Use this ACL filter to add a filter entry for an IPv6 source and destination address and prefix, with a TCP (Transmission Control Protocol) or UDP (User Datagram Protocol) source and destination port specified, to the current extended IPv6 access-list. If a sequence number is specified, the new entry is inserted at the specified location. Otherwise, the new entry is added at the end of the access-list.

The **no** variant of this command removes a filter entry for an IPv6 source and destination address and prefix, with a TCP or UDP source and destination port specified, from the current extended IPv6 access-list. You can specify the filter entry for removal by entering either its sequence number, or its filter entry profile.

**Syntax [tcp|udp]**

```
[<sequence-number>] {deny|permit} {tcp|udp}
{<ipv6-source-address/prefix>|any} {eq <sourceport>|lt
<sourceport>|gt <sourceport>|ne <sourceport>}
{<IPv6-destination-address/prefix>|any} {eq <destport>|lt
<destport>|gt <destport>|ne <destport>} [log]

no {deny|permit} {tcp|udp} {<ipv6-source-address/prefix>|any}
{eq <sourceport>|lt <sourceport>|gt <sourceport>|ne
<sourceport>}} {<IPv6-destination-address/prefix>|any} {eq
<destport>|lt <destport>|gt <destport>|ne <destport>} [log]

no <sequence-number>
```

| Parameter                    | Description   |
|------------------------------|---|
| <sequence-number>            | <1-65535><br>The sequence number for the filter entry of the selected access control list.  |
| deny                         | Specifies the packets to reject.  |
| permit                       | Specifies the packets to accept.  |
| tcp                          | TCP packet.   |
| udp                          | UDP packet.   |
| <ipv6-source-address/prefix> | IPv6 source address, or local address.<br>The IPv6 address uses the format X:X::X:Prefix-Length. The prefix-length is usually set between 0 and 64. |
| any                          | Any source address or local address.  |
| eq                           | Equal to.   |
| lt                           | Less than.  |
| gt                           | Greater than.   |
| ne                           | Not equal to.   |
| <sourceport>                 | The source port number, specified as an integer between 0 and 65535.  |

| Parameter  | Description   |
|--|---|
| <code>&lt;ipv6-destination-address/prefix&gt;</code> | IPv6 destination address, or local address. The IPv6 address uses the format X:X::X:X/Prefix-Length. The prefix-length is usually set between 0 and 64. |
| <code>&lt;destport&gt;</code>                        | The destination port number, specified as an integer between 0 and 65535.   |
| <code>log</code>                                     | Log the results.  |

**Mode** IPv6 Extended ACL Configuration

**Default** Any traffic controlled by a software ACL that does not explicitly match a filter is denied.

**Usage notes** The filter entry will match on any packet that has the specified source and destination IPv6 addresses and the specified TCP or UDP source and destination port. The parameter `any` may be specified if an address does not matter.

**NOTE:** Software ACLs will **deny** access unless **explicitly permitted** by an ACL action.

**Examples** To add a new filter entry with sequence number 5 to the access-list named `my-list` to reject TCP packets from 2001:0db8::0/64 port 10 to 2001:0db8::f/64 port 20, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list extended my-list
awplus(config-ipv6-ext-acl)# 5 deny tcp 2001:0db8::0/64 eq 10
2001:0db8::f/64 eq 20
```

To add a new filter entry with sequence number 5 to the extended IPv6 access-list named `my-list` to reject UDP packets from 2001:0db8::0/64 port 10 to 2001:0db8::f/64 port 20, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list extended my-list
awplus(config-ipv6-ext-acl)# 5 deny udp 2001:0db8::0/64 eq 10
2001:0db8::f/64 eq 20
```

To remove the filter entry with sequence number 5 to the extended IPv6 access-list named `my-list`, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list extended my-list
awplus(config-ipv6-ext-acl)# no 5
```

**Related commands**

- [ipv6 access-list extended \(named\)](#)
- [show ipv6 access-list \(IPv6 Software ACLs\)](#)
- [show running-config](#)

# ipv6 access-list standard (named)

**Overview** This command configures an IPv6 standard access-list for filtering frames that permit or deny IPv6 packets from a specific source IPv6 address.

The **no** variant of this command removes a specified IPv6 standard access-list.

**Syntax [list-name]** `ipv6 access-list standard <ipv6-acl-list-name>`  
`no ipv6 access-list standard <ipv6-acl-list-name>`

| Parameter                               | Description   |
|---|---|
| <code>&lt;ipv6-acl-list-name&gt;</code> | A user-defined name for the IPv6 software standard access-list. |

**Syntax [deny|permit]** `ipv6 access-list standard <ipv6-acl-list-name> [{deny|permit} {<ipv6-source-address/prefix-length>|any} [exact-match]]`  
`no ipv6 access-list standard <ipv6-acl-list-name> [{deny|permit} {<ipv6-source-address/prefix-length>|any} [exact-match]]`

| Parameter  | Description   |
|--|---|
| <code>&lt;ipv6-acl-list-name&gt;</code>                | A user-defined name for the IPv6 software standard access-list.   |
| <code>deny</code>                                      | The IPv6 software standard access-list rejects packets that match the type, source, and destination filtering specified with this command.                    |
| <code>permit</code>                                    | The IPv6 software standard access-list permits packets that match the type, source, and destination filtering specified with this command.                    |
| <code>&lt;ipv6-source-address/prefix-length&gt;</code> | Specifies a source address and prefix length. The IPv6 address prefix uses the format X:X::/prefix-length. The prefix-length is usually set between 0 and 64. |
| <code>any</code>                                       | Matches any source IPv6 address.  |
| <code>exact-match</code>                               | Exact match of the prefixes.  |

**Mode** Global Configuration

**Default** Any traffic controlled by a software ACL that does not explicitly match a filter is denied.

**Usage notes** Use IPv6 standard access-lists to control the transmission of IPv6 packets on an interface, and restrict the content of routing updates. The switch stops checking the IPv6 standard access-list when a match is encountered.

For backwards compatibility you can either create IPv6 standard access-lists from within this command, or you can enter `ipv6 access-list standard` followed by only the IPv6 standard access-list name. This latter (and preferred) method moves you to the `(config-ipv6-std-acl)` prompt for the selected IPv6 standard access-list, and from here you can configure the filters for this selected IPv6 standard access-list.

**NOTE:** Software ACLs will **deny** access unless **explicitly permitted** by an ACL action.

**Example** To enter the IPv6 Standard ACL Configuration mode for the access-list named `my-list`, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list standard my-list
awplus(config-ipv6-std-acl)#
```

**Related commands** [\(ipv6 access-list standard filter\)](#)  
[show ipv6 access-list \(IPv6 Software ACLs\)](#)  
[show running-config](#)

## (ipv6 access-list standard filter)

**Overview** Use this ACL filter to add a filter entry for an IPv6 source address and prefix length to the current standard IPv6 access-list. If a sequence number is specified, the new entry is inserted at the specified location. Otherwise, the new entry is added at the end of the access-list.

The **no** variant of this command removes a filter entry for an IPv6 source address and prefix from the current standard IPv6 access-list. You can specify the filter entry for removal by entering either its sequence number, or its filter entry profile.

**Syntax [icmp]** [`<sequence-number>`] {deny|permit}  
{`<ipv6-source-address/prefix-length>`|any}  
no {deny|permit} {`<ipv6-source-address/prefix-length>`|any}  
no `<sequence-number>`

| Parameter  | Description   |
|--|---|
| <code>&lt;sequence-number&gt;</code>                   | <code>&lt;1-65535&gt;</code><br>The sequence number for the filter entry of the selected access control list. |
| deny   | Specifies the packets to reject.  |
| permit   | Specifies the packets to accept.  |
| <code>&lt;ipv6-source-address/prefix-length&gt;</code> | IPv6 source address and prefix-length in the form X::X:X/P.   |
| any  | Any IPv6 source host address.   |

**Mode** IPv6 Standard ACL Configuration

**Default** Any traffic controlled by a software ACL that does not explicitly match a filter is denied.

**Usage** The filter entry will match on any IPv6 packet that has the specified IPv6 source address and prefix length. The parameter `any` may be specified if an address does not matter.

**NOTE:** Software ACLs will **deny** access unless **explicitly permitted** by an ACL action.

**Examples** To add an ACL filter entry with sequence number 5 that will deny any IPv6 packets to the standard IPv6 access-list named `my-list`, enter the commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list standard my-list
awplus(config-ipv6-std-acl)# 5 deny any
```

To remove the ACL filter entry that will deny any IPv6 packets from the standard IPv6 access-list named `my-list`, enter the commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list standard my-list
awplus(config-ipv6-std-acl)# no deny any
```

Alternately, to remove the ACL filter entry with sequence number 5 to the standard IPv6 access-list named `my-list`, enter the commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list standard my-list
awplus(config-ipv6-std-acl)# no 5
```

**Related  
commands**

[ipv6 access-list standard \(named\)](#)  
[show ipv6 access-list \(IPv6 Software ACLs\)](#)  
[show running-config](#)

# ipv6 prefix-list

**Overview** Use this command to create an IPv6 prefix list or an entry in an existing prefix list.

Use the **no** variant of this command to delete a whole prefix list, a prefix list entry, or a description.

**Syntax**

```
ipv6 prefix-list <list-name> [seq <1-429496725>] {deny|permit}
{any|<ipv6-prefix>} [ge <0-128>] [le <0-128>]
ipv6 prefix-list <list-name> description <text>
no ipv6 prefix-list <list-name> [seq <1-429496725>]
no ipv6 prefix-list <list-name> [description <text>]
```

| Parameter         | Description  |
|-------------------|--|
| <list-name>       | Specifies the name of a prefix list.   |
| seq <1-429496725> | Sequence number of the prefix list entry.  |
| deny              | Specifies that the prefixes are excluded from the list.                              |
| permit            | Specifies that the prefixes are included in the list.                                |
| <ipv6-prefix>     | Specifies the IPv6 prefix and prefix length in hexadecimal in the format X:X::X:X/M. |
| any               | Any prefix match. Same as ::0/0 le 128.  |
| ge <0-128>        | Specifies the minimum prefix length to be matched.                                   |
| le <0-128>        | Specifies the maximum prefix length to be matched.                                   |
| description       | Prefix list specific description.  |
| <text>            | Up to 80 characters of text description of the prefix list.                          |

**Mode** Global Configuration

**Usage notes** When the device processes a prefix list, it starts to match prefixes from the top of the prefix list, and stops whenever a permit or deny occurs. To promote efficiency, use the **seq** parameter and place common permits or denials towards the top of the list. If you do not use the **seq** parameter, the sequence values are generated in a sequence of 5.

The parameters **ge** and **le** specify the range of the prefix lengths to be matched. The parameters **ge** and **le** are only used if an ip-prefix is stated. When setting these parameters, set the **le** value to be less than 128, and the **ge** value to be less than or equal to the **le** value and greater than the ip-prefix mask length.

Prefix lists implicitly exclude prefixes that are not explicitly permitted in the prefix list. This means if a prefix that is being checked against the prefix list reaches the end of the prefix list without matching a permit or deny, this prefix will be denied.

**Example** To check the first 32 bits of the prefix 2001:db8:: and that the subnet mask must be greater than or equal to 34 and less than or equal to 40, enter the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 prefix-list mylist seq 12345 permit
2001:db8::/32 ge 34 le 40
```

**Related commands**

- [match ipv6 address](#)
- [show ipv6 prefix-list](#)
- [show running-config ipv6 prefix-list](#)

# show ipv6 access-list (IPv6 Software ACLs)

**Overview** Use this command to display all configured IPv6 access-lists or the IPv6 access-list specified by name.

**Syntax** show ipv6 access-list [*<access-list-name>*]  
show ipv6 access-list standard [*<access-list-name>*]  
show ipv6 access-list extended [*<access-list-name>*]

| Parameter                       | Description   |
|---------------------------------|---|
| <i>&lt;access-list-name&gt;</i> | Only display information about an IPv6 access-list with the specified name. |
| standard                        | Only display information about standard access-lists.                       |
| extended                        | Only display information about extended access-lists.                       |

**Mode** User Exec and Privileged Exec

**Example** To show all configured IPv6 access-lists, use the following command:

```
awplus# show ipv6 access-list
```

**Output** Figure 41-1: Example output from **show ipv6 access-list**

```
IPv6 access-list deny_icmp
deny icmp any any vlan 1

IPv6 access-list deny_ssh
deny tcp abcd::0/64 any eq 22
```

**Example** To show the IPv6 access-list named **deny\_icmp**, use the following command:

```
awplus# show ipv6 access-list deny_icmp
```

**Output** Figure 41-2: Example output from **show ipv6 access-list** for a named ACL

```
IPv6 access-list deny_icmp
deny icmp any any vlan 1
```

**Related commands**

- [\(ipv6 access-list extended IP protocol filter\)](#)
- [ipv6 access-list standard \(named\)](#)
- [\(ipv6 access-list extended TCP UDP filter\)](#)
- [\(ipv6 access-list standard filter\)](#)

# show ipv6 prefix-list

**Overview** Use this command to display the prefix-list entries.

Note that this command is valid for RIPng and BGP4+ routing protocols only.

**Syntax** `show ipv6 prefix-list [<name>|detail|summary]`

| Parameter | Description   |
|-----------|---|
| <name>    | Specify the name of an individual IPv6 prefix list.                       |
| detail    | Specify this parameter to show detailed output for all IPv6 prefix lists. |
| summary   | Specify this parameter to show summary output for all IPv6 prefix lists.  |

**Mode** User Exec and Privileged Exec

**Example**

```
awplus# show ipv6 prefix-list
awplus# show ipv6 prefix-list 10.10.0.98/8
awplus# show ipv6 prefix-list detail
```

**Related commands** [ipv6 prefix-list](#)

# vty ipv6 access-class (named)

**Overview** For IPv6, use this command to set a standard named software access list to be the management ACL. This is then applied to all available VTY lines for controlling remote access by Telnet and SSH. This command allows or denies packets containing the IPv6 addresses included in the ACL to create a connection to your device.

ACLs that are attached using this command have an implicit 'deny-all' filter as the final entry in the ACL. A typical configuration is to permit a specific address, or range of addresses, and rely on the 'deny-all' filter to block all other access.

Use the **no** variant of this command to remove the access list.

**Syntax** vty ipv6 access-class <access-name>  
no vty ipv6 access-class [<access-name>]

| Parameter     | Description  |
|---------------|--|
| <access-name> | Specify an IPv6 standard software access-list name |

**Mode** Global Configuration

**Examples** To set the named standard access-list named **access-ctrl** to be the IPv6 management ACL, use the following commands:

```
awplus# configure terminal  
awplus(config)# vty ipv6 access-class access-ctrl
```

To remove **access-ctrl** from the management ACL, use the following commands:

```
awplus# configure terminal  
awplus(config)# no vty ipv6 access-class access-ctrl
```

**Output** Figure 41-3: Example output from the **show running-config** command

```
awplus#show running-config|grep access-class  
  
vty ipv6 access-class access-ctrl
```

**Related commands** [show running-config](#)

# class

**Overview** Use this command to associate an existing class-map to a policy or policy-map (traffic classification), and to enter Policy Map Class Configuration mode to configure the class-map.

Use the **no** variant of this command to delete an existing class-map.

If your class-map does not exist, you can create it by using the [class-map](#) command.

**Syntax** `class {<name>|default}`  
`no class <name>`

| Parameter | Description                               |
|-----------|---|
| <name>    | Name of the (already existing) class-map. |
| default   | Specify the default class-map.            |

**Mode** Policy Map Configuration

**Example** The following example creates the policy-map `pmap1` (using the `policy-map` command), then associates this to an already existing class-map named `cmap1`, use the commands:

```
awplus# configure terminal
awplus(config)# policy-map pmap1
awplus(config-pmap)# class cmap1
awplus(config-pmap-c)#
```

**Related commands** [class-map](#)  
[policy-map](#)

# class-map

**Overview** Use this command to create a class-map.  
Use the **no** variant of this command to delete the named class-map.

**Syntax** `class-map <name>`  
`no class-map <name>`

| Parameter | Description                          |
|-----------|--------------------------------------|
| <name>    | Name of the class-map to be created. |

**Mode** Global Configuration

**Example** This example creates a class-map called `cmap1`, use the commands:

```
awplus# configure terminal
awplus(config)# class-map cmap1
awplus(config-cmap)#
```

# clear mls qos interface policer-counters

**Overview** Resets an interface's policer counters to zero. You can either clear a specific class-map, or you can clear all class-maps by not specifying a class map.

**Syntax** `clear mls qos interface <port> policer-counters [class-map <class-map>]`

| Parameter   | Description  |
|-------------|--|
| <port>      | The port may be a switch port (e.g. port1.0.4), a static channel group (e.g. sa3), or a dynamic (LACP) channel group (e.g. po4). |
| class-map   | Select a class-map.  |
| <class-map> | Class-map name.  |

**Mode** Privileged Exec

**Example** To reset the policy counters to zero for all class-maps for port1.0.4, use the command:

```
awplus# clear mls qos interface port1.0.4 policer-counters
```

**Related commands** [show mls qos interface policer-counters](#)

# clear mls qos interface queue-counters

**Overview** Use this command to clear the QoS queue counters for an interface.

**Syntax** `clear mls qos interface <interface> queue-counters`

| Parameter   | Description   |
|-------------|---|
| <interface> | The interface to clear the counters for. This can be a switchport, a static channel group, or a dynamic (LACP) channel group. |

**Mode** Privileged Exec

**Example** To clear the egress queue counters on interface port1.0.1, use the command:

```
awplus# clear mls qos interface port1.0.1 queue-counters
```

To clear the egress queue counters on the static aggregator sa1, use the command:

```
awplus# clear mls qos interface sa1 queue-counters
```

**Related commands** [show mls qos interface queue-counters](#)

**Command changes** Version 5.5.2-2.1: command added

# default-action

**Overview** Sets the action for the default class-map belonging to a particular policy-map. The action for a non-default class-map depends on the action of any ACL that is applied to the policy-map.

The default action can therefore be thought of as specifying the action that will be applied to any data that does not meet the criteria specified by the applied matching commands.

Use the **no** variant of this command to reset to the default action of 'permit'.

**Syntax** `default-action <action>`  
`no default-action`

| Parameter       | Description   |
|-----------------|---|
| <action> permit | Permit packets  |
| deny            | Deny packets.   |
| send-to-cpu     | Send packets to the CPU.                                    |
| copy-to-cpu     | Copy packets to the CPU as well as forwarding them.         |
| copy-to-mirror  | Copy packets to the mirror port as well as forwarding them. |
| send-to-mirror  | Send packets to the mirror port instead of forwarding them. |

**Default** The default is **permit**.

**Mode** Policy Map Configuration

**Examples** To set the action for the default class-map to 'deny', use the command:

```
awplus(config-pmap)# default-action deny
```

To set the action for the default class-map to 'copy-to-mirror' for use with the [mirror interface](#) command, use the command:

```
awplus(config-pmap)# default-action copy-to-mirror
```

**Related commands** [mirror interface](#)

# description (QoS policy-map)

**Overview** Adds a textual description of the policy-map. This can be up to 80 characters long. Use the **no** variant of this command to remove the current description from the policy-map.

**Syntax** `description <line>`  
`no description`

| Parameter                 | Description                               |
|---------------------------|---|
| <code>&lt;line&gt;</code> | Up to 80 character long line description. |

**Mode** Policy Map Configuration

**Example** To add the description, VOIP traffic, use the command:

```
awplus(config-pmap)# description VOIP traffic
```

# egress-rate-limit

**Overview** Use this command to limit the amount of traffic that can be transmitted per second from this port.

Use the **no** variant of this command to disable the limiting of traffic egressing on the interface.

**Syntax** `egress-rate-limit <rate-limit> max-burst-size <size>`  
`no egress-rate-limit`

| Parameter                       | Description   |
|---------------------------------|---|
| <code>&lt;rate-limit&gt;</code> | Bandwidth <1-10000000 units per second> (usable units: k, m, g). The egress rate limit can be configured in multiples of 64kbps. If you configure a value that is not an exact multiple of 64kbps, then the value will be rounded up to the nearest higher exact multiple of 64kbps. The minimum is 64 Kb. The default unit is Kb ( <b>k</b> ), but Mb ( <b>m</b> ) or Gb ( <b>g</b> ) can also be specified. The command syntax is not case sensitive, so a value such as 20m or 20M will be interpreted as 20 megabits.   |
| <code>&lt;size&gt;</code>       | The maximum burst size in kilobytes (k), megabytes (m) or gigabytes (g). The minimum value for the max-burst-size is 64 kilobytes. Only certain values are valid; if you enter an invalid value, the max-burst size will be rounded to the nearest valid value. The default value is the number of bytes that would be transmitted in one full second of transmission at the rate limit. We recommend setting the maximum burst size to approximately the number of bytes that would be transmitted in one-third of a second of transmission at the rate limit. This means entering a value of approximately <code>&lt;rate-limit&gt;/24</code> . |

**Mode** Interface Configuration

**Usage notes** Egress rate limiting uses a token bucket system. The rate limit represents how fast the bucket fills and the maximum burst size represents its maximum depth. The maximum burst size enables the switch to groom upstream traffic so that it meets the requirements of upstream devices. See the examples for more detail about the resulting behavior.

**Examples** To set a rate limit on port 1.0.1 of 5Mbps and burst size of 200KB, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# egress-rate-limit 5m max-burst-size 200k
```

When maximum burst size is 200KB, a burst of up to approximately 200KB can be sent at line rate (100 or 1000Mbps) if there are packets in the queues to send. If

traffic is still sitting in the queues once the 200KB burst has been sent, then that traffic will be only transmitted at 5Mbps, not at line rate. If the average egress traffic rate is over 5Mbps, then the queues will fill up over time. When the queues become full, the switch will drop packets and/or send pause frames to the traffic source. You can enable the switch to send pause frames by entering the command **flowcontrol**.

To disable egress rate limiting on a port, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# no egress-rate-limit
```

**Related commands** [egress-rate-limit overhead](#)

**Command changes** Version 5.4.6-2.1: **max-burst-size** parameter added

# egress-rate-limit overhead

**Overview** Use this command to allow for the size of packet preamble and inter-packet gap (the “overhead”) in egress queue rate limiting on switch ports.

Doing this keeps the rate limit at the same percentage of line rate for all packet sizes. Otherwise, the percentage of line rate changes with packet size, because of the size of the overhead relative to smaller packets. This means smaller packets take up a larger percentage of the line rate.

Use the **no** variant of this command to turn off the overhead allowance.

**Syntax** `egress-rate-limit overhead <bytes>`  
`no egress-rate-limit overhead`

| Parameter                  | Description   |
|----------------------------|---|
| <code>&lt;bytes&gt;</code> | The number of bytes to allow for overhead. For standard ethernet packets, use a value of 20 bytes (8 bytes of preamble and a inter-packet gap of 12 bytes). |

**Default** No overhead allowance

**Mode** Interface Configuration

**Example** To configure an overhead allowance of 20 bytes (8 bytes of preamble and a inter-packet gap of 12 bytes) on port1.0.1, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# egress-rate-limit overhead 20
```

To return port1.0.1 to the default of no overhead allowance, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# no egress-rate-limit overhead
```

**Related commands** [egress-rate-limit](#)

**Command changes** Version 5.4.9-2.1: command added

# match access-group

**Overview** Use this command to apply an ACL to a class-map or VLAN.

Use the **no** variant of this command to remove the match.

**Syntax** `match access-group {<hw-IP-ACL>|<hw-MAC-ACL>|<hw-named-ACL>}`  
`no match access-group`  
`{<hw-IP-ACL>|<hw-MAC-ACL>|<hw-named-ACL>}`

| Parameter      | Description   |
|----------------|---|
| <hw-IP-ACL>    | Specify a hardware IP ACL number in the range <3000-3699>.      |
| <hw-MAC-ACL>   | Specify a hardware MAC ACL number in the range <4000-4699>.     |
| <hw-named-ACL> | Specify a hardware named ACL (IP, IPv6 or MAC address entries). |

**Mode** Class Map or VLAN Access-Map

**Usage notes** First create an access-list that applies the appropriate action to matching packets. Then use the **match access-group** command to apply this access-list as desired. Note that this command will apply the access-list matching only to *incoming* data packets.

**Examples** To configure a class-map named "cmap1", which matches traffic against access-list 3001, which allows IP traffic from any source to any destination, use the commands:

```
awplus# configure terminal
awplus(config)# access-list 3001 permit ip any any
awplus(config)# class-map cmap1
awplus(config-cmap)# match access-group 3001
```

To configure a class-map named "cmap2", which matches traffic against access-list 4001, which allows MAC traffic from any source to any destination, use the commands:

```
awplus# configure terminal
awplus(config)# access-list 4001 permit any any
awplus(config)# class-map cmap2
awplus(config-cmap)# match access-group 4001
```

To configure a class-map named "cmap3", which matches traffic against access-list "hw\_acl", which allows IP traffic from any source to any destination, use the commands:

```
awplus# configure terminal
awplus(config)# access-list hardware hw_acl
awplus(config-ip-hw-acl)# permit ip any any
awplus(config)# class-map cmap3
awplus(config-cmap)# match access-group hw_acl
```

To apply ACL 3001 to VLAN 48, where the ACL drops IP traffic from any source to any destination, use the commands:

```
awplus# configure terminal
awplus(config)# access-list 3001 deny ip any any
awplus(config)# vlan access-map deny_all
awplus(config-vlan-access-map)# match access-group 3001
awplus(config-vlan-access-map)# exit
awplus(config)# vlan filter deny_all vlan-list 48 input
```

**Related  
commands**

[class-map](#)  
[vlan access-map](#)

**Command  
changes**

Version 5.4.6-2.1: support for VLAN access-maps added

# match cos

**Overview** Use this command to define a COS to match against incoming packets.  
Use the **no** variant of this command to remove CoS.

**Syntax** `match cos <0-7>`  
`no match cos`

| Parameter | Description            |
|-----------|------------------------|
| <0-7>     | Specify the CoS value. |

**Mode** Class Map Configuration

**Examples** To set the class-map's CoS to 4, use the commands:

```
awplus# configure terminal
awplus(config)# class-map cmap1
awplus(config-cmap)# match cos 4
```

To remove CoS from a class-map, use the commands:

```
awplus# configure terminal
awplus(config)# class-map cmap1
awplus(config-cmap)# no match cos
```

# match dscp

**Overview** Use this command to define the DSCP to match against incoming packets. Use the **no** variant of this command to remove a previously defined DSCP.

**Syntax** `match dscp <0-63>`  
`no match dscp`

| Parameter | Description   |
|-----------|---|
| <0-63>    | Specify DSCP value (only one value can be specified). |

**Mode** Class Map Configuration

**Usage** Use the **match dscp** command to define the match criterion after creating a class-map.

**Examples** To configure a class-map named `cmap1` with criterion that matches DSCP 56, use the commands:

```
awplus# configure terminal
awplus(config)# class-map cmap1
awplus(config-cmap)# match dscp 56
```

To remove a previously defined DSCP from a class-map named `cmap1`, use the commands:

```
awplus# configure terminal
awplus(config)# class-map cmap1
awplus(config-cmap)# no match dscp
```

**Related commands** [class-map](#)

# match eth-format protocol

**Overview** This command sets the Ethernet format and the protocol for a class-map to match on.

Select one Layer 2 format and one Layer 3 protocol when you issue this command.

Use the **no** variant of this command to remove the configured Ethernet format and protocol from a class-map.

**Syntax** `match eth-format <layer-two-format> protocol  
<layer-three-protocol>`

`no match eth-format protocol`

The following eth-formats and protocols are available (note that not all options are available on all AlliedWare Plus switch models):

| Parameter                            | Description  |
|--------------------------------------|--|
| <i>&lt;layer-two-formats&gt;</i>     |  |
| 802dot2-tagged                       | 802.2 Tagged Packets (enter the parameter name).   |
| 802dot2-untagged                     | 802.2 Untagged Packets (enter the parameter name).   |
| ethii-tagged                         | EthII Tagged Packets (enter the parameter name).   |
| ethii-untagged                       | EthII Untagged Packets (enter the parameter name).   |
| ethii-any                            | EthII Tagged or Untagged Packets (enter the parameter name).   |
| netwareraw-tagged                    | Netware Raw Tagged Packets (enter the parameter name).   |
| netwareraw-untagged                  | Netware Raw Untagged Packets (enter the parameter name).   |
| snap-tagged                          | SNAP Tagged Packets (enter the parameter name).  |
| snap-untagged                        | SNAP Untagged Packets (enter the parameter name).  |
| <i>&lt;layer-three-protocols&gt;</i> |  |
| <word>                               | A Valid Protocol Number in hexadecimal.  |
| any                                  | Note that the parameter "any" is only valid when used with the netwarerawtagged and netwarerawuntagged protocol options. |
| sna-path-control                     | Protocol Number 04 (enter the parameter name or its number).   |
| proway-lan                           | Protocol Number 0E (enter the parameter name or its number).   |
| eia-rs Protocol                      | Number 4E (enter the parameter name or its number).  |
| proway Protocol                      | Number 8E (enter the parameter name or its number).  |

| Parameter         | Description  |
|-------------------|--|
| ipx-802dot2       | Protocol Number E0 (enter the parameter name or its number).   |
| netbeui           | Protocol Number F0 (enter the parameter name or its number).   |
| iso-clns-is       | Protocol Number FE (enter the parameter name or its number).   |
| xdot75-internet   | Protocol Number 0801 (enter the parameter name or its number). |
| nbs-internet      | Protocol Number 0802 (enter the parameter name or its number). |
| ecma-internet     | Protocol Number 0803 (enter the parameter name or its number). |
| chaosnet          | Protocol Number 0804 (enter the parameter name or its number). |
| xdot25-level-3    | Protocol Number 0805 (enter the parameter name or its number). |
| arp Protocol      | Number 0806 (enter the parameter name or its number).          |
| xns-compat        | Protocol Number 0807 (enter the parameter name or its number). |
| banyan-systems    | Protocol Number 0BAD (enter the parameter name or its number). |
| bbn-simnet        | Protocol Number 5208 (enter the parameter name or its number). |
| dec-mop-dump-ld   | Protocol Number 6001 (enter the parameter name or its number). |
| dec-mop-rem-cdons | Protocol Number 6002 (enter the parameter name or its number). |
| dec-decnet        | Protocol Number 6003 (enter the parameter name or its number). |
| dec-lat           | Protocol Number 6004 (enter the parameter name or its number). |
| dec-diagnostic    | Protocol Number 6005 (enter the parameter name or its number). |
| dec-customer      | Protocol Number 6006 (enter the parameter name or its number). |
| dec-lavc          | Protocol Number 6007 (enter the parameter name or its number). |
| rarp              | Protocol Number 8035 (enter the parameter name or its number). |
| dec-lanbridge     | Protocol Number 8038 (enter the parameter name or its number). |

| Parameter        | Description  |
|------------------|--|
| dec-encryption   | Protocol Number 803D (enter the parameter name or its number). |
| appletalk        | Protocol Number 809B (enter the parameter name or its number). |
| ibm-sna          | Protocol Number 80D5 (enter the parameter name or its number). |
| appletalk-aarp   | Protocol Number 80F3 (enter the parameter name or its number). |
| snmp             | Protocol Number 814CV.   |
| ethertalk-2      | Protocol Number 809B (enter the parameter name or its number). |
| ethertalk-2-aarp | Protocol Number 80F3 (enter the parameter name or its number). |
| ipx-snap         | Protocol Number 8137 (enter the parameter name or its number). |
| ipx-802dot3      | Protocol Number FFFF (enter the parameter name or its number). |
| ip               | Protocol Number 0800 (enter the parameter name or its number). |
| ipx              | Protocol Number 8137 (enter the parameter name or its number). |
| ipv6             | Protocol Number 86DD (enter the parameter name or its number). |

**Mode** Class Map Configuration

**Examples** To set the eth-format to ethii-tagged and the protocol to 0800 (IP) for class-map cmap1, use the commands:

```
awplus# configure terminal
awplus(config)# class-map cmap1
awplus(config-cmap)# match eth-format ethii-tagged protocol
0800
awplus(config-cmap)# match eth-format ethii-tagged protocol ip
```

To remove the eth-format and the protocol from the class-map cmap1, use the commands:

```
awplus# configure terminal
awplus(config)# class-map cmap1
awplus(config-cmap)# no match eth-format protocol
```

# match inner-cos

**Overview** Sets the Inner CoS for a class-map to match on.  
Use the **no** variant of this command to remove CoS.

**Syntax** `match inner-cos <0-7>`  
`no match inner-cos`

| Parameter | Description                  |
|-----------|------------------------------|
| <0-7>     | Specify the Inner CoS value. |

**Mode** Class Map Configuration

**Examples** To set the class-map's inner-cos to 4, use the commands:

```
awplus# configure terminal
awplus(config)# class-map cmap1
awplus(config-cmap)# match inner-cos 4
```

To remove CoS from the class-map, use the commands:

```
awplus# configure terminal
awplus(config)# class-map cmap1
awplus(config-cmap)# no match inner-cos
```

# match inner-vlan

**Overview** Use this command to define the inner VLAN ID as match criteria.  
Use the **no** variant of this command to disable the VLAN ID used as match criteria.

**Syntax** `match inner-vlan <1-4094>`  
`no match inner-vlan`

| Parameter | Description      |
|-----------|------------------|
| <1-4094>  | The VLAN number. |

**Mode** Class Map Configuration

**Usage notes** This command is used in double-tagged networks to match on a VLAN ID belonging to the client network. For more information on VLAN double-tagged networks, see the [VLAN\\_Feature Overview and Configuration Guide](#).

**Examples** To configure a class-map named `cmap1` to match traffic from inner VLAN 3, use the commands:

```
awplus# configure terminal
awplus(config)# class-map cmap1
awplus(config-cmap)# match inner-vlan 3
```

To disable the configured VLAN ID as a match criteria for the class-map named `cmap1`, use the commands:

```
awplus# configure terminal
awplus(config)# class-map cmap1
awplus(config-cmap)# no match inner-vlan
```

# match ip-precedence

**Overview** Use this command to identify IP precedence values as match criteria.  
Use the **no** variant of this command to remove IP precedence values from a class-map.

**Syntax** `match ip-precedence <0-7>`  
`no match ip-precedence`

| Parameter | Description                         |
|-----------|-------------------------------------|
| <0-7>     | The precedence value to be matched. |

**Mode** Class Map Configuration

**Example** To configure a class-map named `cmap1` to match all IPv4 packets with a precedence value of 5, use the commands:

```
awplus# configure terminal
awplus(config)# class-map cmap1
awplus(config-cmap)# match ip-precedence 5
```

# match mac-type

**Overview** Use this command to set the MAC type for a class-map to match on.  
Use **no** variant of this command to remove the MAC type match entry.

**Syntax** `match mac-type {l2broadcast|l2multicast|l2unicast}`  
`no match mac-type`

| Parameter   | Description                |
|-------------|----------------------------|
| l2broadcast | Layer 2 Broadcast traffic. |
| l2multicast | Layer 2 Multicast traffic. |
| l2unicast   | Layer 2 Unicast traffic.   |

**Mode** Class Map Configuration

**Examples** To set the class-map's MAC type to Layer 2 multicast, use the commands:

```
awplus# configure terminal
awplus(config)# class-map cmap1
awplus(config-cmap)# match mac-type l2multicast
```

To remove the class-map's MAC type entry, use the commands:

```
awplus# configure terminal
awplus(config)# class-map cmap1
awplus(config-cmap)# no match mac-type
```

# match tcp-flags

**Overview** Sets one or more TCP flags (control bits) for a class-map to match on.  
Use the **no** variant of this command to remove one or more TCP flags for a class-map to match on.

**Syntax** `match tcp-flags [ack] [fin] [psh] [rst] [syn] [urg]`  
`no match tcp-flags [ack] [fin] [psh] [rst] [syn] [urg]`

| Parameter | Description  |
|-----------|--------------|
| ack       | Acknowledge. |
| fin       | Finish.      |
| psh       | Push.        |
| rst       | Reset.       |
| syn       | Synchronize. |
| urg       | Urgent.      |

**Mode** Class Map Configuration

**Examples** To set the class-map's TCP flags to **ack** and **syn**, use the commands:

```
awplus# configure terminal
awplus(config)# class-map
awplus(config-cmap)# match tcp-flags ack syn
```

To remove the TCP flags **ack** and **rst**, use the commands:

```
awplus# configure terminal
awplus(config)# class-map
awplus(config-cmap)# no match tcp-flags ack rst
```

# match vlan

**Overview** Use this command to define the VLAN ID as match criteria.  
Use the **no** variant of this command to disable the VLAN ID used as match criteria.

**Syntax** `match vlan <1-4094>`  
`no match vlan`

| Parameter | Description      |
|-----------|------------------|
| <1-4094>  | The VLAN number. |

**Mode** Class Map Configuration

**Examples** To configure a class-map named `cmap1` to include traffic from VLAN 3, use the commands:

```
awplus# configure terminal
awplus(config)# class-map cmap1
awplus(config-cmap)# match vlan 3
```

To disable the configured VLAN ID as a match criteria for the class-map named `cmap1`, use the commands:

```
awplus# configure terminal
awplus(config)# class-map cmap1
awplus(config-cmap)# no match vlan
```

# mls qos cos

**Overview** This command assigns a CoS (Class of Service) user-priority value to untagged frames entering a specified interface. By default, all untagged frames are assigned a CoS value of 0.

Use the **no** variant of this command to return the interface to the default CoS setting for untagged frames entering the interface.

**Syntax** `mls qos cos <0-7>`  
`no mls qos cos`

| Parameter | Description                                |
|-----------|--|
| <0-7>     | The Class of Service, user-priority value. |

**Default** By default, all untagged frames are assigned a CoS value of 0. Note that for tagged frames, the default behavior is not to alter the CoS value.

**Mode** Interface Configuration

**Example** To assign a CoS user priority value of 2 to all untagged packets entering port1.0.1 to port1.0.4, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1-port1.0.4
awplus(config-if)# mls qos cos 2
```

# mls qos enable

**Overview** Use this command to enable QoS.

Use the **no** variant of this command to globally disable QoS and remove all QoS configuration. The **no** variant of this command removes all class-maps, policy-maps, and policers that have been created. Running the **no mls qos** command will therefore remove all pre-existing QoS configurations on the switch.

**Mode** Global Configuration

**Syntax** `mls qos enable`  
`no mls qos`

**Example** To enable QoS on the switch, use the commands:

```
awplus# configure terminal
awplus(config)# mls qos enable
```

# mls qos map cos-queue

**Overview** Use this command to set the default CoS to egress queue mapping. This is the default queue mapping for packets that do not get assigned an egress queue via any other QoS functionality.

Use the **no** variant of this command to reset the cos-queue map back to its default setting. The default mappings for this command are:

|                |   |   |   |   |   |   |   |   |
|----------------|---|---|---|---|---|---|---|---|
| CoS Priority : | 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 |
| -----          |   |   |   |   |   |   |   |   |
| CoS QUEUE:     | 2 | 0 | 1 | 3 | 4 | 5 | 6 | 7 |

**Syntax** `mls qos map cos-queue <cos-priority> to <queue-number>`  
`no mls qos map cos-queue`

| Parameter      | Description   |
|----------------|---|
| <cos-priority> | CoS priority value. Can take a value between 0 and 7. |
| <queue-number> | Queue number. Can take a value between 0 and 7.       |

**Mode** Global Configuration

**Examples** To map CoS 2 to queue 0, use the command:

```
awplus# configure terminal  
awplus(config)# mls qos map cos-queue 2 to 0
```

To set the cos-queue map back to its defaults, use the command:

```
awplus# configure terminal  
awplus(config)# no mls qos map cos-queue
```

**Related commands** [show mls qos interface](#)

# mls qos map premark-dscp

**Overview** This command configures the premark-dscp map. It is used when traffic is classified by a class-map that has **trust dscp** configured. Based on a lookup DSCP, the map determines new QoS settings for the traffic.

The **no** variant of this command resets the premark-dscp map to its defaults. If no DSCP is specified then all DSCP entries will be reset to their defaults.

**Syntax**

```
mls qos map premark-dscp <0-63> to  
{ [new-dscp <0-63>] [new-cos <0-7>]  
[new-bandwidth-class {green|yellow|red}]}  
no mls qos map premark-dscp [<0-63>]
```

| Parameter           | Description  |
|---------------------|--|
| premark-dscp <0-63> | The DSCP value on ingress.   |
| new-dscp <0-63>     | The DSCP value that the packet will have on egress. If unspecified, this value will remain the DSCP ingress value. |
| new-cos <0-7>       | The CoS value that the packet will have on egress. If unspecified, this value will retain its value on ingress.    |
| new-bandwidth-class | Modify Egress Bandwidth-class. If unspecified, this value will be set to green.                                    |
| green               | Egress Bandwidth-class green (marked down Bandwidth-class).  |
| yellow              | Egress Bandwidth-class yellow (marked down Bandwidth-class).   |
| red                 | Egress Bandwidth-class red (marked down Bandwidth-class).  |

**Mode** Global Configuration

**Usage notes** With the **trust dscp** command set, this command (**mls qos map premark-dscp**) enables you to remap the DSCP, CoS, output queue, or bandwidth class values.

However, note that you cannot simultaneously change the DSCP and CoS, because they use the same byte in the IP header.

**Example** To set the entry for DSCP 1 to use a new DSCP of 2, use the command:

```
awplus# configure terminal  
awplus(config)# mls qos map premark-dscp 1 to new-dscp 2
```

**Example** To set the entry for DSCP 1 to use a new CoS of 3, and a new bandwidth class of yellow, use the command:

```
awplus# configure terminal
awplus(config)# mls qos map premark-dscp 1 to new-cos 3
new-bandwidth-class yellow
```

**Example** To reset the entry for DSCP 1 use the command:

```
awplus# configure terminal
awplus(config)# no mls qos map premark-dscp 1
```

**Related commands** [show mls qos maps premark-dscp](#)  
[trust dscp](#)

# mls qos queue name

**Overview** Use this command to give a name and optional description to a specific egress queue.

Use the **no** variant of this command to remove the name and description from an egress queue.

**Syntax** `mls qos queue <0-7> name <name> [description <description>]`  
`no mls qos queue <0-7> name`

| Parameter     | Description  |
|---------------|--|
| <0-7>         | The number of the egress queue to name.  |
| <name>        | The name you want to give the egress queue. The name can contain any printable ASCII character (ASCII 33-126), except for spaces.              |
| <description> | The description you want to give the egress queue. The description can contain any printable ASCII character (ASCII 32-126), including spaces. |

**Default** Queues have no name or description

**Mode** Global Configuration

**Example** To give queue 6 the name 'Video' and the description 'Real-time interactive, broadcast video', use the commands:

```
awplus# configure terminal
awplus(config)# mls qos queue 6 name Video description Real-time
interactive, broadcast video
```

To remove the name and description from queue 6, use the commands:

```
awplus# configure terminal
awplus(config)# no mls qos queue 6 name
```

**Command changes** Version 5.5.2-2.1: command added

# no police

**Overview** Use this command to disable any policer previously configured on the class-map.

**Syntax** no police

**Mode** Policy Map Class Configuration

**Usage notes** This command disables any policer previously configured on the class-map.

**Example** To disable policing on a class-map, use the commands:

```
awplus# configure terminal
awplus(config)# policy-map name
awplus(config-pmap)# class classname
awplus(config-pmap-c)# no police
```

**Related commands** [police single-rate action](#)  
[police twin-rate action](#)

# police single-rate action

**Overview** Configures a single-rate policer for a class-map.

**Syntax** `police single-rate <cir> <cbs> <ebs> action  
{drop-red|remark-transmit}`

| Parameter       | Description  |
|-----------------|--|
| <cir>           | Specify the Committed Information Rate (CIR) (1-100000000 kbps).   |
| <cbs>           | Specify the Committed Burst Size (CBS) (0-16777216 bytes).   |
| <ebs>           | Specify a Excess Burst Size (EBS) (0-16777216 bytes).  |
| action          | Specify the action if the rate is exceeded.  |
| drop-red        | Drop the red packets.  |
| remark-transmit | Modify the packets using the remark map, then transmit. You can configure the remark map using the <a href="#">remark-map</a> command. |

**Mode** Policy Map Class Configuration

**Usage notes** You can use a policer to meter the traffic classified by the class-map and assign it to one of three bandwidth classes.

The bandwidth classes are green (conforming), yellow (partially-conforming), and red (non-conforming). A single-rate policer is based on three values. These are the average rate, minimum burst and maximum burst.

| Color  | Definition   |
|--------|--|
| green  | The traffic rate is less than the average rate and minimum burst.    |
| yellow | The traffic rate is between the minimum burst and the maximum burst. |
| red    | The traffic rate exceeds the average rate and the maximum burst.     |

Using an action of drop-red means that any packets classed as red are discarded.

**NOTE:** *This command will not take effect when applied to a class-map that attaches to a channel group whose ports span processor instances.*

Note that the [remark-map](#) does not only apply to red traffic. If a remark-map is configured on the same class-map as the policer, then the remark-map will apply to green- colored and yellow-colored traffic irrespective of the value configured on the **action** parameter of the policer. So, even if **action** is configured to **drop-red**, the remark-map will be applied to green and yellow traffic. So, the **action** parameter only applies to red- colored traffic. If **action** is set to **drop-red**, then red

traffic is dropped; if **action** is set to **remark-transmit**, then the red traffic has the action of the remark map applied to it, and is then transmitted.

**Example** To configure a single rate meter measuring traffic of 100 Mbps that drops a sustained burst of traffic over this rate, use the commands:

```
awplus# configure terminal
awplus(config)# policy-map name
awplus(config-pmap)# class classname
awplus(config-pmap-c)# police single-rate 100000 1875000
1875000 action drop-red
```

**Related commands**

- [no police](#)
- [police twin-rate action](#)
- [remark-map](#)

# police twin-rate action

**Overview** Configures a twin-rate policer for a class-map.

**Syntax** `police twin-rate <cir> <pir> <cbs> <pbs> action  
{drop-red|remark-transmit}`

| Parameter       | Description  |
|-----------------|--|
| <cir>           | Specify the Committed Information Rate (CIR) (1-100000000 kbps).   |
| <pir>           | Specify the Peak Information Rate (PIR) (1-100000000 kbps).  |
| <cbs>           | Specify the Committed Burst Size (CBS) (0-16777216 bytes).   |
| <pbs>           | Specify the Peak Burst Size (PBS) (0-16777216 bytes).  |
| action          | Specify the action if rate is exceeded.  |
| drop-red        | Drop the red packets.  |
| remark-transmit | Modify the packets using the remark map, then transmit. You can configure the remark map using the <a href="#">remark-map</a> command. |

**Mode** Policy Map Class Configuration

**Usage notes** A policer can be used to meter the traffic classified by the class-map and as a result will be given one of three bandwidth classes. These are green (conforming), yellow (partially-conforming), and red (non-conforming).

A twin-rate policer is based on four values. These are the minimum rate (CIR), minimum burst size (CBS), maximum rate (PIR), and maximum burst size (PBS). The following table shows how these values define the bandwidth classes.

| Bandwidth Class | Definition   |
|-----------------|--|
| green           | The sum of the number of existing (buffered) bytes plus those arriving at the port per unit time results in a value that is less than that set for the CBS.            |
| yellow          | The sum of the number of existing (buffered) bytes plus those arriving at the port per unit time results in a value that is between those set for the CBS and the PBS. |
| red             | The sum of the number of existing (buffered) bytes plus those arriving at the port per unit time results in a value that exceeds that set for the PBS.                 |

Using an action of drop-red means that any packets classed as red will be discarded.

Using an action of remark-transmit means that the packet will be remarked with the values configured in the policed-dscp map. The index into this map is determined by the DSCP in the packet.

Note that the [remark-map](#) does not only apply to red traffic. If a remark-map is configured on the same class-map as the policer, then the remark-map will apply to green-colored and yellow-colored traffic irrespective of the value configured on the **action** parameter of the policer. So, even if **action** is configured to **drop-red**, the remark-map will be applied to green and yellow traffic. So, the **action** parameter only applies to red-colored traffic. If **action** is set to **drop-red**, then red traffic is dropped; if **action** is set to **remark-transmit**, then the red traffic has the action of the remark map applied to it, and is then transmitted.

**Example** To configure a twin rate meter measuring a minimum rate of 10 Mbps and a maximum rate of 20 Mbps, and drop red packets, use the commands:

```
awplus# configure terminal
awplus(config)# policy-map name
awplus(config-pmap)# class classname
awplus(config-pmap-c)# police twin-rate 10000 20000 1875000
3750000 action drop-red
```

To configure a twin rate meter measuring a minimum rate of 10 Mbps and a maximum rate of 20 Mbps that uses the remark map to remark any non-conforming traffic, use the commands:

```
awplus# configure terminal
awplus(config)# policy-map name
awplus(config-pmap)# class classname
awplus(config-pmap-c)# police twin-rate 10000 20000 1875000
3750000 action remark-transmit
```

**Related commands** [no police](#)  
[police single-rate action](#)

# policy-map

**Overview** Use this command to create a policy-map and to enter Policy Map Configuration mode to configure the specified policy-map.

Use the **no** variant of this command to delete an existing policy-map.

**Syntax** `policy-map <name>`  
`no policy-map <name>`

| Parameter                 | Description             |
|---------------------------|-------------------------|
| <code>&lt;name&gt;</code> | Name of the policy-map. |

**Mode** Global Configuration

**Example** To create a policy-map called pmap1, use the commands:

```
awplus# configure terminal
awplus(config)# policy-map pmap1
awplus(config-pmap)#
```

**Related commands** [class-map](#)

# priority-queue

**Overview** This command configures strict priority-based scheduling on the specified egress queues. You must specify at least one queue.

**Syntax** `priority-queue [0] [1] [2] [3] [4] [5] [6] [7]`

| Parameter                      | Description  |
|--------------------------------|--|
| <code>[0] [1] . . . [7]</code> | Specify the queues that will use strict priority scheduling. With strict priority scheduling, the switch will completely empty the highest numbered queue first, then start processing the next lowest numbered queue. |

**Mode** Interface Configuration.

**Usage notes** By default, the queues on all ports are set for priority queuing. You can change the queue emptying sequence to weighted round robin, by using the [wrr-queue weight queues](#) command. You can then use the [priority-queue](#) command to reset the selected queues to priority queuing.

Note that the emptying sequence for priority queuing is always highest queue number to lowest queue number.

**Example** To apply priority-based scheduling to egress queues 1 and 2, use the commands:

```
awplus#configure terminal
awplus(config)#interface port1.0.1
awplus(config-if)#priority-queue 1 2
```

**Related commands**

- [show mls qos interface](#)
- [show mls qos interface queue-counters](#)
- [wrr-queue weight queues](#)

# remark-map

**Overview** Use this command to configure the remark map. If a re-mark map is applied to a class, and a policer is also applied to the same class, then:

- green and yellow traffic will all be acted upon by the remark-map, and
- red traffic will be either dropped or acted upon by the remark-map, depending on whether the policer **action** is set to **drop-red** or **remark-transmit**.

The **no** variant of this command resets the remark map to its defaults. Specifying the bandwidth class is optional. If no bandwidth class is specified, then all bandwidth classes are reset to their defaults.

**Syntax** remark-map [bandwidth-class {green|yellow|red}] to {[new-dscp <0-63>] [new-bandwidth-class {green|yellow|red}]}

no remark-map [bandwidth-class {green|yellow|red}] to {[new-dscp <0-63>] [new-bandwidth-class {green|yellow|red}]}

| Parameter           | Description                                       |
|---------------------|---|
| bandwidth-class     | Specify the bandwidth class of packets to remark. |
| green               | Remark green packets.                             |
| yellow              | Remark yellow packets.                            |
| red                 | Remark red packets.                               |
| new-dscp            | Specify the new DSCP value.                       |
| <0-63>              | The DSCP value.                                   |
| new-bandwidth-class | Specify the new bandwidth class.                  |
| green               | Remark the packet green.                          |
| yellow              | Remark the packet yellow.                         |
| red                 | Remark the packet red.                            |

**Mode** Policy Map Class Configuration

**Examples** To remark the policed green traffic to a new DSCP of 2 and a new bandwidth class of yellow, use the commands:

```
awplus# configure terminal
awplus(config)# policy-map pmap1
awplus(config-pmap)# class cmap1
awplus(config-pmap-c)# remark-map bandwidth-class green to
new-dscp 2 new-bandwidth-class yellow
```

To remark the policed green traffic to a new DSCP of 2, use the commands:

```
awplus# configure terminal
awplus(config)# policy-map pmap1
awplus(config-pmap)# class cmap1
awplus(config-pmap-c)# remark-map bandwidth-class green to
new-dscp 2
```

To reset the DSCP for all bandwidth classes, use the commands:

```
awplus# configure terminal
awplus(config)# policy-map pmap1
awplus(config-pmap)# class cmap1
awplus(config-pmap-c)# no remark-map to new-dscp
```

**Related commands** [police single-rate action](#)  
[police twin-rate action](#)

# remark new-cos

**Overview** This command enables you to configure and remark either or both of:

- the CoS flag in the data packet
- the input into the CoS to queue map, thus changing the destination egress queue.

**Syntax** remark new-cos <0-7> [internal|external|both]  
no remark new-cos [internal|external|both]

| Parameter | Description  |
|-----------|--|
| <0-7>     | The new value for the CoS flag and/or the input into the CoS to queue map.                           |
| external  | Remarks the CoS flag in the packet.  |
| internal  | Remarks the new-CoS input into the CoS to queue map.   |
| both      | Remarks (with the same value) both the CoS flag in the packet and the input to the CoS to queue map. |

**Mode** Policy Map Class Configuration

**Usage notes** The default CoS to Queue mappings are shown in the following table:

|                 |   |   |   |   |   |   |   |   |
|-----------------|---|---|---|---|---|---|---|---|
| CoS Value       | 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 |
| Egress Queue No | 2 | 0 | 1 | 3 | 4 | 5 | 6 | 7 |

The relationship between this command and the CoS to queue map is shown in the following figure.

Figure 42-1: Remarking and the CoS to Q map

Table 42-1: CoS to egress queue remarking function

| Input  | Command                         | Output   |
|--|---------------------------------|--|
| CoS field = 1  | Remark new-cos (not configured) | CoS value = 1<br>Packet sent to egress queue 0 |
| CoS field = 1  | Remark new-cos 2 external       | CoS value = 2<br>Packet sent to egress queue 0 |
| CoS set to 1   | Remark new-cos 2 internal       | CoS value = 1<br>Packet sent to egress queue 1 |
| CoS set to 1   | Remark new-cos 2 both           | CoS value = 2<br>Packet sent to egress queue 1 |
| Note: This table assumes that the CoS to Queue map is set to its default values. |                                 |  |

**NOTE:** VLAN ID translation and VLAN double-tagging (*switchport vlan translation*) cannot be used on the same port in combination with CoS remarking.

**Example** For policy-map "pmap3" and class-map "cmap1", set the CoS value to 2 and also set the input to the CoS to queue map so that the traffic is assigned to egress queue 1:

```
awplus# configure terminal
awplus(config)# policy-map pmap3
awplus(config-pmap)# class cmap1
awplus(config-pmap-c)# remark new-cos 2 both
```

**Related commands** [mls qos map cos-queue](#)  
[show mls qos maps cos-queue](#)

# service-policy input

**Overview** Use this command to apply a policy-map to the input of an interface.  
Use the **no** variant of this command to remove a policy-map and interface association.

**Syntax** `service-policy input <policy-map>`  
`no service-policy input <policy-map>`

| Parameter                       | Description  |
|---------------------------------|--|
| <code>&lt;policy-map&gt;</code> | Policy map name that will be applied to the input. |

**Mode** Interface Configuration

**Usage notes** This command can be applied to switch ports or static channel groups, but not to dynamic (LACP) channel groups.

**Example** To apply a policy-map named `pmap1` to interface `port1.0.2`, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
wplus(config-if)# service-policy input pmap1
```

# show class-map

**Overview** Use this command to display the QoS class-maps' criteria for classifying traffic.

**Syntax** `show class-map [<class-map-name>]`

| Parameter                           | Description            |
|-------------------------------------|------------------------|
| <code>&lt;class-map-name&gt;</code> | Name of the class-map. |

**Mode** User Exec and Privileged Exec

**Example** To display a QoS class-map's match criteria for classifying traffic, use the command:

```
awplus# show class-map cmap1
```

**Output** Figure 42-2: Example output from the **show class-map** command

```
awplus#show class-map

CLASS-MAP-NAME: myClass
Match Mac Type: 2 12mcast

CLASS-MAP-NAME: default
```

**Related commands** [class-map](#)

# show mls qos

**Overview** Use this command to display whether QoS is enabled or disabled on the switch.

**Syntax** `show mls qos`

**Mode** User Exec and Privileged Exec

**Example** To display whether QoS is enabled or disabled, use the command:

```
awplus# show mls qos
```

**Output** Figure 42-3: Example output from the **show mls qos** command

```
awplus#show mls qos
Enable
```

**Related commands** [mls qos enable](#)

# show mls qos interface

**Overview** Displays the current settings for the interface. This includes its default CoS and queue, scheduling used for each queue, and any policies/maps that are attached.

**Syntax** `show mls qos interface [<port>]`

| Parameter | Description  |
|-----------|--------------|
| <port>    | Switch port. |

**Mode** User Exec and Privileged Exec

**Example** To display current CoS and queue settings for interface port1.0.1, use the command:

```
awplus# show mls qos interface port1.0.1
```

**Output** Figure 42-4: Example output from the **show mls qos interface** command for port1.0.1

```
awplus#show mls qos interface port1.0.1
Interface: port1.0.1

```

Table 42-2: Parameters in the output of the show mls qos interface command

| Parameter               | Description  |
|-------------------------|--|
| Number of egress queues | The total number of egress queues available on this interface.                         |
| Egress Queue            | Number of this egress queue.   |
| Status                  | Queue can either be enabled or disabled.   |
| Scheduler               | The scheduling mode being used for servicing the transmission of packets on this port. |

Table 42-2: Parameters in the output of the show mls qos interface command

| Parameter                       | Description  |
|---------------------------------|--|
| Queue Limit                     | The percentage of the port's buffers that have been allocated to this queue.   |
| Egress Rate Limit               | The amount of traffic that can be transmitted via this queue per second. 0 Kb means there is currently no rate-limiting enabled.   |
| Egress Traffic Shaping Overhead | The number of bytes specified to allow for the size of packet preamble and inter-packet gap (the "overhead") in egress queue rate limiting. Use the <a href="#">egress-rate-limit overhead</a> command to change this. |

**Command changes**

Version 5.5.1-0.1: DSCP queue mapping removed from output

# show mls qos interface policer-counters

**Overview** This command displays an interface's policer counters. This can either be for a specific class-map or for all class-maps attached to the interface. If no class-map is specified then all class-map policer counters attached to the interface are displayed.

**Syntax** `show mls qos interface <port> policer-counters [class-map <class-map>]`

| Parameter   | Description         |
|-------------|---------------------|
| <port>      | Switch port.        |
| class-map   | Select a class-map. |
| <class-map> | Class-map name.     |

**Mode** User Exec and Privileged Exec

**Usage** Note that:

- The hardware does not record distinct counters for the number of Green or Yellow bytes, so the field marked Green/Yellow is the summation of bytes that have been marked Green or Yellow by the meter.
- The counters are based on metering performed on the specified class-map. Therefore, the 'Dropped Bytes' counter is the number of bytes dropped due to metering. This is different from packets dropped via a 'deny' action in the ACL. If a policer is configured to perform re-marking, bytes can be marked Red but are not dropped, and is shown with a value of 0 for the Dropped field and a non-0 value for the 'Red Bytes' field.

**Example** To show the counters for all class-maps attached to port1.0.1, use the command:

```
awplus# show mls qos interface port1.0.1 policer-counters
```

**Output** Figure 42-5: Example output from **show mls qos interface policer-counters** on a port

```
awplus#show mls qos interface port1.0.1 policer-counters
Interface:                port1.0.1
  Class-map:               default
    Green/Yellow Bytes:    0
    Red Bytes:             0
    Dropped Bytes:        0
    Non-dropped Bytes:    0
  Class-map:               cmap1
    Green/Yellow Bytes:    1290
    Red Bytes:             0
    Dropped Bytes:        0
    Non-dropped Bytes:    1290
```

# show mls qos interface queue-counters

**Overview** This command displays an interface's egress queue counters. This can either be for a specific queue or for all queues on the interface. If no queue is specified all queue counters on the interface will be displayed.

The counters show the number of frames currently in the queue and the maximum number of frames allowed in the queue, for individual egress queues and the port's queue (which will be a sum of all egress queues).

**Syntax** `show mls qos interface <port> queue-counters [queue <0-7>]`

| Parameter   | Description                                      |
|-------------|--|
| <port>      | The switch port to display counters for.         |
| queue <0-7> | The number of the queue to display counters for. |

**Mode** User Exec and Privileged Exec

**Example** To show the counters for all queues on port1.0.1, use the command:

```
awplus# show mls qos interface port1.0.1 queue-counters
```

**Output** Figure 42-6: Example output from **show mls qos interface queue-counters**

```
Interface port1.0.1 Queue Counters:
  Port queue length      1169
  Egress Queue length:
    Queue 0              0
    Queue 1              0
    Queue 2              1169
    Queue 3              0
    Queue 4              0
    Queue 5              0
    Queue 6              0
    Queue 7              0

Egress queue drop/transmit counters:
      Queue 0      Dropped Bytes      Dropped Pkts      Tx Bytes      Tx Pkts
      Queue 1      0              0              0              0
      Queue 2      0              0              0              0
      Queue 3      0              0              0              0
      Queue 4      0              0              576            9
      Queue 5      0              0              0              0
      Queue 6      0              0      10489664      63901
      Queue 7      0              0              0              0
```

Table 42-3: Parameters in the output from **show mls qos interface queue-counters**

| Parameter                           | Description  |
|-------------------------------------|--|
| Interface                           | Port we are showing the counters for.  |
| Port queue length                   | Number of frames in the port's queue. This will be the sum of all egress queues on the port. |
| Egress Queue length                 | Number of frames in a specific egress queue.   |
| Egress queue drop/transmit counters | The number of bytes and packets dropped and transmitted on each egress queue.                |

**Related commands** [clear mls qos interface queue-counters](#)

# show mls qos interface storm-status

**Overview** Show the current configuration and status of the QoS Storm Protection (QSP) on the given port.

**Syntax** `show mls qos interface <port> storm-status`

| Parameter | Description  |
|-----------|--------------|
| <port>    | Switch port. |

**Mode** User Exec and Privileged Exec

**Example** To see the QSP status on port1.0.1, use the command:

```
awplus# show mls qos interface port1.0.1 storm-status
```

**Output** Figure 42-7: Example output from **show mls qos interface storm-status**

|                      |             |
|----------------------|-------------|
| Interface:           | port1.0.1   |
| Storm-Protection:    | Enabled     |
| Port-status:         | Enabled     |
| Storm Action:        | vlandisable |
| Storm Window:        | 5000 ms     |
| Storm Downtime:      | 0 s         |
| Timeout Remaining:   | 0 s         |
| Last read data-rate: | 0 kbps      |
| Storm Rate:          | 1000 kbps   |

# show mls qos maps cos-queue

**Overview** Show the current configuration of the cos-queue map.

**Syntax** `show mls qos maps cos-queue`

**Mode** User Exec and Privileged Exec

**Example** To display the current configuration of the cos-queue map, use the command:

```
awplus# show mls qos maps cos-queue
```

**Output** Figure 42-8: Example output from **show mls qos maps cos-queue**

```
COS-TO-QUEUE-MAP :
COS :           0 1 2 3 4 5 6 7
-----
QUEUE:         2 0 1 3 4 5 6 7
```

**Related commands** [mls qos map cos-queue](#)

# show mls qos maps premark-dscp

**Overview** This command displays the premark-dscp map. This map is used to replace the DSCP, CoS and/or bandwidth class of a packet matching the class-map, based on a lookup DSCP value.

**Syntax** `show mls qos maps premark-dscp [<0-63>]`

| Parameter | Description       |
|-----------|-------------------|
| <0-63>    | DSCP table entry. |

**Mode** User Exec and Privileged Exec

**Example** To display the premark-dscp map for DSCP 1, use the command:

```
awplus# show mls qos maps premark-dscp 1
```

# show platform classifier statistics utilization brief

**Overview** This command displays the number of used entries available for various platform functions, and the percentage that number of entries represents of the total available.

**Syntax** `show platform classifier statistics utilization brief`

**Mode** Privileged Exec

**Example** To display the platform classifier utilization statistics, use the following command:  
`awplus# show platform classifier statistics utilization brief`

**Output** Figure 42-10: Output from **show platform classifier statistics utilization brief**

```
[Instance 0]
Capacity: 503
Number of Entries:
Policy Type          Group ID    Used / Allocated
-----
ACL                  1476395010 119 / 119 (100%)
  Interface                    119
  VACL                          0
  AMFAPPS                       0
DoS                    Inactive    0 / 0 ( 0%)
VLAN Counter
  Group-Octet                Inactive    0 / 0 ( 0%)
  Group-Packet                Inactive    0 / 0 ( 0%)
Flooding Nexthop
Redirects              Inactive    0 / 0 ( 0%)
Remote-Mirror         Inactive    0 / 0 ( 0%)
VLAN Isolate          Inactive    0 / 0 ( 0%)
QoS                    Inactive    0 / 0 ( 0%)

Rule Limit Reached (clear on read): 0
Total Rule Limit Reached from startup: 0
```

**Output parameters** Depending on your switch, you will see some of the following parameters in the output from **show platform classifier statistics utilization brief**

| Parameter      | Description  |
|----------------|--|
| IPv6 Multicast | Reserved hardware space for use by IPv6 multicast, when the <code>ipv6 multicast-routing</code> command is used. |
| System         | Fixed system entries. For example, resiliency links make use of system ACLs.                                     |
| MLD Snooping   | Entries to send various packets that MLD Snooping is interested in to the CPU.                                   |

| Parameter      | Description   |
|----------------|---|
| DHCP Snooping  | Entries used to send DHCP and ARP packets to the CPU. User-added DHCP Snooping filters under ACLs are counted under the ACL or QoS categories.  |
| Loop Detection | Entries uses to send the special loop detection frame to the CPU.   |
| EPSR           | Entries used to send EPSR control traffic to the CPU.   |
| CFM            | Entries used by Connectivity Fault Management.  |
| G8032          | Entries used to send G.8032 control traffic to the CPU.   |
| Global ACLs    | Entries for ACLs appear here if the ACLs are applied globally instead of per switchport.  |
| ACL            | Entries for ACL filters that have been applied directly to ports using the <a href="#">access-group</a> command.  |
| VACL           | Entries for VLAN-based ACLs (ACLs that are applied to VLANs instead of ports).  |
| DOS            | Entries used for Denial of Service protection.  |
| UFO            | Entries used by Upward Forwarding Only (UFO).   |
| QoS            | Entries for ACL filters and other class-map configurations, such as policers, applied through policy maps using the service input command.  |
| RA Guard       | Entries used to block IPv6 router advertisements, configured with the <b>ipv6 nd raguard</b> command.   |
| AMFAPPS        | Entries used by AMF Application Proxy. These entries enable the SES Controller to block infected ports.   |
| Pre-Ingress    | Entries used for VLAN ID Translation (and also for subnet-based and MAC-based VLAN entries on SBx81XLEM cards).   |
| Egress         | Entries used for VLAN ID Translation.   |
| UDB            | User Defined Bytes (UDB), which are a limited resource of bytes that can be used to implement additional arbitrary matching on packet bytes on some switches. The software manages the use and allocation of these bytes automatically. The output of this table is intended for use by Allied Telesis Customer Support only. |

[ipv6 access-list \(named IPv6 hardware ACL\)](#)

# show policy-map

**Overview** Displays the policy-maps configured on the switch. The output also shows whether or not they are connected to a port (attached / detached) and shows their associated class-maps.

**Syntax** `show policy-map [<name>]`

| Parameter | Description                        |
|-----------|------------------------------------|
| <name>    | The name of a specific policy-map. |

**Mode** User Exec and Privileged Exec

**Example** To display a listing of the policy-maps configured on the switch, use the command:

```
awplus# show policy-map
```

**Output** Figure 42-11: Example output from the **show policy-map** command

```
POLICY-MAP-NAME: example
  Interfaces:
  Default class-map action: permit

  CLASS-MAP-NAME: default
    Policer counters enabled
```

**Related commands** [no police](#)  
[service-policy input](#)

# storm-action

**Overview** Sets the action to be taken when triggered by QoS Storm Protection (QSP). There are three available options:

- **portdisable** will disable the port in software.
- **vlandisable** will disable the port from the VLAN matched by the class-map in class-map. This option requires the match vlan class-map to be present in the class-map
- **linkdown** will physically bring the port down. .

The **no** variant of this command will negate the action set by the **storm-action** command.

**Syntax** storm-action {portdisable|vlandisable|linkdown}  
no storm-action

| Parameter   | Description                   |
|-------------|-------------------------------|
| portdisable | Disable the port in software. |
| vlandisable | Disable the VLAN.             |
| linkdown    | Shutdown the port physically. |

**Mode** Policy Map Class Configuration

**Examples** To apply the storm protection of **vlandisable** to the policy-map named "pmap2" and the class-map named "cmap1", use the following commands:

```
awplus# configure terminal
awplus(config)# policy-map pmap2
awplus(config-pmap)# class cmap1
awplus(config-pmap-c# storm-action vlandisable
```

To negate the storm protection set on the policy-map named "pmap2" and the class-map named "cmap1", use the following commands:

```
awplus# configure terminal
awplus(config)# policy-map pmap2
awplus(config-pmap)# class cmap1
awplus(config-pmap-c# no storm-action
```

**Related commands**

- [storm-downtime](#)
- [storm-protection](#)
- [storm-rate](#)
- [storm-window](#)

# storm-downtime

**Overview** Sets the time to re-enable a port that has been disabled by QoS Storm Protection (QSP). The time is given in seconds, from a minimum of one second to maximum of 86400 seconds (i.e. one day).

The **no** variant of this command resets the time to the default value of 10 seconds.

**Syntax** `storm-downtime <1-86400>`  
`no storm-downtime`

| Parameter | Description |
|-----------|-------------|
| <1-86400> | Seconds.    |

**Default** 10 seconds

**Mode** Policy Map Class Configuration

**Examples** To re-enable the port in 1 minute, use the following commands:

```
awplus# configure terminal
awplus(config)# policy-map pmap2
awplus(config-pmap)# class cmap1
awplus(config-pmap-c)# storm-downtime 60
```

To re-set the port to the default (10 seconds), use the following commands:

```
awplus# configure terminal
awplus(config)# policy-map pmap2
awplus(config-pmap)# class cmap1
awplus(config-pmap-c)# no storm-downtime
```

**Related commands** [storm-action](#)  
[storm-protection](#)  
[storm-rate](#)  
[storm-window](#)

# storm-protection

**Overview** Use this command to enable policy-based Storm Protection (such as QSP - QoS Storm Protection). Storm protection is activated as soon as a port is enabled. However, it will only be functional after [storm-rate](#) and [storm-window](#) have been set.

The **no** variant of this command disables policy-based Storm Protection.

**Syntax** `storm-protection`  
`no storm-protection`

**Default** By default, storm protection is disabled.

**Mode** Policy Map Class Configuration

**Examples** To enable QSP on cmap2 in pmap2, use the following commands:

```
awplus# configure terminal
awplus(config)# policy-map pmap2
awplus(config-pmap)# class cmap2
awplus(config-pmap-c)# storm-protection
```

To disable QSP on cmap2 in pmap2, use the following commands:

```
awplus# policy-map pmap2
awplus(config-pmap)# class cmap2
awplus(config-pmap-c)# no storm-protection
```

**Related commands** [show mls qos interface storm-status](#)  
[storm-action](#)  
[storm-downtime](#)  
[storm-rate](#)  
[storm-window](#)

# storm-rate

**Overview** Sets the data rate that triggers the storm-action. The rate is in kbps and the range is from 1kbps to 40Gbps.

Note that this setting is made in conjunction with the [storm-window](#) command.

Use the **no** variant of this command to negate the **storm-rate** command.

**Syntax** `storm-rate <1-40000000>`  
`no storm-rate`

| Parameter                       | Description                  |
|---------------------------------|------------------------------|
| <code>&lt;1-40000000&gt;</code> | The range of the storm-rate. |

**Default** No default

**Mode** Policy Map Class Configuration

**Usage** This setting is made in conjunction with the [storm-window](#) command.

**Examples** To limit the data rate to 100Mbps, use the following commands:

```
awplus# configure terminal
awplus(config)# policy-map pmap2
awplus(config-pmap)# class cmap2
awplus(config-pmap-c)# storm-rate 100000
```

To negate the limit set previously, use the following commands:

```
awplus# configure terminal
awplus(config)# policy-map pmap2
awplus(config-pmap)# class cmap2
awplus(config-pmap-c)# no storm-rate
```

**Related commands**

- [storm-action](#)
- [storm-downtime](#)
- [storm-protection](#)
- [storm-window](#)

# storm-window

**Overview** Sets the window size of QoS Storm Protection (QSP). This sets the time to poll the data-rate every given milliseconds. Minimum window size is 100 ms and the maximum size is 60 sec.

Use the **no** variant of this command to negate the **storm-window** command.

**Syntax** `storm-window <100-60000>`  
`no storm-window`

| Parameter   | Description                                |
|-------------|--|
| <100-60000> | The window size, measured in milliseconds. |

**Default** No default

**Mode** Policy Map Class Configuration

**Usage** This command should be set in conjunction with the [storm-rate](#) command.

**Examples** To set the QSP window size to 5000 ms, use the following commands:

```
awplus# configure terminal
awplus(config)# policy-map pmap2
awplus(config-pmap)# class cmap2
awplus(config-pmap-c)# storm-window 5000
```

To negate the QSP window size set previously, use the following commands:

```
awplus# configure terminal
awplus(config)# policy-map pmap2
awplus(config-pmap)# class cmap2
awplus(config-pmap-c)# no storm-window
```

**Related commands**

- [storm-action](#)
- [storm-downtime](#)
- [storm-protection](#)
- [storm-rate](#)

# strict-priority-queue egress-rate-limit queues

**Overview** Sets a limit on the amount of traffic that can be transmitted per second from these queues. The default unit is in Kb, but Mb or Gb can also be specified. The minimum is 651 Kb.

This limit applies to WRR queues too. Setting the limit with this command is the same as setting it with [wrr-queue egress-rate-limit queues](#).

**Syntax** `strict-priority-queue egress-rate-limit <bandwidth> queues [0] [1] [2] [3] [4] [5] [6] [7]`  
`no strict-priority-queue egress-rate-limit <bandwidth> queues [0] [1] [2] [3] [4] [5] [6] [7]`

| Parameter         | Description  |
|-------------------|--|
| <bandwidth>       | Bandwidth <1-100000000 kbits> (usable units: k, m, g). |
| [0] [2] . . . [7] | Selects one or more queues numbered 0 to 7.            |

**Mode** Interface Configuration

**Example** To limit the egress rate of queues 0, 1 and 2 on port1.0.1, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# strict-priority-queue egress-rate-limit
500M queues 0 1 2
```

**Related commands** [show mls qos interface](#)  
[wrr-queue egress-rate-limit queues](#)

# trust dscp

**Overview** This command enables the premark-dscp map to replace the DSCP, bandwidth-class and/or CoS of classified traffic based on a lookup DSCP value.

With the **no** variant of this command, no premark-dscp mapping function will be applied for the selected class-map. QoS components of the packet existing either at ingress, or applied by the class-map, will pass unchanged.

**Syntax** `trust dscp`  
`no trust`

**Mode** Policy-Map Configuration

**Examples** To enable the premark-dscp map lookup for policy-map pmap1, use the commands:

```
awplus# configure terminal
awplus(config)# policy-map pmap1
awplus(config-pmap)# trust dscp
```

To disable the premark-dscp map lookup for policy-map pmap1, use the commands:

```
awplus# configure terminal
awplus(config)# policy-map pmap1
awplus(config-pmap)# no trust
```

**Related commands** [mls qos map premark-dscp](#)

# wrr-queue disable queues

**Overview** Use this command to disable an egress queue from transmitting traffic. The **no** variant of this command enables an egress queue to transmit traffic.

**Syntax** `wrr-queue disable queues [0] [1] [2] [3] [4] [5] [6] [7]`  
`no wrr-queue disable queues [0] [1] [2] [3] [4] [5] [6] [7]`

| Parameter       | Description                                 |
|-----------------|---|
| [0] [2] ... [7] | Selects one or more queues numbered 0 to 7. |

**Mode** Interface Configuration

**Examples** To disable queue 1 on port1.0.1 from transmitting traffic, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# wrr-queue disable queues 1
```

To enable queue 1 on port1.0.1 to transmit traffic, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# no wrr-queue disable queues 1
```

**Related commands** [show mls qos interface](#)

# wrr-queue egress-rate-limit queues

**Overview** Sets a limit on the amount of traffic that can be transmitted per second from these queues. The default unit is in Kb, but Mb or Gb can also be specified. The minimum is 651 Kb.

This limit applies to strict priority queues too. Setting the limit with this command is the same as setting it with [strict-priority-queue egress-rate-limit queues](#).

**Syntax** `wrr-queue egress-rate-limit <bandwidth> queues  
[0] [1] [2] [3] [4] [5] [6] [7]`  
`no wrr-queue egress-rate-limit <bandwidth> queues  
[0] [1] [2] [3] [4] [5] [6] [7]`

| Parameter       | Description  |
|-----------------|--|
| <bandwidth>     | Bandwidth <1-100000000 kbits> (usable units: k, m, g). |
| [0] [2] ... [7] | Selects one or more queues numbered 0 to 7.            |

**Mode** Interface Configuration

**Example** To limit the egress rate of queues 0, 1 and 2 on port1.0.1, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# wrr-queue egress-rate-limit 500M queues 0 1
2
```

**Related commands** [show mls qos interface](#)  
[strict-priority-queue egress-rate-limit queues](#)

# wrr-queue weight queues

**Overview** This command configures weighted round-robin based scheduling on the specified egress queues on switch port interfaces only. The weights are specified as ratios relative to each other.

Use the **no wrr-queue** command to remove weighted round-robin based scheduling from the specified egress queue. The queue then reverts to its normal priority-based scheduling.

**Syntax** `wrr-queue weight <1-15> queues [0] [1] [2] [3] [4] [5] [6] [7]`  
`no wrr-queue <queue-number>`

| Parameter       | Description   |
|-----------------|---|
| <1-15>          | Weight (the higher the number the greater will be the queue servicing). |
| [0] [2] ... [7] | Selects one or more queues numbered 0 to 7.                             |
| <queue-number>  | Egress queue to revert to priority-based scheduling.                    |

**Mode** Interface Configuration for switch port interfaces only (not for static aggregated interfaces).

**Usage notes** You cannot apply weighted round-robin based scheduling to static aggregated interfaces (for example, sa2).

**Example** To apply a WRR weight of 6 to queues 0 and 1 on port1.0.1, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# wrr-queue weight 6 queues 0 1
```

To remove weighted round-robin scheduling from egress queue 2 on port1.0.1, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# no wrr-queue 2
```

**Related commands** [priority-queue](#)  
[show mls qos interface](#)

# 43

# 802.1X Commands

## Introduction

**Overview** 802.1X is an IEEE standard providing a mechanism for authenticating devices attached to a LAN port or wireless device. Devices wishing to access services behind a port must authenticate themselves before any Ethernet packets are allowed to pass through. The protocol is referred to as 802.1X because it was initially defined in the IEEE standard 802.1X, published in 2001 and revised in 2004 and again as the current 802.1X 2010 standard.

This chapter provides an alphabetical reference of commands used to configure 802.1X port access control. For more information, see the [AAA and Port Authentication\\_Feature Overview and Configuration Guide](#).

# dot1x accounting

**Overview** This command overrides the **default** RADIUS accounting method for IEEE 802.1X-based authentication on an interface by allowing you to apply a user-defined named method list.

Use the **no** variant of this command to remove the named list from the interface and apply the **default** method list.

**Syntax** dot1x accounting {default|<list-name>}  
no dot1x accounting

| Parameter   | Description                              |
|-------------|--|
| default     | Apply the default accounting method list |
| <list-name> | Apply the user-defined named list        |

**Default** The **default** method list is applied to an interface by default.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Example** To apply the named list 'vlan10\_acct' on the vlan10 interface, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# dot1x accounting vlan10_acct
```

To remove the named list from the vlan10 interface and set the authentication method back to **default**, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# no dot1x accounting
```

**Related commands** [aaa accounting dot1x](#)

**Command changes** Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

# dot1x authentication

**Overview** This command overrides the **default** 802.1X-based authentication method on an interface by allowing you to apply a user-defined named list.

Use the **no** variant of this command to remove the named list from the interface and apply the **default** method.

**Syntax** dot1x authentication {default|<list-name>}  
no dot1x authentication

| Parameter      | Description                                  |
|----------------|--|
| <i>default</i> | Apply the default authentication method list |
| <list-name>    | Apply the user-defined named list            |

**Default** The **default** method list is applied to an interface by default.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Example** To apply the named list 'vlan10\_auth' on the vlan10 interface, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# dot1x authentication vlan10_auth
```

To remove the named list from the vlan10 interface and set the authentication method back to **default**, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# no dot1x authentication
```

**Related commands** [aaa authentication dot1x](#)

**Command changes** Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

# debug dot1x

**Overview** Use this command to enable 802.1X IEEE Port-Based Network Access Control troubleshooting functions.

Use the **no** variant of this command to disable this function.

**Syntax** debug dot1x [all|auth-web|event|nsm|packet|timer]  
no debug all dot1x  
no debug dot1x [all|auth-web|event|nsm|packet|timer]

| Parameter | Description  |
|-----------|--|
| all       | Used with the <b>no</b> variant of this command exclusively; turns off all debugging for 802.1X. |
| auth-web  | Specifies debugging for 802.1X auth-web information.   |
| events    | Specifies debugging for 802.1X events.   |
| nsm       | Specifies debugging for NSM messages.  |
| packet    | Specifies debugging for 802.1X packets.  |
| timer     | Specifies debugging for 802.1X timers.   |

**Mode** Privileged Exec and Global Configuration

**Usage notes** This command turns on a mode where trace-level information is output during authentication conversations. Be aware that this is a very verbose output. It is mostly useful to capture this as part of escalating an issue to ATI support.

**Examples** Use this command without any parameters to turn on normal 802.1X debug information.

```
awplus# debug dot1x  
awplus# show debugging dot1x
```

```
802.1X debugging status:  
 802.1X events debugging is  
 802.1X timer debugging is on  
 802.1X packets debugging is on  
 802.1X NSM debugging is on
```

**Related commands** [show debugging dot1x](#)  
[undebug dot1x](#)

**Command changes** Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

# dot1x control-direction

- Overview** This command sets the direction of the filter for the unauthorized interface.
- If the optional **in** parameter is specified with this command then packets entering the specified port are discarded. The **in** parameter discards the ingress packets received from the supplicant.
- If the optional **both** parameter is specified with this command then packets entering (ingress) and leaving (egress) the specified port are discarded. The **both** parameter discards the packets received from the supplicant and sent to the supplicant.
- The **no** variant of this command sets the direction of the filter to **both**. The port will then discard both ingress and egress traffic.

**Syntax** dot1x control-direction {in|both}  
no dot1x control-direction

| Parameter | Description  |
|-----------|--|
| in        | Discard received packets from the supplicant (ingress packets).  |
| both      | Discard received packets from the supplicant (ingress packets) and transmitted packets to the supplicant (egress packets). |

- Default** The authentication port direction is set to **both** by default.
- Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Examples** To set the port direction to the default (**both**) for port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no dot1x control-direction
```

To set the port direction to **in** for port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# dot1x control-direction in
```

To set the port direction to **in** for authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# dot1x control-direction in
```

**Related commands** auth profile (global)

**Command changes** Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

# dot1x eap

**Overview** This command selects the transmit mode for the EAP packet. If the authentication feature is not enabled then EAP transmit mode is not enabled. The default setting discards EAP packets.

**Syntax** `dot1x eap {discard|forward|forward-untagged-vlan|forward-vlan}`

| Parameter                          | Description                                   |
|------------------------------------|---|
| <code>discard</code>               | Discard.                                      |
| <code>forward</code>               | Forward to all ports on the switch.           |
| <code>forward-untagged-vlan</code> | Forward to ports with the same untagged VLAN. |
| <code>forward-vlan</code>          | Forward to ports with the same VLAN.          |

**Default** The transmit mode is set to `discard` EAP packets by default.

**Mode** Global Configuration

**Examples** To set the transmit mode of EAP packet to **forward**, to forward EAP packets to all ports on the switch, use the commands:

```
awplus# configure terminal
awplus(config)# dot1x eap forward
```

To set the transmit mode of EAP packet to **discard**, to discard EAP packets, use the commands:

```
awplus# configure terminal
awplus(config)# dot1x eap discard
```

To set the transmit mode of EAP packet to **forward-untagged-vlan**, to forward EAP packets to ports with the same untagged VLAN, use the commands:

```
awplus# configure terminal
awplus(config)# dot1x eap forward-untagged-vlan
```

To set the transmit mode of EAP packet to **forward-vlan**, to forward EAP packets to ports with the same VLAN, use the commands:

```
awplus# configure terminal
awplus(config)# dot1x eap forward-vlan
```

**Command changes** Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

# dot1x eapol-version

**Overview** This command sets the EAPOL protocol version for EAP packets when 802.1X port authentication is applied.

Use the **no** variant of this command to set the EAPOL protocol version to 1.

The default EAPOL protocol version is version 1.

**Syntax** dot1x eapol-version {1|2}  
no dot1x eapol-version

| Parameter | Description                    |
|-----------|--------------------------------|
| 1 2       | EAPOL protocol version 1 or 2. |

**Default** The EAP version for 802.1X authentication is set to 1 by default.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Examples** To set the EAPOL protocol version to 2 for port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# dot1x eapol-version 2
```

To set the EAPOL protocol version to the default version (1) for interface port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no dot1x eapol-version
```

To set the EAPOL protocol version to 2 for authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# dot1x eapol-version 2
```

**Validation Commands** auth profile (global)  
show dot1x  
show dot1x interface

**Command changes** Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

# dot1x initialize interface

**Overview** This command removes authorization for a specified connected interface. The connection will attempt to re-authorize when the specified port attempts to make use of the network connection.

**NOTE:** *Reauthentication could be a long time after the use of this command because the reauthorization attempt is not triggered by this command. The attempt is triggered by the first packet from the interface trying to access the network resources.*

**Syntax** `dot1x initialize interface <interface-list>`

| Parameter                           | Description  |
|-------------------------------------|--|
| <code>&lt;interface-list&gt;</code> | The interfaces or ports to configure. An interface-list can be: <ul style="list-style-type: none"><li>• a VLAN (e.g. vlan2)</li><li>• a switchport (e.g. port1.0.4)</li><li>• a static channel group (e.g. sa2)</li><li>• a dynamic (LACP) channel group (e.g. po2)</li><li>• a continuous range of interfaces separated by a hyphen (e.g. port1.0.1-port1.0.3)</li><li>• a comma-separated list (e.g. port1.0.1, port1.0.3-port1.0.4). Do not mix interface types in a list.</li></ul> The specified interfaces must exist. |

**Mode** Privileged Exec

**Examples** To initialize 802.1X port authentication on the interface port1.0.2, use the command:

```
awplus# dot1x initialize interface port1.0.2
```

To unauthorize switch port1.0.2 and attempt reauthentication on switch port1.0.2, use the command:

```
awplus# dot1x initialize interface port1.0.2
```

To unauthorize all switch ports for a 18-port device and attempt reauthentication, use the command:

```
awplus# dot1x initialize interface port1.0.1-port1.0.18
```

**Related commands** [dot1x initialize supplicant](#)  
[show dot1x](#)  
[show dot1x interface](#)

**Command changes** Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

# dot1x initialize supplicant

**Overview** This command removes authorization for a connected supplicant with the specified MAC address or username. The connection will attempt to re-authorize when the specified supplicant attempts to make use of the network connection.

**NOTE:** *Reauthentication could be a long time after the use of this command because the reauthorization attempt is not triggered by this command. The attempt is triggered by the first packet from the supplicant trying to access the network resources.*

**Syntax** dot1x initialize supplicant {<macadd>|username}

| Parameter  | Description                                      |
|------------|--|
| dot1x      | IEEE 802.1X Port-Based Access Control.           |
| initialize | Initialize the port to attempt reauthentication. |
| supplicant | Specify the supplicant to initialize.            |
| <macadd>   | MAC (hardware address of the supplicant.         |
| username   | The name of the supplicant entry.                |

**Mode** Privileged Exec

**Example** To initialize the supplicant authentication, use the commands

```
awplus# configure terminal
awplus(config)# dot1x initialize supplicant 0090.99ab.a020
awplus(config)# dot1x initialize supplicant guest
```

**Related commands** [dot1x initialize interface](#)

**Command changes** Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

# dot1x keytransmit

**Overview** Use this command to enable key transmission on the interface specified previously in Interface mode.

This command enables key transmission over an Extensible Authentication Protocol (EAP) packet between the authenticator and supplicant.

The **no** variant of this command disables key transmission on the interface specified.

**Syntax** dot1x keytransmit  
no dot1x keytransmit

**Default** Key transmission for port authentication is disabled by default.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Examples** To enable the key transmit feature on interface port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# dot1x keytransmit
```

To disable the key transmit feature on interface port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no dot1x keytransmit
```

**Related commands** [show dot1x](#)  
[show dot1x interface](#)

**Command changes** Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

# dot1x max-auth-fail

**Overview** Use this command to configure the maximum number of login attempts for a supplicant (client device) using the **auth-fail vlan** feature, when using 802.1X port authentication on an interface.

The **no** variant of this command resets the maximum login attempts for a supplicant (client device) using the auth-fail vlan feature, to the default configuration of 3 login attempts.

**Syntax** dot1x max-auth-fail <0-10>  
no dot1x max-auth-fail

| Parameter | Description  |
|-----------|--|
| <0-10>    | Specify the maximum number of login attempts for supplicants on an interface using 802.1X port authentication. |

**Default** The default maximum number of login attempts for a supplicant on an interface using 802.1X port authentication is 3 login attempts.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Usage notes** This command sets the maximum number of login attempts for supplicants on an interface. The supplicant is moved to the auth-fail VLAN from the Guest VLAN after the number of failed login attempts using 802.1X authentication is equal to the number set with this command.

See the [AAA and Port Authentication Feature Overview and Configuration Guide](#) for information about:

- the auth-fail VLAN feature, and
- restrictions regarding combinations of authentication enhancements working together

**Examples** To configure the maximum number of login attempts for a supplicant on interface port1.0.2 to a single login attempt, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# dot1x max-auth-fail 1
```

To configure the maximum number of login attempts for a supplicant on interface port1.0.2 to the default number of 3 login attempts, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no dot1x max-auth-fail
```

To configure the maximum number of login attempts for a supplicant on authentication profile 'student' to a single login attempt, use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# dot1x max-auth-fail 1
```

**Command  
changes**

Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

# dot1x max-reauth-req

**Overview** Use this command to set the number of reauthentication attempts before an interface is unauthorized.

The **no** variant of this command resets the reauthentication delay to the default.

**Syntax** dot1x max-reauth-req <1-10>  
no dot1x max-reauth-req

| Parameter | Description   |
|-----------|---|
| <1-10>    | Specify the maximum number of reauthentication attempts for supplicants on an interface using 802.1X port authentication. |

**Default** The default maximum reauthentication attempts for interfaces using 802.1X port authentication is two (2) reauthentication attempts, before an interface is unauthorized.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Usage notes** Use this command to set the maximum reauthentication attempts after failure.

**Examples** To configure the maximum number of reauthentication attempts for interface port1.0.2 to a single (1) reauthentication request, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# dot1x max-reauth-req 1
```

To configure the maximum number of reauthentication attempts for interface port1.0.2 to the default maximum number of two (2) reauthentication attempts, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no dot1x max-reauth-req
```

To configure the maximum number of reauthentication attempts for authentication profile 'student' to a single (1) reauthentication request, use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# dot1x max-reauth-req 1
```

**Command  
changes**

Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

# dot1x max-req

**Overview** Use this command to change the number of times the device resends an EAP Request packet if that packet is lost between the authenticating device and the supplicant. If the supplicant does not respond to an EAP Request after this number of retries, the supplicant fails the authentication process.

Use the **no** variant of this command to return to the default number of retries.

**Syntax** `dot1x max-req <1-10>`  
`no dot1x max-req`

| Parameter | Description   |
|-----------|---|
| <1-10>    | The number of retries. Note that this does not include the initial attempt, so the total number of attempts is one higher than the number you specify here. |

**Default** The default value is 2.

Note: This means the authenticator sends the original attempt and 2 more attempts, which is 3 attempts in total.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Usage notes** You can set this on a per-supplicant basis by using the **max-req** parameter in the commands:

- `auth supplicant-ip`
- `auth supplicant-mac`

**Example** To change the number of retries to 5 for port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# dot1x max-req 5
```

To return the number of retries to the default setting of 2 for port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no dot1x max-req
```

To set the number of retries to 1 for authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# dot1x max-req 1
```

**Related  
commands**

**Command  
changes**

Version 5.5.3-1.1: command added

# dot1x port-control

**Overview** This command enables 802.1X port authentication on the interface specified, and sets the control of the authentication port.

The **no** variant of this command disables the port authentication on the interface specified.

**Syntax** `dot1x port-control {force-unauthorized|force-authorized|auto}`  
`no dot1x port-control`

| Parameter                       | Description   |
|---------------------------------|---|
| <code>force-unauthorized</code> | Force the port state to unauthorized. Specify this to force a port to always be in an unauthorized state. |
| <code>force-authorized</code>   | Force the port state to authorized. Specify this to force a port to always be in an authorized state.     |
| <code>auto</code>               | Allow the port client to negotiate authentication. Specify this to enable authentication on the port.     |

**Default** 802.1X port control is disabled by default.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Usage notes** Use this command to force a port state.

When **port-control** is set to **auto**, the 802.1X authentication feature is executed on the interface, but only if the **aaa authentication dot1x** command has been issued.

If you attempt to change the authentication configuration on an interface that has threat protection quarantine configured, you will see the following error message:

```
% portx.x.x: Application Proxy quarantine configuration must be removed before port authentication is changed
```

Before changing the interface's authentication configuration you must either:

- remove the interface's threat protection configuration, or
- shut down the interface.

**Examples** To enable port authentication on the interface port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# dot1x port-control auto
```

To enable port authentication force authorized on the interface port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# dot1x port-control force-authorized
```

To disable port authentication on the interface port1.0.2 use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no dot1x port-control
```

To enable port authentication on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# dot1x port-control auto
```

**Command  
changes**

Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

# dot1x timeout tx-period

**Overview** This command sets the transmit timeout for the authentication request on the specified interface.

The **no** variant of this command resets the transmit timeout period to the default (30 seconds).

**Syntax** dot1x timeout tx-period <1-65535>  
no dot1x timeout tx-period

| Parameter | Description |
|-----------|-------------|
| <1-65535> | Seconds.    |

**Default** The default transmit period for port authentication is 30 seconds.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Usage notes** Use this command to set the interval between successive attempts to request an ID.

**Examples** To set the transmit timeout period to 5 seconds on interface port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# dot1x timeout tx-period 5
```

To reset transmit timeout period to the default (30 seconds) on interface port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no dot1x timeout tx-period
```

To set the transmit timeout period to 5 seconds on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# dot1x timeout tx-period 5
```

# show debugging dot1x

**Overview** Use this command to see what debugging is turned on for 802.1X.  
For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show debugging dot1x`

**Mode** User Exec and Privileged Exec

**Example** To enable 802.1X debugging and display the debugging option set, use the following commands:

```
awplus# debug dot1x  
awplus# show debugging dot1x
```

```
802.1X debugging status:  
802.1X events debugging is on  
802.1X timer debugging is on  
802.1X packets debugging is on  
802.1X NSM debugging is on
```

**Related commands** [debug dot1x](#)

**Command changes** Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

# show dot1x

**Overview** Use this command to show authentication information for 802.1X port authentication.

If you specify the optional **all** parameter then this command also displays all authentication information for each port available on the switch.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare\\_Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show dot1x [all]`

| Parameter | Description  |
|-----------|--|
| all       | Displays all authentication information for each port available on the switch. |

**Mode** Privileged Exec

**Example** `awplus# show dot1x all`

# show dot1x diagnostics

**Overview** This command shows 802.1X authentication diagnostics for the specified interface (optional).

If no interface is specified then authentication diagnostics are shown for all interfaces.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show dot1x diagnostics [interface <interface-list>]`

| Parameter                           | Description  |
|-------------------------------------|--|
| <code>interface</code>              | Specify a port to show.  |
| <code>&lt;interface-list&gt;</code> | The interfaces or ports to configure. An interface-list can be: <ul style="list-style-type: none"><li>• a VLAN (e.g. vlan2)</li><li>• a switchport (e.g. port1.0.4)</li><li>• a static channel group (e.g. sa2)</li><li>• a dynamic (LACP) channel group (e.g. po2)</li><li>• a continuous range of interfaces separated by a hyphen (e.g. port1.0.1-port1.0.3)</li><li>• a comma-separated list (e.g. port1.0.1, port1.0.3-port1.0.4). Do not mix interface types in a list.</li></ul> The specified interfaces must exist. |

**Mode** Privileged Exec

**Example** See the sample output below showing 802.1X authentication diagnostics for port1.0.2:

```
awplus# show dot1x diagnostics interface port1.0.2
```

**Output** Figure 43-1: Example output from the **show dot1x diagnostics** command

**Command changes** Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

# show dot1x interface

**Overview** Use this command to show the status of 802.1X port-based authentication on the specified interface.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare\\_Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show dot1x interface <interface-list>`

| Parameter                           | Description  |
|-------------------------------------|--|
| <code>&lt;interface-list&gt;</code> | The interfaces to display information about. An interface-list can be: <ul style="list-style-type: none"><li>• a VLAN (e.g. vlan2)</li><li>• a switchport (e.g. port1.0.4)</li><li>• a static channel group (e.g. sa2)</li><li>• a dynamic (LACP) channel group (e.g. po2)</li><li>• a continuous range of interfaces separated by a hyphen (e.g. port1.0.1-port1.0.3)</li><li>• a comma-separated list (e.g. port1.0.1, port1.0.3-port1.0.4). Do not mix interface types in a list.</li></ul> |

**Mode** Privileged Exec

**Examples** See the sample output below showing 802.1X authentication status for port1.0.2:

```
awplus# show dot1x interface port1.0.2
```

**Table 2:** Example output from the **show dot1x interface** command for a port

```
awplus#show dot1x interface port1.0.2

- Related commands**
- [show auth diagnostics](#)
  - [show dot1x sessionstatistics](#)
  - [show dot1x statistics interface](#)
  - [show dot1x supplicant interface](#)

**Command changes** Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

# show dot1x sessionstatistics

**Overview** This command shows authentication session statistics for the specified interface, which may be a static channel (or static aggregator) or a dynamic (or LACP) channel group or a switch port.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show dot1x sessionstatistics [interface <interface-list>]`

| Parameter        | Description  |
|------------------|--|
| interface        | Specify a port to show.  |
| <interface-list> | The interfaces to display information about. An interface-list can be: <ul style="list-style-type: none"><li>• a VLAN (e.g. vlan2)</li><li>• a switchport (e.g. port1.0.4)</li><li>• a static channel group (e.g. sa2)</li><li>• a dynamic (LACP) channel group (e.g. po2)</li><li>• a continuous range of interfaces separated by a hyphen (e.g. port1.0.1-port1.0.3)</li><li>• a comma-separated list (e.g. port1.0.1, port1.0.3-port1.0.4). Do not mix interface types in a list.</li></ul> |

**Mode** Privileged Exec

**Example** See sample output below showing 802.1X authentication session statistics for port1.0.2:

```
awplus# show dot1x sessionstatistics interface port1.0.2
```

```
Authentication session statistics for interface port1.0.2
  session user name: manager
  session authentication method: Remote server
  session time: 19440 secs
  session terminat cause: Not terminated yet
```

**Command changes** Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

# show dot1x statistics interface

**Overview** Use this command to show the authentication statistics for the specified interface. For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

The output from this command is the same as the output from the [show auth statistics interface](#) command.

**Syntax** `show dot1x statistics interface <interface-list>`

| Parameter                           | Description  |
|-------------------------------------|--|
| <code>&lt;interface-list&gt;</code> | The interfaces to display information about. An interface-list can be: <ul style="list-style-type: none"><li>• a VLAN (e.g. vlan2)</li><li>• a switchport (e.g. port1.0.4)</li><li>• a static channel group (e.g. sa2)</li><li>• a dynamic (LACP) channel group (e.g. po2)</li><li>• a continuous range of interfaces separated by a hyphen (e.g. port1.0.1-port1.0.3)</li><li>• a comma-separated list (e.g. port1.0.1, port1.0.3-port1.0.4). Do not mix interface types in a list.</li></ul> |

**Mode** Privileged Exec

**Example** To display 802.1X authentication statistics for port1.0.2, use the command:

```
awplus# show dot1x statistics interface port1.0.2
```

**Output** Figure 43-2: Example output from **show dot1x statistics interface** for a port

**Command changes** Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

# show dot1x supplicant

**Overview** This command shows the supplicant state of the authentication mode set for the switch.

This command shows a summary when the optional **brief** parameter is used.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare\\_Plus” Feature Overview and Configuration Guide](#).

**Syntax** show dot1x supplicant [<macadd>] [brief]

| Parameter | Description                               |
|-----------|---|
| <macadd>  | MAC (hardware) address of the Supplicant. |
| brief     | Brief summary of the Supplicant state.    |

**Mode** Privileged Exec

**Example** See sample output below showing the 802.1X authenticated supplicant on the switch:

```
awplus# show dot1x supplicant
```

```
authenticationMethod: dot1x
totalSupplicantNum: 1
authorizedSupplicantNum: 1
macBasedAuthenticationSupplicantNum: 0
dot1xAuthenticationSupplicantNum: 1
webBasedAuthenticationSupplicantNum: 0
Supplicant name: manager
Supplicant address: 00d0.59ab.7037
  authenticationMethod: dot1x
    Two-Step Authentication:
      firstAuthentication: Pass - Method: mac
      secondAuthentication: Pass - Method: dot1x
portStatus: Authorized - currentId: 4
abort:F fail:F start:F timeout:F success:T
PAE: state: Authenticated - portMode: Auto
PAE: reAuthCount: 0 - rxRespId: 0
PAE: quietPeriod: 60 - maxReauthReq: 2 - txPeriod: 30
BE: state: Idle - reqCount: 0 - idFromServer: 3
BE: suppTimeout: 30 - serverTimeout: 30
CD: adminControlledDirections: in - operControlledDirections: in
CD: bridgeDetected: false
KR: rxKey: false
KT: keyAvailable: false - keyTxEnabled: false
RADIUS server group (auth): radius
RADIUS server (auth): 192.168.1.40
```

See sample output below showing the supplicant on the switch using the **brief** parameter:

```
awplus# show dot1x supplicant 00d0.59ab.7037 brief
```

```
Interface port1.0.2
 authenticationMethod: dot1x
 totalSupplicantNum: 1
 authorizedSupplicantNum: 1
   macBasedAuthenticationSupplicantNum: 0
   dot1xAuthenticationSupplicantNum: 1
   webBasedAuthenticationSupplicantNum: 0
```

| Interface | VID | Mode | MAC Address    | Status        | IP Address    | Username |
|-----------|-----|------|----------------|---------------|---------------|----------|
| port1.0.2 | 2   | D    | 00d0.59ab.7037 | Authenticated | 192.168.2.201 | manager  |

See sample output below showing the supplicant on the switch using the **brief** parameter:

```
awplus# show dot1x supplicant brief
```

For example, if two-step authentication is configured with 802.1X authentication as the first method and web authentication as the second method then the output is as follows:

```
Interface port1.0.2 authenticationMethod: dot1x/web
 Two-Step Authentication
   firstMethod: dot1x
   secondMethod: web
 totalSupplicantNum: 1
 authorizedSupplicantNum: 1
   macBasedAuthenticationSupplicantNum: 0
   dot1xAuthenticationSupplicantNum: 0
   webBasedAuthenticationSupplicantNum: 1
   otherAuthenticationSupplicantNum: 0
```

| Interface | VID | Mode | MAC Address    | Status        | IP Address    | Username |
|-----------|-----|------|----------------|---------------|---------------|----------|
| port1.0.2 | 5   | W    | 0008.0d5e.c216 | Authenticated | 192.168.1.200 | web      |

# 44

# Authentication Commands

## Introduction

**Overview** Port authentication commands enable you to specify three different types of device authentication: 802.1X authentication, web authentication, and MAC authentication.

- 802.1X is an IEEE standard providing a mechanism for authenticating devices attached to a LAN port or wireless device.
- Web authentication is applicable to devices that have a human user who opens the web browser and types in a user name and password when requested.
- MAC authentication is used to authenticate devices that have neither a human user nor implement 802.1X supplicant when making a network connection request.

This chapter provides an alphabetical reference for MAC and web authentication commands. For a list of 802.1X commands see the [802.1X Commands](#) chapter.

For more information on configuring and using port authentication, see the [AAA and Port Authentication Feature Overview and Configuration Guide](#).

# auth auth-fail vlan

**Overview** Use this command to enable the **auth-fail vlan** feature on the specified vlan interface. This feature assigns supplicants (client devices) to the specified VLAN if they fail port authentication.

Use the **no** variant of this command to disable the auth-fail vlan feature for a specified VLAN interface.

**Syntax** `auth auth-fail vlan <1-4094>`  
`no auth auth-fail vlan`

| Parameter | Description  |
|-----------|--|
| <1-4094>  | Assigns the VLAN ID to any supplicants that have failed port authentication. |

**Default** The auth-fail vlan feature is disabled by default.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Usage notes** Use the auth-fail vlan feature when using web authentication instead of the Guest VLAN feature, when you need to separate networks where one supplicant (client device) requires authentication and another supplicant does not require authentication from the same interface.

This is because the DHCP lease time using the Web-Authentication feature is shorter, and the auth-fail vlan feature enables assignment to a different VLAN if a supplicant fails authentication.

To enable the auth-fail vlan feature with web authentication, you need to set the web authentication server virtual IP address by using the [auth-web-server ipaddress](#) command or the [auth-web-server dhcp ipaddress](#) command.

When using 802.1X port authentication, use a [dot1x max-auth-fail](#) command to set the maximum number of login attempts. Three login attempts are allowed by default for 802.1X port authentication before supplicants trying to authenticate are moved from the Guest VLAN to the auth-fail VLAN. See the [dot1x max-auth-fail](#) on page 2191 for command information.

See the [AAA and Port Authentication Feature Overview and Configuration Guide](#) for information about:

- the auth-fail VLAN feature, which allows the Network Administrator to separate the supplicants who attempted authentication, but failed, from the supplicants who did not attempt authentication, and
- restrictions regarding combinations of authentication enhancements working together

Use appropriate ACLs (Access Control Lists) on interfaces for extra security if a supplicant allocated to the designated auth-fail vlan can access the same network

as a supplicant on the Guest VLAN. For more information about ACL concepts, and configuring ACLs see the [ACL Feature Overview and Configuration Guide](#). For more information about ACL commands see:

- [IPv4 Hardware Access Control List \(ACL\) Commands](#)
- [IPv4 Software Access Control List \(ACL\) Commands](#)
- [IPv6 Hardware Access Control List \(ACL\) Commands](#)
- [IPv6 Software Access Control List \(ACL\) Commands](#)

**Examples** To enable the auth-fail vlan feature for port1.0.2 and assign VLAN 100, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth auth-fail vlan 100
```

To disable the auth-fail vlan feature for port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth auth-fail vlan
```

**Related commands** [auth profile \(global\)](#)  
[dot1x max-auth-fail](#)  
[show dot1x](#)  
[show dot1x interface](#)  
[show running-config](#)

**Command changes** Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

# auth critical

**Overview** Use this command to enable the critical port feature on the interface. When the critical port feature is enabled on an interface, and all the RADIUS servers are unavailable, then the interface becomes authorized.

The **no** variant of this command disables the critical port feature on the interface.

**Syntax** `auth critical`  
`no auth critical`

**Default** The critical port of port authentication is disabled.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Examples** To enable the critical port feature on interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth critical
```

To disable the critical port feature on interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth critical
```

To enable the critical port feature on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth critical
```

**Related commands**

- [auth profile \(global\)](#)
- [show auth-web-server](#)
- [show dot1x](#)
- [show dot1x interface](#)
- [show running-config](#)

# auth dhcp-framed-ip-lease

**Overview** Use this command to enable DHCP Framed IP Lease on an interface.

When the DHCP Framed IP Lease feature is enabled on an interface, supplicants authenticated using 802.1x or MAC authentication will be assigned a specific IP address, and other network settings, gathered from the RADIUS server during the authentication process.

Use the **no** variant of this command to disable DHCP Framed IP Lease.

**Syntax** `auth dhcp-framed-ip-lease`  
`no auth dhcp-framed-ip-lease`

**Default** DHCP Framed IP Lease is disabled by default.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Usage notes** You need to complete the following steps to configure the DHCP Framed IP Lease feature on your network.

**On the RADIUS server:**

- Configure the RADIUS server with the username and password for 802.1x or MAC authentication
- Configure the following 'framed' RADIUS attributes on the RADIUS server for the that user:
  - Framed-IP-Address (8): the IPv4 address for the supplicant
  - Framed-IP-Netmask (9): the netmask for the supplicant
  - Framed-Route (22): the default gateway IPv4 address for the supplicant
  - Session-Timeout (27): IP address lease time for the supplicant

**NOTE:** *The Frame-IP-Address (8) attribute must be configured for this feature to work. All other attributes are optional.*

**On the DHCP server:**

- Configure the RADIUS client
- Enable 802.1x or MAC authentication on the required interface/s
- Enable DHCP Framed IP Lease feature on the required interface/s
- Setup a DHCP pool with the network range for the IP address/es registered on the RADIUS server
- Enable DHCP server

For more information, see the [AAA and Port Authentication Feature Overview and Configuration Guide](#).

**Example** To enable DHCP Framed IP Lease on port1.0.1, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# auth dhcp-framed-ip-lease
```

To disable DHCP Framed IP Lease on port1.0.1, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# no auth dhcp-framed-ip-lease
```

**Related commands** [show dot1x supplicant](#)  
[show ip dhcp pool](#)

**Command changes** Version 5.4.8-2.1: command added

# auth dynamic-vlan-creation

**Overview** Use this command to enable and disable the Dynamic VLAN assignment feature.

The Dynamic VLAN assignment feature allows a supplicant (client device) to be placed into a specific VLAN based on information returned from the RADIUS server during authentication, on a given interface.

Use the **no** variant of this command to disable the Dynamic VLAN assignment feature.

**Syntax** `auth dynamic-vlan-creation [rule {deny|permit}] [type {multi|single}]`  
`no auth dynamic-vlan-creation`

| Parameter | Description  |
|-----------|--|
| rule      | VLAN assignment rule.  |
| deny      | Deny a differently assigned VLAN ID. This is the default rule.   |
| permit    | Permit a differently assigned VLAN ID.   |
| type      | Specifies whether multiple different VLANs can be assigned to supplicants (client devices) attached to the port, or whether only a single VLAN can be assigned to supplicants on the port. |
| multi     | Multiple Dynamic VLAN.   |
| single    | Single Dynamic VLAN.   |

**Default** By default, the Dynamic VLAN assignment feature is disabled.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Usage notes** If the Dynamic VLAN assignment feature is enabled, VLAN assignment is dynamic. If the Dynamic VLAN assignment feature is disabled then RADIUS attributes are ignored and configured VLANs are assigned to ports. Dynamic VLANs may be associated with authenticated MAC addresses if the **type** parameter is applied with the **rule** parameter.

The **rule** parameter deals with the case where there are multiple supplicants attached to a port, and the type parameter has been set to **single-vlan**. The parameter specifies how the switch should act if different VLAN IDs end up being assigned to different supplicants. The keyword value **deny** means that once a given VID has been assigned to the first supplicant, then if any subsequent supplicant is assigned a different VID, that supplicant is rejected. The keyword value **permit** means that once a given VID has been assigned to the first supplicant, then if any subsequent supplicant is assigned a different VID, that supplicant is accepted, but it is actually assigned the same VID as the first supplicant.

If you issue an **auth dynamic-vlan-creation** command without a **rule** parameter then a second supplicant with a different VLAN ID is rejected. It is not assigned to the first supplicant's VLAN. Issuing an **auth dynamic-vlan-creation** command without a **rule** parameter has the same effect as issuing an **auth dynamic-vlan-creation rule deny** command rejecting supplicants with differing VLANs.

The **type** parameter specifies whether multiple different VLANs can be assigned to supplicants attached to the port, or whether only a single VLAN can be assigned to supplicants on the port. The **type** parameter can select the port base VLAN or the MAC base VLAN from the RADIUS VLAN ID. This can be used when the host-mode is set to multi-supplicant. For **single**-host ports, the VLAN ID will be assigned to the port. It is not supported with the Guest VLAN feature. Display the ID assigned using a **show vlan** command. For **multi**-host ports, the VLAN ID will be assigned to the MAC address of the authenticated supplicant. The VLAN ID assigned for the MAC Base VLAN is displayed using the **show platform table vlan** command.

To configure Dynamic VLAN with Web Authentication, you need to set the Web Authentication Server virtual IP address by using the **auth-web-server ipaddress** command or the **auth-web-server dhcp ipaddress** command. You also need to create a hardware access-list that can be applied to the switch port interface.

You need to configure an IPv4 address for the VLAN interface on which Web Authentication is running.

**Examples** To enable the Dynamic VLAN assignment feature on interface port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# switchport access vlan 10
awplus(config-if)# auth-web enable
awplus(config-if)# auth dynamic-vlan-creation
awplus(config-if)# interface vlan10
awplus(config-if)# ip address 10.1.1.1/24
```

To enable the Dynamic VLAN assignment feature with Web Authentication on interface port1.0.2 when Web Authentication is needed, use the commands:

```
awplus# configure terminal
awplus(config)# auth-web-server ipaddress 1.2.3.4
awplus(config)# access-list hardware acl-web send-to-cpu ip any
1.2.3.4
awplus(config)# interface port1.0.2
awplus(config-if)# auth-web enable
awplus(config-if)# auth dynamic-vlan-creation
awplus(config-if)# access-group acl-web
awplus(config-if)# interface vlan1
awplus(config-if)# ip address 10.1.1.1/24
```

To disable the Dynamic VLAN assignment feature on interface port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth dynamic-vlan-creation
```

To enable the Dynamic VLAN assignment feature on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth dynamic-vlan-creation
```

**Command  
changes**

Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

# auth guest-vlan

**Overview** Use this command to enable and configure the Guest VLAN feature on the interface specified by associating a Guest VLAN with an interface. This command does not start authentication. The supplicant's (client device's) traffic is associated with the native VLAN of the interface unless it is already associated with another VLAN. The **routing** option enables routing from the Guest VLAN to another VLAN, so the switch can lease DHCP addresses and accept access to a limited network.

The **no** variant of this command disables the guest VLAN feature on the interface specified.

**Syntax** `auth guest-vlan <1-4094> [routing]`  
`no auth guest-vlan [routing]`

| Parameter | Description   |
|-----------|---|
| <1-4094>  | VLAN ID (VID).                                      |
| routing   | Enables routing from the Guest VLAN to other VLANs. |

**Default** The Guest VLAN authentication feature is disabled by default.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Usage notes** The Guest VLAN feature may be used by supplicants (client devices) that have not attempted authentication, or have failed the authentication process. Note that if a port is in multi-supplicant mode with per-port dynamic VLAN configuration, after the first successful authentication, subsequent hosts cannot use the guest VLAN due to the change in VLAN ID. This may be avoided by using per-user dynamic VLAN assignment.

When using the Guest VLAN feature with the multi-host mode, a number of supplicants can communicate via a guest VLAN before authentication. A supplicant's traffic is associated with the native VLAN of the specified switch port. The supplicant must belong to a VLAN before traffic from the supplicant can be associated.

Note that you must enable 802.1X on the port and define a VLAN using the [vlan](#) command before you can configure it as a guest VLAN.

Roaming Authentication cannot be enabled if DHCP snooping is enabled ([service dhcp-snooping](#) command), and vice versa.

Note that Guest VLAN can use only untagged ports.

See the [AAA and Port Authentication Feature Overview and Configuration Guide](#) for information about:

- Guest VLAN, and

- restrictions regarding combinations of authentication enhancements working together

**Examples** To define vlan100 and assign the guest VLAN feature to vlan100 on interface port1.0.2, and enable routing from the guest VLAN to other VLANs, use the following commands:

```
awplus# configure terminal
awplus(config)# vlan database
awplus(config-vlan)# vlan 100
awplus(config-vlan)# exit
awplus(config)# interface port1.0.2
awplus(config-if)# dot1x port-control auto
awplus(config-if)# auth guest-vlan 100 routing
```

To disable the guest VLAN feature on port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth guest-vlan
```

To define vlan100 and assign the guest VLAN feature to vlan100 on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# vlan database
awplus(config-vlan)# vlan 100
awplus(config-vlan)# exit
awplus(config)# auth profile student
awplus(config-auth-profile)# auth guest-vlan 100
```

**Related commands**

- [auth guest-vlan forward](#)
- [dot1x port-control](#)
- [show dot1x](#)
- [show dot1x interface](#)

**Command changes** Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

# auth guest-vlan forward

**Overview** Use this command to enable packet forwarding from the guest VLAN to a destination IP address or subnet. If this command is configured, the device can lease DHCP addresses and accept access to a limited part of your network. Also, when using NAP authentication, the supplicant can log on to a domain controller to gain certification.

Use the **no** variant of this command to disable packet forwarding from the Guest VLAN to a destination IP address or subnet.

**Syntax** `auth guest-vlan forward {<ip-address>|<ip-address/mask>} [dns|tcp <1-65535>|udp <1-65535>]`  
`no auth guest-vlan forward {<ip-address>|<ip-address/mask>} [dns|tcp <1-65535>|udp <1-65535>]`

| Parameter   | Description  |
|---|--|
| <code>&lt;ip-address&gt;</code><br><code>&lt;ip-address/mask&gt;</code> | The IP address or subnet to which the guest VLAN can forward packets, in dotted decimal notation |
| <code>dns</code>  | Enable forwarding of DNS packets   |
| <code>tcp &lt;1-65535&gt;</code>  | Enable forwarding of packets for the specified TCP port number                                   |
| <code>udp &lt;1-65535&gt;</code>  | Enable forwarding of packets for the specified UDP port number                                   |

**Default** Forwarding is disabled by default.

**Mode** Interface Configuration mode for a specified switch port, or Authentication Profile mode

**Usage** Before using this command, you must configure the guest VLAN with the [auth guest-vlan](#) command.

**Example** To enable packet forwarding from the guest VLAN to the destination IP address on interface port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth guest-vlan forward 10.0.0.1
```

To enable forwarding of DNS packets from the guest VLAN to the destination IP address on interface port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface
awplus(config-if)# auth guest-vlan forward 10.0.0.1 dns
```

To disable forwarding of DNS packets from the guest VLAN to the destination IP address on port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth guest-vlan forward 10.0.0.1 dns
```

To enable the TCP forwarding port 137 on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth guest-vlan forward 10.0.0.1
tcp 137
```

# auth guest-vlan hw-forwarding

**Overview** Use this command to enable hardware forwarding on the guest VLAN. By default, hardware forwarding is disabled and all traffic on the VLAN is forwarded by the CPU.

Use the **no** variant of this command to disable hardware forwarding on the guest VLAN.

**Syntax** `auth guest-vlan hw-forwarding`  
`no auth guest-vlan hw-forwarding`

**Default** Disabled.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Example** To enable guest VLAN hardware forwarding on interface port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth guest-vlan hw-forwarding
```

To disable guest VLAN hardware forwarding on port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth guest-vlan hw-forwarding
```

To enable guest VLAN hardware forwarding authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth guest-vlan hw-forwarding
```

**Related commands** [auth profile \(global\)](#)  
[auth guest-vlan](#)  
[auth guest-vlan forward](#)

**Command changes** Version 5.5.0-1.1: command added to x230, GS970M, IE210 series switches.  
Version 5.5.1-0.1: command added to all other AlliedWare Plus switches.

# auth host-mode

**Overview** Use this command to select the host mode on the specified interface.

Use the **no** variant of this command to set host mode to the default setting (single host).

**Syntax**

```
auth host-mode  
{host-plus-voice|single-host|multi-host|multi-supPLICANT}  
  
no auth host-mode
```

| Parameter        | Description  |
|------------------|--|
| host-plus-voice  | In this mode, only one voice device (IP phone) and one host device can join the network. You use the RADIUS attribute 'Cisco-AVPair device-traffic-class=voice' to identify the IP phone. For more information and a step-by-step configuration example, see the "Limit the number of supplicants when connecting via an IP phone" section of the <a href="#">AAA and Port Authentication Feature Overview and Configuration Guide</a> . |
| single-host      | In this mode, only one supplicant is allowed per port. This is the default mode.   |
| multi-host       | In this mode, once the first host on a port is authenticated, all other downstream hosts are allowed without being authenticated (piggy-back mode).  |
| multi-supPLICANT | In this mode, multiple separate supplicants are individually authenticated on one port.  |

**Default** The default host mode for port authentication is for a single host.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Usage notes** **Single-host mode**

With this mode, only one supplicant may be authenticated on the port. Once that host has been authenticated, no other supplicants may be authenticated until the first supplicant's session has closed. This means, of course, that none of the other hosts downstream of the port will be able to send or receive traffic on that port.

This option is recommended when you know that there should only be one host connected to a port. By limiting the port to a single authenticated host, you guard against the consequences of someone accidentally or maliciously connecting a downstream switch to the port.

**Multi-host mode**

With this mode, once the first host has been authenticated on the port, all other downstream hosts are allowed without being authenticated. This is sometimes known as piggy-back mode. It is useful when the downstream switch attached to

the authenticating port is an intelligent switch that can act as an authentication supplicant.

If you trust that malicious users cannot be connected to that switch but you do not know the identity of those users, then you can simply authenticate the switch and then allow its attached users to have network access. If the valid switch is disconnected and an invalid one is connected which is not configured with the correct authentication credentials, then the devices connected to the invalid switch will be blocked from accessing the network.

**Examples** To set the host mode to multi-supplicant on interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth host-mode multi-supplicant
```

To set the host mode to the default (single host) on interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth host-mode
```

To set the host mode to multi-supplicant on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth host-mode multi-supplicant
```

To set the host mode to the default (single host) on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# no auth host-mode
```

**Command changes** Version 5.5.2-1.1: **host-plus-voice** parameter added

# auth log

**Overview** Use this command to configure the types of authentication feature log messages that are output to the log file.

Use the **no** variant of this command to remove either specified types or all types of authentication feature log messages that are output to the log file.

**Syntax**

```
auth log {dot1x|auth-mac|auth-web}  
{success|failure|logoff|all}  
  
no auth log {dot1x|auth-mac|auth-web}  
{success|failure|logoff|all}
```

| Parameter | Description   |
|-----------|---|
| dot1x     | Specify only 802.1X-Authentication log messages are output to the log file.   |
| auth-mac  | Specify only MAC-Authentication log messages are output to the log file.  |
| auth-web  | Specify only Web-Authentication log messages are output to the log file.  |
| success   | Specify only successful authentication log messages are output to the log file.   |
| failure   | Specify only authentication failure log messages are output to the log file.  |
| logoff    | Specify only authentication log-off messages are output to the log file. Note that link down, age out and expired ping polling messages will be included.   |
| all       | Specify all types of authentication log messages are output to the log file. Note that this is the default behavior for the authentication logging feature. |

**Default** All types of authentication log messages are output to the log file by default.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Examples** To configure the logging of MAC authentication failures to the log file for supplicants (client devices) connected to interface port1.0.2, use the following commands:

```
awplus# configure terminal  
awplus(config)# interface port1.0.2  
awplus(config-if)# auth log auth-mac failure
```

To disable the logging of all types of authentication log messages to the log file for auth-mac supplicants (client devices) connected to interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth log auth-mac all
```

To configure the logging of web authentication failures to the log file for supplicants (client devices) connected to authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth log auth-web failure
```

To disable the logging of all types of authentication log messages to the log file for auth-mac supplicants (client devices) connected to authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# no auth log auth-mac all
```

**Related commands**

- [auth profile \(global\)](#)
- [show running-config](#)

# auth max-supPLICANT

**Overview** Use this command to set the maximum number of supplicants (client devices) that can be authenticated on the selected port. Once this value is exceeded, further supplicants will not be authenticated.

The **no** variant of this command resets the maximum supplicant number to the default.

**Syntax** `auth max-supPLICANT <2-1024>`  
`no auth max-supPLICANT`

| Parameter | Description   |
|-----------|---------------|
| <2-1024>  | Limit number. |

**Default** 1024

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Examples** To set the maximum number of supplicants to 10 on interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth max-supPLICANT 10
```

To reset the maximum number of supplicants to the default value on interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth max-supPLICANT
```

To set the maximum number of supplicants to 10 on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth max-supPLICANT 10
```

To reset the maximum number of supplicants to the default value on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# no auth max-supPLICANT
```

**Related commands**

- auth max-supPLICANT untagged-vlan
- auth profile (global)
- show dot1x
- show dot1x interface
- show running-config

# auth max-suppliant tagged-vlan

**Overview** Use this command to set the maximum number of supplicants (client devices) that can be authenticated on the selected port on tagged VLANs. Once this value is exceeded, further supplicants will not be authenticated on tagged VLANs on that port.

This command is useful for preventing unwanted supplicants from connecting to the network when a host (e.g. a PC) connects to an AlliedWare Plus NAS via an IP phone. For more information and a step-by-step configuration example, see the [“Limit the number of supplicants when connecting via an IP phone”](#) section of the [AAA and Port Authentication Feature Overview and Configuration Guide](#).

Use the **no** variant of this command to reset the maximum number of supplicants on tagged VLANs to the default.

**Syntax** `auth max-suppliant tagged-vlan <0-1024>`  
`no auth max-suppliant tagged-vlan <0-1024>`

**Default** 1024

**Mode** Interface Configuration for a switch port; or Authentication Profile mode.

**Examples** To set the maximum number of supplicants on tagged VLANs on interface port1.0.2 to 1, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth max-suppliant tagged-vlan 1
```

To reset the maximum number of supplicants on tagged VLANs on interface port1.0.2 to the default, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth max-suppliant tagged-vlan
```

To set the maximum number of supplicants on tagged VLANs on authentication profile 'accounts' to 1, use the commands:

```
awplus# configure terminal
awplus(config)# auth profile accounts
awplus(config-auth-profile)# auth max-suppliant tagged-vlan 1
```

To reset the maximum number of supplicants on tagged VLANs on authentication profile 'accounts' to the default value, use the commands:

```
awplus# configure terminal
awplus(config)# auth profile accounts
awplus(config-auth-profile)# no auth max-suppliant tagged-vlan
```

**Related commands** `auth max-suplicant`  
`auth max-suplicant untagged-vlan`

**Command changes** Version 5.5.2-1.1: command added

# auth max-suppliant untagged-vlan

**Overview** Use this command to set the maximum number of supplicants (client devices) that can be authenticated on the selected port on untagged VLANs. Once this value is exceeded, further supplicants will not be authenticated on untagged VLANs on that port.

This command is useful for preventing unwanted supplicants from connecting to the network when a host (e.g. a PC) connects to an AlliedWare Plus NAS via an IP phone. For more information and a step-by-step configuration example, see the [“Limit the number of supplicants when connecting via an IP phone”](#) section of the [AAA and Port Authentication Feature Overview and Configuration Guide](#).

Use the **no** variant of this command to reset the maximum number of supplicants on untagged VLANs to the default.

**Syntax** `auth max-suppliant untagged-vlan <0-1024>`  
`no auth max-suppliant untagged-vlan <0-1024>`

**Default** 1024

**Mode** Interface Configuration for a switch port; or Authentication Profile mode.

**Examples** To set the maximum number of supplicants on untagged VLANs on interface port1.0.2 to 1, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth max-suppliant untagged-vlan 1
```

To reset the maximum number of supplicants on untagged VLANs on interface port1.0.2 to the default, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth max-suppliant untagged-vlan
```

To set the maximum number of supplicants on untagged VLANs on authentication profile 'accounts' to 1, use the commands:

```
awplus# configure terminal
awplus(config)# auth profile accounts
awplus(config-auth-profile)# auth max-suppliant untagged-vlan 1
```

To reset the maximum number of supplicants on untagged VLANs on authentication profile 'accounts' to the default value, use the commands:

```
awplus# configure terminal
awplus(config)# auth profile accounts
awplus(config-auth-profile)# no auth max-suppliant untagged-vlan
```

**Related commands** [auth max-suplicant](#)  
[auth max-suplicant tagged-vlan](#)

**Command changes** Version 5.5.2-1.1: command added

# auth multi-vlan-session

**Overview** Use this command to enable packet forwarding on multiple VLANs for an authenticated supplicant attached to a trunked (tagged VLAN) port.

By default, AlliedWare Plus only allows packet forwarding on the VLAN that a device was authenticated on. This command enables packet forwarding to the attached device on any VLAN configured on the switchport. After the device authenticates it will have access to all VLANs configured on the switchport.

Use the **no** variant of this command to disable packet forwarding on multiple VLANs for an authenticated supplicant.

**Syntax** `auth multi-vlan-session`  
`no auth multi-vlan-session`

**Default** By default, **multi-vlan-session** is disabled.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Example** To allow a client attached to port1.0.2 to access all VLANs configured on the AlliedWare Plus device, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# switchport mode trunk
awplus(config-if)# switchport trunk allowed vlan all
awplus(config-if)# auth host-mode multi-supplicant
awplus(config-if)# auth multi-vlan-session
```

To disable **multi-vlan-session** on interface port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth multi-vlan-session
```

**Related commands**

- [show dot1x interface](#)

**Command changes** Version 5.4.8-1.1: command added  
Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

# auth priority

**Overview** Use this command to enable authentication priority on an interface. This sets the tri-authentication order of priority for MAC, 802.1X, and web-based authentication. If tri-authentication is not configured on the interface then this command has no effect.

You specify the authentication methods in order of priority. The first method in the list has the highest priority, the second method has the second highest priority, and the third method has the lowest priority. Any methods not specified will have the lowest priority.

Use the **no** variant of this command to disable authentication priority.

**Syntax** `auth priority {[auth-mac] [dot1x] [auth-web]}`  
`no auth priority`

| Parameter | Description                            |
|-----------|--|
| auth-mac  | Set MAC authentication priority.       |
| dot1x     | Set 802.1X authentication priority.    |
| auth-web  | Set web-based authentication priority. |

**Default** Authentication priority is not set.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Usage notes** Before using this command you must correctly configure tri-authentication on the interface. Tri-authentication is when multiple authentication methods (MAC, 802.1X, and/or web-based) are configured on the same interface. With tri-authentication, a supplicant is authorized to use the network as soon as they are successfully authenticated by any of the configured authentication methods.

When authentication priority is not set, once a supplicant is authenticated any future attempts to authenticate are ignored. When, however, authentication priority is set, and a higher priority authentication attempt is made by the supplicant, a new authentication process starts. The supplicant will then be authorized, or unauthorized, based on the result of this new authentication attempt.

**Example** To configure 802.1X authentication to have a higher priority than MAC authentication on interface port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# switchport mode access
awplus(config-if)# auth-mac enable
awplus(config-if)# dot1x port-control auto
awplus(config-if)# auth priority dot1x auth-mac
```

To disable authentication priority on interface port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth priority
```

To configure 802.1X authentication to have a higher priority than MAC authentication on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-if)# switchport mode access
awplus(config-if)# auth-mac enable
awplus(config-if)# dot1x port-control auto
awplus(config-if)# auth priority dot1x auth-mac
```

**Related commands**

- [auth-web enable](#)
- [dot1x port-control](#)

**Command changes** Version 5.5.0-2.1: command added

# auth profile (global)

**Overview** Use this command to enter port authentication profile mode and configure a port authentication profile.

If the specified profile does not exist a new authentication profile is created with the name provided.

Use the **no** variant of this command to delete the specified port authentication profile.

**Syntax** `auth profile <profile-name>`  
`no auth profile <profile-name>`

| Parameter                         | Description                                 |
|-----------------------------------|---|
| <code>&lt;profile-name&gt;</code> | Name of the profile to create or configure. |

**Default** No port authentication profiles are created by default.

**Mode** Global Configuration

**Usage** A port authentication profile is a configuration object that aggregates multiple port authentication commands. These profiles are attached or detached from an interface using the [auth profile \(interface\)](#) command.

**Example** To create a new authentication profile 'student', use the following commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)#
```

To delete an authentication profile 'student', use the following commands:

```
awplus# configure terminal
awplus(config)# no auth profile student
```

**Related commands** [auth profile \(interface\)](#)  
[description \(auth-profile\)](#)

# auth profile (interface)

**Overview** Use this command to attach a port authentication profile to the current interface. Use the **no** variant of this command to detach a port authentication profile from the current interface.

**Syntax** `auth profile <profile-name>`  
`no auth profile <profile-name>`

| Parameter                         | Description   |
|-----------------------------------|---|
| <code>&lt;profile-name&gt;</code> | The name of the profile to attach to the current interface. |

**Default** No profile is attached by default.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Usage** This command attaches an authentication profile, that was created using the [auth profile \(global\)](#) command, to a static channel, a dynamic (LACP) channel group, or a switch port.

You can only attach one profile to an interface at a time. Use the **no** variant of the command to detach a profile before attempting to attach another one.

**Example** To attach the authentication profile 'student' to port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth profile student
```

To detach the authentication profile 'student' from port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth profile student
```

**Related commands** [auth profile \(global\)](#)

# auth reauthentication

**Overview** Use this command to enable re-authentication on the interface specified in the Interface mode, which may be a static channel group (or static aggregator) or a dynamic (or LACP) channel group or a switch port.

Use the **no** variant of this command to disable reauthentication on the interface.

**Syntax** `auth reauthentication`  
`no auth reauthentication`

**Default** Reauthentication of port authentication is disabled by default.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Examples** To enable reauthentication on interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth reauthentication
```

To disable reauthentication on interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth reauthentication
```

To enable reauthentication on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth reauthentication
```

**Related commands** [auth profile \(global\)](#)  
[show dot1x](#)  
[show dot1x interface](#)  
[show running-config](#)

# auth roaming disconnected

**Overview** This command allows a supplicant to move to another authenticating interface without reauthentication, even if the link is down for the interface that the supplicant is currently connected to.

You must enter the [auth roaming enable](#) command on both interfaces before using this command.

The **no** variant of this command disables roaming authentication on interfaces that are link-down, and forces a supplicant to be reauthenticated when moving between interfaces.

See the [AAA and Port Authentication Feature Overview and Configuration Guide](#) for further information about this feature.

**Syntax** `auth roaming disconnected`  
`no auth roaming disconnected`

**Default** By default, the authentication status for a roaming supplicant is deleted when an interface goes down, so supplicants must reauthenticate.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Usage notes** Note that 802.1X port authentication, MAC-authentication, or Web-authentication must be configured before using this feature. The port that the supplicant is moving to must have the same authentication configuration as the port the supplicant is moving from.

Roaming Authentication cannot be enabled if DHCP snooping is enabled ([service dhcp-snooping](#) command), and vice versa.

**Examples** To allow supplicants to move from port1.0.2 without reauthentication even when the link is down, when using 802.1X authentication, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# dot1x port-control auto
awplus(config-if)# auth roaming enable
awplus(config-if)# auth roaming disconnected
```

To require supplicants to reauthenticate when moving from port1.0.2 if the link is down, when using 802.1X authentication, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth roaming disconnected
```

To allow supplicants using authentication profile 'student' to move between ports without reauthentication even when the link is down, use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth roaming disconnected
```

To require supplicants using authentication profile 'student' to reauthenticate when moving between ports if the link is down, use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# no auth roaming disconnected
```

**Related  
commands**

- auth profile (global)
- auth-mac enable
- auth roaming enable
- auth-web enable
- dot1x port-control
- show auth interface
- show dot1x interface
- show running-config

# auth roaming enable

**Overview** Use this command to allow a supplicant to move to another authenticating interface without reauthentication, providing the link is up for the interface that the supplicant is currently connected to.

The **no** variant of this command disables roaming authentication on an interface, and forces a supplicant to be reauthenticated when moving between interfaces.

See the [AAA and Port Authentication Feature Overview and Configuration Guide](#) for further information about this feature.

**Syntax** `auth roaming enable`  
`no auth roaming enable`

**Default** Roaming authentication is disabled by default.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Usage notes** Note that 802.1X port authentication, MAC authentication, or web-based authentication must be configured before using this feature. The port that the supplicant is moving to must have the same authentication configuration as the port the supplicant is moving from.

This command only enables roaming authentication for links that are up. If you want roaming authentication on links that are down, you must also use the command [auth roaming disconnected](#).

Roaming Authentication cannot be enabled if DHCP snooping is enabled ([service dhcp-snooping](#) command), and vice versa.

**Examples** To enable roaming authentication for port1.0.4, when using auth-mac authentication, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.4
awplus(config-if)# auth-mac enable
awplus(config-if)# auth roaming enable
```

To disable roaming authentication for port1.0.4, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.4
awplus(config-if)# no auth roaming enable
```

To enable roaming authentication for authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth roaming enable
```

# auth supplicant-ip

**Overview** Use this command to add a supplicant (client device) IP address on a given interface.

Use the **no** variant of this command to delete the supplicant IP address and reset other parameters to their default values. The IP address can be determined before authentication for auth-web clients only.

**Syntax** `auth supplicant-ip <ip-addr> [max-reauth-req <1-10>] [max-req <1-10>] [port-control {auto|force-authorized|force-unauthorized|skip-second-auth}] [quiet-period <1-65535>] [reauthentication] [reauth-period <1-4294967295>] [supp-timeout <1-65535>] [server-timeout <1-65535>]`

`no auth supplicant-ip <ip-addr> [reauthentication]`

| Parameter                                       | Description  |
|---|--|
| <code>&lt;ip-addr&gt;</code>                    | IP address of the supplicant entry in A.B.C.D/P format.  |
| <code>max-reauth-req &lt;1-10&gt;</code>        | Number of reauthentication attempts before becoming unauthorized (default 2).  |
| <code>max-req &lt;1-10&gt;</code>               | Number of times the device resends an EAP Request packet if that packet is lost between the authenticating device and the specified supplicant (default 2, which is 3 transmission attempts in total). If the supplicant does not respond to an EAP Request after this number of retries, the supplicant fails the authentication process. |
| <code>port-control</code>                       | Port control options:<br><b>auto</b> : Allow port client to negotiate authentication<br><b>force-authorized</b> : Force port state to authorized<br><b>force-unauthorized</b> : Force port state to unauthorized<br><b>skip-second-auth</b> : Skip second authentication step.   |
| <code>quiet-period &lt;1-65535&gt;</code>       | Quiet period in the HELD state in seconds (default 60 seconds).  |
| <code>reauthentication</code>                   | Enable reauthentication on a port.   |
| <code>reauth-period &lt;1-4294967295&gt;</code> | Seconds between reauthorization attempts (default 3600 seconds).   |
| <code>supp-timeout &lt;1-65535&gt;</code>       | Supplicant response timeout in seconds (default 30 seconds).   |
| <code>server-timeout &lt;1-65535&gt;</code>     | Authentication server response timeout in seconds (default 30 seconds).  |

**Default** No supplicant IP address for port authentication exists by default until first created with the **auth supplicant-ip** command. The parameter defaults are shown in the table above.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Examples** To add the supplicant IP address 192.168.10.0/24 to force authorized port control for interface port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth supplicant-ip 192.168.10.0/24
port-control force-authorized
```

To delete the supplicant IP address 192.168.10.0/24 for interface port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth supplicant-ip 192.168.10.0/24
```

To disable reauthentication for the supplicant(s) IP address 192.168.10.0/24 for interface port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth supplicant-ip 192.168.10.0/24
reauthentication
```

To add the supplicant IP address 192.168.10.0/24 to force authorized port control for auth profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth supplicant-ip
192.168.10.0/24 port-control force-authorized
```

**Related commands**

- [show dot1x](#)
- [show dot1x interface](#)
- [show running-config](#)

**Command changes** Version 5.5.3-1.1: **max-req** parameter added

# auth supplicant-mac

**Overview** This command adds a supplicant (client device) MAC address or MAC mask on a given interface with the parameters as specified in the table below.

Use the **no** variant of this command to delete the supplicant MAC address and reset other parameters to their default values.

**Syntax** `auth supplicant-mac <mac-addr> [mask <mac-addr-mask>]  
[max-reauth-req <1-10>] [max-req <1-10>] [port-control  
{auto|force-authorized|force-unauthorized|skip-second-auth}]  
[quiet-period <1-65535>] [reauthentication] [reauth-period  
<1-4294967295>] [supp-timeout <1-65535>] [server-timeout  
<1-65535>]  
  
no auth supplicant-mac <mac-addr> [reauthentication]`

| Parameter                                     | Description   |
|---|---|
| <code>&lt;mac-addr&gt;</code>                 | MAC (hardware) address of the supplicant entry in HHHH.HHHH.HHHH MAC address hexadecimal format.  |
| <code>mask<br/>&lt;mac-addr-mask&gt;</code>   | A mask applied to MAC addresses in order to select only those addresses containing a specific string. The mask comprises a string of three (period separated) bytes, where each byte comprises four hexadecimal characters that will generally be either 1 or 0. When the mask is applied to a specific MAC address, a match is only required for characters that correspond to a 1 in the mask. Characters that correspond to a 0 in the mask are effectively ignored.<br><br>In the examples section below, the mask ffff.ff00.0000 is applied for the MAC address 0000.5E00.0000. The applied mask will then match only those MAC addresses that begin with 0000.5E (in this case the OUI component). The remaining portion of the addresses (in this case the NIC component) will be ignored. |
| <code>max-reauth-req<br/>&lt;1-10&gt;</code>  | Number of reauthentication attempts before becoming unauthorized (default 2).   |
| <code>max-req &lt;1-10&gt;</code>             | Number of times the device resends an EAP Request packet if that packet is lost between the authenticating device and the specified supplicant (default 2, which is 3 transmission attempts in total). If the supplicant does not respond to an EAP Request after this number of retries, the supplicant fails the authentication process.  |
| <code>port-control</code>                     | Port control options:<br><b>auto</b> : Allow port client to negotiate authentication<br><b>force-authorized</b> : Force port state to authorized<br><b>force-unauthorized</b> : Force port state to unauthorized<br><b>skip-second-auth</b> : Skip second authentication step.  |
| <code>quiet-period<br/>&lt;1-65535&gt;</code> | Quiet period in the HELD state in seconds (default 60 seconds).   |

| Parameter                       | Description   |
|---------------------------------|---|
| reauthentication                | Enable reauthentication on a port.                                      |
| reauth-period<br><1-4294967295> | Seconds between reauthorization attempts (default 3600 seconds).        |
| supp-timeout<br><1-65535>       | Supplicant response timeout in seconds (default 30 seconds).            |
| server-timeout<br><1-65535>     | Authentication server response timeout in seconds (default 30 seconds). |

**Default** No supplicant MAC address for port authentication exists by default until first created with the **auth supplicant-mac** command. The defaults for parameters are shown in the table above.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Examples** To add the supplicant MAC address 0000.5E00.5343 to force authorized port control for interface port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth supplicant-mac 0000.5E00.5343
port-control force-authorized
```

To apply the mask ffff.ff00.0000 in order to add any supplicant MAC addresses whose MAC address begins with 0000.5E, and then to force authorized port control for interface port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth supplicant-mac 0000.5E00.0000 mask
ffff.ff00.0000 port-control force-authorized
```

To delete the supplicant MAC address 0000.5E00.5343 for interface port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth supplicant-mac 0000.5E00.5343
```

To disable reauthentication for the supplicant MAC address 0000.5E00.5343 for interface port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# no auth supplicant-mac 0000.5E00.5343
reauthentication
```

To add the supplicant MAC address 0000.5E00.5343 to force authorized port control for authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth supplicant-mac
0000.5E00.5343 port-control force-authorized
```

To delete the supplicant MAC address 0000.5E00.5343 for authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# no auth supplicant-mac
0000.5E00.5343
```

**Command  
changes**

Version 5.5.3-1.1: **max-req** parameter added

# auth timeout connect-timeout

**Overview** Use this command to set the connect-timeout period for the interface.  
Use the **no** variant of this command to reset the connect-timeout period to the default.

**Syntax** `auth timeout connect-timeout <1-65535>`  
`no auth timeout connect-timeout`

| Parameter                    | Description  |
|------------------------------|--|
| <code>&lt;1-65535&gt;</code> | Specifies the connect-timeout period (in seconds). |

**Default** The connect-timeout default is 30 seconds.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Usage notes** This command is used for MAC and web authentication. If the connect-timeout has lapsed and the supplicant has the state **connecting**, then the supplicant is deleted. When `auth-web-server session-keep` or `auth two-step enable` is enabled, we recommend you configure a longer connect-timeout period.

**Examples** To set the connect-timeout period to 3600 seconds for port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth timeout connect-timeout 3600
```

To reset the connect-timeout period to the default (30 seconds) for port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth timeout connect-timeout
```

To set the connect-timeout period to 3600 seconds for authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth timeout connect-timeout 3600
```

**Related commands** `auth profile (global)`  
`show dot1x`  
`show dot1x interface`

# auth timeout quiet-period

**Overview** Use this command to set a time period for which another authentication request is not accepted on a given interface, after an authentication request has failed.

Use the **no** variant of this command to reset the quiet period to the default.

**Syntax**

```
auth timeout quiet-period <1-65535>
no auth timeout quiet-period
```

| Parameter | Description                              |
|-----------|--|
| <1-65535> | Specifies the quiet period (in seconds). |

**Default** The quiet period for port authentication is 60 seconds.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Examples** To set the quiet period to 10 seconds for interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth timeout quiet-period 10
```

To reset the quiet period to the default (60 seconds) for interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth timeout quiet-period
```

To set the quiet period to 10 seconds for authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth timeout quiet-period 10
```

**Related commands** [auth profile \(global\)](#)

# auth timeout reauth-period

**Overview** Use this command to set the timer for reauthentication on a given interface. The re-authentication for the supplicant (client device) is executed at this timeout. The timeout is only applied if the **auth reauthentication** command is applied.

Use the **no** variant of this command to reset the **reauth-period** parameter to the default (3600 seconds).

**Syntax** `auth timeout reauth-period <1-4294967295>`  
`no auth timeout reauth-period`

| Parameter      | Description                                       |
|----------------|---|
| <1-4294967295> | The reauthentication timeout period (in seconds). |

**Default** The default reauthentication period for port authentication is 3600 seconds, when reauthentication is enabled on the port.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Examples** To set the reauthentication period to 1 day for interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth timeout reauth-period 86400
```

To reset the reauthentication period to the default (3600 seconds) for interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth timeout reauth-period
```

To set the reauthentication period to 1 day for authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth timeout reauth-period 86400
```

To reset the reauthentication period to the default (3600 seconds) for authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# no auth timeout reauth-period
```

**Related commands**

- auth profile (global)
- auth reauthentication
- show dot1x
- show dot1x interface
- show running-config

# auth timeout server-timeout

**Overview** Use this command to set the timeout for the waiting response from the RADIUS server on a given interface.

Use the **no** variant of this command to reset the server-timeout to the default (30 seconds).

**Syntax** `auth timeout server-timeout <1-65535>`  
`no auth timeout server-timeout`

| Parameter | Description                         |
|-----------|-------------------------------------|
| <1-65535> | Server timeout period (in seconds). |

**Default** The server timeout for port authentication is 30 seconds.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Examples** To set the server timeout to 120 seconds for interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth timeout server-timeout 120
```

To set the server timeout to the default (30 seconds) for interface port1.0.2 use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth timeout server-timeout
```

To set the server timeout to 120 seconds for authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth timeout server-timeout 120
```

To set the server timeout to the default (30 seconds) for authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# no auth timeout server-timeout
```

# auth timeout supp-timeout

**Overview** This command sets the timeout of the waiting response from the supplicant (client device) on a given interface.

The **no** variant of this command resets the supplicant timeout to the default (30 seconds).

**Syntax** `auth timeout supp-timeout <1-65535>`  
`no auth timeout supp-timeout`

| Parameter | Description                                 |
|-----------|---|
| <1-65535> | The supplicant timeout period (in seconds). |

**Default** The supplicant timeout for port authentication is 30 seconds.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Examples** To set the supplicant timeout to 2 seconds for interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth timeout supp-timeout 2
```

To reset the supplicant timeout to the default (30 seconds) for interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth timeout supp-timeout
```

To set the supplicant timeout to 2 seconds for authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth timeout supp-timeout 2
```

# auth vlan-restriction

**Overview** Use this command to restrict port authenticated supplicants on an interface to one per VLAN. This is useful, for example, if you have configured multiple supplicants on an interface but you want to restrict network access to a single IP phone and a single authorized workstation.

Use the **no** variant of this command to remove the single supplicant per VLAN restriction.

**Syntax** `auth vlan-restriction`  
`no auth vlan-restriction`

**Default** Not configured

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Usage notes** This is a port authentication command, so you should first configure 802.1X, MAC, or web authentication. In addition, configure multi-supplicants on the interface using the **auth host-mode multi-supplicant** command.

This command works with both dynamic VLANs and static voice VLAN configurations.

**Examples** To restrict supplicants to a one per VLAN on interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth vlan-restriction
```

To remove the one per VLAN supplicant restriction on interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth vlan-restriction
```

**Command changes** Version 5.5.1-2.1: command added

# auth two-step enable

**Overview** Use this command to enable a two-step authentication feature on an interface. When this feature is enabled, the supplicant is authorized in a two-step process. If authentication succeeds, the supplicant becomes authenticated.

Use this command to apply the two-step authentication method based on 802.1X, MAC or web authentication.

Use the **no** variant of this command to disable the two-step authentication feature.

**Syntax** `auth two-step enable`  
`no auth two-step enable`

**Default** Two step authentication is disabled by default.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Usage** The single step authentication methods (either user or device authentication) have a potential security risk:

- an unauthorized user can access the network with an authorized device, or
- an authorized user can access the network with an unauthorized device.

Two-step authentication solves this problem by authenticating both the user and the device. The supplicant will only become authenticated if both these steps are successful. If the first authentication step fails, then the second step is not started.

**Examples** To enable the two step authentication feature, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth two-step enable
```

To disable the two step authentication feature, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth two-step enable
```

To enable MAC authentication followed by 802.1X authentication, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# switchport mode access
awplus(config-if)# auth-mac enable
awplus(config-if)# dot1x port-control auto
awplus(config-if)# auth dynamic-vlan-creation
awplus(config-if)# auth two-step enable
```

To enable MAC authentication followed by web authentication, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# switchport mode access
awplus(config-if)# auth-mac enable
awplus(config-if)# auth-web enable
awplus(config-if)# auth dynamic-vlan-creation
awplus(config-if)# auth two-step enable
```

To enable 802.1X authentication followed by web authentication, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# switchport mode access
awplus(config-if)# dot1x port-control auto
awplus(config-if)# auth-web enable
awplus(config-if)# auth dynamic-vlan-creation
awplus(config-if)# auth two-step enable
```

To enable the two step authentication feature for authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth two-step enable
```

**Command changes** Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

# auth two-step order

**Overview** Use this command to configure the order for two-step authentication. Two-step authentication and the relevant authentication methods must be enabled on the interface.

Use the **no** variant of this command to reset the authentication order to the default.

**Syntax**

```
auth two-step order auth-mac {dot1x|auth-web}  
auth two-step order dot1x {auth-mac|auth-web}  
no auth two-step order
```

| Parameter | Description           |
|-----------|-----------------------|
| auth-mac  | MAC authentication    |
| dot1x     | 802.1X authentication |
| auth-web  | Web authentication    |

**Default** Order is determined by the authentication methods configured on the interface (see **Usage notes**).

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Usage notes** The default authentication order depends on the combination of the authentication methods configured on the interface:

- If auth-mac is configured then auth-mac will be the first method.
- If auth-mac is **not** configured then dot1x will become the first method.
- If only two methods are configured then the remaining method becomes the second method.
- If all three methods are configured then the second method is chosen based on the packet type received (dot1x for an EAPOL packet and auth-web for an HTTP packet).

**Examples** To set the two-step authentication order on port1.0.1 for 802.1X authentication and then MAC authentication, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# switchport mode access
awplus(config-if)# auth-mac enable
awplus(config-if)# dot1x port-control auto
awplus(config-if)# auth two-step enable
awplus(config-if)# auth two-step order dot1x auth-mac
```

To reset the two-step authentication order back to the default, which would be MAC authentication then 802.1X authentication if configured as above, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# no auth two-step order
```

**Command changes** Version 5.5.0-0.3: command added

# auth-mac accounting

**Overview** Use this command to override the **default** RADIUS accounting method for MAC-based authentication on an interface by allowing you to apply a user-defined named list.

Use the **no** variant of this command to remove the named list from the interface and apply the **default** method.

**Syntax** `auth-mac accounting {default|<list-name>}`  
`no auth-mac accounting`

| Parameter   | Description                              |
|-------------|--|
| default     | Apply the default accounting method list |
| <list-name> | Apply the user-defined named list        |

**Default** The **default** method list is applied to an interface by default.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Example** To apply the named list 'vlan10\_acct' on the vlan10 interface, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# auth-mac accounting vlan10_acct
```

To remove the named list from the vlan10 interface and set the accounting method back to **default**, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# no auth-mac accounting
```

**Related commands** [aaa accounting auth-mac](#)

**Command changes** Version 5.4.8-2.1: Command added to AR2050V, AR3050S, AR4050S

# auth-mac authentication

**Overview** This command overrides the **default** MAC authentication method on an interface by allowing you to apply a user-defined named list.

Use the **no** variant of this command to remove the named list from the interface and apply the **default** method.

**Syntax** `auth-mac authentication {default|<list-name>}`  
`no auth-mac authentication`

| Parameter   | Description                                  |
|-------------|--|
| default     | Apply the default authentication method list |
| <list-name> | Apply a user-defined named list              |

**Default** The **default** method list is applied to an interface by default.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Example** To apply the named list 'vlan10\_auth' on the vlan10 interface, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# auth-mac authentication vlan10_auth
```

To remove the named list from the vlan10 interface and set the authentication method back to **default**, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# no auth-mac authentication
```

**Related commands** [aaa authentication auth-mac](#)

**Command changes** Version 5.4.8-2.1: Command added to AR2050V, AR3050S, AR4050S

# auth-mac enable

**Overview** This command enables MAC authentication on the interface specified in the Interface command mode.

Use the **no** variant of this command to disable MAC authentication on an interface.

**Syntax** `auth-mac enable`  
`no auth-mac enable`

**Default** MAC-Authentication is disabled by default.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Usage notes** Enabling **spanning-tree edgeport** on ports after enabling MAC authentication avoids unnecessary re-authentication when the port state changes, which does not happen when spanning tree edgeport is enabled. Note that re-authentication is correct behavior without **spanning-tree edgeport** enabled.

Applying **switchport mode access** on ports is also good practice to set the ports to access mode with ingress filtering turned on, whenever ports for MAC authentication are in a VLAN.

If you attempt to change the authentication configuration on an interface that has threat protection quarantine configured, you will see the following error message:

```
% portx.x.x: Application Proxy quarantine configuration must be removed before port authentication is changed
```

Before changing the interface's authentication configuration you must either:

- remove the interface's threat protection configuration, or
- shut down the interface.

**Examples** To enable MAC authentication on interface port1.0.2 and enable spanning tree edgeport to avoid unnecessary re-authentication, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth-mac enable
awplus(config-if)# spanning-tree edgeport
awplus(config-if)# switchport mode access
```

To disable MAC authentication on interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth-mac enable
```

To enable MAC authentication on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth-mac enable
```

changes**

Version 5.4.8-2.1: Command added to AR2050V, AR3050S, AR4050S

# auth-mac method

**Overview** This command sets the type of authentication method for MAC authentication that is used with RADIUS on the interface specified in the interface command mode.

The **no** variant of this command resets the authentication method used to the default method (PAP) as the RADIUS authentication method used by the MAC authentication.

**Syntax** `auth-mac method [eap-md5|pap]`  
`no auth-mac method`

| Parameter | Description                                  |
|-----------|--|
| eap-md5   | Enable EAP-MD5 as the authentication method. |
| pap       | Enable PAP as the authentication method.     |

**Default** The MAC authentication method is PAP.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Examples** To set the MAC authentication method to PAP on interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth-mac method pap
```

To set the MAC authentication method to the default on interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth-mac method
```

To set the MAC authentication method to EAP-MD5 on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth-mac method eap-md5
```

show auth interface

show running-config

**Command  
changes**

Version 5.4.8-2.1: Command added to AR2050V, AR3050S, AR4050S

# auth-mac password

**Overview** This command changes the password for MAC-based authentication. Use the **no** variant of this command to return the password to its default.

**Syntax** `auth-mac [encrypted] password <password>`  
`no auth-mac password`

| Parameter                     | Description   |
|-------------------------------|---|
| <code>auth-mac</code>         | MAC-based authentication  |
| <code>encrypted</code>        | Specify an encrypted password   |
| <code>password</code>         | Configure the password  |
| <code>&lt;password&gt;</code> | The new password. Passwords can be up to 64 characters in length and can contain any printable characters except: <ul style="list-style-type: none"><li>• ?</li><li>• " (double quotes)</li><li>• space</li></ul> |

**Default** By default, the password is the MAC address of the supplicant.

**Mode** Global Configuration

**Usage notes** Changing the password increases the security of MAC-based authentication, because the default password is easy for an attacker to discover. This is particularly important if:

- some MAC-based supplicants on the network are intelligent devices, such as computers, and/or
- you are using two-step authentication (see the “Ensuring Authentication Methods Require Different Usernames and Passwords” section of the [AAA and Port Authentication Feature\\_Overview\\_and\\_Configuration\\_Guide](#)).

**Examples** To change the password to verySecurePassword, use the commands:

```
awplus# configure terminal
awplus(config)# auth-mac password verySecurePassword
```

**Related commands** [auth two-step enable](#)  
[show auth](#)

# auth-mac reauth-relearning

**Overview** This command sets the MAC address learning of the supplicant (client device) to re-learning for re-authentication on the interface specified in the interface command mode.

Use the **no** variant of this command to disable the auth-mac re-learning option.

**Syntax** `auth-mac reauth-relearning`  
`no auth-mac reauth-relearning`

**Default** Re-learning for port authentication is disabled by default.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Examples** To enable the re-authentication re-learning feature on interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth-mac reauth-relearning
```

To disable the re-authentication re-learning feature on interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth-mac reauth-relearning
```

To enable the re-authentication re-learning feature on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth-mac reauth-relearning
```

# auth-mac static

**Overview** This command configures MAC authentication to use static entries in the FDB. Static entries persist in the FDB, even if there is no traffic flow from the supplicant.

When static FDB entries are configured, the [auth roaming disconnected](#) command is supported for MAC authentication. This command allows a supplicant to move to another authenticating interface without re-authentication.

Use the **no** variant of this command to revert to dynamic FDB entries.

**Syntax** `auth-mac static`  
`no auth-mac static`

**Default** By default MAC authentication supplicants are added to the FDB dynamically.

**Mode** Global Configuration

**Example** To configure MAC authentication to use static FDB entries, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-mac static
```

To configure MAC authentication to use dynamic FDB entries, use the following commands:

```
awplus# configure terminal
awplus(config)# no auth-mac static
```

# auth-mac username

**Overview** Use this command to specify the format of the MAC address in the username and password field when a request for MAC-based authorization is sent to a RADIUS server.

**Syntax** `auth-mac username {ietf|unformatted} {lower-case|upper-case}`

| Parameter                | Description  |
|--------------------------|--|
| <code>ietf</code>        | The MAC address includes a hyphen between each 2 bytes. (Example: xx-xx-xx-xx-xx-xx) |
| <code>unformatted</code> | The MAC address does not include hyphens. (Example: xxxxxxxxxxxx)                    |
| <code>lower-case</code>  | The MAC address uses lower-case characters (a-f)                                     |
| <code>upper-case</code>  | The MAC address uses upper-case characters (A-F)                                     |

**Default** `auth-mac username ietf lower-case`

**Mode** Global Configuration

**Usage** This command is provided to allow other vendors', AlliedWare, and AlliedWare Plus switches to share the same format on the RADIUS server.

**Example** To configure the format of the MAC address in the username and password field to be changed to IETF and upper-case, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-mac username ietf upper-case
```

**Related commands** [auth-mac username](#)  
[show running-config](#)

**Command changes** Version 5.4.8-2.1: Command added to AR2050V, AR3050S, AR4050S

# auth-web accounting

**Overview** This command overrides the default RADIUS accounting method for web-based authentication on an interface by allowing you to apply a user-defined named list.

Use the **no** variant of this command to remove the named list from the interface and apply the default method.

**Syntax** `auth-web accounting {default|<list-name>}`  
`no auth-web accounting`

| Parameter   | Description                              |
|-------------|--|
| default     | Apply the default accounting method list |
| <list-name> | Apply a named accounting method list     |

**Default** The **default** method list is applied to an interface by default.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Example** To apply the named list 'vlan10\_acct' on the vlan10 interface, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# auth-web accounting vlan10_acct
```

To remove the named list from the vlan10 interface and set the accounting method back to default, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# no auth-web accounting
```

**Related commands** [aaa accounting auth-web](#)

# auth-web authentication

**Overview** Use this command to override the default web-based authentication method on an interface by allowing you to apply a user-defined named list.

Use the **no** variant of this command to remove the named list from the interface and apply the default method.

**Syntax** `auth-web authentication {default|<list-name>}`  
`no auth-web authentication`

| Parameter   | Description                                  |
|-------------|--|
| default     | Apply the default authentication method list |
| <list-name> | Apply the user-defined named list            |

**Default** The **default** method list is applied to an interface by default.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Example** To apply the named list 'vlan10\_auth' on the vlan10 interface, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# auth-web authentication vlan10_auth
```

To remove the named list from the vlan10 interface and set the authentication method back to default, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# no auth-web authentication
```

**Related commands** [aaa authentication auth-web](#)

# auth-web enable

**Overview** Use this command to enable web-based authentication in Interface mode on the interface specified.

Use the **no** variant of this command to apply its default.

**Syntax** `auth-web enable`  
`no auth-web enable`

**Default** Web authentication is disabled by default.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Usage notes** Web-based authentication cannot be enabled if DHCP snooping is enabled by using the [service dhcp-snooping](#) command, and vice versa. You need to configure an IPv4 address for the VLAN interface on which web authentication is running.

If you attempt to change the authentication configuration on an interface that has threat protection quarantine configured, you will see the following error message:

```
% portx.x.x: Application Proxy quarantine configuration must be removed before port authentication is changed
```

Before changing the interface's authentication configuration you must either:

- remove the interface's threat protection configuration, or
- shut down the interface.

**Examples** To enable web authentication on static-channel-group 2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# static-channel-group 2
awplus(config-if)# exit
awplus(config)# interface sa2
awplus(config-if)# auth-web enable
```

To disable web authentication on static-channel-group 2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface sa2
awplus(config-if)# no auth-web enable
```

To enable web authentication on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth-web enable
```

To disable web authentication on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# no auth-web enable
```

# auth-web forward

**Overview** Use this command to enable the web authentication packet forwarding feature on the interface specified. This command also enables ARP forwarding, and adds forwarded packets to the **tcp** or **udp** port number specified.

Use the **no** variant of this command to disable the specified packet forwarding feature on the interface.

**Syntax** `auth-web forward [<ip-address>|<ip-address/prefix-length>]  
{dns|tcp <1-65535>|udp <1-65535>}`

or

`auth-web forward {arp|dhcp|dns|tcp <1-65535>|udp <1-65535>}`

The **no** variants of this command are:

`no auth-web forward [<ip-address>|<ip-address/prefix-length>]  
{dns|tcp <1-65535>|udp <1-65535>}`

or

`no auth-web forward {arp|dhcp|dns|tcp <1-65535>|udp <1-65535>}`

| Parameter   | Description  |
|---|--|
| <code>&lt;ip-address&gt;</code><br><code>&lt;ip-address/<br/>prefix-length&gt;</code> | The IP address or subnet on which the web authentication is to be enabled. |
| <code>arp</code>  | Enable forwarding of ARP.  |
| <code>dhcp</code>   | Enable forwarding of DHCP (67/udp).  |
| <code>dns</code>  | Enable forwarding of DNS (53/udp).   |
| <code>tcp</code>  | Enable forwarding of TCP specified port number.                            |
| <code>&lt;1-65535&gt;</code>  | TCP Port number.   |
| <code>udp</code>  | Enable forwarding of UDP specified port number.                            |
| <code>&lt;1-65535&gt;</code>  | UDP Port number.   |

**Default** Packet forwarding for port authentication is enabled by default for "arp", "dhcp" and "dns".

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Usage notes** For more information about the `<ip-address>` parameter, and an example, see the "auth-web forward" section in the [AlliedWare Plus Technical Tips and Tricks](#).

**Examples** To enable the ARP forwarding feature on interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth-web forward arp
```

To add TCP forwarding port 137 on interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth-web forward tcp 137
```

To add the DNS Server IP address 192.168.1.10 on interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# switchport mode access
awplus(config-if)# auth-web enable
awplus(config-if)# auth dynamic-vlan-creation
awplus(config-if)# auth-web forward 192.168.1.10 dns
```

To disable the ARP forwarding feature on interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth-web forward arp
```

To delete TCP forwarding port 137 on interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth-web forward tcp 137
```

To delete all TCP forwarding on interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth-web forward tcp
```

To enable the ARP forwarding feature on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth-web forward arp
```

To add TCP forwarding port 137 on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth-web forward tcp 137
```

To disable the ARP forwarding feature on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# no auth-web forward arp
```

To delete TCP forwarding port 137 on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# no auth-web forward tcp 137
```

To delete all TCP forwarding on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# no auth-web forward tcp
```

**Related commands**

- [show auth](#)
- [show auth interface](#)

# auth-web idle-timeout enable

**Overview** Use this command to enable the idle-timeout for client of web authentication on the interface.

The **no** variant of this command to disable the idle-timeout for client of web authentication on the interface.

**Syntax** `auth-web idle-timeout enable`  
`no auth-web idle-timeout enable`

**Default** The idle-timeout is disabled by default.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Example** To enable the idle-timeout on an interface, use the following commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config)# auth-web enable
awplus(config-if)# auth-web idle-timeout enable
```

To disable the idle-timeout on an interface, use the following commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# no auth-web idle-timeout enable
```

**Related commands** [auth-web enable](#)  
[auth-web idle-timeout timeout](#)

# auth-web idle-timeout timeout

**Overview** Use this command to set the timeout value for web authentication client in seconds. The client will be unauthorized when it does not have any activity for a period that exceeds the timeout value.

The **no** variant of this command sets the timeout value to the default setting, 3600 seconds.

**Syntax** `auth-web idle-timeout timeout <420-86400>`  
`no auth-web idle-timeout timeout`

| Parameter   | Description      |
|-------------|------------------|
| <420-86400> | Time in seconds. |

**Default** The timeout is 3600 seconds by default.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Example** To set 30 minutes as the idle-timeout, use the following commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# auth-web idle-timeout timeout 1800
```

To return the idle-timeout to the default, use the following commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# no auth-web idle-timeout timeout
```

**Related commands** [auth-web enable](#)  
[auth-web idle-timeout enable](#)

# auth-web max-auth-fail

**Overview** Use this command to set the number of authentication failures allowed before rejecting further authentication requests. When the supplicant (client device) fails more than the specified number of times, then login requests are refused during the quiet period.

Use the **no** variant of this command to reset the maximum number of authentication failures to the default.

**Syntax** `auth-web max-auth-fail <0-10>`  
`no auth-web max-auth-fail`

| Parameter | Description  |
|-----------|--|
| <0-10>    | The maximum number of authentication failures allowed before login requests are refused. |

**Default** The maximum number of authentication failures is set to 3.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Examples** To set the lock count to 5 on interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth-web max-auth-fail 5
```

To set the lock count to the default on interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth-web max-auth-fail
```

To set the lock count to 5 on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth-web max-auth-fail 5
```

To set the lock count to the default on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# no auth-web max-auth-fail
```

**Related commands**

- auth profile (global)
- auth timeout quiet-period
- show auth
- show auth interface
- show running-config

# auth-web method

**Overview** Use this command to set the web authentication access method that is used with RADIUS on the interface specified.

Use the **no** variant of this command to set the authentication method to PAP for the interface specified when web authentication is also used with the RADIUS authentication method.

**Syntax** `auth-web method {eap-md5|pap}`  
`no auth-web method`

| Parameter            | Description                                  |
|----------------------|--|
| <code>eap-md5</code> | Enable EAP-MD5 as the authentication method. |
| <code>pap</code>     | Enable PAP as the authentication method.     |

**Default** The web authentication method is set to PAP by default.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Example** To set the web authentication method to EAP-MD5 on interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth-web method eap-md5
```

To set the web authentication method to EAP-MD5 for authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth-web method eap-md5
```

**Related commands** [auth profile \(global\)](#)

[show auth](#)

[show auth interface](#)

[show running-config](#)

# auth-web-server blocking-mode

**Overview** Use this command to enable blocking mode for the Web-Authentication server. The blocking mode displays an authentication success or failure screen immediately from the response result from a RADIUS server.

Use the **no** variant of this command to disable blocking mode for the Web-Authentication server.

**Syntax** `auth-web-server blocking-mode`  
`no auth-web-server blocking-mode`

**Default** By default, blocking mode is disabled for the Web-Authentication server.

**Mode** Global Configuration

**Example** To enable blocking mode for the Web-Authentication server, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server blocking-mode
```

To disable blocking mode for the Web-Authentication server, use the following commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server blocking-mode
```

**Related commands** [auth-web-server redirect-delay-time](#)  
[show auth-web-server](#)  
[show running-config](#)

# auth-web-server dhcp ipaddress

**Overview** Use this command to assign an IP address and enable the DHCP service on the Web-Authentication server for supplicants (client devices).

Use the **no** variant of this command to remove an IP address and disable the DHCP service on the Web-Authentication server for supplicants.

**Syntax** `auth-web-server dhcp ipaddress <ip-address/prefix-length>`  
`no auth-web-server dhcp ipaddress`

| Parameter                                     | Description  |
|---|--|
| <code>&lt;ip-address/prefix-length&gt;</code> | The IPv4 address and prefix length assigned for the DHCP service on the Web-Authentication server for supplicants. |

**Default** No IP address for the Web-Authentication server is set by default.

**Mode** Global Configuration

**Usage notes** See the [AAA and Port Authentication Feature Overview and Configuration Guide](#) for information about:

- using DHCP with web authentication, and
- restrictions regarding combinations of authentication enhancements working together

You cannot use the IPv4 address assigned to the device's interface as the Web-Authentication server address.

Note that this Web Authentication virtual DHCP server is a limited implementation of the DHCP protocol. Separation of IP addresses depends on allocating addresses incrementally and a short lease time. In a situation where a supplicant remains permanently connected but does not authenticate, there is a risk of re-allocation of the same IP address once the server has rolled through the entire address range.

**Examples** To assign the IP address 10.0.0.1 to the Web-Authentication server, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server dhcp ipaddress 10.0.0.1/8
```

To remove an IP address on the Web-Authentication server, use the following commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server dhcp ipaddress
```

**Related commands** `auth-web-server dhcp lease`  
`show auth-web-server`  
`show running-config`

# auth-web-server dhcp lease

**Overview** Use this command to set the DHCP lease time for supplicants (client devices) using the DHCP service on the Web-Authentication server.

Use the **no** variant of this command to reset to the default DHCP lease time for supplicants using the DHCP service on the Web-Authentication server.

**Syntax** `auth-web-server dhcp lease <20-60>`  
`no auth-web-server dhcp lease`

| Parameter | Description   |
|-----------|---|
| <20-60>   | DHCP lease time for supplicants using the DHCP service on the Web-Authentication server in seconds. |

**Default** The default DHCP lease time for supplicants using the DHCP service on the Web-Authentication server is set to 30 seconds.

**Mode** Global Configuration

**Usage notes** See the [AAA and Port Authentication Feature Overview and Configuration Guide](#) for information about:

- using DHCP with web authentication, and
- restrictions regarding combinations of authentication enhancements working together

**Examples** To set the DHCP lease time to 1 minute for supplicants using the DHCP service on the Web-Authentication server, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server dhcp lease 60
```

To reset the DHCP lease time to the default setting (30 seconds) for supplicants using the DHCP service on the Web-Authentication server, use the following commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server dhcp lease
```

**Validation Commands** `show running-config`

**Related commands** `show auth-web-server`  
`auth-web-server dhcp ipaddress`

# auth-web-server dhcp-wpad-option

**Overview** This command sets the DHCP WPAD (Web Proxy Auto-Discovery) option for the Web-Authentication temporary DHCP service.

For more information and examples, see the “Web Auth Proxy” section in the [AlliedWare Plus Technical Tips and Tricks](#).

Use the **no** variant of this command to disable the DHCP WPAD function.

**Syntax** `auth-web-server dhcp wpad-option <url>`  
`no auth-web-server dhcp wpad-option`

| Parameter | Description                               |
|-----------|---|
| <url>     | URL to the server which gets a .pac file. |

**Default** The Web-Authentication server DHCP WPAD option is not set.

**Mode** Global Configuration

**Usage notes** If the supplicant is configured to use WPAD, the supplicant’s web browser will use TCP port 80 as usual. Therefore, the packet can be intercepted by Web-Authentication as normal, and the Web-Authentication Login page can be sent. However, after authentication, the browser does not know where to get the WPAD file and so cannot access external web pages. The WPAD file is usually named proxy.pac file and tells the browser what web proxy to use.

Use this command to tell the supplicant where it can get this file from. The switch itself can be specified as the source for this file, and it can deliver it to the supplicant on request.

**Example** To specify that the proxy.pac file is found on the server at 192.168.1.100, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server dhcp wpad-option
http://192.168.1.100/proxy/proxy.pac
```

**Related commands** [show auth-web-server](#)

# auth-web-server host-name

**Overview** This command assigns a hostname to the web authentication server.  
Use the **no** variant of this command to remove the hostname from the web authentication server.

**Syntax** `auth-web-server host-name <hostname>`  
`no auth-web-server host-name`

| Parameter                     | Description                |
|-------------------------------|----------------------------|
| <code>&lt;hostname&gt;</code> | URL string of the hostname |

**Default** The web authentication server has no hostname.

**Mode** Global Configuration

**Usage notes** When the web authentication server uses HTTPS protocol, the web browser will validate the certificate. If the certificate is invalid, the web page gives a warning message before displaying server content. However, the web page will not give warning message if the server has a hostname same as the one stored in the installed certificate.

**Examples** To set the `auth.example.com` as the hostname of the web authentication server, use the commands:

```
awplus# configure terminal  
awplus(config)# auth-web-server host-name auth.example.com
```

To remove hostname `auth.example.com` from the web authentication server, use the commands:

```
awplus# configure terminal  
awplus(config)# no auth-web-server host-name
```

**Related commands** [aaa authentication auth-web](#)  
[auth-web enable](#)

# auth-web-server intercept-port

**Overview** This command specifies any additional TCP port numbers that the Web-Authentication server is to intercept.

Use the **no** variant of this command to stop intercepting the TCP port numbers.

**Syntax** `auth-web-server intercept-port {<1-65535>|any}`  
`no auth-web-server intercept-port {<1-65535>|any}`

| Parameter | Description               |
|-----------|---------------------------|
| <1-65535> | TCP port number.          |
| any       | Intercept all TCP packets |

**Default** No additional TCP port numbers are intercepted by default.

**Mode** Global Configuration

**Usage notes** If this command is not specified, AlliedWare Plus Web-Authentication intercepts the supplicant's initial TCP port 80 connection to a web page and sends it the Web-Authentication Login page. However, if the supplicant is configured to use a web proxy, then it will usually be using TCP port 8080 (or another user configured port number). In this case Web-Authentication cannot intercept the connection.

To overcome this limitation you can use this command to tell the switch which additional port it should intercept, and then send the Web-Authentication Login page to the supplicant.

When the web authentication switch is in a guest network, the switch does not know the proxy server's port number in the supplicant's proxy setting. To overcome this limitation, you can use the **any** option in this command to intercept all TCP packets.

When you use this command in conjunction with a proxy server configured in the web browser, you must add the proxy server's network as a 'No Proxy' network. You can specify 'No Proxy' networks in the proxy settings in your web browser. For more information, see the "Web Auth Proxy" section in the [Alliedware Plus Technical Tips and Tricks](#).

**Example** To additionally intercept port number 3128, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server intercept-port 3128
```

**Related commands** [show auth-web-server](#)

# auth-web-server ip-conflict-prefer-newer-supPLICANT

**Overview** Use this command to alter the behavior of a Network Access Server (NAS) when it detects a supplicant with a duplicate IP address.

The default behavior is for the NAS to not authorize the newer supplicant. This command allows it to authorize the newer supplicant and unauthorize the original supplicant.

This command applies to Web-based authentication supplicants only.

Use the **no** variant of this command to set the behavior back to default.

**Syntax** `auth-web-server ip-conflict-prefer-newer-supPLICANT`  
`no auth-web-server ip-conflict-prefer-newer-supPLICANT`

**Default** The default behavior is to not authorize the newer supplicant if the NAS detects a duplicate IP address.

**Mode** Global Configuration

**Usage notes** Allied Telesis recommends you investigate and resolve the root cause of the conflicting IP addresses.

**Example** To configure a NAS to authorize the newer supplicant, use the commands:

```
awplus# configure terminal
awplus(config)# auth-web-server
ip-conflict-prefer-newer-supPLICANT
```

**Related commands** [auth-web enable](#)  
[show auth](#)

**Command changes** Version 5.5.2-0.1: command added

# auth-web-server ipaddress

**Overview** This command sets the IP address for the Web-Authentication server.

Use the **no** variant of this command to delete the IP address for the Web-Authentication server.

You cannot use the IPv4 address assigned to the device's interface as the Web-Authentication server address.

**Syntax** `auth-web-server ipaddress <ip-address>`  
`no auth-web-server ipaddress`

| Parameter                       | Description  |
|---------------------------------|--|
| <code>&lt;ip-address&gt;</code> | Web-Authentication server dotted decimal IP address in A.B.C.D format. |

**Default** The Web-Authentication server address on the system is not set by default.

**Mode** Global Configuration

**Examples** To set the IP address 10.0.0.1 to the Web-Authentication server, use the following commands:

```
awplus# configure terminal  
awplus(config)# auth-web-server ipaddress 10.0.0.1
```

To delete the IP address from the Web-Authentication server, use the following commands:

```
awplus# configure terminal  
awplus(config)# no auth-web-server ipaddress
```

**Validation Commands** `show auth`  
`show auth-web-server`  
`show running-config`

# auth-web-server page language

**Overview** Use this command to set the presentation language of Web authentication pages. Titles and subtitles of Web authentication pages will be set accordingly. Note that presently only English or Japanese are offered.

Use the **no** variant of this command to set the presentation language of Web authentication pages to its default (English).

**Syntax** `auth-web-server page language {english|japanese}`  
`no auth-web-server page language`

| Parameter | Description   |
|-----------|---|
| english   | Web authentication pages are presented in English.  |
| japanese  | Web authentication pages are presented in Japanese. |

**Default** Web authentication pages are presented in English by default.

**Mode** Global Configuration

**Examples** To set Japanese as the presentation language of Web authentication pages, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server page language japanese
```

To set English as the presentation language of Web authentication pages, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server page language english
```

To unset the presentation language of Web authentication pages and use English as the default presentation language, use the following commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server page language
```

[auth-web-server page sub-title](#)  
[show auth-web-server page](#)

# auth-web-server login-url

**Overview** This command sets the web-authentication login page URL. This lets you replace the login page with your own page. See “Customising the Login Page” in the [AAA and Port Authentication Feature Overview and Configuration Guide](#) for details.

Use the **no** variant of this command to delete the URL.

**Syntax** `auth-web-server login-url <URL>`  
`no auth-web-server login-url`

| Parameter | Description        |
|-----------|--------------------|
| <URL>     | Set login page URL |

**Default** The built-in login page is set by default.

**Mode** Global Configuration

**Examples** To set `http://example.com/login.html` as the login page, use the commands:

```
awplus# configure terminal
awplus(config)# auth-web-server login-url
http://example.com/login.html
```

To unset the login page URL, use the commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server login-url
```

**Related commands** [show running-config](#)

# auth-web-server page logo

**Overview** This command sets the type of logo that will be displayed on the web authentication page.

Use the **no** variant of this command to set the logo type to **auto**.

Note that if you need to customize the login page extensively, you can instead replace it with your own page. See “Customising the Login Page” in the [AAA and Port Authentication Feature Overview and Configuration Guide](#).

**Syntax** `auth-web-server page logo {auto|default|hidden}`  
`no auth-web-server page logo`

| Parameter | Description  |
|-----------|--|
| auto      | Display the custom logo if installed; otherwise display the default logo |
| default   | Display the default logo   |
| hidden    | Hide the logo  |

**Default** Logo type is **auto** by default.

**Mode** Global Configuration

**Examples** To display the default logo with ignoring installed custom logo, use the commands:

```
awplus# configure terminal
awplus(config)# auth-web-server page logo default
```

To set back to the default logo type **auto**, use the commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server page logo
```

**Validation Commands** `show auth-web-server page`

# auth-web-server page sub-title

**Overview** This command sets the custom sub-title on the web authentication page.

Use the **no** variant of this command to reset the sub-title to its default.

Note that if you need to customize the login page extensively, you can instead replace it with your own page. See “Customising the Login Page” in the [AAA and Port Authentication Feature Overview and Configuration Guide](#).

**Syntax** `auth-web-server page sub-title {hidden|text <sub-title>}`  
`no auth-web-server page sub-title`

| Parameter   | Description                  |
|-------------|------------------------------|
| hidden      | Hide the sub-title           |
| <sub-title> | Text string of the sub-title |

**Default** “Allied-Telesis” is displayed by default.

**Mode** Global Configuration

**Examples** To set the custom sub-title, use the commands:

```
awplus# configure terminal
awplus(config)# auth-web-server page sub-title text Web
Authentication
```

To hide the sub-title, use the commands:

```
awplus# configure terminal
awplus(config)# auth-web-server page sub-title hidden
```

To change back to the default title, use the commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server page sub-title
```

**Validation Commands** `show auth-web-server page`

# auth-web-server page success-message

**Overview** This command sets the success message on the web-authentication page.

Use the **no** variant of this command to remove the success message.

Note that if you need to customize the login page extensively, you can instead replace it with your own page. See “Customising the Login Page” in the [AAA and Port Authentication Feature Overview and Configuration Guide](#).

**Syntax** `auth-web-server page success-message text <success-message>`  
`no auth-web-server page success-message`

| Parameter                            | Description                        |
|--------------------------------------|------------------------------------|
| <code>&lt;success-message&gt;</code> | Text string of the success message |

**Default** No success message is set by default.

**Mode** Global Configuration

**Examples** To set the success message on the web-authentication page, use the commands:

```
awplus# configure terminal
awplus(config)# auth-web-server page success-message text Your
success message
```

To unset the success message on the web-authentication page, use the commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server page success-message
```

**Validation Commands** [show auth-web-server page](#)

# auth-web-server page title

**Overview** This command sets the custom title on the web authentication page.

Use the **no** variant of this command to remove the custom title.

Note that if you need to customize the login page extensively, you can instead replace it with your own page. See “Customising the Login Page” in the [AAA and Port Authentication Feature Overview and Configuration Guide](#).

**Syntax** `auth-web-server page title {hidden|text <title>}`  
`no auth-web-server page title`

| Parameter | Description              |
|-----------|--------------------------|
| hidden    | Hide the title           |
| <title>   | Text string of the title |

**Default** “Web Access Authentication Gateway” is displayed by default.

**Mode** Global Configuration

**Examples** To set the custom title on the web authentication page, use the commands:

```
awplus# configure terminal
awplus(config)# auth-web-server page title text Login
```

To hide the title on the web authentication page, use the commands:

```
awplus# configure terminal
awplus(config)# auth-web-server page title hidden
```

To unset the custom title on the web authentication page, use the commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server page title
```

**Validation Commands** `show auth-web-server page`

# auth-web-server page welcome-message

**Overview** This command sets the welcome message on the web-authentication login page.

Use the **no** variant of this command to remove the welcome message.

Note that if you need to customize the login page extensively, you can instead replace it with your own page. See “Customising the Login Page” in the [AAA and Port Authentication Feature Overview and Configuration Guide](#).

**Syntax** `auth-web-server page welcome-message text <welcome-message>`  
`no auth-web-server page welcome-message`

| Parameter                            | Description                        |
|--------------------------------------|------------------------------------|
| <code>&lt;welcome-message&gt;</code> | Text string of the welcome message |

**Default** No welcome message is set by default.

**Mode** Global Configuration

**Examples** To set the welcome message on the web-authentication page, use the commands:

```
awplus# configure terminal
awplus(config)# auth-web-server page welcome-message text Your
welcome message
```

To remove the welcome message on the web-authentication page, use the commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server page welcome-message
```

**Validation  
Commands** `show auth-web-server page`

# auth-web-server ping-poll enable

**Overview** This command enables the ping polling to the supplicant (client device) that is authenticated by Web-Authentication.

The **no** variant of this command disables the ping polling to the supplicant that is authenticated by Web-Authentication.

**Syntax** `auth-web-server ping-poll enable`  
`no auth-web-server ping-poll enable`

**Default** The ping polling feature for Web-Authentication is disabled by default.

**Mode** Global Configuration

**Examples** To enable the ping polling feature for Web-Authentication, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server ping-poll enable
```

To disable the ping polling feature for Web-Authentication, use the following commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server ping-poll enable
```

**Validation Commands** `show auth`  
`show auth-web-server`  
`show running-config`

# auth-web-server ping-poll failcount

**Overview** This command sets a fail count for the ping polling feature when used with Web-Authentication. The **failcount** parameter specifies the number of unanswered pings. A supplicant (client device) is logged off when the number of unanswered pings are greater than the failcount set with this command.

Use the **no** variant of this command to resets the fail count for the ping polling feature to the default (5 pings).

**Syntax** `auth-web-server ping-poll failcount <1-100>`  
`no auth-web-server ping-poll failcount`

| Parameter | Description |
|-----------|-------------|
| <1-100>   | Count.      |

**Default** The default failcount for ping polling is 5 pings.

**Mode** Global Configuration

**Examples** To set the failcount of ping polling to 10 pings, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server ping-poll failcount 10
```

To set the failcount of ping polling to default, use the following commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server ping-poll failcount
```

**Validation Commands** `show auth`  
`show auth-web-server`  
`show running-config`

# auth-web-server ping-poll interval

**Overview** This command is used to change the ping poll interval. The interval specifies the time period between pings when the supplicant (client device) is reachable.

Use the **no** variant of this command to reset to the default period for ping polling (30 seconds).

**Syntax** `auth-web-server ping-poll interval <1-65535>`  
`no auth-web-server ping-poll interval`

| Parameter | Description |
|-----------|-------------|
| <1-65535> | Seconds.    |

**Default** The interval for ping polling is 30 seconds by default.

**Mode** Global Configuration

**Examples** To set the interval of ping polling to 60 seconds, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server ping-poll interval 60
```

To set the interval of ping polling to the default (30 seconds), use the following commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server ping-poll interval
```

**Validation Commands** `show auth`  
`show auth-web-server`  
`show running-config`

# auth-web-server ping-poll reauth-timer-refresh

**Overview** This command modifies the **reauth-timer-refresh** parameter for the Web-Authentication feature. The **reauth-timer-refresh** parameter specifies whether a re-authentication timer is reset and when the response from a supplicant (a client device) is received.

Use the **no** variant of this command to reset the **reauth-timer-refresh** parameter to the default setting (disabled).

**Syntax** `auth-web-server ping-poll reauth-timer-refresh`  
`no auth-web-server ping-poll reauth-timer-refresh`

**Default** The `reauth-timer-refresh` parameter is disabled by default.

**Mode** Global Configuration

**Examples** To enable the `reauth-timer-refresh` timer, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server ping-poll reauth-timer-refresh
```

To disable the `reauth-timer-refresh` timer, use the following commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server ping-poll
reauth-timer-refresh
```

**Validation  
Commands** `show auth`  
`show auth-web-server`  
`show running-config`

# auth-web-server ping-poll timeout

**Overview** This command modifies the ping poll **timeout** parameter for the Web-Authentication feature. The **timeout** parameter specifies the time in seconds to wait for a response to a ping packet.

Use the **no** variant of this command to reset the timeout of ping polling to the default (1 second).

**Syntax** `auth-web-server ping-poll timeout <1-30>`  
`no auth-web-server ping-poll timeout`

| Parameter | Description |
|-----------|-------------|
| <1-30>    | Seconds.    |

**Default** The default timeout for ping polling is 1 second.

**Mode** Global Configuration

**Examples** To set the timeout of ping polling to 2 seconds, use the command:

```
awplus# configure terminal
awplus(config)# auth-web-server ping-poll timeout 2
```

To set the timeout of ping polling to the default (1 second), use the command:

```
awplus# configure terminal
awplus(config)# no auth-web-server ping-poll timeout
```

**Validation Commands** `show auth`  
`show auth-web-server`  
`show running-config`

# auth-web-server ping-poll type

**Overview** Use this command to set the type of polling used to check that a web authenticated supplicant is still connected. The polling can be done using either ICMP (ping), or ARP messages.

If there is a firewall between an authenticating server and a supplicant, it may block ICMP traffic. If this occurs try changing to ARP polling.

Polling only starts when ping-polling is enabled and the supplicant has been authorized.

Use the **no** variant of this command to set the default polling type of ICMP (ping).

**Syntax** `auth-web-server ping-poll type {arp|ping}`  
`no auth-web-server ping-poll type`

| Parameter       | Description                                      |
|-----------------|--|
| auth-web-server | Web authentication server configuration commands |
| arp             | Enable polling via ARP                           |
| ping            | Enable polling via ICMP (ping)                   |

**Default** ICMP

**Mode** Global Configuration

**Examples** To set the polling type to ARP, use the commands:

```
awplus# configure terminal
awplus(config)# auth-web-server ping-poll enable
awplus(config)# auth-web-server ping-poll type arp
```

To set the polling type to ICMP, use the commands:

```
awplus# configure terminal
awplus(config)# auth-web-server ping-poll enable
awplus(config)# auth-web-server ping-poll type ping
```

To set the polling type to the default, use the commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server ping-poll type
```

**Related commands** [auth-web-server ping-poll enable](#)  
[auth-web-server ping-poll failcount](#)  
[auth-web-server ping-poll interval](#)  
[auth-web-server ping-poll reauth-timer-refresh](#)

auth-web-server ping-poll timeout  
show auth-web-server

**Command changes** Version 5.5.1-1.1: command added

# auth-web-server port

**Overview** This command sets the HTTP port number for the Web-Authentication server. Use the **no** variant of this command to reset the HTTP port number to the default (80).

**Syntax** `auth-web-server port <port-number>`  
`no auth-web-server port`

| Parameter                        | Description   |
|----------------------------------|---|
| <code>&lt;port-number&gt;</code> | Set the local Web-Authentication server port within the TCP port number range 1 to 65535. |

**Default** The Web-Authentication server HTTP port number is set to 80 by default.

**Mode** Global Configuration

**Examples** To set the HTTP port number 8080 for the Web-Authentication server, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server port 8080
```

To reset to the default HTTP port number 80 for the Web-Authentication server, use the following commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server port
```

**Validation Commands** `show auth`  
`show auth-web-server`  
`show running-config`

# auth-web-server redirect-delay-time

**Overview** Use this command to set the delay time in seconds before redirecting the supplicant to a specified URL when the supplicant is authorized.

Use the variant **no** to reset the delay time set previously.

**Syntax** `auth-web-server redirect-delay-time <5-60>`  
`no auth-web-server redirect-delay-time`

| Parameter                        | Description  |
|----------------------------------|--|
| <code>redirect-delay-time</code> | Set the delay time before jumping to a specified URL after the supplicant is authorized. |
| <code>&lt;5-60&gt;</code>        | The time in seconds.   |

**Default** The default redirect delay time is 5 seconds.

**Mode** Global Configuration

**Examples** To set the delay time to 60 seconds for the Web-Authentication server, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server redirect-delay-time 60
```

To reset the delay time, use the following commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server redirect-delay-time
```

**Related commands**

- [auth-web-server blocking-mode](#)
- [auth-web-server redirect-url](#)
- [show auth-web-server](#)
- [show running-config](#)

# auth-web-server redirect-url

**Overview** This command sets a URL for supplicant (client device) authentication. When a supplicant is authorized it will be automatically redirected to the specified URL. Note that if the http redirect feature is used then this command is ignored.

Use the **no** variant of this command to delete the URL string set previously.

**Syntax** `auth-web-server redirect-url <url>`  
`no auth-web-server redirect-url`

| Parameter                | Description                           |
|--------------------------|---------------------------------------|
| <code>&lt;url&gt;</code> | URL (hostname or dotted IP notation). |

**Default** The redirect URL for the Web-Authentication server feature is not set by default (null).

**Mode** Global Configuration

**Examples** To enable and set redirect a URL string `www.alliedtelesis.com` for the Web-Authentication server, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server redirect-url
http://www.alliedtelesis.com
```

To delete a redirect URL string, use the following commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server redirect-url
```

**Related commands** [auth-web-server redirect-delay-time](#)  
[show auth](#)  
[show auth-web-server](#)  
[show running-config](#)

# auth-web-server session-keep

**Overview** This command enables the session-keep feature to jump to the original URL after being authorized by Web-Authentication.

Use the **no** variant of this command to disable the session keep feature.

**Syntax** `auth-web-server session-keep`  
`no auth-web-server session-keep`

**Default** The session-keep feature is disabled by default.

**Mode** Global Configuration

**Usage notes** This function doesn't ensure to keep session information in all cases. Authenticated supplicant may be redirected to unexpected page when session-keep is enabled. This issue occurred by supplicant sending HTTP packets automatically after authentication page is displayed and the URL is written.

**Examples** To enable the session-keep feature, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server session-keep
```

To disable the session-keep feature, use the following commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server session-keep
```

**Validation Commands** `show auth`  
`show auth-web-server`  
`show running-config`

# auth-web-server ssl

**Overview** This command enables HTTPS functionality for the Web-Authentication server feature.

Use the **no** variant of this command to disable HTTPS functionality for the Web-Authentication server.

**Syntax** `auth-web-server ssl`  
`no auth-web-server ssl`

**Default** HTTPS functionality for the Web-Authentication server feature is disabled by default.

**Mode** Global Configuration

**Examples** To enable HTTPS functionality for the Web-Authentication server feature, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server ssl
```

To disable HTTPS functionality for the Web-Authentication server feature, use the following commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server ssl
```

**Validation Commands** `show auth`  
`show auth-web-server`  
`show running-config`

# auth-web-server ssl intercept-port

**Overview** Use this command to register HTTPS intercept port numbers when the HTTPS server uses custom port number (not TCP port number 443).

Note that you need to use the **auth-web-server intercept-port** command to register HTTP intercept port numbers.

Use the **no** variant of this command to delete registered port number.

**Syntax** `auth-web-server ssl intercept-port <1-65535>`  
`no auth-web-server ssl intercept-port <1-65535>`

| Parameter                    | Description                                       |
|------------------------------|---|
| <code>&lt;1-65535&gt;</code> | TCP port number in the range from 1 through 65535 |

**Default** 443/TCP is registered by default.

**Mode** Global Configuration

**Examples** To register HTTPS port number 3128, use the commands:

```
awplus# configure terminal
awplus(config)# auth-web-server ssl intercept-port 3128
```

To delete HTTPS port number 3128, use the commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server ssl intercept-port 3128
```

**Validation Commands** `show auth-web-server`

**Related commands** `auth-web-server intercept-port`

# auth-web-server trustpoint

**Overview** Use this command to set the PKI trustpoint to use for secure web authentication communication to an AlliedWare Plus device.

Use the **no** variant of this command to revert to using the default trustpoint 'default-selfsigned'.

**Syntax** `auth-web-server trustpoint <trustpoint-name>`  
`no auth-web-server trustpoint`

| Parameter                            | Description        |
|--------------------------------------|--------------------|
| <code>&lt;trustpoint-name&gt;</code> | Name of trustpoint |

**Default** By default, web authentication uses the 'default-selfsigned' trustpoint.

**Mode** Global Configuration

**Usage notes** Before using the **auth-web-server trustpoint** command you will need to establish a trustpoint. For example, you can create a local self-signed trustpoint using the procedure outlined below.

Create a self-signed trustpoint called 'web-trust' with keypair 'web\_key':

```
awplus# configure terminal
awplus(config)# crypto pki trustpoint web-trust
awplus(ca-trustpoint)# enrollment selfsigned
awplus(ca-trustpoint)# rsakeypair web_key
awplus(ca-trustpoint)# exit
awplus(config)# exit
```

Create the root and server certificates for this trustpoint:

```
awplus# crypto pki authenticate web-trust
awplus# crypto pki enroll web-trust
```

For more information about the AlliedWare Plus implementation of Public Key Infrastructure (PKI), see the [Public Key Infrastructure \(PKI\) Feature Overview and Configuration Guide](#)

**Example** To configure web authentication to use the trustpoint 'web-trust', use the commands:

```
awplus# configure terminal
awplus(config)# auth-web-server trustpoint web-trust
```

To configure web authentication to use the default trustpoint 'default-selfsigned', use the commands:

```
awplus# configure terminal  
awplus(config)# no auth-web-server trustpoint
```

changes**

Version 5.5.1-2.1: command added

# copy proxy-autoconfig-file

**Overview** Use this command to download the proxy auto configuration (PAC) file to your switch. The Web-Authentication supplicant can get the downloaded file from the system web server.

**Syntax** `copy <filename> proxy-autoconfig-file`

| Parameter                     | Description              |
|-------------------------------|--------------------------|
| <code>&lt;filename&gt;</code> | The URL of the PAC file. |

**Mode** Privileged Exec

**Example** To download the PAC file to this device, use the command:

```
awplus# copy tftp://server/proxy.pac proxy-autoconfig-file
```

**Related commands** [show proxy-autoconfig-file](#)  
[erase proxy-autoconfig-file](#)

# copy web-auth-https-file

**Overview** Use this command to download the SSL server certificate for web-based authentication. The file must be in PEM (Privacy Enhanced Mail) format, and contain the private key and the server certificate.

**Syntax** `copy <filename> web-auth-https-file`

| Parameter                     | Description                             |
|-------------------------------|---|
| <code>&lt;filename&gt;</code> | The URL of the server certificate file. |

**Mode** Privileged Exec

**Example** To download the server certificate file `verisign_cert.pem` from the TFTP server directory `server`, use the command:

```
awplus# copy tftp://server/verisign_cert.pem  
web-auth-https-file
```

**Related commands**

- [auth-web-server ssl](#)
- [erase web-auth-https-file](#)
- [show auth-web-server](#)

# description (auth-profile)

**Overview** Use this command to add a description to an authentication profile in Authentication Profile mode.

Use the **no** variant of this command to remove the current description.

**Syntax** `description <description>`

| Parameter                        | Description  |
|----------------------------------|--|
| <code>&lt;description&gt;</code> | Text describing the selected authentication profile. |

**Default** No description configured by default.

**Mode** Authentication Profile

**Example** To add a description to the authentication profile 'student', use the following commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# description student room setting
```

To remove a description from the authentication profile 'student', use the following commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# no description
```

**Related commands** [auth profile \(global\)](#)

# erase proxy-autoconfig-file

**Overview** Use this command to remove the proxy auto configuration file.

**Syntax** `erase proxy-autoconfig-file`

**Mode** Privileged Exec

**Example** To remove the proxy auto configuration file, use the command:

```
awplus# erase proxy-autoconfig-file
```

**Related commands** [show proxy-autoconfig-file](#)  
[copy proxy-autoconfig-file](#)

# erase web-auth-https-file

**Overview** Use this command to remove the SSL server certificate for web-based authentication.

**Syntax** `erase web-auth-https-file`

**Mode** Privileged Exec

**Example** To remove the SSL server certificate file for web-based authentication use the command:

```
awplus# erase web-auth-https-file
```

**Related commands**

- [auth-web-server ssl](#)
- [copy web-auth-https-file](#)
- [show auth-web-server](#)

# platform l3-hashing-algorithm

**Overview** This command enables you to change the L3 VLAN hash-key-generating algorithm.

The **no** variant of this command returns the hash-key algorithm to the default of `crc32l`.

**Syntax** `platform l3-hashing-algorithm {crc16l|crc16u|crc32l|crc32u}`  
`no platform l3-hashing-algorithm`

| Parameter           | Description   |
|---------------------|---|
| <code>crc16l</code> | The algorithm that will apply to the lower bits of CRC-16 |
| <code>crc16u</code> | The algorithm that will apply to the upper bits of CRC-16 |
| <code>crc32l</code> | The algorithm that will apply to the lower bits of CRC-32 |
| <code>crc32u</code> | The algorithm that will apply to the upper bits of CRC-32 |

**Default** The hash-key algorithm is `crc32l` by default.

**Mode** Global configuration

**Usage notes** Occasionally, when using the Multiple Dynamic VLAN feature, a supplicant cannot be authenticated because a collision occurs within the VLAN L3 table. This can happen when more than four different IP addresses produce the same hash-key.

When this situation occurs, collisions can sometimes be avoided by changing the hashing algorithm from its default of `crc32l`. Several different algorithms may need to be tried to rectify the problem.

You must restart the switch for this command to take effect.

Note that this command is intended for technical support staff, or advanced end users.

**Example** To change the hash-key generating algorithm applying to the lower bits of CRC-16, use the command:

```
awplus# configure terminal
awplus(config)# platform l3-hashing-algorithm crc16l
```

**Related commands** [platform mac-vlan-hashing-algorithm](#)  
[show platform](#)

# platform mac-vlan-hashing-algorithm

**Overview** This command enables you to change the MAC VLAN hash-key-generating algorithm.

The **no** variant of this command returns the hash-key algorithm to the default of `crc32l`

**Syntax** `platform mac-vlan-hashing-algorithm`  
`{crc16l|crc16u|crc32l|crc32u}`  
`no platform mac-vlan-hashing-algorithm`

| Parameter           | Description   |
|---------------------|---|
| <code>crc16l</code> | The algorithm that will apply to the lower bits of CRC-16 |
| <code>crc16u</code> | The algorithm that will apply to the upper bits of CRC-16 |
| <code>crc32l</code> | The algorithm that will apply to the lower bits of CRC-32 |
| <code>crc32u</code> | The algorithm that will apply to the upper bits of CRC-32 |

**Default** The hash-key algorithm is `crc32l` by default.

**Mode** Global configuration

**Usage notes** Occasionally, when using the Multiple Dynamic VLAN feature, a supplicant cannot be authenticated because a collision occurs within the VLAN MAC table. This can happen when more than four different MAC addresses produce the same hash-key.

When this situation occurs, collisions can sometimes be avoided by changing the hashing algorithm from its default of `crc32l`. Several different algorithms may need to be tried to rectify the problem.

You must restart the switch for this command to take effect.

Note that this command is intended for technical support staff, or advanced end users.

**Example** To change the hash-key generating algorithm applying to the lower bits of CRC-16, use the command:

```
awplus# configure terminal
awplus(config)# platform mac-vlan-hashing-algorithm crc16l
```

**Related commands** [platform l3-hashing-algorithm](#)  
[show platform](#)

# show auth

**Overview** This command shows the configuration state of authentication.

**Syntax** show auth [all]

| Parameter | Description   |
|-----------|---|
| all       | Display all authentication information for each authenticated interface. This can be a static channel (or static aggregator), or a dynamic (or LACP) channel group, or a switch port. |

**Mode** Privileged Exec

**Example** To display all authentication information, enter the command:

```
awplus# show auth all
```

**Output** Figure 44-1: Example output from the **show auth** command

```
awplus# show auth all

# show auth diagnostics

**Overview** This command shows authentication diagnostics, optionally for the specified interface, which may be a static channel (or static aggregator) or a dynamic (or LACP) channel group or a switch port.

If no interface is specified then authentication diagnostics are shown for all interfaces.

**Syntax** `show auth diagnostics [interface <interface-list>]`

| Parameter                           | Description  |
|-------------------------------------|--|
| <code>interface</code>              | Specify ports to show.   |
| <code>&lt;interface-list&gt;</code> | The interfaces or ports to configure. An interface-list can be: <ul style="list-style-type: none"><li>• an interface (e.g. <code>vlan2</code>), a switch port (e.g. <code>port1.0.6</code>), a static channel group (e.g. <code>sa2</code>) or a dynamic (LACP) channel group (e.g. <code>po2</code>)</li><li>• a continuous range of interfaces, ports, static channel groups or dynamic (LACP) channel groups separated by a hyphen; e.g. <code>vlan2-8</code>, or <code>port1.0.1-1.0.4</code>, or <code>sa1-2</code>, or <code>po1-2</code></li><li>• a comma-separated list of the above; e.g. <code>port1.0.1, port1.0.4-1.0.6</code>. Do not mix interface types in a list</li></ul> The specified interfaces must exist. |

**Mode** Privileged Exec

**Example** To display authentication diagnostics for port1.0.6, enter the command:

```
awplus# show auth diagnostics interface port1.0.6
```

# show auth interface

**Overview** This command shows the status of port authentication on the specified interface.

**Syntax** `show auth interface <interface-list>`

| Parameter                           | Description  |
|-------------------------------------|--|
| <code>&lt;interface-list&gt;</code> | The interfaces to display information about. An interface-list can be: <ul style="list-style-type: none"><li>• a VLAN (e.g. vlan2)</li><li>• a switchport (e.g. port1.0.4)</li><li>• a static channel group (e.g. sa2)</li><li>• a dynamic (LACP) channel group (e.g. po2)</li><li>• a continuous range of interfaces separated by a hyphen (e.g. port1.0.1-port1.0.3)</li><li>• a comma-separated list (e.g. port1.0.1, port1.0.3-port1.0.4). Do not mix interface types in a list.</li></ul> |

**Mode** Privileged Exec

**Example** To display the web-based authentication status for port1.0.4, enter the command:

```
awplus# show auth interface port1.0.4
```

If port-based authentication is not configured, the output will be

```
% Port-Control not configured on port1.0.4
```

To display the port-based authentication status for port1.0.4, enter the command:

```
awplus# show auth interface port1.0.4
```

```
awplus# show auth interface port1.0.4

# show auth sessionstatistics

**Overview** This command shows authentication session statistics for the specified interface, which may be a static channel (or static aggregator) or a dynamic (or LACP) channel group or a switch port.

**Syntax** `show auth sessionstatistics [interface <interface-list>]`

| Parameter                           | Description  |
|-------------------------------------|--|
| <code>interface</code>              | Specify ports to show.   |
| <code>&lt;interface-list&gt;</code> | The interfaces or ports to configure. An interface-list can be: <ul style="list-style-type: none"><li>• an interface (e.g. <code>vlan2</code>), a switch port (e.g. <code>port1.0.6</code>), a static channel group (e.g. <code>sa2</code>) or a dynamic (LACP) channel group (e.g. <code>po2</code>)</li><li>• a continuous range of interfaces, ports, static channel groups or dynamic (LACP) channel groups separated by a hyphen; e.g. <code>vlan2-8</code>, or <code>port1.0.1-1.0.4</code>, or <code>sa1-2</code>, or <code>po1-2</code></li><li>• a comma-separated list of the above; e.g. <code>port1.0.1, port1.0.4-1.0.6</code>. Do not mix interface types in a list</li></ul> The specified interfaces must exist. |

**Mode** Privileged Exec

**Example** To display authentication statistics for port1.0.6, enter the command:

```
awplus# show auth sessionstatistics interface port1.0.6
```

**Output** Figure 44-3: Example output from the **show auth sessionstatistics** command

```

# show auth supplicant

**Overview** Use this command to show the supplicant (client device) state when authentication is configured for the switch. Use the optional **brief** parameter to show a summary of the supplicant state.

**Syntax** show auth supplicant [*<macadd>*] [brief]

| Parameter             | Description   |
|-----------------------|---|
| <i>&lt;macadd&gt;</i> | Mac (hardware) address of the supplicant. Entry format is HHHH.HHHH.HHHH (hexadecimal). |
| brief                 | Brief summary of the supplicant state.  |

**Mode** Privileged Exec

**Examples** To display a summary of authenticated supplicant information on the device, enter the command:

```
awplus# show auth supplicant brief
```

To display authenticated supplicant information on the device, enter the command:

```
awplus# show auth supplicant
```

To display authenticated supplicant information for the device with MAC address 0000.5E00.5301, enter the command:

```
awplus# show auth supplicant 0000.5E00.5301
```

# show auth supplicant interface

**Overview** This command shows the supplicant (client device) state for the authentication mode set for the interface. Use the optional **brief** parameter to show a summary of the supplicant state.

**Syntax** `show auth-web supplicant interface <interface-list> [brief]`

| Parameter                           | Description  |
|-------------------------------------|--|
| <code>&lt;interface-list&gt;</code> | <p>The interfaces or ports to configure. An interface-list can be:</p> <ul style="list-style-type: none"><li>• an interface (e.g. <code>vlan2</code>), a switch port (e.g. <code>port1.0.6</code>), a static channel group (e.g. <code>sa2</code>) or a dynamic (LACP) channel group (e.g. <code>po2</code>)</li><li>• a continuous range of interfaces, ports, static channel groups or dynamic (LACP) channel groups separated by a hyphen; e.g. <code>vlan2-8</code>, or <code>port1.0.1-1.0.4</code>, or <code>sa1-2</code>, or <code>po1-2</code></li><li>• a comma-separated list of the above; e.g. <code>port1.0.1, port1.0.4-1.0.6</code>. Do not mix interface types in a list</li></ul> <p>The specified interfaces must exist.</p> |
| <code>brief</code>                  | Brief summary of the supplicant state.   |

**Mode** Privileged Exec

**Examples** To display the authenticated supplicant on the interface `port1.0.2`, enter the command:

```
awplus# show auth supplicant interface port1.0.2
```

To display brief summary output for the authenticated supplicant on the interface `port1.0.2`, enter the command:

```
awplus# show auth supplicant interface port1.0.2 brief
```

# show auth two-step supplicant brief

**Overview** This command displays the supplicant state of the two-step authentication feature on the interface.

**Syntax** `show auth two-step supplicant [interface <interface-list>]  
brief`

| Parameter        | Description  |
|------------------|--|
| interface        | The interface selected for display.  |
| <interface-list> | The interfaces to display information about. An interface-list can be: <ul style="list-style-type: none"><li>• a VLAN (e.g. vlan2)</li><li>• a switchport (e.g. port1.0.4)</li><li>• a static channel group (e.g. sa2)</li><li>• a dynamic (LACP) channel group (e.g. po2)</li><li>• a continuous range of interfaces separated by a hyphen (e.g. port1.0.1-port1.0.3)</li><li>• a comma-separated list (e.g. port1.0.1, port1.0.3-port1.0.4). Do not mix interface types in a list.</li></ul> |

**Mode** Privileged Exec

**Usage notes** Do not mix interface types in a list. The specified interfaces must exist.

**Example** To display the supplicant state of the two-step authentication feature, enter the command:

```
awplus# show two-step supplicant interface port1.0.2 brief
```

**Output** Figure 44-8: Example output from **show auth two-step supplicant brief**

# AAA Commands

## Introduction

**Overview** AAA is the collective title for the three related functions of Authentication, Authorization and Accounting. These functions can be applied in a variety of methods with a variety of servers.

The purpose of the AAA commands is to map instances of the AAA functions to sets of servers. The Authentication function can be performed in multiple contexts, such as authentication of users logging in at a console, or 802.1X-Authentication of devices connecting to Ethernet ports.

For each of these contexts, you may want to use different sets of servers for examining the proffered authentication credentials and deciding if they are valid. AAA Authentication commands enable you to specify which servers will be used for different types of authentication.

This chapter provides an alphabetical reference for AAA commands for Authentication, Authorization and Accounting. For more information, see the [AAA and Port\\_Authentication Feature Overview and Configuration Guide](#).

# aaa accounting auth-mac

**Overview** This command configures an accounting method list for MAC-based authentication. An accounting method list specifies what type of accounting messages are sent and which RADIUS servers the accounting messages are sent to. Use this command to configure either the default method list, which is automatically applied to interfaces with MAC-based authentication enabled, or a named method list, which can be applied to an interface with the [auth-mac accounting](#) command.

Use the **no** variant of this command to disable either the default or a named accounting method list for MAC-based authentication. Once all method lists are disabled, AAA accounting for MAC-based authentication is disabled globally.

**Syntax**

```
aaa accounting auth-mac {default|<list-name>}  
{start-stop|stop-only|none} group {<group-name>|radius}  
no aaa accounting auth-mac {default|<list-name>}
```

| Parameter    | Description   |
|--------------|---|
| default      | Configure the default accounting method list  |
| <list-name>  | Configure a named accounting method list  |
| start-stop   | Sends a start accounting message at the beginning of the session and a stop accounting message at the end of the session. |
| stop-only    | Only sends a stop accounting message at the end of the session.   |
| none         | No accounting record sent.  |
| group        | Use a server group  |
| <group-name> | Server group name.  |
| radius       | Use all RADIUS servers.   |

**Default** RADIUS accounting for MAC-based Authentication is disabled by default

**Mode** Global Configuration

**Usage notes** This command can be used to configure either the default accounting method list or a named accounting method list:

- **default:** the default accounting method list which is automatically applied to all interfaces with MAC-based authentication enabled.
- **<list-name>:** a user named list which can be applied to an interface using the [auth-mac accounting](#) command.

There are two ways to define servers where RADIUS accounting messages are sent:

- **group radius:** use all RADIUS servers configured by [radius-server host](#) command

- **group** <group-name>: use the specified RADIUS server group configured with the [aaa group server](#) command

The accounting event to send to the RADIUS server is configured with the following options:

- **start-stop**: sends a **start** accounting message at the beginning of a session and a **stop** accounting message at the end of the session.
- **stop-only**: sends a **stop** accounting message at the end of a session.
- **none**: disables accounting.

**Examples** To enable the default RADIUS accounting for MAC-based authentication, and use all available RADIUS servers, use the commands:

```
awplus# configure terminal
awplus(config)# aaa accounting auth-mac default start-stop
group radius
```

To disable RADIUS accounting for MAC-based Authentication, use the commands:

```
awplus# configure terminal
awplus(config)# no aaa accounting auth-mac default
```

To enable a named RADIUS accounting method list 'vlan10\_acct' for MAC-based authentication, with the RADIUS server group 'rad\_group\_vlan10', use the commands:

```
awplus# configure terminal
awplus(config)# aaa accounting auth-mac vlan10_acct start-stop
group rad_group_vlan10
```

To disable a named RADIUS accounting method list 'vlan10\_acct' for MAC-based authentication, use the commands:

```
awplus# configure terminal
awplus(config)# no aaa accounting auth-mac vlan10_acct
```

**Related commands**

# aaa accounting auth-web

**Overview** This command configures an accounting method list for Web-based authentication. An accounting method list specifies what type of accounting messages are sent and which RADIUS servers the accounting messages are sent to. Use this command to configure either the default method list, which is automatically applied to interfaces with Web-based authentication enabled, or a named method list, which can be applied to an interface with the [auth-web accounting](#) command.

Use the **no** variant of this command to disable either the default or a named accounting method list for Web-based authentication. Once all method lists are disabled, AAA accounting for Web-based authentication is disabled globally.

**Syntax**

```
aaa accounting auth-web {default|<list-name>}  
{start-stop|stop-only|none} group {<group-name>|radius}  
no aaa accounting auth-web {default|<list-name>}
```

| Parameter    | Description   |
|--------------|---|
| default      | Configure the default accounting method list  |
| <list-name>  | Configure a named accounting method list  |
| start-stop   | Sends a start accounting message at the beginning of the session and a stop accounting message at the end of the session. |
| stop-only    | Only sends a stop accounting message at the end of the session.   |
| none         | No accounting record sent.  |
| group        | Use a server group  |
| <group-name> | Server group name.  |
| radius       | Use all RADIUS servers.   |

**Default** RADIUS accounting for Web-based authentication is disabled by default.

**Mode** Global Configuration

**Usage notes** This command can be used to configure either the default accounting method list or a named accounting method list:

- **default:** the default accounting method list which is automatically applied to all interfaces with Web-based authentication enabled.
- **<list-name>:** a user named list which can be applied to an interface using the [auth-web accounting](#) command.

There are two ways to define servers where RADIUS accounting messages are sent:

- **group radius:** use all RADIUS servers configured by [radius-server host](#) command

- **group** <group-name>: use the specified RADIUS server group configured with the `aaa group server` command

Configure the accounting event to be sent to the RADIUS server with the following options:

- **start-stop**: sends a start accounting message at the beginning of a session and a stop accounting message at the end of the session.
- **stop-only**: sends a stop accounting message at the end of a session.
- **none**: disables accounting.

**Examples** To enable the default RADIUS accounting method for Web-based authentication, and use all available RADIUS servers, use the commands:

```
awplus# configure terminal
awplus(config)# aaa accounting auth-web default start-stop
group radius
```

To disable the default RADIUS accounting method for Web-based authentication, use the commands:

```
awplus# configure terminal
awplus(config)# no aaa accounting auth-web default
```

To enable a named RADIUS accounting method list 'vlan10\_acct' for Web-based authentication, with the RADIUS server group 'rad\_group\_vlan10', use the commands:

```
awplus# configure terminal
awplus(config)# aaa accounting auth-web vlan10_acct start-stop
group rad_group_vlan10
```

To disable a named RADIUS accounting method list 'vlan10\_acct' for Web-based authentication, use the commands:

```
awplus# configure terminal
awplus(config)# no aaa accounting auth-web vlan10_acct
```

**Related commands**

- [auth-web accounting](#)
- [auth-web enable](#)
- [radius-server host](#)
- [show aaa server group](#)

# aaa accounting commands

**Overview** This command configures and enables TACACS+ accounting on commands entered at a specified privilege level. Once enabled for a privilege level, accounting messages for commands entered at that privilege level will be sent to a TACACS+ server.

In order to account for all commands entered on a device, configure command accounting for each privilege level separately.

The command accounting message includes, the command as entered, the date and time the command finished executing, and the user-name of the user who executed the command.

Use the **no** variant of this command to disable command accounting for a specified privilege level.

TACACS+ is not available in Secure Mode (see the [crypto secure-mode](#) command).

**Syntax** `aaa accounting commands <1-15> default stop-only group tacacs+  
no aaa accounting commands <1-15> default`

| Parameter | Description  |
|-----------|--|
| <1-15>    | The privilege level being configured, in the range 1 to 15.  |
| default   | Use the default method list, this means the command is applied globally to all user exec sessions.                 |
| stop-only | Send accounting message when the commands have stopped executing.  |
| group     | Specify the server group where accounting messages are sent. Only the tacacs+ group is available for this command. |
| tacacs+   | Use all TACACS+ servers configured by the <a href="#">tacacs-server host</a> command.                              |

**Default** TACACS+ command accounting is disabled by default.

**Mode** Global Configuration

**Usage notes** This command only supports a **default** method list, this means that it is applied to every console and VTY line.

The **stop-only** parameter indicates that the command accounting messages are sent to the TACACS+ server when the commands have stopped executing.

The **group tacacs+** parameters signifies that the command accounting messages are sent to the TACACS+ servers configured by the [tacacs-server host](#) command.

Note that up to four TACACS+ servers can be configured for accounting. The servers are checked for reachability in the order they are configured with only the

first reachable server being used. If no server is found, the accounting message is dropped.

Command accounting cannot coexist with triggers. An error message is displayed if you attempt to enable command accounting while a trigger is configured. Likewise, an error message is displayed if you attempt to configure a trigger while command accounting is configured.

**Examples** To configure command accounting for privilege levels 1, 7, and 15, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa accounting commands 1 default stop-only
group tacacs+
awplus(config)# aaa accounting commands 7 default stop-only
group tacacs+
awplus(config)# aaa accounting commands 15 default stop-only
group tacacs+
```

To disable command accounting for privilege levels 1, 7, and 15, use the following commands:

```
awplus# configure terminal
awplus(config)# no aaa accounting commands 1 default
awplus(config)# no aaa accounting commands 7 default
awplus(config)# no aaa accounting commands 15 default
```

**Related commands**

- [aaa authentication login](#)
- [aaa accounting login](#)

- [tacacs-server host](#)

# aaa accounting dot1x

**Overview** Use this command to configure an accounting method list for IEEE 802.1X-based authentication. An accounting method list specifies what type of accounting messages are sent and which RADIUS servers the accounting messages are sent to. Use this command to configure either the default method list, which is automatically applied to interfaces with IEEE 802.1X-based authentication enabled, or a named method list, which can be applied to an interface with the [dot1x accounting](#) command.

Use the **no** variant of this command to disable either the default or a named accounting method list for 802.1X-based authentication. Once all method lists are disabled, AAA accounting for 802.1x-based authentication is disabled globally.

**Syntax**

```
aaa accounting dot1x {default|<list-name>}  
{start-stop|stop-only|none} group {<group-name>|radius}  
no aaa accounting dot1x {default|<list-name>}
```

| Parameter    | Description   |
|--------------|---|
| default      | Configure the default accounting method list  |
| <list-name>  | Configure a named accounting method list  |
| start-stop   | Sends a start accounting message at the beginning of the session and a stop accounting message at the end of the session. |
| stop-only    | Only sends a stop accounting message at the end of the session.   |
| none         | No accounting record sent.  |
| group        | Use a server group  |
| <group-name> | Server group name.  |
| radius       | Use all RADIUS servers.   |

**Default** RADIUS accounting for 802.1X-based authentication is disabled by default (there is no default server set by default).

**Mode** Global Configuration

**Usage notes** This command can be used to configure either the default accounting method list or a named accounting method list:

- **default:** the default accounting method list which is automatically applied to all interfaces with 802.1X-based authentication enabled.
- **<list-name>:** a user named list which can be applied to an interface using the [dot1x accounting](#) command.

There are two ways to define servers where RADIUS accounting messages will be sent:

- **group radius:** use all RADIUS servers configured by [radius-server host](#) command.
- **group <group-name>:** use the specified RADIUS server group configured with the [aaa group server](#) command.

The accounting event to send to the RADIUS server is configured by the following options:

- **start-stop:** sends a **start** accounting message at the beginning of a session and a **stop** accounting message at the end of the session.
- **stop-only:** sends a **stop** accounting message at the end of a session.
- **none:** disables accounting.

**Examples** To enable RADIUS accounting for 802.1X-based authentication, and use all available RADIUS Servers, use the commands:

```
awplus# configure terminal
awplus(config)# aaa accounting dot1x default start-stop group
radius
```

To disable RADIUS accounting for 802.1X-based authentication, use the commands:

```
awplus# configure terminal
awplus(config)# no aaa accounting dot1x default
```

To enable a named RADIUS accounting method list 'vlan10\_acct' for 802.1X-based authentication, with the RADIUS server group 'rad\_group\_vlan10', use the commands:

```
awplus# configure terminal
awplus(config)# aaa accounting dot1x vlan10_acct start-stop
group rad_group_vlan10
```

To disable a named RADIUS accounting method list 'vlan10\_acct' for 802.1X-based authentication, use the commands:

```
awplus# configure terminal
awplus(config)# no aaa accounting dot1x vlan10_acct
```

**Command  
changes**

Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

# aaa accounting login

**Overview** This command configures RADIUS and TACACS+ accounting for login shell sessions. The specified method list name can be used by the **accounting login** command in the Line Configuration mode. If the **default** parameter is specified, then this creates a default method list that is applied to every console and VTY line, unless another accounting method list is applied on that line.

Note that unlimited RADIUS servers and up to four TACACS+ servers can be configured and consulted for accounting. The first server configured is regarded as the primary server and if the primary server fails then the backup servers are consulted in turn. A backup server is consulted if the primary server fails, i.e. is unreachable.

TACACS+ is not available in Secure Mode (see the [crypto secure-mode](#) command).

Use the **no** variant of this command to remove an accounting method list for login shell sessions configured by an **aaa accounting login** command. If the method list being deleted is already applied to a console or VTY line, accounting on that line will be disabled. If the default method list name is removed by this command, it will disable accounting on every line that has the default accounting configuration.

**Syntax**

```
aaa accounting login  
{default|<list-name>}{start-stop|stop-only|none} {group  
{radius|tacacs+|<group-name>}}  
  
no aaa accounting login {default|<list-name>}
```

| Parameter    | Description   |
|--------------|---|
| default      | Default accounting method list.   |
| <list-name>  | Named accounting method list.   |
| start-stop   | Start and stop records to be sent.  |
| stop-only    | Stop records to be sent.  |
| none         | No accounting record to be sent.  |
| group        | Specify the servers or server group where accounting packets are sent.                                |
| radius       | Use all RADIUS servers configured by the <a href="#">radius-server host</a> command.                  |
| tacacs+      | Use all TACACS+ servers configured by the <a href="#">tacacs-server host</a> command.                 |
| <group-name> | Use the specified RADIUS server group, as configured by the <a href="#">aaa group server</a> command. |

**Default** Accounting for login shell sessions is disabled by default.

**Mode** Global Configuration

**Usage notes** This command enables you to define a named accounting method list. The items that you define in the accounting options are:

- the types of accounting packets that will be sent
- the set of servers to which the accounting packets will be sent

You can define a default method list with the name **default** and any number of other named method lists. The name of any method list that you define can then be used as the *<list-name>* parameter in the [accounting login](#) command.

If the method list name already exists, the command will replace the existing configuration with the new one.

There are two ways to define servers where RADIUS accounting messages are sent:

- **group radius** : use all RADIUS servers configured by [radius-server host](#) command
- **group <group-name>** : use the specified RADIUS server group configured with the [aaa group server](#) command

There is one way to define servers where TACACS+ accounting messages are sent:

- **group tacacs+** : use all TACACS+ servers configured by [tacacs-server host](#) command

The accounting event to send to the RADIUS or TACACS+ server is configured with the following options:

- **start-stop** : sends a **start** accounting message at the beginning of a session and a **stop** accounting message at the end of the session.
- **stop-only** : sends a **stop** accounting message at the end of a session.
- **none** : disables accounting.

**Examples** To configure RADIUS accounting for login shell sessions, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa accounting login default start-stop group
radius
```

To configure TACACS+ accounting for login shell sessions, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa accounting login default start-stop group
tacacs+
```

To reset the configuration of the default accounting list, use the following commands:

```
awplus# configure terminal
awplus(config)# no aaa accounting login default
```

**Related commands**

- [accounting login](#)
- [radius-server host](#)
- [tacacs-server host](#)

# aaa accounting update

**Overview** This command enables periodic accounting reporting to either the RADIUS or TACACS+ accounting server(s) wherever login accounting has been configured.

Note that unlimited RADIUS servers and up to four TACACS+ servers can be configured and consulted for accounting. The first server configured is regarded as the primary server and if the primary server fails then the backup servers are consulted in turn. A backup server is consulted if the primary server fails, i.e. is unreachable.

Use the **no** variant of this command to disable periodic accounting reporting to the accounting server(s).

**Syntax** `aaa accounting update [periodic <1-65535>]`  
`no aaa accounting update`

| Parameter                    | Description  |
|------------------------------|--|
| <code>periodic</code>        | Send accounting records periodically.  |
| <code>&lt;1-65535&gt;</code> | The interval to send accounting updates (in minutes). The default is 30 minutes. |

**Default** Disabled

**Mode** Global Configuration

**Usage notes** Use this command to enable the device to send periodic AAA login accounting reports to the accounting server. When periodic accounting reporting is enabled, interim accounting records are sent at the interval specified by the **periodic** parameter. The accounting updates are start messages.

If the **no** variant of this command is used to disable periodic accounting reporting, any interval specified by the **periodic** parameter is reset to the default of 30 minutes when accounting reporting is re-enabled, unless this interval is specified.

**Examples** To configure the switch to send period accounting updates every 30 minutes, the default period, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa accounting update
```

To configure the switch to send period accounting updates every 10 minutes, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa accounting update periodic 10
```

To disable periodic accounting updates wherever accounting has been configured, use the following commands:

```
awplus# configure terminal  
awplus(config)# no aaa accounting update
```

**Related  
commands**

aaa accounting auth-mac  
aaa accounting auth-web  
aaa accounting dot1x  
aaa accounting login  
radius-server host

# aaa authentication auth-mac

**Overview** This command enables MAC-based authentication globally and allows you to enable either the default authentication method list (in this case, a list of RADIUS servers), which is automatically applied to every interface running MAC-based authentication, or a user named authentication method list, which is applied to an interface with the [auth-mac authentication](#) command.

Use the **no** variant of this command to disable either the default or a named method list for MAC-based authentication. Once all method lists are disabled MAC-based authentication is disabled globally.

**Syntax**

```
aaa authentication auth-mac {default|<list-name>} group  
{<group-name>|radius}  
  
no aaa authentication auth-mac {default|<list-name>}
```

| Parameter    | Description                                      |
|--------------|--|
| default      | Configure the default authentication method list |
| <list-name>  | Configure a named authentication method list     |
| group        | Use a server group                               |
| <group-name> | Server group name.                               |
| radius       | Use all RADIUS servers.                          |

**Default** MAC-based Port Authentication is disabled by default.

**Mode** Global Configuration

**Usage notes** This command can be used to configure either the default authentication method list or a named authentication method list:

- **default:** the default authentication method list which is automatically applied to all interfaces with Web-based authentication enabled.
- **<list-name>:** a user named list which can be applied to an interface using the [auth-web authentication](#) command.

There are two ways to define servers where RADIUS accounting messages are sent:

- **group radius:** use all RADIUS servers configured by [radius-server host](#) command
- **group <group-name>:** use the specified RADIUS server group configured with the [aaa group server](#) command

All configured RADIUS Servers are automatically members of the server group **radius**. If a server is added to a named group **<group-name>**, it also remains a member of the group **radius**.

**Examples** To enable MAC-based authentication globally for all RADIUS servers, and use all available RADIUS servers, use the commands:

```
awplus# configure terminal
awplus(config)# aaa authentication auth-mac default group
radius
```

To disable MAC-based authentication, use the commands:

```
awplus# configure terminal
awplus(config)# no aaa authentication auth-mac default
```

To enable MAC-based authentication for named list 'vlan10\_auth', with RADIUS server group 'rad\_group\_vlan10, use the commands:

```
awplus# configure terminal
awplus(config)# aaa authentication auth-mac vlan10_auth group
rad_group_vlan10
```

To disable MAC-based authentication for named list 'vlan10\_auth', use the commands:

```
awplus# configure terminal
awplus(config)# no aaa authentication auth-mac vlan10_acct
```

**Related commands**

- [aaa group server](#)
- [auth-mac authentication](#)
- [auth-mac enable](#)
- [radius-server host](#)
- [show aaa server group](#)

# aaa authentication auth-web

**Overview** This command enables Web-based authentication globally and allows you to enable either the default authentication method list (in this case, a list of RADIUS servers), which is automatically applied to every interface running Web-based authentication, or a user named authentication method list, which is applied to an interface with the [auth-web authentication](#) command.

Use the **no** variant of this command to disable either the default or a named method list for Web-based authentication. Once all method lists are disabled Web-based authentication is disabled globally.

**Syntax**

```
aaa authentication auth-web {default|<list-name>} group  
{<group-name>|radius}  
  
no aaa authentication auth-web {default|<list-name>}
```

| Parameter    | Description                                      |
|--------------|--|
| default      | Configure the default authentication method list |
| <list-name>  | Configure a named authentication method list     |
| group        | Use a server group                               |
| <group-name> | Server group name.                               |
| radius       | Use all RADIUS servers.                          |

**Default** Web-based authentication is disabled by default.

**Mode** Global Configuration

**Usage notes** This command can be used to configure either the default authentication method list or a named authentication method list:

- **default:** the default authentication method list which is automatically applied to all interfaces with Web-based authentication enabled.
- **<list-name>:** a user named list which can be applied to an interface using the [auth-web authentication](#) command.

There are two ways to define servers where RADIUS accounting messages are sent:

- **group radius:** use all RADIUS servers configured by [radius-server host](#) command
- **group <group-name>:** use the specified RADIUS server group configured with the [aaa group server](#) command

Note that you need to configure an IPv4 address for the VLAN interface on which Web authentication is running.

**Examples** To enable Web-based authentication globally for all RADIUS servers, and use all available RADIUS servers, use the commands:

```
awplus# configure terminal
awplus(config)# aaa authentication auth-web default group
radius
```

To disable Web-based authentication, use the commands:

```
awplus# configure terminal
awplus(config)# no aaa authentication auth-web default
```

To enable Web-based authentication for named list 'vlan10\_auth', with RADIUS server group 'rad\_group\_vlan10, use the commands:

```
awplus# configure terminal
awplus(config)# aaa authentication auth-web vlan10_auth group
rad_group_vlan10
```

To disable Web-based authentication for named list 'vlan10\_auth', use the commands:

```
awplus# configure terminal
awplus(config)# no aaa authentication vlan10_auth
```

**Related commands**

# aaa authentication dot1x

**Overview** Use this command to enable IEEE 802.1X-based authentication globally and to allow you to enable either the default authentication method list (in this case, a list of RADIUS servers), which is automatically applied to every interface running IEEE 802.1X-based authentication, or a user named authentication method list, which is applied to an interface with the [dot1x authentication](#) command.

Use the **no** variant of this command to disable either the default or a named method list for 802.1X-based authentication. Once all method lists are disabled 802.1x-based authentication is disabled globally.

**Syntax**

```
aaa authentication dot1x {default|<list-name>} group  
{<group-name>|radius}  
  
no aaa authentication dot1x {default|<list-name>}
```

| Parameter    | Description                                      |
|--------------|--|
| default      | Configure the default authentication method list |
| <list-name>  | Configure a named authentication method list     |
| group        | Use a server group                               |
| <group-name> | Server group name.                               |
| radius       | Use all RADIUS servers.                          |

**Default** 802.1X-based Port Authentication is disabled by default.

**Mode** Global Configuration

**Usage notes** This command can be used to configure either the default authentication method list or a named authentication method list:

- **default:** the default authentication method list which is automatically applied to all interfaces with 802.1X-based authentication enabled.
- **<list-name>:** a user named list which can be applied to an interface using the [aaa authentication dot1x](#) command.

There are two ways to define servers where RADIUS accounting messages are sent:

- **group radius:** use all RADIUS servers configured by [radius-server host](#) command
- **group <group-name>:** use the specified RADIUS server group configured with the [aaa group server](#) command

**Examples** To enable 802.1X-based authentication globally with all RADIUS servers, and use all available RADIUS servers, use the command:

```
awplus# configure terminal  
awplus(config)# aaa authentication dot1x default group radius
```

To disable 802.1X-based authentication, use the command:

```
awplus# configure terminal
awplus(config)# no aaa authentication dot1x default
```

To enable 802.1X-based authentication for named list 'vlan10\_auth', with RADIUS server group 'rad\_group\_vlan10', use the commands:

```
awplus# configure terminal
awplus(config)# aaa authentication dot1x vlan10_auth group
rad_group_vlan10
```

To disable 802.1X-based authentication for named list 'vlan10\_auth' use the commands:

```
awplus# configure terminal
awplus(config)# no aaa authentication dot1x vlan10_acct
```

**Command  
changes**

Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

# aaa authentication enable default group tacacs+

**Overview** This command enables privilege level authentication against a TACACS+ server. Use the **no** variant of this command to disable privilege level authentication. TACACS+ is not available in Secure Mode (see the [crypto secure-mode](#) command).

**Syntax** `aaa authentication enable default group tacacs+ [local] [none]`  
`no aaa authentication enable default`

| Parameter | Description  |
|-----------|--|
| local     | Use the locally configured enable password ( <b>enable password</b> command) for authentication. |
| none      | No authentication.   |

**Default** Local privilege level authentication is enabled by default ([aaa authentication enable default local](#) command).

**Mode** Global Configuration

**Usage notes** A user is configured on a TACACS+ server with a maximum privilege level. When they enter the [enable \(Privileged Exec mode\)](#) command they are prompted for an enable password which is authenticated against the TACACS+ server. If the password is correct and the specified privilege level is equal to or less than the users maximum privilege level, then they are granted access to that level. If the user attempts to access a privilege level that is higher than their maximum configured privilege level, then the authentication session will fail and they will remain at their current privilege level.

**NOTE:** If both **local** and **none** are specified, you must always specify **local** first.

If the TACACS+ server goes offline, or is not reachable during enable password authentication, and command level authentication is configured as:

- **aaa authentication enable default group tacacs+**  
then the user is never granted access to Privileged Exec mode.
- **aaa authentication enable default group tacacs+ local**  
then the user is authenticated using the locally configured enable password, which if entered correctly grants the user access to Privileged Exec mode. If no enable password is locally configured (**enable password** command), then the enable authentication will fail until the TACACS+ server becomes available again.

- **aaa authentication enable default group tacacs+ none**  
then the user is granted access to Privileged Exec mode with no authentication. This is true even if a locally configured enable password is configured.
- **aaa authentication enable default group tacacs+ local none**  
then the user is authenticated using the locally configured enable password. If no enable password is locally configured, then the enable authentication will grant access to Privileged Exec mode with no authentication.

If the password for the user is not successfully authenticated by the server, then the user is again prompted for an enable password when they enter **enable** via the CLI.

**Examples** To enable a privilege level authentication method that will not allow the user to access Privileged Exec mode if the TACACS+ server goes offline, or is not reachable during enable password authentication, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa authentication enable default group tacacs+
```

To enable a privilege level authentication method that will allow the user to access Privileged Exec mode if the TACACS+ server goes offline, or is not reachable during enable password authentication, and a locally configured enable password is configured, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa authentication enable default group tacacs+
local
```

To disable privilege level authentication, use the following commands:

```
awplus# configure terminal
awplus(config)# no aaa authentication enable default
```

**Related commands**

- [aaa authentication login](#)
- [aaa authentication enable default local](#)
- [enable \(Privileged Exec mode\)](#)
- [enable password](#)
- [enable secret \(deprecated\)](#)
- [tacacs-server host](#)

# aaa authentication enable default local

**Overview** This command enables local privilege level authentication.  
Use the **no** variant of this command to disable local privilege level authentication.

**Syntax** `aaa authentication enable default local`  
`no aaa authentication enable default`

**Default** Local privilege level authentication is enabled by default.

**Mode** Global Configuration

**Usage notes** The privilege level configured for a particular user in the local user database is the privilege threshold above which the user is prompted for an [enable \(Privileged Exec mode\)](#) command.

**Examples** To enable local privilege level authentication, use the following commands:

```
awplus# configure terminal  
awplus(config)# aaa authentication enable default local
```

To disable local privilege level authentication, use the following commands:

```
awplus# configure terminal  
awplus(config)# no aaa authentication enable default
```

**Related commands** [aaa authentication login](#)  
[enable \(Privileged Exec mode\)](#)  
[enable password](#)  
[enable secret \(deprecated\)](#)

# aaa authentication login

**Overview** Use this command to create an ordered list of methods for authenticating user logins. It can also be used to replace an existing method list with a list of the same name. Specify one or more of the options **local** or **group**, in the order you want them to be applied. If the **default** method list name is specified, it is applied to every console and VTY line immediately unless another method list is applied to that line by the [login authentication](#) command. To apply a non-default method list, you must also use the [login authentication](#) command.

TACACS+ is not available in Secure Mode (see the [crypto secure-mode](#) command).

Use the **no** variant of this command to remove a method list from user login authentication. The specified method list name is deleted from the configuration. If the method list name has been applied to any console or VTY line, user login authentication on that line will fail.

Note that the **no aaa authentication login default** command does not remove the default method list. This will return the default method list to its default state (**local** is the default).

**Syntax** `aaa authentication login {default|<list-name>} {[local] [group {radius|ldap|tacacs+|<group-name>}]}`  
`no aaa authentication login {default|<list-name>}`

| Parameter    | Description   |
|--------------|---|
| default      | Set the default authentication server for user login.                                 |
| <list-name>  | Name of authentication server.  |
| local        | Use the local username database.  |
| group        | Use server group.   |
| radius       | Use all RADIUS servers configured by the <a href="#">radius-server host</a> command.  |
| ldap         | Use all LDAP servers configured by the <a href="#">ldap-server</a> command.           |
| tacacs+      | Use all TACACS+ servers configured by the <a href="#">tacacs-server host</a> command. |
| <group-name> | Use the specified RADIUS or LDAP server group.  |

**Default** If the default server is not configured using this command, user login authentication uses the local user database only.

If the **default** method list name is specified, it is applied to every console and VTY line immediately unless a named method list server is applied to that line by the **login authentication** command.

**local** is the default state for the default method list unless a named method list is applied to that line by the **login authentication** command. You can reset it to the default method list using the **no aaa authentication login default** command.

**Mode** Global Configuration

**Usage notes** When a user attempts to log in, the switch sends an authentication request to the first authentication server in the method list. If the first server in the list is reachable and it contains a username and password matching the authentication request, the user is authenticated and the login succeeds. If the authentication server denies the authentication request because of an incorrect username or password, the user login fails. If the first server in the method list is unreachable, the switch sends the request to the next server in the list, and so on.

For example, if the method list specifies **group tacacs+ local**, and a user attempts to log in with a password that does not match a user entry in the first TACACS+ server, if this TACACS+ server denies the authentication request, then the switch does not try any other TACACS+ servers nor the local user database; the user login fails.

**Examples** To configure the default authentication method list for user login to first use all available RADIUS servers for user login authentication, and then use the local user database, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa authentication login default group radius
local
```

To configure the default authentication method list for user login to first use all available LDAP servers for user login authentication, and then use the local user database, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa authentication login default group ldap
local
```

To configure a user login authentication method list called 'USERS' to first use the RADIUS server group 'RAD\_GROUP1' for user login authentication, and then use the local user database, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa authentication login USERS group RAD_GROUP1
local
```

To configure a user login authentication method list called 'USERS' to first use the TACACS+ servers for user login authentication, and then use the local user database, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa authentication login USERS group tacacs+
local
```

To return to the default method list (**local** is the default server), use the following commands:

```
awplus# configure terminal
awplus(config)# no aaa authentication login default
```

To delete an existing authentication method list 'USERS' created for user login authentication, use the following commands:

```
awplus# configure terminal
awplus(config)# no aaa authentication login USERS
```

**Command  
changes**

Version 5.5.2-1.1: **ldap** parameter added

# aaa authorization commands

**Overview** This command configures a method list for commands authorization that can be applied to console or VTY lines. When command authorization is enabled for a privilege level, only authorized users can executed commands in that privilege level.

Use the **no** variant of this command to remove a named method list or disable the default method list for a privilege level.

**Syntax**

```
aaa authorization commands <privilege-level>
{default|<list-name>} group tacacs+ [none]

no aaa authorization commands <privilege-level>
{default|<list-name>}
```

| Parameter         | Description   |
|-------------------|---|
| <privilege-level> | The privilege level of the set of commands the method list will be applied to.<br>AlliedWare Plus defines three sets of commands, that are indexed by a level value:<br><b>Level = 1:</b> All commands that can be accessed by a user with privilege level between 1 and 6 inclusive<br><b>Level = 7:</b> All commands that can be accessed by a user with privilege level between 7 and 14 inclusive<br><b>Level = 15:</b> All commands that can be accessed by a user with privilege level 15 |
| group             | Specify the server group where authorization messages are sent. Only the <code>tacacs+</code> group is available for this command.  |
| tacacs+           | Use all TACACS+ servers configured by the <code>tacacs-server host</code> command.  |
| default           | Configure the default authorization commands method list.   |
| <list-name>       | Configure a named authorization commands method list  |
| none              | If specified, this provides a local fallback to command authorization so that if authorization servers become unavailable then the device will accept all commands normally allowed for the privilege level of the user.  |

**Mode** Global Configuration

**Usage notes** TACACS+ command authorization provides centralized control of the commands available to a user of an AlliedWare Plus device. Once enabled:

- The command string and username are encrypted and sent to the first available configured TACACS+ server (the first server configured) for authorization.

- The TACACS+ server decides if the user is authorized to execute the command and returns the decision to the AlliedWare Plus device.
- Depending on this decision the device will then either execute the command or notify the user that authorization has failed.

If multiple TACACS+ servers are configured, and the first server is unreachable or does not respond, the other servers will be queried, in turn, for an authorization decision. If all servers are unreachable and a local fallback has been configured, with the **none** parameter, then commands are authorized based on the user's privilege level; the same behavior as if command authorization had not been configured. If, however, the local fallback is not configured and all servers become unreachable then all commands except **logout**, **exit**, and **quit** will be denied.

The **default** method list is defined with a local fallback unless configured differently using this command.

**Example** To configure a commands authorization method list, named TAC15, using all TACACS+ servers to authorize commands for privilege level 15, with a local fallback, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa authorization commands 15 TAC15 group
tacacs+ none
```

To configure the default method list to authorize commands for privilege level 7, with no local fallback, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa authorization commands 7 default group
tacacs+
```

To remove the authorization method list TAC15, use the following commands:

```
awplus# configure terminal
awplus(config)# no aaa authorization commands 15 TAC15
```

**Related commands** [aaa authorization config-commands](#)  
[authorization commands](#)

**Command changes** Version 5.4.6-2.1: command added

# aaa authorization config-commands

**Overview** Use this command to enable command authorization on configuration mode commands. By default, command authorization applies to commands in exec mode only.

Use the **no** variant of this command to disable command authorization on configuration mode commands.

**Syntax** `aaa authorization config-commands`  
`no aaa authorization config-commands`

**Default** By default, command authorization is disabled on configuration mode commands.

**Mode** Global Configuration

**Usage notes** If authorization of configuration mode commands is not enabled then all configuration commands are accepted by default, including command authorization commands.

**NOTE:** *Authorization of configuration commands is required for a secure TACACS+ command authorization configuration as it prevents the feature from being disabled to gain access to unauthorized exec mode commands.*

**Example** To enable command authorization for configuration mode commands, use the commands:

```
awplus# configure terminal
awplus(config)# aaa authorization config-commands
```

To disable command authorization for configuration mode commands, use the commands:

```
awplus# configure terminal
awplus(config)# no aaa authorization config-commands
```

**Related commands** [aaa authorization commands](#)  
[authorization commands](#)  
[tacacs-server host](#)

**Command changes** Version 5.4.6-2.1: command added

# aaa group server

**Overview** Use this command to create an AAA group of RADIUS or LDAP servers, and to enter Server Group Configuration mode.

A server group is used to specify a subset of RADIUS or LDAP servers in AAA commands. Once in Server Group Configuration mode you can add servers to the group.

Use the **no** variant of this command to remove an existing server group.

**Syntax**

```
aaa group server {radius|ldap} <group-name>  
no aaa group server {radius|ldap} <group-name>
```

| Parameter    | Description                                |
|--------------|--|
| radius       | Create or configure a RADIUS server group. |
| ldap         | Create or configure an LDAP server group.  |
| <group-name> | Server group name.                         |

**Mode** Global Configuration

**Usage notes** To add servers to a RADIUS or LDAP server group, use the **server** command. Each RADIUS server in a server group must be configured using the [radius-server host](#) command. Similarly, each LDAP server in a server group must be configured using the [ldap-server](#) command.

Server groups named 'radius' and 'ldap' are predefined and include all RADIUS and LDAP servers configured using the [radius-server host](#) or [ldap-server](#) commands.

**Examples** To create a RADIUS server group named 'GROUP1' with hosts 192.168.1.1, 192.168.2.1 and 192.168.3.1, use the commands:

```
awplus(config)# aaa group server radius GROUP1  
awplus(config-sg)# server 192.168.1.1 auth-port 1812 acct-port 1813  
awplus(config-sg)# server 192.168.2.1 auth-port 1812 acct-port 1813  
awplus(config-sg)# server 192.168.3.1 auth-port 1812 acct-port 1813
```

To remove a RADIUS server group named 'GROUP1' from the configuration, use the command:

```
awplus(config)# no aaa group server radius GROUP1
```

To create an LDAP server group named 'GROUP2' with servers named 'SERVER1', 'SERVER2' and 'SERVER3', use the commands:

```
awplus(config)# aaa group server ldap GROUP2
awplus(config-ldap-group)# server SERVER1
awplus(config-ldap-group)# server SERVER2
awplus(config-ldap-group)# server SERVER3
```

To remove an LDAP server group named 'GROUP2' from the configuration, use the command:

```
awplus(config)# no aaa group server ldap GROUP2
```

changes**

Version 5.5.2-1.1: **ldap** parameter added

# aaa local authentication attempts lockout-time

**Overview** This command configures the duration of the user lockout period.

Use the **no** variant of this command to restore the duration of the user lockout period to its default of 300 seconds (5 minutes).

**Syntax** `aaa local authentication attempts lockout-time <lockout-time>`  
`no aaa local authentication attempts lockout-time`

| Parameter                         | Description   |
|-----------------------------------|---|
| <code>&lt;lockout-time&gt;</code> | <code>&lt;0-10000&gt;</code> . Time in seconds to lockout the user. |

**Mode** Global Configuration

**Default** The default for the lockout-time is 300 seconds (5 minutes).

**Usage notes** While locked out all attempts to login with the locked account will fail. The lockout can be manually cleared by another privileged account using the [clear aaa local user lockout](#) command.

**Examples** To configure the lockout period to 10 minutes (600 seconds), use the commands:

```
awplus# configure terminal
awplus(config)# aaa local authentication attempts lockout-time
600
```

To restore the default lockout period of 5 minutes (300 seconds), use the commands:

```
awplus# configure terminal
awplus(config)# no aaa local authentication attempts
lockout-time
```

**Related commands** [aaa local authentication attempts max-fail](#)

# aaa local authentication attempts max-fail

**Overview** This command configures the maximum number of failed login attempts before a user account is locked out. Every time a login attempt fails the failed login counter is incremented.

Use the **no** variant of this command to restore the maximum number of failed login attempts to the default setting (five failed login attempts).

**Syntax** `aaa local authentication attempts max-fail <failed-logins>`  
`no aaa local authentication attempts max-fail`

| Parameter                          | Description   |
|------------------------------------|---|
| <code>&lt;failed-logins&gt;</code> | <code>&lt;1-32&gt;</code> . Number of login failures allowed before locking out a user. |

**Mode** Global Configuration

**Default** The default for the maximum number of failed login attempts is five failed login attempts.

**Usage** When the failed login counter reaches the limit configured by this command that user account is locked out for a specified duration configured by the [aaa local authentication attempts lockout-time](#) command.

When a successful login occurs the failed login counter is reset to 0. When a user account is locked out all attempts to login using that user account will fail.

**Examples** To configure the number of login failures that will lock out a user account to two login attempts, use the commands:

```
awplus# configure terminal
awplus(config)# aaa local authentication attempts max-fail 2
```

To restore the number of login failures that will lock out a user account to the default number of login attempts (five login attempts), use the commands:

```
awplus# configure terminal
awplus(config)# no aaa local authentication attempts max-fail
```

**Related commands** [aaa local authentication attempts lockout-time](#)  
[clear aaa local user lockout](#)

# aaa login fail-delay

**Overview** Use this command to configure the minimum time period between failed login attempts. This setting applies to login attempts via the console, SSH and Telnet. Use the **no** variant of this command to reset the minimum time period to its default value.

**Syntax** `aaa login fail-delay <1-10>`  
`no aaa login fail-delay`

| Parameter | Description   |
|-----------|---|
| <1-10>    | The minimum number of seconds required between login attempts |

**Default** 1 second

**Mode** Global configuration

**Example** To apply a delay of at least 5 seconds between login attempts, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa login fail-delay 5
```

**Related commands** [aaa authentication login](#)  
[aaa local authentication attempts lockout-time](#)  
[clear aaa local user lockout](#)

# accounting login

**Overview** This command applies a login accounting method list to console or VTY lines for user login. When login accounting is enabled using this command, logging events generate an accounting record to the accounting server.

The accounting method list must be configured first using this command. If an accounting method list is specified that has not been created by this command then accounting will be disabled on the specified lines.

The **no** variant of this command resets AAA Accounting applied to console or VTY lines for local or remote login. **default** login accounting is applied after issuing the **no accounting login** command. Accounting is disabled with **default**.

**Syntax** `accounting login {default|<list-name>}`  
`no accounting login`

| Parameter   | Description                     |
|-------------|---------------------------------|
| default     | Default accounting method list. |
| <list-name> | Named accounting method list.   |

**Default** By default login accounting is disabled in the **default** accounting server. No accounting will be performed until accounting is enabled using this command.

**Mode** Line Configuration

**Examples** To apply the accounting server `USERS` to all VTY lines, use the following commands:

```
awplus# configure terminal
awplus(config)# line vty 0 32
awplus(config-line)# accounting login USERS
```

**Related commands** [aaa accounting commands](#)  
[aaa accounting login](#)

# authorization commands

**Overview** This command applies a command authorization method list, defined using the [aaa authorization commands](#) command, to console and VTY lines.

Use the **no** variant of this command to reset the command authorization configuration on the console and VTY lines.

**Syntax** `authorization commands <privilege-level> {default|<list-name>}`  
`no authorization commands <privilege-level>`

| Parameter                            | Description   |
|--------------------------------------|---|
| <code>&lt;privilege-level&gt;</code> | The privilege level of the set of commands the method list will be applied to.<br>AlliedWare Plus defines three sets of commands, that are indexed by a level value:<br><b>Level = 1:</b> All commands that can be accessed by a user with privilege level between 1 and 6 inclusive<br><b>Level = 7:</b> All commands that can be accessed by a user with privilege level between 7 and 14 inclusive<br><b>Level = 15:</b> All commands that can be accessed by a user with privilege level 15 |
| <code>default</code>                 | Configure the default authorization commands method list.   |
| <code>&lt;list-name&gt;</code>       | Configure a named authorization commands method list  |

**Default** The **default** method list is applied to each console and VTY line by default.

**Mode** Line Configuration

**Usage notes** If the specified method list does not exist users will not be able to execute any commands in the specified method list on the specified VTY lines.

**Example** To apply the TAC15 command authorization method list with privilege level 15 to VTY lines 0 to 5, use the following commands:

```
awplus# configure terminal
awplus(config)# line vty 0 5
awplus(config-line)# authorization commands 15 TAC15
```

To reset the command authorization configuration with privilege level 15 on VTY lines 0 to 5, use the following commands:

```
awplus# configure terminal
awplus(config)# line vty 0 5
awplus(config-line)# no authorization commands 15
```

**Related commands** [aaa authorization commands](#)

aaa authorization config-commands

tacacs-server host

**Command changes** Version 5.4.6-2.1: command added

# clear aaa local user lockout

**Overview** Use this command to clear the lockout on a specific user account or all user accounts.

**Syntax** `clear aaa local user lockout {username <username>|all}`

| Parameter  | Description                           |
|------------|---------------------------------------|
| username   | Clear lockout for the specified user. |
| <username> | Specifies the user account.           |
| all        | Clear lockout for all user accounts.  |

**Mode** Privileged Exec

**Examples** To unlock the user account 'bob' use the following command:

```
awplus# clear aaa local user lockout username bob
```

To unlock all user accounts use the following command:

```
awplus# clear aaa local user lockout all
```

**Related commands** [aaa local authentication attempts lockout-time](#)

# debug aaa

**Overview** This command enables AAA debugging.

Use the **no** variant of this command to disable AAA debugging.

**Syntax** debug aaa [accounting|all|authentication|authorization]  
no debug aaa [accounting|all|authentication|authorization]

| Parameter      | Description                        |
|----------------|------------------------------------|
| accounting     | Accounting debugging.              |
| all            | All debugging options are enabled. |
| authentication | Authentication debugging.          |
| authorization  | Authorization debugging.           |

**Default** AAA debugging is disabled by default.

**Mode** Privileged Exec

**Examples** To enable authentication debugging for AAA, use the command:

```
awplus# debug aaa authentication
```

To disable authentication debugging for AAA, use the command:

```
awplus# no debug aaa authentication
```

**Related commands** [show debugging aaa](#)  
[undebug aaa](#)

# login authentication

**Overview** Use this command to apply an AAA server for authenticating user login attempts from a console or remote logins on these console or VTY lines. The authentication method list must be specified by the **aaa authentication login** command. If the method list has not been configured by the **aaa authentication login** command, login authentication will fail on these lines.

Use the **no** variant of this command to reset AAA Authentication configuration to use the default method list for login authentication on these console or VTY lines.

**Command Syntax**

```
login authentication {default|<list-name>}  
no login authentication
```

| Parameter   | Description  |
|-------------|--|
| default     | The default authentication method list. If the default method list has not been configured by the <a href="#">aaa authentication login</a> command, the local user database is used for user login authentication. |
| <list-name> | Named authentication server.   |

**Default** The default login authentication method list, as specified by the [aaa authentication login](#) command, is used to authenticate user login. If this has not been specified, the default is to use the local user database.

**Mode** Line Configuration

**Examples** To reset user authentication configuration on all VTY lines, use the following commands:

```
awplus# configure terminal  
awplus(config)# line vty 0 32  
awplus(config-line)# no login authentication
```

**Related commands** [aaa authentication login](#)  
[line](#)

# proxy-port

**Overview** Use this command to change the local UDP port used for communication between local RADIUS client applications and the RadSecProxy AAA application. Any unused UDP port may be selected. The default port is 1645.

Use the **no** variant of this command to change the UDP port back to the default of 1645.

**Syntax** `proxy-port <port>`  
`no proxy-port`

| Parameter                 | Description               |
|---------------------------|---------------------------|
| <code>&lt;port&gt;</code> | UDP Port Number, 1-65536. |

**Default** The default port is 1645.

**Mode** RadSecProxy AAA Configuration Mode

**Usage notes** It is not necessary to change the value from the default unless UDP port 1645 is required for another purpose. RADIUS requests received on this port from external devices will be ignored. The port is only used for local (intra-device) communication.

**Example** To configure change the UDP port to 7001, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-secure-proxy aaa
awplus(config-radsecproxy-aaa)# proxy-port 7001
```

**Related commands** [radius-secure-proxy aaa](#)  
[server \(radsecproxy-aaa\)](#)  
[server name-check](#)  
[server trustpoint](#)

# radius-secure-proxy aaa

**Overview** Use this command to enter the RadSecProxy AAA (authentication, authorization, and accounting) application configuration mode. This application allows local RADIUS-based clients on system to communicate with remote RadSec servers via a secure (TLS) proxy.

**Syntax** `radius-secure-proxy aaa`

**Mode** Global Configuration Mode

**Example** To change mode from User Exec mode to the RadSecProxy AAA configuration mode, use the commands:

```
awplus# configure terminal
awplus(config)# radius-secure-proxy aaa
awplus(config-radsecproxy-aaa)#
```

**Related commands**

- [proxy-port](#)
- [server \(radsecproxy-aaa\)](#)
- [server name-check](#)
- [server trustpoint](#)

# server (radsecproxy-aaa)

**Overview** Use this command to add a server to the RadSecProxy AAA application. Local RADIUS client applications will attempt, via the proxy, to communicate with any RadSec servers that are operational (in addition to any non-TLS RADIUS servers that are configured).

Use the **no** variant of this command to delete a previously-configured server from the RadSecProxy AAA application.

**Syntax** `server {<hostname>|<ip-addr>} [timeout <1-1000>] [name-check {on|off}]`

`no server {<hostname>|<ip-addr>}`

| Parameter                     | Description   |
|-------------------------------|---|
| <code>&lt;hostname&gt;</code> | Hostname of RadSec server   |
| <code>&lt;ip-addr&gt;</code>  | Specify the client IPv4 address, in dotted decimal notation (A.B.C.D).  |
| <code>timeout</code>          | Specify the amount of time that the RadSecProxy AAA application should wait for replies from this server. RADIUS server timeout (which defaults to 5 seconds).                  |
| <code>&lt;1-1000&gt;</code>   | Time in seconds to wait for a server reply.   |
| <code>name-check</code>       | Specify whether or not to enforce certificate name checking for this client. If the parameter is not specified then the global behavior, which defaults to <b>on</b> , is used. |
| <code>on</code>               | Enable name checking for this client.   |
| <code>off</code>              | Disable name checking for this client.  |

**Mode** RadSecProxy AAA Configuration Mode

**Usage notes** The server may be specified by its domain name or by its IPv4 address. If a domain name is used, it must be resolvable using a configured DNS name server.

Each server may be configured with a timeout; if not specified, the global timeout value for RADIUS servers will be used. The global timeout may be changed using the **radius-server timeout** command. The default global timeout is 5 seconds.

Each server may be configured to use certificate name-checking; if not specified, the global behavior defined by **server name-check** or **no server name-check** will be used. If name checking is enabled, the Common Name portion of the subject field of the server's X.509 certificate must match the domain name or IP address specified in this command.

**Example** To add a server 'mynas.local' with a timeout of 3 seconds, and name checking off, use the commands:

```
awplus# configure terminal
awplus(config)# radius-secure-proxy aaa
awplus(config-radsecproxy-aaa)# server mynas.local name-check
off
```

**Related commands**

- [proxy-port](#)
- [radius-secure-proxy aaa](#)
- [server name-check](#)
- [server trustpoint](#)

# server mutual-authentication

**Overview** This command enables or disables mutual certificate authentication for all RadSecProxy servers. When enabled, the RadSecProxy AAA application will send a local X.509 certificate to the server when establishing a TLS connection.

Use the **no** variant of this command to disable mutual certificate validation causing the RadSecProxy AAA application to not transmit a certificate to the server.

**NOTE:** *If mutual authentication is disabled on the client (AAA) application but enabled on the server, a connection will not be established.*

**Syntax** `server mutual-authentication`  
`no server mutual-authentication`

**Default** Mutual authentication is enabled by default.

**Mode** RadSecProxy AAA Configuration Mode

**Example** Disable mutual certificate validation with the following command:

```
awplus# configure terminal
awplus(config)# radius-secure-proxy aaa
awplus(config-radsecproxy-aaa)# no server
mutual-authentication
```

**Related commands** [radius-secure-proxy aaa](#)  
[server name-check](#)  
[server \(radsecproxy-aaa\)](#)

**Command changes** Version 5.4.6-2.1: command added

# server name-check

**Overview** This command sets the global behavior for certificate name-checking for the RadSecProxy AAA application to **on**. This behavior will be used for all servers associated with the application that do not specify a behavior on a per-server basis. If name-checking is enabled, the Common Name portion of the subject field of the client's X.509 certificate must match the domain name or IP address specified in the **server (radsecproxy-aaa)** command.

Use the **no** variant of this command to set the global behavior for certificate name checking to **off**

**Syntax** `server name-check`  
`no server name-check`

**Default** Certificate name checking is on by default.

**Mode** RadSecProxy AAA Configuration Mode

**Example** Disable certificate name checking globally with the following command:

```
awplus# configure terminal
awplus(config)# radius-secure-proxy aaa
awplus(config-radsecproxy-aaa)# no server name-check
```

**Related commands** [proxy-port](#)  
[radius-secure-proxy aaa](#)  
[server \(radsecproxy-aaa\)](#)  
[server trustpoint](#)

# server trustpoint

**Overview** This command adds one or more trustpoints to be used with the RadSecProxy AAA application. Multiple trustpoints may be specified, or the command may be executed more than once, to add multiple trustpoints to the application.

The **no** version of this command removes one or more trustpoints from the list of trustpoints associated with the application.

**Syntax** `server trustpoint [<trustpoint-list>]`  
`no server trustpoint [<trustpoint-list>]`

| Parameter         | Description   |
|-------------------|---|
| <trustpoint-list> | Specify one or more trustpoints to be added or deleted. |

**Default** By default, no trustpoints are associated with the application.

**Mode** RadSecProxy AAA Configuration Mode

**Usage notes** The device certificate associated with first trustpoint added to the application will be transmitted to remote servers. The certificate received from the remote server must have an issuer chain that terminates with the root CA certificate for any of the trustpoints that are associated with the application.

If no trustpoints are specified in the command, the trustpoint list will be unchanged.

If **no server trustpoint** is issued without specifying any trustpoints, then all trustpoints will be disassociated from the application.

**Example** You can add multiple trustpoints to the RadSecProxy AAA application by executing the command multiple times:

```
awplus# configure terminal
awplus(config)# radius-secure-proxy aaa
awplus(config-radsecproxy-aaa)# server trustpoint example_1
awplus(config-radsecproxy-aaa)# server trustpoint example_2
```

Alternatively, add multiple trustpoints with a single command:

```
awplus(config-radsecproxy-aaa)# server trustpoint example_3
example_4
```

Disassociate all trustpoints from the RadSecProxy AAA application using the command:

```
awplus(config-radsecproxy-aaa)# no server trustpoint
```

**Related commands** [proxy-port](#)  
[radius-secure-proxy aaa](#)

server (radsecproxy-aaa)  
server name-check

# show aaa local user locked

**Overview** This command displays the failed attempts against each user account attempting to login into the device, along with the failure times and locations.

Use this command's output to see if a user is currently locked out or not. You can check:

- the number of login attempts that have a 'V' in the 'Valid' column, and
- if the last attempt happened within the lockout time. If the number of 'V' attempts exceeds the maximum allowed number of attempts, and the last attempt is within the lockout time, then the user is locked out.

The maximum number of attempts is 5 by default. You can change it using the command **aaa local authentication attempts max-fail**. The lockout time is 5 minutes by default. You can change it using the command **aaa local authentication attempts lockout-time**.

Once a user's lockout status is cleared, this command will no longer display any failed attempts for that user. The status gets cleared by:

- being manually cleared by another privileged user, using the [clear aaa local user lockout](#) command, or
- the locked out user successfully logs into the system after waiting for the lockout time to pass.

In the Valid column:

- 'V' means this login attempt counts towards the maximum allowed number of attempts
- 'I' means this login attempt does not count towards the maximum allowed number of attempts, because it was more than 15 minutes ago.

**Syntax** `show aaa local user locked`

**Mode** User Exec and Privileged Exec

**Example** To display the current failed attempts for local users, use the command:

```
awplus# show aaa local user locked
```

**Output** Figure 45-1: Example output from the **show aaa local user locked** command

```
awplus#show aaa local user locked
manager:
When                Type  Source                Valid

2023-02-09 11:47:58 TTY   /dev/ttyS0           V
2023-02-09 11:48:05 RHOST 192.168.5.1          V
2023-02-09 11:22:51 RHOST 192.168.5.1          I
2023-02-09 11:22:54 TTY   /dev/ttyS0           I
user3:
When                Type  Source                Valid
2023-02-09 11:38:58 TTY   /dev/ttyS0           V
2023-02-09 11:39:04 RHOST 192.168.5.1          V
2023-02-09 11:39:06 TTY   /dev/ttyS0           V
2023-02-09 11:39:22 RHOST 192.168.5.1          V
2023-02-09 11:39:26 TTY   /dev/ttyS0           V
```

This output example was run at 11:49. The lockout-time and max-fail settings are set to their defaults:

- manager: is not locked out because they only have 2 valid attempts.
- user1: is locked out because they have 7 valid attempts and the most recent was within the lockout time.
- user2: is not locked out because only 4 attempts are valid.
- user3: is not locked out. Even though they have 5 valid attempts, the most recent attempt is older than the lockout time of 5 minutes.

# show debugging aaa

**Overview** Use this command to see what debugging is turned on for AAA (Authentication, Authorization, Accounting).

**Syntax** `show debugging aaa`

**Mode** User Exec and Privileged Exec

**Example** To display the current debugging status of AAA, use the command:

```
awplus# show debug aaa
```

**Output** Figure 45-3: Example output from the **show debug aaa** command

```
AAA debugging status:  
Authentication debugging is on  
Accounting debugging is off
```

# show radius server group

**Overview** Use this command to show the RADIUS server group configuration.

**Syntax** show radius server group [*<group-name>*]

| Parameter                 | Description               |
|---------------------------|---------------------------|
| <i>&lt;group-name&gt;</i> | RADIUS server group name. |

**Default** Command name is set to something by default.

**Mode** Privileged Exec

**Usage** Use this command with the *<group-name>* parameter to display information for a specific RADIUS server group, or without the parameter to display information for all RADIUS server groups.

**Example** To display information for all RADIUS server groups, use the command:

```
awplus# show radius server group
```

To display a information for a RADIUS server group named 'rad\_group\_list1', use the command:

```
awplus# show radius server group rad_group_list1
```

**Output** Figure 45-4: Example output from **show radius server group**

```
awplus#show radius server group
RADIUS Group Configuration
  Group Name : radius?
  Server Host/   Auth  Acct  Auth  Acct
  IP Address     Port  Port  Status Status

# Lightweight Directory Access Protocol (LDAP) Commands

## Introduction

**Overview** This chapter provides an alphabetical reference of commands used to configure Lightweight Directory Access Protocol (LDAP).

LDAP is an authentication protocol that facilitates user access to various IT resources e.g. applications, servers, networking equipment, and file servers.

It can be used to connect to internal networks over OpenVPN. Although both LDAP and RADIUS are interchangeable on AlliedWare Plus devices as an authentication protocol, LDAP is added because of its ability to interact with directory services such as Microsoft's Active Directory (AD).

For more information, see the [LDAP Feature Overview and Configuration Guide](#).

# authentication (ldap-server)

**Overview** Use this command to set the authentication method used to authenticate users against the Lightweight Directory Access Protocol (LDAP) server.

Use the **no** variant of this command to reset the authentication method to **search**.

**Syntax** authentication {search|bind-only}  
no authentication

| Parameter | Description  |
|-----------|--|
| search    | The <b>search</b> method initially binds to the LDAP server, then searches for the user, then binds to the user using the DN found with the search. The initial bind is either anonymous, or using the user specified with the <a href="#">bind authenticate root-dn</a> command.  |
| bind-only | The <b>bind-only</b> method attempts to bind to the LDAP server using a predicted DN based on the username, the user attribute (set with the <a href="#">login-attribute</a> command) and the base DN (set with the <a href="#">base-dn</a> command). The format of this user DN is as follows: '<username>=<login-attribute>,<base-dn>' |

**Default** Search

**Mode** LDAP Server Configuration

**Example** To set the authentication method to bind-only for the LDAP server called 'Server1', use the commands:

```
awplus# configure terminal
awplus(config)# ldap-server Server1
awplus(config-ldap-server)# authentication bind-only
```

To reset the authentication method to the default (search) for 'Server1', use the commands:

```
awplus# configure terminal
awplus(config)# ldap-server Server1
awplus(config-ldap-server)# no authentication
```

**Related commands**

- [base-dn](#)
- [bind authenticate root-dn](#)
- [ldap-server](#)
- [login-attribute](#)
- [search-filter](#)

**Command changes** Version 5.5.2-1.1: command added

# base-dn

- Overview** Use this command to set the base DN (Distinguished Name) of the LDAP server.
- When using 'search' authentication, the base DN is the LDAP server's starting point to search for the user within the directory.
- If 'bind-only' authentication is enabled, then the base DN is the suffix of the DN that is used to bind to the user.
- Use the **no** variant of this command to remove the configured base DN.

**Syntax** base-dn <base-dn>  
no base-dn

| Parameter | Description                     |
|-----------|---------------------------------|
| <base-dn> | The base DN of the LDAP server. |

**Default** Not set

**Mode** LDAP Server Configuration

**Example** To set the base DN for the LDAP server called 'Server1' to 'dc=example, dc=com', use the commands:

```
awplus# configure terminal
awplus(config)# ldap-server Server1
awplus(config-ldap-server)# base-dn dc=example,dc=com
```

To clear the base DN for Server1, use the commands:

```
awplus# configure terminal
awplus(config)# ldap-server Server1
awplus(config-ldap-server)# no base-dn
```

**Related commands**

- [authentication \(ldap-server\)](#)
- [bind authenticate root-dn](#)
- [group-attribute](#)
- [group-dn](#)
- [ldap-server](#)
- [login-attribute](#)
- [search-filter](#)

**Command changes** Version 5.5.2-1.1: command added

# bind authenticate root-dn

**Overview** Use this command to set the authenticated user to bind to when searching for a user on an LDAP server. Do not set this option if you wish to use anonymous binding with the 'search' method.

This option is ignored with the 'bind-only' authentication method.

Use the **no** variant of this command to unset the authenticated user.

**Syntax** `bind authenticate root-dn <user-dn> password <password>`  
`no bind authenticate root-dn`

| Parameter                     | Description                                  |
|-------------------------------|--|
| <code>&lt;user-dn&gt;</code>  | The DN of the authenticated user to bind to. |
| <code>&lt;password&gt;</code> | The password of the authenticated user.      |

**Default** Not set

**Mode** LDAP Server Configuration

**Example** To set the authenticated user to 'cn=admin,dc=example,dc=com' with the password '12345678' for the LDAP server called 'Server1', use the commands:

```
awplus# configure terminal
awplus(config)# ldap-server Server1
awplus(config-ldap-server)# bind authenticate root-dn
cn=admin,dc=example,dc=com password 12345678
```

**Related commands** [authentication \(ldap-server\)](#)

[search-filter](#)

**Command changes** Version 5.5.2-1.1: command added

# deadtime (ldap-server)

**Overview** Use this command to configure the deadtime for an LDAP server. The configured deadtime is how long in seconds before an unresponsive LDAP server is considered dead.

Use the **no** variant of this command to remove the deadtime configured on an LDAP server. When you remove the deadtime, the server will never be considered dead.

**Syntax** `deadtime <0-1440>`  
`no deadtime`

| Parameter                   | Description   |
|-----------------------------|---|
| <code>&lt;0-1440&gt;</code> | The number of seconds that the server can be unresponsive for before it is considered dead. |

**Default** 0 seconds (the LDAP server is never considered dead)

**Mode** LDAP Server Configuration

**Example** To set the deadtime to 20 seconds for the LDAP server called 'Server1', use the commands:

```
awplus# configure terminal
awplus(config)# ldap-server Server1
awplus(config-ldap-server)# deadtime 20
```

To reset the deadtime to the default for 'Server1', use the commands:

```
awplus# configure terminal
awplus(config)# ldap-server Server1
awplus(config-ldap-server)# no deadtime
```

**Related commands** [host \(ldap-server\)](#)  
[ldap-server](#)  
[port \(ldap-server\)](#)  
[retransmit \(ldap-server\)](#)  
[show ldap server group](#)  
[timeout \(ldap-server\)](#)

**Command changes** Version 5.5.2-1.1: command added

# debug ldap client

**Overview** Use this command to enable LDAP debugging.

Use the **no** variant of this command to disable all LDAP debugging.

**Syntax** debug ldap client all

```
debug ldap client {[acl] [args] [ber] [config] [conns] [filter]  
[packets] [parse] [shell] [stats] [stats2] [sync] [trace]}
```

```
no debug ldap client
```

| Parameter | Enable or disable debugging for ...                       |
|-----------|---|
| all       | All LDAP debugging options                                |
| acl       | Access Control List processing                            |
| args      | Heavy trace debugging (args, arguments)                   |
| ber       | Print out packets sent and received (ber, Bit Error Rate) |
| config    | Configuration processing                                  |
| conns     | Connection management                                     |
| filter    | Search filter processing                                  |
| packets   | Debug packet handling                                     |
| parse     | Parsing processing  |
| shell     | Print communication with shell backends                   |
| stats     | Stats from connections, operations and results            |
| stats2    | Stats from log entries sent                               |
| sync      | Syncrepl consumer processing (LDAP Sync replication)      |
| trace     | Trace function calls                                      |

**Default** By default, all LDAP debugging is disabled.

**Mode** Global Configuration

**Example** To turn on all LDAP debugging, use the command:

```
awplus# debug ldap client all
```

To turn on filter and packet LDAP debugging, use the command:

```
awplus# debug ldap client filter packets
```

To disable all LDAP debugging, use the command:

```
awplus# no debug ldap client
```

**Related commands**   aaa authentication login  
                          aaa group server  
                          ldap-server

**Command changes**   Version 5.5.2-1.1: command added

# group-attribute

**Overview** Use this command to configure the name of the attribute that group members are stored in.

It is only necessary to set this option if [group-dn](#) is used and you don't want to use the default attribute, which is 'uniquemember'.

Use the **no** variant of this command to revert to the default group attribute.

**Syntax** `group-attribute <attribute>`  
`no group-attribute`

| Parameter                      | Description                                     |
|--------------------------------|---|
| <code>&lt;attribute&gt;</code> | The attribute that group members are stored in. |

**Default** The default group attribute is 'uniquemember'.

**Mode** LDAP Server Configuration

**Example** To set the group attribute for the LDAP server called 'Server1' to 'member', use the commands:

```
awplus# configure terminal
awplus(config)# ldap-server Server1
awplus(config-ldap-server)# group-attribute member
```

To reset the group attribute to default for 'Server1', use the commands:

```
awplus# configure terminal
awplus(config)# ldap-server Server1
awplus(config-ldap-server)# no group-attribute
```

**Related commands**

- [bind authenticate root-dn](#)
- [group-dn](#)
- [ldap-server](#)
- [login-attribute](#)
- [search-filter](#)

**Command changes** Version 5.5.2-1.1: command added

# group-dn

**Overview** Use this command to configure the group DN (Distinguished Name) of the group that users should be a member of.

By default the device will determine this by checking the 'uniquemember' attribute of the group to see if it contains the user's DN string. This can be changed with the [group-attribute](#) command.

Use the **no** variant of this command to remove the configured group DN.

**Syntax** `group-dn <group-dn>`  
`no group-dn`

| Parameter                     | Description   |
|-------------------------------|---|
| <code>&lt;group-dn&gt;</code> | The DN of the group that users should be a member of. |

**Default** Not set

**Mode** LDAP Server Configuration

**Example** To set the group DN for the LDAP server called 'Server1' to 'cn=Users,dc=example,dc=com', use the commands:

```
awplus# configure terminal
awplus(config)# ldap-server Server1
awplus(config-ldap-server)# group-dn cn=Users,dc=example,
dc=com
```

To clear the group DN for 'Server1', use the commands:

```
awplus# configure terminal
awplus(config)# ldap-server Server1
awplus(config-ldap-server)# no group-dn
```

**Related commands**

- [base-dn](#)
- [bind authenticate root-dn](#)
- [group-attribute](#)
- [ldap-server](#)
- [login-attribute](#)
- [search-filter](#)

**Command changes** Version 5.5.2-1.1: command added

# host (ldap-server)

**Overview** Use this command to configure the address of the remote LDAP server you want to connect to.

Use the **no** variant of this command to remove the remote LDAP server.

**Syntax** `host {<host-name>|<ip-address>|<ipv6-address>}`  
`no host`

| Parameter                         | Description  |
|-----------------------------------|--|
| <code>&lt;hostname&gt;</code>     | The hostname of the LDAP server.                               |
| <code>&lt;ip-address&gt;</code>   | The IPv4 address of the LDAP server. Uses the format A.B.C.D.  |
| <code>&lt;ipv6-address&gt;</code> | The IPv6 address of the LDAP server. Uses the format x:x::x:x. |

**Default** Not set

**Mode** LDAP Server Configuration

**Example** To set the host for the LDAP server called 'Server1' to the IP address 10.0.0.1, use the commands:

```
awplus# configure terminal
awplus(config)# ldap-server Server1
awplus(config-ldap-server)# host 10.0.0.1
```

To set the host for Server1 to the IPv6 address 2001:0db8::a2, use the commands:

```
awplus# configure terminal
awplus(config)# ldap-server Server1
awplus(config-ldap-server)# host 2001:db8::a2
```

To set the host for Server1 to the hostname www.ldapserver.com, use the commands:

```
awplus# configure terminal
awplus(config)# ldap-server Server1
awplus(config-ldap-server)# host www.ldapserver.com
```

To unset the host for Server1, use the commands:

```
awplus# configure terminal
awplus(config)# ldap-server Server1
awplus(config-ldap-server)# no host
```

**Related commands** [ldap-server](#)

secure trustpoint (ldap-server)  
timeout (ldap-server)

**Command changes** Version 5.5.2-1.1: command added

# ldap-server

**Overview** Use this command to configure an LDAP server and enter LDAP server configuration mode.

Use the **no** variant of this command to remove the specified server.

**Syntax** ldap-server <server-name>  
no ldap-server <server-name>

| Parameter     | Description                  |
|---------------|------------------------------|
| <server-name> | The name of the LDAP server. |

**Default** Not set

**Mode** Global Configuration

**Example** To create and configure an LDAP server called 'Server1', use the commands:

```
awplus# configure terminal
awplus(config)# ldap-server Server1
awplus(config-ldap-server)#
```

To configure the LDAP server called 'Server1', use the commands:

```
awplus# configure terminal
awplus(config)# ldap-server Server1
awplus(config-ldap-server)#
```

To remove an LDAP server called 'Server1', use the commands:

```
awplus# configure terminal
awplus(config)# no ldap-server Server1
```

**Related commands**

- [secure trustpoint \(ldap-server\)](#)
- [show ldap server group](#)
- [timeout \(ldap-server\)](#)

**Command changes** Version 5.5.2-1.1: command added

# login-attribute

**Overview** Use this command to set the name of the attribute user names are stored in. The device will search this attribute for the user's DN (Distinguished Name).

It is only necessary to set this option if you don't want to use the default attribute, which is 'uid'.

If the authentication method is 'bind-only', then this attribute is used as the first component of the user DN, with the base DN added to complete the user DN.

Use the **no** variant of this command to reset the login attribute to the default of 'uid'.

**Syntax** login-attribute <attribute>  
no login-attribute

| Parameter   | Description   |
|-------------|---|
| <attribute> | The LDAP attribute to use for the username of connecting users. |

**Default** uid

**Mode** LDAP Server Configuration

**Example** To set the login attribute for the LDAP server called 'Server1' to 'sAMAccountName', use the commands:

```
awplus# configure terminal
awplus(config)# ldap-server Server1
awplus(config-ldap-server)# login-attribute sAMAccountName
```

To reset the login attribute for 'Server1' to the default, use the commands:

```
awplus# configure terminal
awplus(config)# ldap-server Server1
awplus(config-ldap-server)# no login-attribute
```

**Related command** [authentication \(ldap-server\)](#)  
[base-dn](#)  
[bind authenticate root-dn](#)  
[group-attribute](#)  
[group-dn](#)  
[ldap-server](#)  
[search-filter](#)

**Command changes** Version 5.5.2-1.1: command added

# port (ldap-server)

**Overview** Use this command to configure the port you are using to connect to the remote LDAP server.

Note that if secure ciphers are enabled, then the secure port is used instead. Secure ciphers are configured with the [secure mode \(ldap-server\)](#) command.

Use the **no** variant of this command to reset the port number to the default (389).

**Syntax** port <1-65535>  
no port

| Parameter | Description                       |
|-----------|-----------------------------------|
| <1-65535> | Port number from 1 through 65535. |

**Default** 389

**Mode** LDAP Server Configuration

**Example** To set the port for the LDAP server called 'Server1' to 1579, use the commands:

```
awplus# configure terminal
awplus(config)# ldap-server Server1
awplus(config-ldap-server)# port 1579
```

To reset the port for 'Server1' to the default of 389, use the commands:

```
awplus# configure terminal
awplus(config)# ldap-server Server1
awplus(config-ldap-server)# no port
```

**Related commands**

- [deadtime \(ldap-server\)](#)
- [host \(ldap-server\)](#)
- [ldap-server](#)
- [retransmit \(ldap-server\)](#)
- [secure cipher \(ldap-server\)](#)
- [secure mode \(ldap-server\)](#)
- [secure trustpoint \(ldap-server\)](#)
- [show ldap server group](#)
- [timeout \(ldap-server\)](#)

**Command changes** Version 5.5.2-1.1: command added

# retransmit (ldap-server)

**Overview** Use this command to configure the number of times a device will attempt to reconnect to the LDAP server before aborting.

Use the **no** variant of this command to reset the reconnect attempts to the default value of 3.

**Syntax** retransmit <0-100>  
no retransmit

| Parameter | Description  |
|-----------|--|
| <0-100>   | The number of times the device will attempt to reconnect to the LDAP server. |

**Default** 3 times

**Mode** LDAP Server Configuration

**Example** To set the number of reconnect attempts for the LDAP server called 'Server1' to 5 attempts, use the commands:

```
awplus# configure terminal
awplus(config)# ldap-server Server1
awplus(config-ldap-server)# retransmit 5
```

To reset the number of reconnect attempts for 'Server1' to 3 attempts, use the commands:

```
awplus# configure terminal
awplus(config)# ldap-server Server1
awplus(config-ldap-server)# no retransmit
```

**Related commands** [deadtime \(ldap-server\)](#)  
[host \(ldap-server\)](#)  
[ldap-server](#)  
[port \(ldap-server\)](#)  
[timeout \(ldap-server\)](#)

**Command changes** Version 5.5.2-1.1: command added

# search-filter

**Overview** Use this command to add a filter to use when searching for a user on the LDAP server.

The filter should be a form similar to 'attribute=value' or '&(attribute1=value1)(attribute2=value2)

Use the **no** variant of this command to remove the search filter.

**Syntax** search-filter <filter>  
no search-filter

| Parameter | Description                                  |
|-----------|--|
| <filter>  | The filter to use when searching for a user. |

**Default** Not set

**Mode** LDAP Server Configuration

**Usage notes** If the 'bind-only' authentication method is used, then this value is unused.  
For the search authentication method, a search operation is used to search the LDAP server. The client specifies the starting point (base DN) of the search, the search scope (either the object, its children, or the subtree rooted at the object), and a search filter.

**Example** To set a search filter on the LDAP server called 'Server1' to 'building=block1', use the commands:

```
awplus# configure terminal
awplus(config)# ldap-server Server1
awplus(config-ldap-server)# search-filter building=block1
```

To unset the search filter of 'Server1', use the commands:

```
awplus# configure terminal
awplus(config)# ldap-server Server1
awplus(config-ldap-server)# no search-filter
```

**Related commands** [authentication \(ldap-server\)](#)

[bind authenticate root-dn](#)  
[group-attribute](#)  
[group-dn](#)  
[ldap-server](#)

## login-attribute

**Command changes** Version 5.5.2-1.1: command added

# secure cipher (ldap-server)

**Overview** Use this command to configure the OpenSSL ciphers used in LDAP secure mode. You can choose groups of ciphers from a number of Mozilla TLS configs, or specify multiple individual ciphers in OpenSSL format.

Use the **no** variant of this command to remove the configured ciphers on a server.

**Syntax** `secure cipher {old|intermediate|modern}`  
`secure cipher <cipher-list>`  
`no secure cipher`

| Parameter     | Description   |
|---------------|---|
| old           | Ciphers in Mozilla's old TLS config. Alongside the modern and intermediate ciphers, this includes the following ciphers:<br>DHE-RSA-CHACHA20-POLY1305,ECDHE-ECDSA-AES128SHA256,<br>ECDHE-RSA-AES128-SHA256,ECDHE-ECDSA-AES128-SHA,<br>ECDHE-RSA-AES128-SHA,ECDHE-ECDSA-AES256-SHA384,<br>ECDHE-RSA-AES256-SHA384, ECDHE-ECDSA-AES256-SHA,<br>ECDHE-RSA-AES256-SHA,DHE-RSA-AES128-SHA256, DHE-RSA-AES256-SHA256,<br>AES128-GCM-SHA256, AES256-GCM-SHA384,AES128-SHA256, AES256-SHA256,<br>AES128-SHA, AES256-SHA, DES-CBC3-SHA |
| intermediate  | Ciphers in Mozilla's intermediate TLS config. Alongside the modern ciphers, this includes the following ciphers:<br>ECDHE-ECDSA-AES128-GCM-SHA256,ECDHE-RSA-AES128-CM-SHA256,<br>ECDHE-ECDSA-AES256-GCM-SHA384,ECDHE-RSA-AES256-CM-SHA384,<br>ECDHE-ECDSA-CHACHA20-POLY1305,ECDHE-RSA-CHACHA20-POLY1305,<br>DHE-RSA-AES128-GCM-SHA256,DHE-RSA-AES256-GCM-SHA384   |
| modern        | Ciphers in Mozilla's modern TLS config. Includes the following ciphers:<br>TLS_AES_128_GCM_SHA256,TLS_AES_256_GCM_SHA384,<br>TLS_CHACHA20_POLY1305_SHA256   |
| <cipher-list> | The name (or names) of a cipher in OpenSSL format. This is a <b>space</b> separated list of cipher names, for example:<br>DHE-DSS-AES256-GCM-SHA384 TLS_AES_256_GCM_SHA384  |

**Default** Not set

**Mode** LDAP Server Configuration

**Example** To use the Intermediate Mozilla cipher suite on the LDAP server called Server1, use the commands:

```
awplus# configure terminal
awplus(config)# ldap-server Server1
awplus(config-ldap-server)# secure cipher intermediate
```

To remove the configured ciphers on 'Server1', use the commands:

```
awplus# configure terminal
awplus(config)# ldap-server Server1
awplus(config-ldap-server)# no secure cipher
```

To use the ciphers DHE-DSS-AES256-GCM-SHA384 and TLS\_AES\_256\_GCM\_SHA384 on 'Server1', use the commands:

```
awplus# configure terminal
awplus(config)# ldap-server Server1
awplus(config-ldap-server)# secure cipher
DHE-DSS-AES256-GCM-SHA384 TLS_AES_256_GCM_SHA384
```

[ldap-server](#)  
[port \(ldap-server\)](#)  
[secure mode \(ldap-server\)](#)  
[secure trustpoint \(ldap-server\)](#)

**Command  
changes**

Version 5.5.2-1.1: command added

# secure mode (ldap-server)

**Overview** Use this command to configure the LDAP server to use secure mode. Secure mode encrypts communications with the LDAP server using TLS (Transport Layer Security). If you don't specify a port number, the default port (636) is used.

For secure mode, you should also set the CA certificate using the [secure trustpoint \(ldap-server\)](#) command.

Use **no secure mode** to disable secure mode for communicating with this LDAP server.

Use **no secure mode secure-port** to reset the secure mode port to the default.

**Syntax** `secure mode [secure-port <port>]`  
`no secure mode`  
`no secure mode secure-port`

| Parameter | Description  |
|-----------|--|
| <port>    | The secure port for communicating with the LDAP server |

**Default** Secure mode is disabled, and the default port is 636

**Mode** LDAP Server Configuration

**Example** To enable secure mode for communicating with the LDAP server called 'Server1', with the default port, use the commands:

```
awplus# configure terminal
awplus(config)# ldap-server Server1
awplus(config-ldap-server)# secure mode
```

To disable secure mode for communicating with 'Server1', use the commands:

```
awplus# configure terminal
awplus(config)# ldap-server Server1
awplus(config-ldap-server)# no secure mode
```

To enable secure mode with the port 1234 for communicating with 'Server1', use the commands:

```
awplus# configure terminal
awplus(config)# ldap-server Server1
awplus(config-ldap-server)# secure mode secure-port 1234
```

To reset the secure mode port to the default on 'Server1', use the commands:

```
awplus# configure terminal
awplus(config)# ldap-server Server1
awplus(config-ldap-server)# no secure mode secure-port
```

**Related  
commands**

[ldap-server](#)  
[port \(ldap-server\)](#)  
[secure cipher \(ldap-server\)](#)  
[secure trustpoint \(ldap-server\)](#)

**Command  
changes**

Version 5.5.2-1.1: command added

# secure trustpoint (ldap-server)

**Overview** Use this command to link a preconfigured trustpoint to the LDAP server configuration. The trustpoint must be the LDAP server certificate and is required to successfully connect to the LDAP server when secure mode is enabled.

Use the **no** variant of this command to remove a trustpoint from an LDAP server.

**Syntax** `secure trustpoint <trustpoint>`  
`no secure trustpoint`

| Parameter                       | Description  |
|---------------------------------|--|
| <code>&lt;trustpoint&gt;</code> | The name of the trustpoint used for LDAP secure mode |

**Default** Not set

**Mode** LDAP Server Configuration

**Example** To set the trustpoint to Trustpoint1 for the LDAP server called 'Server1', use the commands:

```
awplus# configure terminal
awplus(config)# ldap server Server1
awplus(config-ldap-server)# secure trustpoint Trustpoint1
```

To remove the trustpoint from 'Server1', use the commands:

```
awplus# configure terminal
awplus(config)# ldap server Server1
awplus(config-ldap-server)# no secure trustpoint
```

**Related commands** [host \(ldap-server\)](#)  
[ldap-server](#)  
[port \(ldap-server\)](#)  
[secure cipher \(ldap-server\)](#)  
[secure mode \(ldap-server\)](#)

**Command changes** Version 5.5.2-1.1: command added

# server (ldap-group)

**Overview** Use this command to add an LDAP server to an LDAP server group. The server is identified by the name of the server, which is created using the [ldap-server](#) command. Use the **no** variant of this command to remove an LDAP server from an LDAP server group.

**Syntax** `server <server-name>`  
`no server <server-name>`

| Parameter                        | Description   |
|----------------------------------|---|
| <code>&lt;server-name&gt;</code> | The name of the LDAP server group, specified when creating the LDAP server. |

**Default** By default, LDAP servers are only added to the default 'ldap' server group.

**Mode** LDAP Server Group Configuration

**Usage notes** The server is appended to the server list of the group, and the order of configuration determines the precedence of servers.

**Example** To add the LDAP server called 'Server1' to the LDAP server group called 'Group1', use the commands:

```
awplus# configure terminal
awplus(config)# aaa group server ldap Group1
awplus(config-ldap-group)# server Server1
```

To remove 'Server1' from 'Group1', use the commands:

```
awplus# configure terminal
awplus(config)# aaa group server ldap Group1
awplus(config-ldap-group)# no server Server1
```

**Related commands** [aaa authentication login](#)  
[aaa group server](#)  
[ldap-server](#)  
[show ldap server group](#)

**Command changes** Version 5.5.2-1.1: command added

# show ldap server group

**Overview** Use this command to display information about LDAP server groups, their servers and the status of those servers.

**Syntax** `show ldap server group [<group-name>]`

| Parameter                       | Description                        |
|---------------------------------|------------------------------------|
| <code>&lt;group-name&gt;</code> | The name of the LDAP server group. |

**Mode** Global Configuration

**Usage notes** If you specify a single group name, you will only see information relating to that specific server group. Otherwise, all LDAP server groups are shown, including the 'ldap' group that contains every LDAP server.

**Example** To show all server groups, use the command:

```
awplus# show ldap server group
```

To show the default LDAP group that includes all the LDAP servers, use the command:

```
awplus# show ldap server group ldap
```

To show a server group named 'CustomGroup1', use the command:

```
awplus# show ldap server group CustomGroup1
```

**Output** Figure 46-1: Example output from **show ldap server group**

```
LDAP Group Configuration
Group Name : ldap
LDAP server name  Server Host/IP Address  Port  Status
-----
server_one       10.1.1.1          N/A   Alive
server_two       10.2.1.1          N/A   Dead (1 hour)

Group Name : CustomGroup1
LDAP server name  Server Host/IP Address  Port  Status
-----
server_one       10.1.1.1          N/A   Alive

Group Name : CustomGroup2
LDAP server name  Server Host/IP Address  Port  Status
-----
No LDAP servers currently defined
```

**Command changes** Version 5.5.2-1.1: command added

# timeout (ldap-server)

**Overview** Use this command to set the time to wait for a connection before reattempting to connect to the LDAP server.

Use the **no** variant of this command to reset the timeout back to the default value.

**Syntax** `timeout <1-1000>`  
`no timeout`

| Parameter                   | Description   |
|-----------------------------|---|
| <code>&lt;1-1000&gt;</code> | The number of seconds to wait for a connection before reattempting to connect to the LDAP server. |

**Default** 5 seconds

**Mode** LDAP Server Configuration

**Example** To set the server timeout for the LDAP server called 'Server1' to 10 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# ldap-server Server1
awplus(config-ldap-server)# timeout 10
```

To set the server timeout for 'Server1' to the default, use the commands:

```
awplus# configure terminal
awplus(config)# ldap-server Server1
awplus(config-ldap-server)# no timeout
```

  - [“undebug radius”](#) on page 2464

# auth radius send nas-identifier

**Overview** Use this command to enable the device to include the NAS-Identifier(32) attribute in RADIUS authentication requests.

Use the **no** variant of this command to stop including the NAS-Identifier attribute.

**Syntax** `auth radius send nas-identifier {<name>|vlan-id}`  
`no auth radius send nas-identifier`

| Parameter                 | Description  |
|---------------------------|--|
| <code>&lt;name&gt;</code> | Send this user-defined text as the NAS-Identifier. You can specify up to 253 characters.   |
| <code>vlan-id</code>      | Send the VLAN ID of the authentication port as the NAS-Identifier. This is the configured VLAN ID, not the dynamic VLAN ID or guest VLAN ID. |

**Mode** Global Configuration

**Example** To use a user-defined identifier of NASID100 as the NAS-Identifier attribute, use the commands:

```
awplus# configure terminal
awplus(config)# auth radius send nas-identifier NASID100
```

To use the VLAN ID as the NAS-Identifier attribute, use the commands:

```
awplus# configure terminal
awplus(config)# auth radius send nas-identifier vlan-id
```

To stop sending the NAS-Identifier attribute, use the commands:

```
awplus# configure terminal
awplus(config)# no auth radius send nas-identifier
```

**Related commands** [auth radius send service-type](#)

# auth radius send service-type

**Overview** Use this command to enable the device to include the Service-Type(6) attribute in RADIUS authentication requests. The Service-Type attribute has a value of:

- Framed(2) for 802.1x
- Call-Check(10) for MAC authentication
- Unbound(5) for Web authentication.

Use the **no** variant of this command to stop including the Service-Type attribute.

**Syntax** `auth radius send service-type`  
`no auth radius send service-type`

**Mode** Global Configuration

**Example** To send the Service-Type attribute, use the commands:

```
awplus# configure terminal
awplus(config)# auth radius send service-type
```

**Related commands** [auth radius send nas-identifier](#)

# clear radius dynamic-authorization counters

**Overview** Use this command to set the Dynamic Authorization message counters to zero.

**Syntax** `clear radius dynamic-authorization counters`

**Mode** Privileged Exec

**Example** To set the Dynamic Authorization message counters to zero, use the command:

```
awplus# clear radius dynamic-authorization counters
```

**Related commands** [radius dynamic-authorization-client](#)  
[show radius dynamic-authorization counters](#)

**Command changes** Version 5.5.1-1.1: command added

# deadtime (RADIUS server group)

**Overview** Use this command to configure the **deadtime** parameter for the RADIUS server group. This command overrides the global dead-time configured by the [radius-server deadtime](#) command. The configured deadtime is the time period in minutes to skip a RADIUS server for authentication or accounting requests if the server is 'dead'. Note that a RADIUS server is considered 'dead' if there is no response from the server within a defined time period.

Use the **no** variant of this command to reset the deadtime configured for the RADIUS server group. If the global deadtime for RADIUS server is configured the value will be used for the servers in the group. The global deadtime for the RADIUS server is set to 0 minutes by default.

**Syntax** `deadtime <0-1440>`  
`no deadtime`

| Parameter                   | Description                |
|-----------------------------|----------------------------|
| <code>&lt;0-1440&gt;</code> | Amount of time in minutes. |

**Default** The deadtime is set to 0 minutes by default.

**Mode** RADIUS Server Group Configuration

**Usage** If the RADIUS server does not respond to a request packet, the packet is retransmitted the number of times configured for the **retransmit** parameter (after waiting for a **timeout** period to expire). The server is then marked 'dead', and the time is recorded. The **deadtime** parameter configures the amount of time to skip a dead server; if a server is dead, no request message is sent to the server for the **deadtime** period.

**Examples** To configure the deadtime for 5 minutes for the RADIUS server group 'GROUP1', use the commands:

```
awplus(config)# aaa group server radius GROUP1
awplus(config-sg)# server 192.168.1.1
awplus(config-sg)# deadtime 5
```

To remove the deadtime configured for the RADIUS server group 'GROUP1', use the commands:

```
awplus(config)# aaa group server radius GROUP1
awplus(config-sg)# no deadtime
```

**Related commands** [aaa group server](#)  
[radius-server deadtime](#)

# debug radius

**Overview** This command enables RADIUS debugging. If no option is specified, all debugging options are enabled.

Use the **no** variant of this command to disable RADIUS debugging. If no option is specified, all debugging options are disabled.

**Syntax** debug radius [packet|event|all]  
no debug radius [packet|event|all]

| Parameter | Description  |
|-----------|--|
| packet    | Debugging for RADIUS packets is enabled or disabled. |
| event     | Debugging for RADIUS events is enabled or disabled.  |
| all       | Enable or disable all debugging options.             |

**Default** RADIUS debugging is disabled by default.

**Mode** Privileged Exec

**Examples** To enable debugging for RADIUS packets, use the command:

```
awplus# debug radius packet
```

To enable debugging for RADIUS events, use the command:

```
awplus# debug radius event
```

To disable debugging for RADIUS packets, use the command:

```
awplus# no debug radius packet
```

To disable debugging for RADIUS events, use the command:

```
awplus# no debug radius event
```

**Related commands** [show debugging radius](#)  
[undebug radius](#)

# ip radius source-interface

**Overview** This command configures the source IP address of every outgoing RADIUS packet to use a specific IP address or the IP address of a specific interface. If the specified interface is down or there is no IP address on the interface, then the source IP address of outgoing RADIUS packets depends on the interface the packets leave.

Use the **no** variant of this command to remove the source interface configuration. The source IP address in outgoing RADIUS packets will be the IP address of the interface from which the packets are sent.

**Syntax** `ip radius source-interface {<interface>|<ip-address>}`  
`no ip radius source-interface`

| Parameter                       | Description                                      |
|---------------------------------|--|
| <code>&lt;interface&gt;</code>  | Interface name.                                  |
| <code>&lt;ip-address&gt;</code> | IP address in the dotted decimal format A.B.C.D. |

**Default** Source IP address of outgoing RADIUS packets depends on the interface the packets leave.

**Mode** Global Configuration

**Examples** To configure all outgoing RADIUS packets to use the IP address of the interface "vlan1" for the source IP address, use the following commands:

```
awplus# configure terminal  
awplus(config)# ip radius source-interface vlan1
```

To configure the source IP address of all outgoing RADIUS packets to use 192.168.1.10, use the following commands:

```
awplus# configure terminal  
awplus(config)# ip radius source-interface 192.168.1.10
```

To reset the source interface configuration for all outgoing RADIUS packets, use the following commands:

```
awplus# configure terminal  
awplus(config)# no ip radius source-interface
```

**Related commands** [radius-server host](#)  
[show radius statistics](#)

# radius dynamic-authorization-client

**Overview** Use this command to add a Dynamic Authorization Client (DAC). A Network Access Server (NAS) will only accept Dynamic Authorization (DA) messages from DACs that have been authorized using this command.

Use the **no** variant of this command to remove a DAC from the list of authorized clients.

**Syntax** `radius dynamic-authorization-client <ip-address> key <key-string>`

`no radius dynamic-authorization-client <ip-address>`

When in secure mode (see the [crypto secure-mode](#) command), the syntax in config files will be:

`radius dynamic-authorization-client <ip-address> key-encrypted <encrypted-key-string>`

| Parameter                       | Description   |
|---------------------------------|---|
| <code>&lt;ip-address&gt;</code> | IP address of the DAC, entered in the form A.B.C.D  |
| <code>key</code>                | Sets the shared-key of the client.  |
| <code>key-encrypted</code>      | Set an encrypted shared secret key. When secure mode is enabled, the running configuration contains this parameter instead of the <code>key</code> parameter. It indicates that the device stores keys in the running configuration in encrypted form instead of in plain text. |

**Mode** Global Configuration

**Usage notes** The RADIUS protocol does not support unsolicited messages sent from the RADIUS server to the NAS. This means that the network access configuration a supplicant receives from a RADIUS server cannot be updated until the supplicant re-authenticates with the RADIUS server.

In some situations it is desirable to either update a supplicant's configuration, or even disconnect their session.

This command allows a Dynamic Authentication Client to send a message that will either update or terminate a supplicant's session.

**Example** To add a DAC with IP address 10.0.0.1, use the commands:

```
awplus# configure terminal
awplus(config)# radius dynamic-authorization-client 10.0.0.1
key secret-key
```

To remove the configuration for a DAC with IP address 10.0.0.1, use the commands:

```
awplus# configure terminal
awplus(config)# no radius dynamic-authorization-client 10.0.0.1
```

**Related commands** [clear radius dynamic-authorization counters](#)  
[show radius dynamic-authorization counters](#)

**Command changes** Version 5.5.1-1.1: command added

# radius-server deadtime

**Overview** Use this command to specify the global **deadtime** for all RADIUS servers. If a RADIUS server is considered dead, it is skipped for the specified deadtime. This command specifies for how many minutes a RADIUS server that is not responding to authentication requests is passed over by requests for RADIUS authentication.

Use the **no** variant of this command to reset the global deadtime to the default of 0 seconds, so that RADIUS servers are not skipped even if they are dead.

**Syntax** `radius-server deadtime <minutes>`  
`no radius-server deadtime`

| Parameter                    | Description  |
|------------------------------|--|
| <code>&lt;minutes&gt;</code> | RADIUS server deadtime in minutes in the range 0 to 1440 (24 hours). |

**Default** The default RADIUS deadtime configured on the system is 0 seconds.

**Mode** Global Configuration

**Usage** The RADIUS client considers a RADIUS server to be dead if it fails to respond to a request after it has been retransmitted as often as specified globally by the [radius-server retransmit](#) command or for the server by the [radius-server host](#) command. To improve RADIUS response times when some servers may be unavailable, set a **deadtime** to skip dead servers.

**Examples** To set the dead time of the RADIUS server to 60 minutes, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server deadtime 60
```

To disable the dead time of the RADIUS server, use the following commands:

```
awplus# configure terminal
awplus(config)# no radius-server deadtime
```

**Related commands**

- [deadtime \(RADIUS server group\)](#)
- [radius-server host](#)
- [radius-server retransmit](#)
- [show radius statistics](#)

# radius-server host

**Overview** Use this command to specify a remote RADIUS server host for authentication or accounting, and to set server-specific parameters. The parameters specified with this command override the corresponding global parameters for RADIUS servers. This command specifies the IP address or host name of the remote RADIUS server host and assigns authentication and accounting destination UDP port numbers.

This command adds the RADIUS server address and sets parameters to the RADIUS server. The RADIUS server is added to the running configuration after you issue this command. If parameters are not set using this command then common system settings are applied.

Use the **no** variant of this command to remove the specified server host as a RADIUS authentication and/or accounting server and set the destination port to the default RADIUS server port number (1812).

**Syntax**

```
radius-server host {<host-name>|<ip-address>} [acct-port <0-65535>] [auth-port <0-65535>] [key <key-string>] [retransmit <0-100>] [timeout <1-1000>]

radius-server host {<host-name>|<ip-address>} [acct-port <0-65535>] [auth-port <0-65535>] [key-encrypted <encrypted-key-string>] [retransmit <0-100>] [timeout <1-1000>]

no radius-server host {<host-name>|<ip-address>} [acct-port <0-65535>] [auth-port <0-65535>]
```

| Parameter    | Description  |
|--------------|--|
| <host-name>  | Server host name. The DNS name of the RADIUS server host.  |
| <ip-address> | The IP address of the RADIUS server host.  |
| acct-port    | Accounting port. Specifies the UDP destination port for RADIUS accounting requests. If 0 is specified, the server is not used for accounting. The default UDP port for accounting is 1813.                                       |
| <0-65535>    | UDP port number. (Accounting port number is set to (accounting port number is set to 1813 by default) Specifies the UDP destination port for RADIUS accounting requests. If 0 is specified, the host is not used for accounting. |
| auth-port    | Authentication port. Specifies the UDP destination port for RADIUS authentication requests. If 0 is specified, the server is not used for authentication. The default UDP port for authentication is 1812.                       |
| <0-65535>    | UDP port number (authentication port number is set to 1812 by default). Specifies the UDP destination port for RADIUS authentication requests. If 0 is specified, the host is not used for authentication.                       |
| timeout      | Specifies the amount of time to wait for a response from the server. If this parameter is not specified the global value configured by the <b>radius-server timeout</b> command is used.   |

| Parameter                                 | Description   |
|---|---|
| <code>&lt;1-1000&gt;</code>               | Time in seconds to wait for a server reply (timeout is set to 5 seconds by default). The time interval (in seconds to wait for the RADIUS server to reply before retransmitting a request or considering the server dead. This setting overrides the global value set by the <b>radius-server timeout</b> command. If no timeout value is specified for this server, the global value is used.  |
| <code>retransmit</code>                   | Specifies the number of retries before skip to the next server. If this parameter is not specified the global value configured by the <b>radius-server retransmit</b> command is used.  |
| <code>&lt;0-100&gt;</code>                | Maximum number of retries (maximum number of retries is set to 3 by default). The maximum number of times to resend a RADIUS request to the server, if it does not respond within the timeout interval, before considering it dead and skipping to the next RADIUS server. This setting overrides the global setting of the <b>radius-server retransmit</b> command. If no retransmit value is specified, the global value is used.   |
| <code>key</code>                          | Set shared secret key with RADIUS servers.  |
| <code>&lt;key-string&gt;</code>           | Shared key string applied. Specifies the shared secret authentication or encryption key for all RADIUS communications between this device and the RADIUS server. This key must match the encryption used on the RADIUS daemon. All leading spaces are ignored, but spaces within and at the end of the string are used.<br><br>If spaces are used in the string, do not enclose the string in quotation marks unless the quotation marks themselves are part of the key. This setting overrides the global setting of the <b>radius-server key</b> command. If no key value is specified, the global value is used. |
| <code>key-encrypted</code>                | Set an encrypted shared secret key. When secure mode is enabled, the running configuration contains this parameter instead of the key parameter. It indicates that the device stores keys in the running configuration in encrypted form instead of in plain text.  |
| <code>&lt;encrypted-key-string&gt;</code> | Encrypted shared key string.  |

**Default** The RADIUS client address is not configured (null) by default. No RADIUS server is configured.

**Mode** Global Configuration

**Usage** Multiple **radius-server host** commands can be used to specify multiple hosts. The software searches for hosts in the order they are specified. If no host-specific timeout, retransmit, or key values are specified, the global values apply to that host. If there are multiple RADIUS servers for this client, use this command multiple times—once to specify each server.

If you specify a host without specifying the auth port or the acct port, it will by default be configured for both authentication and accounting, using the default UDP ports. To set a host to be a RADIUS server for authentication requests only, set

the **acct-port** parameter to 0; to set the host to be a RADIUS server for accounting requests only, set the **auth-port** parameter to 0.

A RADIUS server is identified by IP address, authentication port and accounting port. A single host can be configured multiple times with different authentication or accounting ports. All the RADIUS servers configured with this command are included in the predefined RADIUS server group **radius**, which may be used by AAA authentication, authorization and accounting commands. The client transmits (and retransmits, according to the **retransmit** and **timeout** parameters) RADIUS authentication or accounting requests to the servers in the order you specify them, until it gets a response.

**Examples** To add the RADIUS server 10.0.0.20, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server host 10.0.0.20
```

To set the secret key to 'mySecret' on the RADIUS server 10.0.0.20, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server host 10.0.0.20 key mySecret
```

To delete the RADIUS server 10.0.0.20, use the following commands:

```
awplus# configure terminal
awplus(config)# no radius-server host 10.0.0.20
```

To configure rad1.company.com for authentication only, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server host rad1.company.com acct-port 0
```

To remove the RADIUS server rad1.company.com configured for authentication only, use the following commands:

```
awplus# configure terminal
awplus(config)# no radius-server host rad1.company.com
acct-port 0
```

To configure rad2.company.com for accounting only, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server host rad2.company.com auth-port 0
```

To configure 192.168.1.1 with authentication port 1000, accounting port 1001 and retransmit count 5, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server host 192.168.1.1 auth-port 1000
acct-port 1001 retransmit 5
```

**Related commands**

- Version 5.4.9-2.1: **key-encrypted** parameter added

# radius-server key

**Overview** This command sets a global secret key for RADIUS authentication on the device. The shared secret text string is used for RADIUS authentication between the device and a RADIUS server.

Note that if no secret key is explicitly specified for a RADIUS server, the global secret key will be used for the shared secret for the server.

Use the **no** variant of this command to reset the secret key to the default (null).

**Syntax** `radius-server key <key-string>`  
`no radius-server key`

When in secure mode, the syntax in config files will be:

`radius-server key-encrypted <encrypted-key-string>`

| Parameter   | Description   |
|---|---|
| <code>key &lt;key-string&gt;</code>                     | Shared secret among RADIUS server and 802.1X client.  |
| <code>key-encrypted &lt;encrypted-key-string&gt;</code> | This parameter indicates that the key is in its encrypted form. You would not normally enter this command. Instead, if you enter key and secure mode is enabled, the running config contains this parameter instead of the key parameter. This indicates that in secure mode the device stores keys in the running config in encrypted form instead of in plain text. |

**Default** The RADIUS server secret key on the system is not set by default (null).

**Mode** Global Configuration

**Usage** Use this command to set the global secret key shared between this client and its RADIUS servers. If no secret key is specified for a particular RADIUS server using the **radius-server host** command, this global key is used.

After enabling AAA authentication with the **aaa authentication login** command, set the authentication and encryption key using the **radius-server key** command so the key entered matches the key used on the RADIUS server.

**Examples** To set the global secret key to **allied** for RADIUS server, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server key allied
```

To set the global secret key to **secret** for RADIUS server, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server key secret
```

To delete the global secret key for RADIUS server, use the following commands:

```
awplus# configure terminal
awplus(config)# no radius-server key
```

**Related commands**

- [radius-server host](#)
- [show radius statistics](#)

# radius-server retransmit

**Overview** This command sets the retransmit counter to use RADIUS authentication on the device. This command specifies how many times the device transmits each RADIUS request to the RADIUS server before giving up.

This command configures the **retransmit** parameter for RADIUS servers globally. If the **retransmit** parameter is not specified for a RADIUS server by the **radius-server host** command then the global configuration set by this command is used for the server instead.

Use the **no** variant of this command to reset the re-transmit counter to the default (3).

**Syntax** `radius-server retransmit <retries>`  
`no radius-server retransmit`

| Parameter                    | Description   |
|------------------------------|---|
| <code>&lt;retries&gt;</code> | RADIUS server retries in the range <0-100>. The number of times a request is resent to a RADIUS server that does not respond, before the server is considered dead and the next server is tried. If no retransmit value is specified for a particular RADIUS server using the <b>radius-server host</b> command, this global value is used. |

**Default** The default RADIUS retransmit count on the device is 3.

**Mode** Global Configuration

**Examples** To set the RADIUS **retransmit** count to 1, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server retransmit 1
```

To set the RADIUS **retransmit** count to the default (3), use the following commands:

```
awplus# configure terminal
awplus(config)# no radius-server retransmit
```

To configure the RADIUS **retransmit** count globally with 5, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server retransmit 5
```

To disable retransmission of requests to a RADIUS server, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server retransmit 0
```

**Related  
commands** radius-server deadtime  
radius-server host  
show radius statistics

# radius-server timeout

**Overview** Use this command to specify the RADIUS global timeout value. This is how long the device waits for a reply to a RADIUS request before retransmitting the request, or considering the server to be dead. If no timeout is specified for the particular RADIUS server by the **radius-server host** command, it uses this global timeout value.

Note that this command configures the **timeout** parameter for RADIUS servers globally.

The **no** variant of this command resets the transmit timeout to the default (5 seconds).

**Syntax** `radius-server timeout <seconds>`  
`no radius-server timeout`

| Parameter                    | Description   |
|------------------------------|---|
| <code>&lt;seconds&gt;</code> | RADIUS server timeout in seconds in the range 1 to 1000. The global time in seconds to wait for a RADIUS server to reply to a request before retransmitting the request, or considering the server to be dead (depending on the <b>radius-server retransmit</b> command). |

**Default** The default RADIUS transmit timeout on the system is 5 seconds.

**Mode** Global Configuration

**Examples** To globally set the device to wait 20 seconds before retransmitting a RADIUS request to unresponsive RADIUS servers, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server timeout 20
```

To set the RADIUS **timeout** parameter to 1 second, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server timeout 1
```

To set the RADIUS **timeout** parameter to the default (5 seconds), use the following commands:

```
awplus# configure terminal
awplus(config)# no radius-server timeout
```

To configure the RADIUS server **timeout** period globally with 3 seconds, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server timeout 3
```

To reset the global **timeout** period for RADIUS servers to the default, use the following command:

```
awplus# configure terminal  
awplus(config)# no radius-server timeout
```

**Related  
commands**

## server (RADIUS server group)

**Overview** This command adds a RADIUS server to a server group in RADIUS Server Group Configuration mode. The RADIUS server should be configured by the [radius-server host](#) command.

The device adds each server to the end of the group's list of servers, so add the servers in order of priority. If you add a server and it is already in the list, it will be removed and then re-added to the end of the list.

The server is identified by IP address and authentication and accounting UDP port numbers. So a RADIUS server can have multiple entries in a group with different authentication and/or accounting UDP ports. The **auth-port** specifies the UDP destination port for authentication requests to the server. To disable authentication for the server, set **auth-port** to 0. If the authentication port is missing, the default port number is 1812. The **acct-port** specifies the UDP destination port for accounting requests to the server. To disable accounting for the server, set **acct-port** to 0. If the accounting port is missing, the default port number is 1813.

Use the **no** variant of this command to remove a RADIUS server from the server group.

**Syntax**

```
server {<hostname>|<ip-address>} [auth-port <0-65535>]  
[acct-port <0-65535>]  
  
no server {<hostname>|<ip-address>} [auth-port <0-65535>]  
[acct-port <0-65535>]
```

| Parameter    | Description  |
|--------------|--|
| <hostname>   | Server host name   |
| <ip-address> | Server IP address<br>The server is identified by IP address, authentication and accounting UDP port numbers. So a RADIUS server can have multiple entries in a group with different authentication and/or accounting UDP ports.  |
| auth-port    | Authentication port<br>The <b>auth-port</b> specifies the UDP destination port for authentication requests to the server. To disable authentication for the server, set <b>auth-port</b> to 0. If the authentication port is missing, the default port number is 1812. |
| <0-65535>    | UDP port number (default: 1812)  |
| acct-port    | Accounting port<br>The <b>acct-port</b> specifies the UDP destination port for accounting requests to the server. To disable accounting for the server, set <b>acct-port</b> to 0. If the accounting port is missing, the default port number is 1813.                 |
| <0-65535>    | UDP port number (default: 1813)  |

**Default** The default Authentication port number is 1812 and the default Accounting port number is 1813.

**Mode** RADIUS Server Group Configuration

**Usage notes** The RADIUS server to be added must be configured by the **radius-server host** command. In order to add or remove a server, the **auth-port** and **acct-port** parameters in this command must be the same as the corresponding parameters in the **radius-server host** command.

**Examples** To create a RADIUS server group 'RAD\_AUTH1' for authentication, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa group server radius RAD_AUTH1
awplus(config-sg)# server 192.168.1.1 acct-port 0
awplus(config-sg)# server 192.168.2.1 auth-port 1000 acct-port 0
```

To create a RADIUS server group 'RAD\_ACCT1' for accounting, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa group server radius RAD_ACCT1
awplus(config-sg)# server 192.168.2.1 auth-port 0 acct-port 1001
awplus(config-sg)# server 192.168.3.1 auth-port 0
```

To remove server 192.168.3.1 from the existing server group 'GROUP1', use the following commands:

```
awplus# configure terminal
awplus(config)# aaa group server radius GROUP1
awplus(config-sg)# no server 192.168.3.1
```

  Deadtime: 0
```

| Output Parameter    | Meaning  |
|---------------------|--|
| Source Interface    | The interface name or IP address to be used for the source address of all outgoing RADIUS packets. |
| Secret Key          | A shared secret key to a radius server.  |
| Timeout             | A time interval in seconds.  |
| Retransmit Count    | The number of retry count if a RADIUS server does not response.                                    |
| Deadtime            | A time interval in minutes to mark a RADIUS server as "dead".                                      |
| Interim-Update      | A time interval in minutes to send Interim-Update Accounting report.                               |
| Group Deadtime      | The deadtime configured for RADIUS servers within a server group.                                  |
| Server Host         | The RADIUS server hostname or IP address.  |
| Authentication Port | The destination UDP port for RADIUS authentication requests.                                       |
| Accounting Port     | The destination UDP port for RADIUS accounting requests.   |

| Output Parameter | Meaning  |
|------------------|--|
| Auth Status      | The status of the authentication port.<br>The status ("dead", "error", or "alive") of the RADIUS authentication server and, if dead, how long it has been dead for.                |
|                  | Alive      The server is alive.  |
|                  | Error      The server is not responding.   |
|                  | Dead      The server is detected as dead and it will not be used for deadtime period. The time displayed in the output shows the server is in dead status for that amount of time. |
|                  | Unknown    The server is never used or the status is unknown.  |
| Acct Status      | The status of the accounting port.<br>The status ("dead", "error", or "alive") of the RADIUS accounting server and, if dead, how long it has been dead for.                        |

# show radius dynamic-authorization counters

**Overview** Use this command to display the Dynamic Authorization message counters. It shows the count of sent and received messages, as well as a count of any error messages.

**Syntax** `show radius dynamic-authorization counters`

**Mode** Privileged Exec

**Example** To display the Dynamic Authorization message counters, use the following command:

```
awplus# show radius dynamic-authorization counters
```

**Output** Figure 47-4: Example output from **show radius dynamic-authorization counters**

```
awplus#show radius dynamic-authorization counters

RADIUS Dynamic Authorization packet counters
-----
Received:
  Disconnect request      : 9
  CoA request             : 6

Sent:
  Disconnect ACK         : 4
  CoA ACK                : 0
  Disconnect NAK        : 2
  CoA NAK                : 6

Dropped:
  Duplicate packet       : 2
  Expired packet         : 1

Error-cause:
  Unsupported attribute   : 0
  Missing attribute      : 0
  Invalid request        : 0
  NAS ID mismatch        : 0
  No session context found : 3

Errors:
  Unknown message type   : 0
  Unknown client         : 0
  Bad attribute           : 0
  Bad authenticator      : 0
  Malformed packet       : 0
```

**Command changes** Version 5.5.1-1.1: command added

# show radius statistics

**Overview** This command shows the RADIUS client statistics for the device.

**Syntax** show radius statistics

**Mode** User Exec and Privileged Exec

**Example** See the sample output below showing RADIUS client statistics and RADIUS configuration:

```
awplus# show radius statistics
```

**Output** Figure 47-5: Example output from the **show radius statistics** command:

```
RADIUS statistics for Server: 150.87.18.89
Access-Request Tx   : 5 - Retransmit   : 0
Access-Accept Rx   : 1 - Access-Reject Rx : 2
Access-Challenge Rx : 2
Unknown Type      : 0 - Bad Authenticator : 0
Malformed Access-Resp : 0 - Wrong Identifier : 0
Bad Attribute     : 0 - Packet Dropped   : 0
TimeOut          : 0 - Dead count       : 0
Pending Request   : 0
```

# undebug radius

**Overview** This command applies the functionality of the **no debug radius** command.

# 48

# Local RADIUS Server Commands

## Introduction

**Overview** This chapter provides an alphabetical reference for commands used to configure the local RADIUS server on the device. For more information, see the [Local RADIUS Server Feature Overview and Configuration Guide](#).

The local RADIUS server is not available in Secure Mode (see the [crypto secure-mode](#) command).

- Command List**
- [“attribute \(radsrv-grp\)”](#) on page 2467

# attribute (radsrv-grp)

**Overview** Use this command to define a RADIUS attribute for the local RADIUS server user group.

For a complete list of defined RADIUS attributes and values, see the [Local RADIUS Server Feature Overview and Configuration Guide](#).

When used with the **value** parameter the **attribute** command configures RADIUS attributes to the user group. If the specified attribute is already defined then it is replaced with the new value.

Use the **no** variant of this command to delete an attribute from the local RADIUS server user group.

**Syntax** `attribute [repeated] {<attribute-name>|<attribute-id>} <value>`  
`no attribute {<attribute-name>|<attribute-id>}`

| Parameter        | Description  |
|------------------|--|
| repeated         | This optional parameter allows you to set multiple instances of the same attribute name or attribute ID.   |
| <attribute-name> | RADIUS attribute name for standard attributes or Vendor-Specific attributes (see the <a href="#">Local RADIUS Server Feature Overview and Configuration Guide</a> for tables of attributes). |
| <attribute-id>   | RADIUS attribute numeric identifier for standard attributes.   |
| <value>          | RADIUS attribute value.  |

**Default** By default, no attributes are configured.

**Mode** Local RADIUS Server User Group Configuration

**Usage notes** For the Standard attributes, the attribute may be specified using either the attribute name, or its numeric identifier. For example, the command:

```
awplus(config-radsrv-group)# attribute acct-terminate-cause 1
```

will produce the same results as the command:

```
awplus(config-radsrv-group)# attribute 49 1
```

In the same way, where the specific attribute has a pre-defined value, the parameter <value> may be substituted with the Value Name or with its numeric value, for example the command:

```
awplus(config-radsrv-group)# attribute acct-terminate-cause  
user-request
```

will produce the same results as the command:

```
awplus(config-radsrv-group)# attribute 49 1
```

or the command:

```
awplus(config-radsrv-group)# attribute acct-terminate-cause 1
```

You can define more than one instance of an attribute name (or id) by using the **repeated** parameter. For example:

```
awplus(config-radsrv-group)# attribute repeated  
Nas-filter-Rule "deny in tcp from any to 0.0.0.0/0 23"  
  
awplus(config-radsrv-group)# attribute repeated  
Nas-filter-Rule "deny in tcp from any to fe80::b1 23"
```

**Examples** To define the attribute name 'Service-Type' with Administrative User (6) to the RADIUS User Group 'Admin', use the following commands:

```
awplus# configure terminal  
awplus(config)# radius-server local  
awplus(config-radsrv)# group Admin  
awplus(config-radsrv-group)# attribute Service-Type 6
```

To delete the attribute 'Service-Type' from the RADIUS User Group 'Admin', use the following commands:

```
awplus# configure terminal  
awplus(config)# radius-server local  
awplus(config-radsrv)# group Admin  
awplus(config-radsrv-group)# no attribute Service-Type
```

To define multiple values for attribute 'NAS-Filter-Rule', use the commands:

```
awplus# configure terminal  
awplus(config)# radius-server local  
awplus(config-radsrv)# group dynamicAcl  
awplus(config-radsrv-group)# attribute repeated  
NAS-Filter-Rule "deny in tcp from any to 0.0.0.0/0 23"  
awplus(config-radsrv-group)# attribute repeated  
NAS-Filter-Rule "deny in tcp from any to fe80::b1 23"
```

To delete a specific value from the attribute 'NAS-Filter-Rule', use the commands:

```
awplus# configure terminal  
awplus(config)# radius-server local  
awplus(config-radsrv)# group dynamicAcl  
awplus(config-radsrv-group)# no attribute NAS-Filter-Rule "deny  
in tcp from any to 0.0.0.0/0 23"
```

**Related  
commands**

[egress-vlan-id \(radsrv-grp\)](#)  
[egress-vlan-name \(radsrv-grp\)](#)  
[help radius-attribute](#)

**Command  
changes**

Version 5.5.0-1.1: **repeated** parameter added

# authentication

**Overview** Use this command to enable the specified authentication methods on the local RADIUS server.

Use the **no** variant of this command to disable specified authentication methods on the local RADIUS server.

**Syntax** authentication {mac|eapmd5|eaptls|peap}  
no authentication {mac|eapmd5|eaptls|peap}

| Parameter | Description                            |
|-----------|--|
| mac       | Enable MAC authentication method.      |
| eapmd5    | Enable EAP-MD5 authentication method.  |
| eaptls    | Enable EAP-TLS authentication method.  |
| peap      | Enable EAP-PEAP authentication method. |

**Default** All authentication methods are enabled by default.

**Mode** RADIUS Server Configuration

**Examples** The following commands enable EAP-MD5 authentication methods on the local RADIUS server.

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# authentication eapmd5
```

The following commands disable EAP-MD5 authentication methods on Local RADIUS server.

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# no authentication eapmd5
```

**Related commands** [server enable](#)  
[show radius local-server statistics](#)

# client (radsecproxy-srv)

**Overview** Use this command to add a RadSec client (for example, a NAS device) to the RadSecProxy local-server application. The application will accept RADIUS requests from all configured clients.

Use the **no** variant of this command to delete a previously-configured client from the RadSecProxy local-server application.

**Syntax** `client {<hostname>|<ip-addr>} [name-check {on|off}]`  
`no client {<hostname>|<ip-addr>}`

| Parameter  | Description   |
|------------|---|
| <hostname> | Hostname of client.   |
| <ip-addr>  | Specify the client IPv4 address, in dotted decimal notation (A.B.C.D).  |
| name-check | Specify whether or not to enforce certificate name checking for this client. If the parameter is not specified then the global behavior, which defaults to <b>on</b> , is used. |
| on         | Enable name checking for this client.   |
| off        | Disable name checking for this client.  |

**Mode** RadSecProxy Local Server Configuration

**Usage notes** The client may be specified by its domain name or by its IPv4 address. If a domain name is used, it must be resolvable using a configured DNS name server.

Each client may be configured to use certificate name-checking; if not specified, the global behavior defined by **client name-check** or **no client name-check** will be used. If name checking is enabled, the Common Name portion of the subject field of the client's X.509 certificate must match the domain name or IP address specified in this command.

**NOTE:** *If mutual authentication is disabled then this parameter has no effect, see the [client mutual-authentication](#) command.*

**Example** To add a client called 'mynas.local' with certificate name checking **off**, use the commands:

```
awplus# configure terminal
awplus(config)# radius-secure-proxy local-server
awplus(config-radsecproxy-srv)# client mynas.local name-check
off
```

**Related commands** [client mutual-authentication](#)  
[client name-check](#)

client trustpoint  
radius-secure-proxy local-server

# client mutual-authentication

**Overview** This command enables or disables mutual certificate authentication for all RadSecProxy clients. When enabled, the RadSecProxy local-server application will request and validate an X.509 certificate from the client when establishing a connection.

The **no** variant of this command disables mutual certificate validation. The local-server application will still transmit the local server certificate to the client, but will not expect or validate a certificate from the client.

**Syntax** `client mutual-authentication`  
`no client mutual-authentication`

**Default** Mutual authentication is enabled by default.

**Mode** RadSecProxy Local Server Configuration

**Example** Disable mutual certificate validation with the following command:

```
awplus# configure terminal
awplus(config)# radius-secure-proxy local-server
awplus(config-radsecproxy-srv)# no client
mutual-authentication
```

**Related commands** [client \(radsecproxy-srv\)](#)  
[client name-check](#)  
[radius-secure-proxy local-server](#)

**Command changes** Version 5.4.6-2.1: command added

# client name-check

**Overview** This command sets the global behavior for certificate name-checking for the RadSecProxy localserver application to **on**. This behavior will be used for all clients associated with the application that do not specify a behavior on a per-client basis. If name-checking is enabled, the Common Name portion of the subject field of the client's X.509 certificate must match the domain name or IP address specified in the **client (radsecproxy-aaa)** command.

Use the **no** variant of this command to set the global behavior for certificate name checking to **off**

**Syntax** `client name-check`  
`no client name-check`

**Default** Certificate name checking is on by default.

**Mode** RadSecProxy Local Server Configuration

**Example** Disable certificate name checking globally with the following command:

```
awplus# configure terminal
awplus(config)# radius-secure-proxy local-server
awplus(config-radsecproxy-srv)# no client name-check
```

**Related commands** [client \(radsecproxy-srv\)](#)  
[client trustpoint](#)  
[radius-secure-proxy local-server](#)

# client trustpoint

**Overview** This command adds one or more trustpoints to be used with the RadSecProxy local-server application. Multiple trustpoints may be specified, or the command may be executed more than once, to add multiple trustpoints to the application.

The **no** version of this command removes one or more trustpoints from the list of trustpoints associated with the application.

**Syntax** `client trustpoint [<trustpoint-list>]`  
`no client trustpoint [<trustpoint-list>]`

| Parameter         | Description   |
|-------------------|---|
| <trustpoint-list> | Specify one or more trustpoints to be added or deleted. |

**Mode** RadSecProxy Local Server Configuration

**Usage notes** The device certificate associated with the first trustpoint added to the application will be transmitted to remote servers. The certificate received from the remote server must have an issuer chain that terminates with the root CA certificate for any of the trustpoints that are associated with the application.

If you enter **client trustpoint** without specifying a trustpoint, the trustpoint list will be unchanged.

If you enter **no client trustpoint** without specifying a trustpoint, all trustpoints will be disassociated from the application.

**Example** You can add multiple trustpoints to the RadSecProxy local-server by executing the command multiple times:

```
awplus# configure terminal
awplus(config)# radius-secure-proxy local-server
awplus(config-radsecproxy-srv)# client trustpoint example_1
awplus(config-radsecproxy-srv)# client trustpoint example_2
```

Alternatively, add multiple trustpoints with a single command:

```
awplus(config-radsecproxy-srv)# client trustpoint example_3
example_4
```

Disassociate all trustpoints from the RadSecProxy local-server application using the command:

```
awplus(config-radsecproxy-srv)# no client trustpoint
```

**Related commands** [client \(radsecproxy-srv\)](#)  
[client name-check](#)  
[radius-secure-proxy local-server](#)

# clear radius local-server statistics

**Overview** Use this command to clear the statistics stored on the device for the local RADIUS server.

Use this command without any parameters to clear all types of local RADIUS server statistics.

**Syntax** `clear radius local-server statistics [nas|server|user]`

| Parameter | Description  |
|-----------|--|
| nas       | Clear the NAS (Network Access Server) statistics on the device. For example, clearing statistics stored for NAS server invalid passwords.    |
| server    | Clear the Local RADIUS Server statistics on the device. For example, clearing Local RADIUS Servers statistics for all failed login attempts. |
| user      | Clear the Local RADIUS Server user statistics. For example, clearing statistics stored for the number of successful user logins.             |

**Mode** Privileged Exec

**Usage** Refer to the sample output for the [show radius local-server statistics](#) for further information about the type of statistics each parameter option for this command clears. Both the **nas** and **server** parameters clear unknown username and invalid passwords statistics, while the **user** parameter clears the number of successful and failed logins for each local RADIUS server user.

**Examples** To clear the NAS (Network Access Server) statistics stored on the device, use the command:

```
awplus# clear radius local-server statistics nas
```

To clear the local RADIUS server statistics stored on the device, use the command:

```
awplus# clear radius local-server statistics server
```

To clear the local RADIUS server user statistics stored on the device, use the command:

```
awplus# clear radius local-server statistics user
```

**Related commands** [show radius local-server statistics](#)

# copy fdb-radius-users (to file)

**Overview** Use this command to create a set of local RADIUS server users from MAC addresses in the local FDB. A local RADIUS server user created using this command can be used for MAC authentication.

**Syntax** `copy fdb-radius-users  
{local-radius-user-db|nvs|flash|usb|debug|tftp|scp|  
fserver|<url>} [interface <port>] [vlan <vid>] [group <name>]  
[export-vlan [<radius-group-name>]]`

| Parameter            | Description  |
|----------------------|--|
| local-radius-user-db | Copy the local RADIUS server users created to the local RADIUS server.   |
| nvs                  | Copy the local RADIUS server users created to NVS memory.  |
| flash                | Copy the local RADIUS server users created to Flash memory.  |
| usb                  | Copy the local RADIUS server users created to USB storage device.  |
| debug                | Copy the local RADIUS server users created to debug.   |
| tftp                 | Copy the local RADIUS server users created to the TFTP destination.  |
| scp                  | Copy the local RADIUS server users created to the SCP destination.   |
| fserver              | Copy the local RADIUS server users created to the remote file server.  |
| <url>                | Copy the local RADIUS server users created to the specified URL.   |
| interface <port>     | Copy only MAC addresses learned on a specified device port. Wildcards may be used when specifying an interface name. |
| vlan <vid>           | Copy only MAC addresses learned on a specified VLAN.   |
| group <name>         | Assign a group name to the local RADIUS server users created.  |
| export-vlan          | Export VLAN ID assigned to exported FDB entry.   |
| <radius-group-name>  | Prefix for Radius group name storing VLAN ID   |

**Mode** Privileged Exec

**Usage notes** The local RADIUS server users created are written to a specified destination file in local RADIUS user CSV (Comma Separated Values) format. The local RADIUS server users can then be imported to a local RADIUS server using the [copy local-radius-user-db \(from file\)](#) command.

The name and password of the local RADIUS server users created use a MAC address, which can be used for MAC authentication.

This command does not copy a MAC address learned by the CPU or the management port.

This command can filter FDB entries by the interface name and the VLAN ID. When the interface name and the VLAN ID are specified, this command generates local RADIUS server users from only the MAC address learned on the specified interface and on the specified VLAN.

**Examples** To register the local RADIUS server users from the local FDB directly to the local RADIUS server, use the command:

```
awplus# copy fdb-radius-users local-radius-user-db
```

To register the local RADIUS server users from the interface port1.0.1 to the local RADIUS server, use the command:

```
awplus# copy fdb-radius-users local-radius-user-db interface port1.0.1
```

To copy output generated as local RADIUS server user data from MAC addresses learned on vlan10 on interface port1.0.1 to the file radius-user.csv, use the command:

```
awplus# copy fdb-radius-users radius-user.csv interface port1.0.1 vlan10
```

To copy output generated as local RADIUS server user data from MAC addresses learned on vlan10 on interface port1.0.1 to a file on the remote file server, use the command:

```
awplus# copy fdb-radius-users fserver interface port1.0.1 vlan10
```

**Related commands** [copy local-radius-user-db \(to file\)](#)  
[copy local-radius-user-db \(from file\)](#)

# copy local-radius-user-db (from file)

**Overview** Use this command to copy the Local RADIUS server user data from a file. The file, including the RADIUS user data in the file, must be in the CSV (Comma Separated Values) format.

You can select **add** or **replace** as the copy method. The **add** parameter option copies the contents of specified file to the local RADIUS server user database. If the same user exists then the old user is removed before adding a new user. The **replace** parameter option deletes all contents of the local RADIUS server user database before copying the contents of specified file.

**Syntax** `copy <source-url> local-radius-user-db [add|replace]`

| Parameter                       | Description   |
|---------------------------------|---|
| <code>&lt;source-url&gt;</code> | URL of the source file.   |
| <code>add</code>                | Add file contents to local RADIUS server user database.               |
| <code>replace</code>            | Replace current local RADIUS server user database with file contents. |

**Default** When no copy method is specified with this command the **replace** option is applied.

**Mode** Privileged Exec

**Examples** To replace the current local RADIUS server user data to the contents of `http://datahost/ user.csv`, use the following command:

```
awplus# copy http://datahost/user.csv local-radius-user-db
```

To add the contents of `http://datahost/user.csv` to the current local RADIUS server user database, use the following command:

```
awplus# copy http://datahost/user.csv local-radius-user-db add
```

**Related commands** [copy fdb-radius-users \(to file\)](#)  
[copy local-radius-user-db \(to file\)](#)

## copy local-radius-user-db (to file)

**Overview** Use this command to copy the local RADIUS server user data to a file. The output file produced is CSV (Comma Separated Values) format.

**Syntax** `copy local-radius-user-db  
{nvs|flash|usb|tftp|scp|<destination-url>}`

| Parameter         | Description                  |
|-------------------|------------------------------|
| nvs               | Copy to NVS memory.          |
| flash             | Copy to Flash memory.        |
| usb               | Copy to USB storage device.  |
| tftp              | Copy to TFTP destination.    |
| scp               | Copy to SCP destination.     |
| <destination-url> | URL of the Destination file. |

**Mode** Privileged Exec

**Example** Copy the current local RADIUS server user data to `http://datahost/user.csv`.

```
awplus# copy local-radius-user-db http://datahost/user.csv
```

**Related commands** [copy fdb-radius-users \(to file\)](#)  
[copy local-radius-user-db \(from file\)](#)

# crypto pki enroll local (deleted)

**Overview** This command is no longer available. Please use the following command instead:

```
crypto pki enroll <trustpoint>
```

Note that “local” is a valid name for a trustpoint, so you do not need to modify existing configurations or scripts.

# crypto pki enroll local local-radius-all-users (deleted)

**Overview** This command is no longer available. Please use the following command instead:

```
crypto pki enroll <trustpoint> local-radius-all-users
```

Note that "local" is a valid name for a trustpoint, so you do not need to modify existing configurations or scripts.

# crypto pki enroll local user (deleted)

**Overview** This command is no longer available. Please use the following command instead:

```
crypto pki enroll <trustpoint> user <username>
```

Note that “local” is a valid name for a trustpoint, so you do not need to modify existing configurations or scripts.

# crypto pki export local pem (deleted)

**Overview** This command is no longer available. Please use the [crypto pki export pem](#) command instead:

```
crypto pki export <trustpoint> pem [terminal|<url>]
```

Note that "local" is a valid name for a trustpoint, so you do not need to modify existing configurations or scripts.

# crypto pki export local pkcs12 (deleted)

**Overview** This command is no longer available. Please use the [crypto pki export pkcs12](#) command instead:

```
crypto pki export <trustpoint> pkcs12 {ca|server|<username>}  
<url>
```

Note that “local” is a valid name for a trustpoint, so you do not need to modify existing configurations or scripts.

# crypto pki trustpoint local (deleted)

**Overview** This command is no longer available. Please use the following command instead:

```
crypto pki trustpoint <trustpoint>
```

Note that "local" is a valid name for a trustpoint, so you do not need to modify existing configurations or scripts.

# debug crypto pki (deleted)

**Overview** This command is no longer available.

# domain-style

**Overview** Use this command to enable a specified domain style on the local RADIUS server. The local RADIUS server decodes the domain portion of a username login string when this command is enabled.

Use the **no** variant of this command to disable the specified domain style on the local RADIUS server.

**Syntax** `domain-style {suffix-atsign|ntdomain}`  
`no domain-style {suffix-atsign|ntdomain}`

| Parameter                  | Description  |
|----------------------------|--|
| <code>suffix-atsign</code> | Enable at sign "@" delimited suffix style, i.e. "user@domain". |
| <code>ntdomain</code>      | Enable NT domain style, i.e. "domain\user".                    |

**Default** This feature is disabled by default.

**Mode** RADIUS Server Configuration

**Usage notes** When both domain styles are enabled, the first domain style configured has the highest priority. A username login string is matched against the first domain style enabled. Then, if the username login string is not decoded, it is matched against the second domain style enabled.

**Examples** To enable NT domain style on the local RADIUS server, use the commands:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# domain-style ntdomain
```

To disable NT domain style on the local RADIUS server, use the commands:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# no domain-style ntdomain
```

**Related commands** [server enable](#)

## egress-vlan-id (radsrv-grp)

**Overview** Use this command to configure the standard RADIUS attribute 'Egress-VLANID (56)' for the local RADIUS Server user group.

Use the **no** variant of this command to remove the Egress-VLANID attribute from the local RADIUS server user group.

**Syntax** `egress-vlan-id <vid> [tagged|untagged]`  
`no egress-vlan-id`

| Parameter | Description   |
|-----------|---|
| <vid>     | The VLAN identifier to be used for the Egress VLANID attribute, in the range 1 to 4094.   |
| tagged    | Set frames on the VLAN as tagged. This sets the tag indication field to indicate that all frames on this VLAN are tagged.         |
| untagged  | Set all frames on the VLAN as untagged. This sets the tag indication field to indicate that all frames on this VLAN are untagged. |

**Default** By default, no Egress-VLANID attributes are configured.

**Mode** Local RADIUS Server User Group Configuration

**Usage** When a Voice VLAN is configured for dynamic VLAN allocation ([switchport voice vlan](#) command), the RADIUS server must be configured to send the VLAN information when an IP phone is successfully authenticated. Use either the [egress-vlan-id \(radsrv-grp\)](#) command or the [egress-vlan-name \(radsrv-grp\)](#) command, and specify the **tagged** parameter.

**Examples** To set the 'Egress-VLANID' attribute for the 'NormalUsers' local RADIUS server user group to VLAN identifier 200, with tagged frames, use the commands:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# group NormalUsers
awplus(config-radsrv-group)# egress-vlan-id 200 tagged
```

To remove the 'Egress-VLANID' attribute for the 'NormalUsers' local RADIUS server user group, use the commands:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# group NormalUsers
awplus(config-radsrv-group)# no egress-vlan-id
```

**Related commands**    `attribute (radsrv-grp)`  
                          `egress-vlan-name (radsrv-grp)`  
                          `switchport voice vlan`

# egress-vlan-name (radsrv-grp)

**Overview** Use this command to configure the standard RADIUS attribute 'Egress-VLAN-Name (58)' for the local RADIUS server user group.

Use the **no** variant of this command to remove the Egress-VLAN-Name attribute from the local RADIUS server user group.

**Syntax** `egress-vlan-name <vlan-name> [tagged|untagged]`  
`no egress-vlan-name`

| Parameter                      | Description   |
|--------------------------------|---|
| <code>&lt;vlan-name&gt;</code> | The VLAN name to be configured as the Egress-VLAN-Name attribute.   |
| <code>tagged</code>            | Set frames on the VLAN as tagged. This sets the tag indication field to indicate that all frames on this VLAN are tagged.         |
| <code>untagged</code>          | Set all frames on the VLAN as untagged. This sets the tag indication field to indicate that all frames on this VLAN are untagged. |

**Default** By default, no Egress-VLAN-Name attributes are configured.

**Mode** Local RADIUS Server User Group Configuration

**Usage** When a Voice VLAN is configured for dynamic VLAN allocation ([switchport voice vlan](#) command), the RADIUS server must be configured to send the VLAN information when an IP phone is successfully authenticated. Use either the [egress-vlan-id \(radsrv-grp\)](#) command or the [egress-vlan-name \(radsrv-grp\)](#) command, and specify the **tagged** parameter.

**Examples** To configure the 'Egress-VLAN-Name' attribute for the RADIUS server user group 'NormalUsers' with the VLAN name `vlan2` and all frames on this VLAN tagged, use the commands:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# group NormalUsers
awplus(config-radsrv-group)# egress-vlan-name vlan2 tagged
```

To delete the 'Egress-VLAN-Name' attribute for the 'NormalUsers' group, use the commands:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# group NormalUsers
awplus(config-radsrv-group)# no egress-vlan-name
```

**Related commands**    attribute (radsrv-grp)  
                          egress-vlan-id (radsrv-grp)  
                          switchport voice vlan

# group (radsrv)

**Overview** Use this command to create a local RADIUS server user group, and enter local RADIUS Server User Group Configuration mode.

Use the **no** variant of this command to delete the local RADIUS server user group.

**Syntax** `group <user-group-name>`  
`no group <user-group-name>`

| Parameter                            | Description             |
|--------------------------------------|-------------------------|
| <code>&lt;user-group-name&gt;</code> | User group name string. |

**Mode** RADIUS Server Configuration

**Examples** The following command creates the user group NormalUsers.

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# group NormalUsers
```

The following command deletes the user group NormalUsers.

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# no group NormalUsers
```

**Related commands** [user \(radsrv\)](#)  
[show radius local-server user](#)  
[vlan \(radsrv-grp\)](#)

# nas

**Overview** This command adds a client device (the Network Access Server or the NAS) to the list of devices that are able to send authentication requests to the local RADIUS server. The NAS is identified by its IP address and a shared secret (also referred to as a shared key) must be defined that the NAS will use to establish its identity.

Use the **no** variant of this command to remove a NAS client from the list of devices that are allowed to send authentication requests to the local RADIUS server.

**Syntax** `nas <ip-address> key <nas-keystring>`  
`no nas <ip-address>`

| Parameter                          | Description            |
|------------------------------------|------------------------|
| <code>&lt;ip-address&gt;</code>    | RADIUS NAS IP address. |
| <code>&lt;nas-keystring&gt;</code> | NAS shared keystring.  |

**Mode** RADIUS Server Configuration

**Examples** The following commands add the NAS with an IP address of 192.168.1.2 to the list of clients that may send authentication requests to the local RADIUS server. Note the shared key that this NAS will use to establish its identify is NAS\_PASSWORD.

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# nas 192.168.1.2 key NAS_PASSWORD
```

The following commands remove the NAS with an IP address of 192.168.1.2 from the list of clients that are allowed to send authentication requests to the local RADIUS server:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# no nas 192.168.1.2
```

**Related commands** [show radius local-server nas](#)

# help radius-attribute

**Overview** Use this command to display a list of standard and vendor specific valid RADIUS attributes that are supported by the local RADIUS server.

**Syntax** `help radius-attribute [<attribute-name>|<attribute-ID>]`

| Parameter                           | Description  |
|-------------------------------------|--|
| <code>&lt;attribute-name&gt;</code> | List the details and predefined values for the named attribute.    |
| <code>&lt;attribute-ID&gt;</code>   | List the details and predefined values for the given attribute ID. |

**Mode** Privileged Exec

**Usage notes** When used without a parameter, this command lists all of the available RADIUS attributes.

When used with an attribute name or ID, this command displays the attribute name, value type, and any predefined values.

**Example** To list all available RADIUS attributes, use the following command:

```
awplus# help radius-attribute
```

```
awplus#help radius-attribute
Standard Attributes:
 1      User-Name
 2      User-Password
 3      CHAP-Password
 4      NAS-IP-Address
 5      NAS-Port
 6      Service-Type
...
```

To display the details for the RADIUS attribute Frag-Status, use the following command:

```
awplus# help radius-attribute frag-status
```

```
awplus#help radius-attribute frag-status
Frag-Status : integer (Integer number)

Pre-defined values :
  Fragmentation-Supported (1)
  More-Data-Pending (2)
  More-Data-Request (3)
  Reserved (0)
```

**Related commands** [attribute \(radsrv-grp\)](#)

**Command changes** Version 5.4.8-0.2: command added  
Version 5.4.9-0.1: added to x530 Series products

# radius-secure-proxy local-server

**Overview** Use this command to enter the RadSecProxy local-server application configuration mode. This application allows remote RadSec clients to communicate with the local RADIUS server process via a secure (TLS) proxy.

**Syntax** `radius-secure-proxy local-server`

**Mode** Global Configuration Mode

**Example** To change mode from User Exec mode to the RadSecProxy local-server configuration mode, use the commands:

```
awplus# configure terminal
awplus(config)# radius-secure-proxy local-server
awplus(config-radsecproxy-srv)#
```

**Related commands**

- [client \(radsecproxy-srv\)](#)
- [client name-check](#)
- [client trustpoint](#)

# radius-server local

**Overview** Use this command to navigate to the Local RADIUS server configuration mode (`config-radsrv`) from the Global Configuration mode (`config`).

**Syntax** `radius-server local`

**Mode** Global Configuration

**Example** Local RADIUS Server commands are available from `config-radsrv` configuration mode. To change mode from User Exec mode to the Local RADIUS Server mode (`config-radsrv`), use the commands:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)#
```

## Output

```
awplus(config)#radius-server local
Creating Local CA repository.....OK
Enrolling Local System to local trustpoint..OK
awplus(config-radsrv)#
```

**Related commands**

- [server enable](#)
- [show radius local-server group](#)
- [show radius local-server nas](#)
- [show radius local-server statistics](#)
- [show radius local-server user](#)

# server auth-port

**Overview** Use this command to change the UDP port number for local RADIUS server authentication.

Use the **no** variant of this command to reset the RADIUS server authentication port back to the default.

**Syntax** `server auth-port <1-65535>`  
`no server auth-port`

| Parameter | Description      |
|-----------|------------------|
| <1-65535> | UDP port number. |

**Default** The default local RADIUS server UDP authentication port number is 1812.

**Mode** RADIUS Server Configuration

**Examples** The following commands set the RADIUS server authentication port to 10000.

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# server auth-port 10000
```

The following commands reset the RADIUS server authentication port back to the default UDP port of 1812.

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# no server auth-port
```

**Related commands** [server enable](#)  
[show radius local-server statistics](#)

# server enable

**Overview** This command enables the local RADIUS server. The local RADIUS server feature is started immediately when this command is issued.

The **no** variant of this command disables local RADIUS server. When this command is issued, the local RADIUS server stops operating.

**Syntax** `server enable`  
`no server enable`

**Default** The local RADIUS server is disabled by default and must be enabled for use with this command.

**Mode** RADIUS Server Configuration

**Examples** To enable the local RADIUS server, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# server enable
```

To disable the local RADIUS server, use the command:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# no server enable
```

**Related commands** [server auth-port](#)  
[show radius local-server statistics](#)

# show radius local-server group

**Overview** Use this command to display information about the local RADIUS server user group.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show radius local-server group [<user-group-name>]`

| Parameter                            | Description             |
|--------------------------------------|-------------------------|
| <code>&lt;user-group-name&gt;</code> | User group name string. |

**Mode** User Exec and Privileged Exec

**Example** The following command displays Local RADIUS server user group information.

```
awplus# show radius local-server group
```

## Output

**Table 1:** Example output from the **show radius local-server group** command

|                  |               |
|------------------|---------------|
| Group-Name       | Vlan          |
| -----            |               |
| NetworkOperators | ManagementNet |
| NormalUsers      | CommonNet     |

**Table 2:** Parameters in the output of the **show radius local-server group** command

| Parameter  | Description                      |
|------------|----------------------------------|
| Group-Name | Group name.                      |
| Vlan       | VLAN name assigned to the group. |

**Related commands** [group \(radsrv\)](#)

# show radius local-server nas

**Overview** Use this command to display information about NAS (Network Access Servers) registered to the local RADIUS server.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show radius local-server nas [<ip-address>]`

| Parameter    | Description                             |
|--------------|---|
| <ip-address> | Specify NAS IP address for show output. |

**Mode** User Exec and Privileged Exec

**Example** The following command displays NAS information.

```
awplus# show radius local-server nas
```

## Output

**Table 3:** Example output from the **show radius local-server nas** command

| NAS-Address | Shared-Key                 |
|-------------|----------------------------|
| 127.0.0.1   | awplus-local-radius-server |

**Table 4:** Parameters in the output of the **show radius local-server nas** command

| Parameter   | Description                            |
|-------------|--|
| NAS-Address | IP address of NAS.                     |
| Shared-Key  | Shared key used for RADIUS connection. |

**Related commands** [nas](#)

# show radius local-server statistics

**Overview** Use this command to display statistics about the local RADIUS server.  
For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show radius local-server statistics`

**Mode** User Exec and Privileged Exec

**Usage notes** Both unknown usernames and invalid passwords will display as failed logins in the show output.

**Example** The following command displays Local RADIUS server statistics.

```
awplus# show radius local-server statistics
```

## Output

**Table 5:** Example output from the **show radius local-server statistics** command

```
Server status      : Run (administrative status is enable)

**Related commands** [clear radius local-server statistics](#)  
[radius-server local](#)  
[server enable](#)  
[server auth-port](#)

# show radius local-server user

**Overview** Use this command to display information about the local RADIUS server user.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax**

```
show radius local-server user [<user-name>]  
show radius local-server user [<user-name>] format csv  
show radius local-server user [<user-name>] detail
```

| Parameter   | Description   |
|-------------|---|
| <user-name> | RADIUS user name. If no user name is specified, information for all users is displayed. |
| format csv  | Format output as CSV. This parameter is only available in Privileged Exec mode.         |
| detail      | Display detailed information about the user.  |

**Mode** User Exec and Privileged Exec

**Examples** The following command displays Local RADIUS server user information for user Tom.

```
awplus# show radius local-server user Tom
```

**Table 6:** Example output from the **show radius local-server user** command

| User-Name | Group            | Vlan          |
|-----------|------------------|---------------|
| Tom       | NetworkOperators | ManagementNet |

The following command displays all Local RADIUS server information for all users.

```
awplus# show radius local-server user
```

The following command displays Local RADIUS server user information for Tom in CSV format (only available in Privileged Exec mode).

```
awplus# show radius local-server user Tom format csv
```

**Table 7:** Example output from the **show radius local-server user Tom format csv** command

|  |
|--|
| true,"NetworkOperators","Tom","abcd",0,2099/01/01,1,"","","ManagementNet"false,3600,false,0,"",false,"",false,false,"","",false,false,,false,0,0,"",true |
|--|

The following command displays detailed Local RADIUS server user information for all users.

```
awplus# show radius local-server user detail
```

**Table 8:** Example output from the **show radius local-server user detail** command

```
awplus# show radius local-server user detail
Total users: 1
Maximum users allowed by license: 3
-----
Username   : Tom
Group      : NetworkOperators
Vlan       : VlanName
```

**Table 9:** Parameters in the output from the **show radius local-server user** command

| Parameter | Description                      |
|-----------|----------------------------------|
| User-Name | User name.                       |
| Group     | Group name assigned to the user. |
| Vlan      | VLAN name assigned to the user.  |

**Related commands** [group \(radsrv\)](#)  
[user \(radsrv\)](#)

**Command changes** Version 5.4.9-0.1: **detail** parameter added

# user (radsrv)

**Overview** Use this command to register a user to the local RADIUS server.  
Use the **no** variant of this command to delete a user from the local RADIUS server.

**Syntax** `user <radius-user-name> [encrypted] password <user-password>  
[group <user-group>]`  
`no user <radius-user-name>`

| Parameter                             | Description   |
|---------------------------------------|---|
| <code>&lt;radius-user-name&gt;</code> | RADIUS user name. This can also be a MAC address in the IEEE standard format of HH-HH-HH-HH-HH-HH if you are configuring MAC authentication to use local RADIUS server.   |
| <code>encrypted</code>                | Specifies that the password is being entered in its encrypted form, so that it is not further encrypted. When creating a new user, enter the password in plaintext, and do not use the <b>encrypted</b> parameter. Use the <b>encrypted</b> parameter only when referring to a user that has previously been created. For instance, when adding an existing user from another RADIUS server, use the <b>encrypted</b> parameter, and enter the encrypted version of the password that appears in the output of <b>show</b> commands for the user. |
| <code>&lt;user-password&gt;</code>    | User password. This can also be a MAC address in the IEEE standard format of HH-HH-HH-HH-HH-HH if you are configuring MAC authentication to use local RADIUS server.  |
| <code>group</code>                    | Specify the group for the user.   |
| <code>&lt;user-group&gt;</code>       | User group name.  |

**Mode** RADIUS Server Configuration

**Usage notes** RADIUS user names cannot contain question mark (?), space ( ), or quote (" ") characters. RADIUS user names containing the below characters cannot use certificate authentication:

`/ \ '$ & () * ; < > ` |`

Certificates cannot be created and exported for RADIUS user names that contain the above characters. We advise you to avoid using these characters in RADIUS user names if you need to use certificate authentication, because you will not be able to create and export certificates.

You also can use the IEEE standard format hexadecimal notation (HH-HH-HH-HH-HH-HH) to specify a supplicant MAC address to configure the user name and user password parameters to use local RADIUS server for MAC Authentication. See the [AAA and Port\\_Authentication Feature Overview and Configuration\\_Guide](#) for a sample MAC configuration. See also the command **user**

**00-db-59-ab-70-37 password 00-db-59-ab-70-37** as shown in the command examples.

**Examples** The following commands add user 'Tom' to the local RADIUS server and sets his password to 'QwerSD'.

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# user Tom password QwerSD
```

The following commands add user 'Tom' to the local RADIUS server user group 'NormalUsers' and sets his password 'QwerSD'.

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# user Tom password QwerSD group
NormalUsers
```

The following commands remove user 'Tom' from the local RADIUS server:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# no user Tom
```

The following commands add the supplicant MAC address 00-d0-59-ab-70-37 to the local RADIUS server:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# user 00-db-59-ab-70-37 password
00-db-59-ab-70-37
```

The following commands remove the supplicant MAC address 00-d0-59-ab-70-37 from the local RADIUS server:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# no user 00-db-59-ab-70-37
```

**Related commands** [group \(radsrv\)](#)  
[show radius local-server user](#)

# vlan (radsrv-grp)

**Overview** Use this command to set the VLAN ID or name for the local RADIUS server user group. The VLAN information is used for authentication with the dynamic VLAN feature.

Use the **no** variant of this command to clear the VLAN ID or VLAN name for the local RADIUS server user group.

**Syntax** vlan {<vid>|<vlan-name>}  
no vlan

| Parameter   | Description |
|-------------|-------------|
| <vid>       | VLAN ID.    |
| <vlan-name> | VLAN name.  |

**Default** VLAN information is not set by default.

**Mode** Local RADIUS Server User Group Configuration

**Examples** The following commands set VLAN ID 200 to the group named 'NormalUsers':

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# group NormalUsers
awplus(config-radsrv-group)# vlan 200
```

The following commands remove VLAN ID 200 from the group named 'NormalUsers':

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# group NormalUsers
awplus(config-radsrv-group)# no vlan
```

# Public Key Infrastructure and Crypto Commands

## Introduction

**Overview** This chapter provides an alphabetical reference of commands used to configure the Public Key Infrastructure (PKI) capabilities on an AlliedWare Plus device. For more information about PKI, see the [Public Key Infrastructure \(PKI\) Feature Overview and Configuration Guide](#).

- Command List**
- “crypto key generate rsa” on page 2510
  - “crypto key zeroize” on page 2511
  - “crypto pki authenticate” on page 2512
  - “crypto pki enroll” on page 2513
  - “crypto pki enroll user” on page 2514
  - “crypto pki export pem” on page 2516
  - “crypto pki export pkcs12” on page 2517
  - “crypto pki import pem” on page 2519
  - “crypto pki import pkcs12” on page 2521
  - “crypto pki trustpoint” on page 2522
  - “crypto secure-mode” on page 2523
  - “crypto secure-mode delete hostkey” on page 2524
  - “crypto verify” on page 2525
  - “crypto verify bootrom” on page 2527
  - “crypto verify signed” on page 2529
  - “enrollment (ca-trustpoint)” on page 2531
  - “fingerprint (ca-trustpoint)” on page 2532
  - “no crypto pki certificate” on page 2534
  - “rsakeypair (ca-trustpoint)” on page 2535

- [“show crypto key mypubkey rsa”](#) on page 2536
- [“show crypto pki certificates”](#) on page 2537
- [“show crypto pki enrollment user”](#) on page 2539
- [“show crypto pki trustpoint”](#) on page 2540
- [“show hash”](#) on page 2541
- [“show secure-mode”](#) on page 2542
- [“subject-name \(ca-trustpoint\)”](#) on page 2543

# crypto key generate rsa

**Overview** Use this command to generate a cryptographic public/private key pair for the Rivest-Shamir-Adleman (RSA) encryption algorithm.

**Syntax** `crypto key generate rsa [label <keylabel>] [<1024-4096>]`

| Parameter   | Description   |
|-------------|---|
| <keylabel>  | The name of the key to be created. The name must start with an alphanumeric character, and may only contain alphanumeric characters, underscores, dashes, or periods. The maximum length of the name is 63 characters. If no label is specified the default value "server-default" is used. |
| <1024-4096> | The bit length for the key. If no bit length is specified the default of 2048 is used.  |

**Mode** Privileged Exec

**Usage notes** The generated key may be used for multiple server certificates in the system. A key is referenced by its label. A bit length between 1024 and 4096 bits may be specified. Larger bit lengths are more secure, but require more computation time. The specified key must not already exist.

**Example** To create a key with the label "example-server-key" and a bit length of 2048, use the commands:

```
awplus> enable  
awplus# crypto key generate rsa label example-server-key 2048
```

**Related commands** [crypto key zeroize](#)  
[rsakeypair \(ca-trustpoint\)](#)  
[show crypto key mypubkey rsa](#)

# crypto key zeroize

**Overview** Use this command to delete one or all cryptographic public/private key pairs.

**Syntax** `crypto key zeroize rsa <keylabel>`  
`crypto key zeroize all`

| Parameter                         | Description  |
|-----------------------------------|--|
| <code>rsa &lt;keylabel&gt;</code> | Delete a single key pair for the Rivest-Shamir-Adleman (RSA) encryption algorithm. |
| <code>all</code>                  | Delete all keys.   |

**Mode** Privileged Exec

**Usage notes** When the system is in secure mode, this command will securely delete the file (the file's sectors in NVS will be overwritten with random data three times before deletion). When the device is not in secure mode, this command has the same effect as using the **delete** command (it deletes the file from Flash memory but does not overwrite it with zeros).

The specified key must exist but must not be in use for any existing server certificates.

A key may not be deleted if it is associated with the server certificate or server certificate signing request for an existing trustpoint. To remove a server certificate so that the key may be deleted, use the **no crypto pki enroll** command to de-enroll the server.

**Example** To delete an RSA key named "example-server-key", use the following command:

```
awplus# crypto key zeroize rsa example-server-key
```

**Related commands** [crypto key generate rsa](#)  
[show crypto key mypubkey rsa](#)  
[crypto secure-mode](#)

**Command changes** Version 5.4.6-1.1: zeroize functionality added to x930 Series  
Version 5.4.8-1.2: zeroize functionality added to x220, XS900MX, x550 Series  
Version 5.4.8-2.1: zeroize functionality added to SBx908 GEN2, x950 Series

# crypto pki authenticate

**Overview** Use this command to authenticate a trustpoint by generating or importing the root CA certificate. This must be done before the server can be enrolled to the trustpoint.

**Syntax** `crypto pki authenticate <trustpoint>`

| Parameter                       | Description                                     |
|---------------------------------|---|
| <code>&lt;trustpoint&gt;</code> | The name of the trustpoint to be authenticated. |

**Mode** Privileged Exec

**Usage notes** If the trustpoint's **enrollment** setting is "selfsigned", then this command causes a private key to be generated for the root CA, and a self-signed certificate to be generated based on that key.

If the trustpoint's **enrollment** setting is "terminal", then this command prompts the user to paste a certificate Privacy Enhanced Mail (PEM) file at the CLI terminal. If the certificate is a valid selfsigned CA certificate, then it will be stored as the trustpoint's root CA certificate.

The specified trustpoint must already exist, and its enrollment mode must have been defined.

**Example** To show the **enrollment** setting of a trustpoint named "example" and then generate a certificate from it, use the commands:

```
awplus> enable
awplus# configure terminal
awplus(config)# crypto pki trustpoint example
awplus(ca-trustpoint)# enrollment selfsigned
awplus(config)# exit
awplus# exit
awplus# crypto pki authenticate example
```

**Related commands**

- [crypto pki import pem](#)
- [crypto pki trustpoint](#)
- [enrollment \(ca-trustpoint\)](#)

# crypto pki enroll

**Overview** Use this command to enroll the local server to the specified trustpoint.  
Use the **no** variant of this command to de-enroll the server by removing its certificate

**Syntax** `crypto pki enroll <trustpoint>`  
`no crypto pki enroll <trustpoint>`

| Parameter                       | Description                               |
|---------------------------------|---|
| <code>&lt;trustpoint&gt;</code> | The name of the trustpoint to be enrolled |

**Mode** Privileged Exec

**Usage notes** For the local server, “enrollment” is the process of creating of a certificate for the server that has been signed by a CA associated with the trustpoint. The public portion of the RSA key pair specified using the `rsa` parameter for the trustpoint will be included in the server certificate.

If the trustpoint represents a locally self-signed certificate authority, then this command results in the direct generation of the server certificate, signed by the root CA for the trustpoint.

If the trustpoint represents an external certificate authority, then this command results in the generation of a Certificate Signing Request (CSR) file, which is displayed at the terminal in Privacy-Enhanced Mail (PEM) format, suitable for copying and pasting into a file or message. The CSR must be sent to the external CA for processing. When the CA replies with the signed certificate, that certificate should be imported using the `crypto pki import pem` command, to complete the enrollment process.

The specified trustpoint must already exist, and it must already be authenticated.

**Example** To enroll the local server with the trustpoint “example”, use the following commands:

```
awplus> enable  
awplus# crypto pki enroll example
```

**Related commands** [crypto pki enroll user](#)  
[crypto pki import pem](#)  
[crypto pki trustpoint](#)  
[enrollment \(ca-trustpoint\)](#)

# crypto pki enroll user

**Overview** Use this command to enroll a single RADIUS user or all RADIUS users to the specified trustpoint.

Use the **no** variant of this command to remove the PKCS#12 file from the system. Note that the PKCS#12 files are generated in a temporary (volatile) file system, so a system restart also results in removal of all of the files.

**Syntax**

```
crypto pki enroll <trustpoint>
{user <username>|local-radius-all-users}

no crypto pki enroll <trustpoint>
{user <username>|local-radius-all-users}
```

| Parameter    | Description   |
|--------------|---|
| <trustpoint> | The name of the trustpoint to which users are to be enrolled. |
| <username>   | The name of the user to enroll to the trustpoint.             |

**Mode** Privileged Exec

**Usage notes** For RADIUS users, “enrollment” is the process of generating a private key and a corresponding client certificate for each user, with the certificate signed by the root CA for the trustpoint. The resulting certificates may be exported to client devices, for use with PEAP or EAP-TLS authentication with the local RADIUS server.

The specified trustpoint must represent a locally self-signed certificate authority.

The private key and certificate are packaged into a PKCS#12-formatted file, suitable for export using the **crypto pki export pkcs12** command. The private key is encrypted for security, with a passphrase that is entered at the command line. The passphrase is required when the PKCS#12 file is imported on the client system. The passphrase is not stored anywhere on the device, so users are responsible for remembering it until the export-import process is complete.

If **local-radius-all-users** is specified instead of an individual user, then keys and certificates for all RADIUS users will be generated at once. All the keys will be encrypted using the same passphrase.

The specified trustpoint must already exist, it must represent a locally self-signed CA, and it must already have been authenticated.

**Example** To enroll the user “example-user” with the trustpoint “example”, use the following commands:

```
awplus> enable
awplus# crypto pki enroll example user example-user
```

To enroll all local RADIUS users with the trustpoint "example", use the following commands:

```
awplus> enable
```

```
awplus# crypto pki enroll example local-radius-all-users
```

**Related commands**

- [crypto pki export pkcs12](#)
- [crypto pki trustpoint](#)

# crypto pki export pem

**Overview** Use this command to export the root CA certificate for the given trustpoint to a file in Privacy-Enhanced Mail (PEM) format. The file may be transferred to the specified destination URL, or displayed at the terminal.

**Syntax** `crypto pki export <trustpoint> pem [terminal|<url>]`

| Parameter                       | Description   |
|---------------------------------|---|
| <code>&lt;trustpoint&gt;</code> | The name of the trustpoint for which the root CA certificate is to be exported. |
| <code>terminal</code>           | Display the PEM file to the terminal.   |
| <code>&lt;url&gt;</code>        | Transfer the PEM file to the specified URL.                                     |

**Default** The PEM will be displayed to the terminal by default.

**Mode** Privileged Exec

**Usage notes** The specified trustpoint must already exist, and it must already be authenticated.

**Example** To display the PEM file for the trustpoint "example" to the terminal, use the following commands:

```
awplus> enable
awplus# crypto pki export example pem terminal
```

To export the PEM file "example.pem" for the trustpoint "example" to the URL "tftp://server\_a/", use the following commands:

```
awplus> enable
awplus# crypto pki export example pem
tftp://server_a/example.pem
```

**Related commands**

- [crypto pki authenticate](#)
- [crypto pki import pem](#)
- [crypto pki trustpoint](#)

# crypto pki export pkcs12

**Overview** Use this command to export a certificate and private key for an entity in a trustpoint to a file in PKCS#12 format at the specified URL. The private key is encrypted with a passphrase for security.

**Syntax** `crypto pki export <trustpoint> pkcs12 {ca|server|<username>} <url>`

| Parameter    | Description  |
|--------------|--|
| <trustpoint> | The name of the trustpoint for which the certificate and key are to be exported.   |
| ca           | If this option is specified, the command exports the root CA certificate and corresponding key.  |
| server       | If this option is specified, the command exports the server certificate and corresponding key.   |
| <username>   | If a RADIUS username is specified, the command exports the PKCS#12 file that was previously generated using the <code>crypto pki enroll user</code> command. To avoid ambiguity with keywords, the username may be prefixed by the string "user:". |
| <url>        | The destination URL for the PKCS#12 file. The format of the URL is the same as any valid destination for a file copy command.  |

**Mode** Privileged Exec

**Usage notes** If the **ca** option is specified, this command exports the root CA certificate and the corresponding private key, if the trustpoint has been authenticated as a locally selfsigned CA. (If the trustpoint represents an external CA, then there is no private key on the system corresponding to the root CA certificate. Use the **crypto pki export pem** file to export the certificate by itself.) The command prompts for a passphrase to encrypt the private key.

If the **server** option is specified, this command exports the server certificate and the corresponding private key, if the server has been enrolled to the trustpoint. The command prompts for a passphrase to encrypt the private key.

If a RADIUS username is specified, this command exports the PKCS#12 file that was generated using the **crypto pki enroll user** command. (The key within the file was already encrypted as part of the user enrollment process.)

In the event that there is a RADIUS user named "ca" or "server", enter "user:ca" or "user:server" as the username.

The key and certificate must already exist.

**Example** To export the PKCS#12 file "example.pk12" for the trustpoint "example" to the URL "tftp://backup/", use the following commands:

```
awplus> enable  
awplus# crypto pki export example pkcs12 ca  
tftp://backup/example.pk12
```

**Related commands**

- crypto pki enroll user
- crypto pki export pem
- crypto pki import pkcs12

# crypto pki import pem

**Overview** This command imports a certificate for the given trustpoint from a file in Privacy-Enhanced Mail (PEM) format. The file may be transferred from the specified destination URL, or entered at the terminal.

**Syntax** `crypto pki import <trustpoint> pem [terminal|<url>]`

| Parameter                       | Description  |
|---------------------------------|--|
| <code>&lt;trustpoint&gt;</code> | The name of the trustpoint for which the root CA certificate is to be imported.  |
| <code>terminal</code>           | Optional parameter, If specified, the command prompts the user to enter (or paste) the PEM file at the terminal. If parameter is specified terminal is assumed by default. |
| <code>&lt;url&gt;</code>        | Optional parameter, If specified, the PEM file is transferred from the specified URL   |

**Default** The PEM will be imported from the terminal by default.

**Mode** Privileged Exec

**Usage notes** The command is generally used for trustpoints representing external certificate authorities. It accepts root CA certificates, intermediate CA certificates, and server certificates. The system automatically detects the certificate type upon import.

Using this command to import root CA certificates at the terminal is identical to the functionality provided by the `crypto pki authenticate` command, for external certificate authorities. The imported certificate is validated to ensure it is a proper CA certificate.

Intermediate CA certificates are validated to ensure they are proper CA certificates, and that the issuer chain ends in a root CA certificate already installed for the trustpoint. If there is no root CA certificate for the trustpoint (i.e., if the trustpoint is unauthenticated) then intermediate CA certificates may not be imported.

Server certificates are validated to ensure that the issuer chain ends in a root CA certificate already installed for the trustpoint. If there is no root CA certificate for the trustpoint (i.e., if the trustpoint is unauthenticated) then server certificates may not be imported.

The specified trustpoint must already exist. If the imported certificate is self-signed, then no certificates may exist for the trustpoint. Otherwise, the issuer's certificate must already be present for the trustpoint.

**Example** To import the PEM file for the trustpoint "example" from the terminal, use the following commands:

```
awplus> enable
awplus# crypto pki import example pem
```

To import the PEM file for the trustpoint "example" from the URL "tftp://server\_a/", use the following commands:

```
awplus> enable  
awplus# crypto pki import example pem  
tftp://server_a/example.pem
```

**Related  
commands**

[crypto pki authenticate](#)  
[crypto pki export pem](#)  
[crypto pki trustpoint](#)

# crypto pki import pkcs12

**Overview** This command imports a certificate and private key for an entity in a trustpoint from a file in PKCS#12 format at the specified URL. The command prompts for a passphrase to decrypt the private key within the file.

**Syntax** `crypto pki import <trustpoint> pkcs12 {ca|server} <url>`

| Parameter    | Description  |
|--------------|--|
| <trustpoint> | The name of the trustpoint for which the certificate and key are to be imported.   |
| ca           | If this option is specified, the command imports the root CA certificate and corresponding key.                          |
| server       | If this option is specified, the command imports the server certificate and corresponding key.                           |
| <url>        | The source URL for the PKCS#12 file. The format of the URL is the same as any valid destination for a file copy command. |

**Mode** Privileged Exec

**Usage notes** If the **ca** option is specified, this command imports the root CA certificate and the corresponding private key. This is only valid if the root CA certificate does not already exist for the trustpoint (i.e., if the trustpoint is unauthenticated).

If the **server** option is specified, this command imports the server certificate and the corresponding private key. The imported private key is given a new unique label of the form "localN", where N is a non-negative integer. This operation is only valid if the server certificate does not already exist for the trustpoint (i.e., if the server is not enrolled to the trustpoint).

PKCS#12 files for RADIUS users may not be imported with this command. (There is no value in doing so, as the files are not needed on the local system.)

The specified trustpoint must already exist. The key and certificate must not already exist.

**Example** To import the PKCS#12 file "example.pk12" for the trustpoint "example" to the URL "tftp://backup/", use the following commands:

```
awplus> enable
awplus# crypto pki import example pkcs12 ca
tftp://backup/example.pk12
```

**Related commands** [crypto pki export pkcs12](#)  
[crypto pki import pem](#)

# crypto pki trustpoint

**Overview** Use this command to declare the named trustpoint and enter trustpoint configuration mode.

Use the **no** variant of this command to destroy the trustpoint.

**Syntax** `crypto pki trustpoint <trustpoint>`  
`no crypto pki trustpoint <trustpoint>`

| Parameter                       | Description   |
|---------------------------------|---|
| <code>&lt;trustpoint&gt;</code> | The name of the trustpoint. The name must start with an alphanumeric character, and may only contain alphanumeric characters, underscores, dashes, or periods. The maximum length of the name is 63 characters. |

**Mode** Global Configuration

**Usage notes** If the trustpoint did not previously exist, it is created as a new trustpoint. The trustpoint will be empty (unauthenticated) unless the name "local" is selected, in which case the system will automatically authenticate the trustpoint as a local self-signed certificate authority.

The **no** variant of this command destroys the trustpoint by removing all CA and server certificates associated with the trustpoint, as well as the private key associated with the root certificate (if the root certificate was locally self-signed). This is a destructive and irreversible operation, so this command should be used with caution.

**Example** To configure a trustpoint named "example", use the following commands:

```
awplus> enable
awplus# configure terminal
awplus(config)# crypto pki trustpoint example
```

**Related commands** [show crypto pki certificates](#)  
[show crypto pki trustpoint](#)

**Command changes** Version 5.4.6-1.1: command added to x930 Series  
Version 5.4.8-1: command added to x220, XS900MX, x550 Series  
Version 5.4.8-2.1: command added to SBx908 GEN2, x950 Series

# crypto secure-mode

**Overview** Use this command to put the device into Secure Mode. When in Secure Mode, the following are disabled:

- Telnet
- SSHv1
- SNMPv1/v2
- All privilege levels except 1 and 15
- Algorithms that are not supported under FIPS, including MD5, RSA-1 and DSA
- The ability to store passwords in cleartext and to specify an **enable** password.

In Secure Mode, the web server on the device (used by the Device GUI) only accepts AES128-SHA ciphers.

*Note: Stacking is not supported in Secure Mode.*

Use the **no** variant of this command to leave Secure Mode. You should delete all sensitive information first; see the ["Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide](#).

**Syntax** `crypto secure-mode`  
`no crypto secure-mode`

**Default** By default, the device is not in Secure Mode.

**Mode** Global Configuration

**Example** For step-by-step instructions about how to enter and leave Secure Mode, see "How to Enable Secure Mode" in the ["Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide](#).

**Related commands** `boot system`  
`crypto key zeroize`  
`crypto pki trustpoint`  
`crypto verify`  
`show secure-mode`

**Command changes** Version 5.4.6-1.1: command added to x930 Series  
Version 5.4.8-1.2: command added to x220, XS900MX, x550 Series  
Version 5.4.8-2.1: command added to SBx908 GEN2, x950 Series

# crypto secure-mode delete hostkey

**Overview** Use this command to delete the encryption key used for securing configuration secrets in secure mode. Note that doing this will make these secrets impossible to decrypt, potentially impacting the device configuration.

**Syntax** `crypto secure-mode delete hostkey`

**Default** Not set.

**Mode** Privileged Exec

**Example** To delete the encrypted key, use the command:

```
awplus# crypto secure-mode delete hostkey
```

**Related commands** [radius-server host](#)  
[radius-server key](#)  
[ntp authentication-key](#)  
[crypto secure-mode](#)

**Command changes** Version 5.4.9-2.1: command added

# crypto verify

**Overview** Use this command to compare the SHA256 checksum of a file with its correct checksum. This confirms that the file has not been corrupted or interfered with during download. You can verify any kind of file, but you cannot specify a file path, so the file must be stored in the top level of the device's flash memory.

**CAUTION:** *If a file fails to verify and you believe the file may have been interfered with, we recommend immediately performing a security audit of your network.*

Once the device has verified the file, you can use the **copy running-config startup-config** command to save the file/hash pair in the running configuration. If you do this, the device will verify the file every time it boots up and will take action if the verification fails.

The action taken when verification fails on boot-up depends on the type of file and whether the device is in Secure Mode:

- If the device is in Secure Mode and the boot-up firmware file fails verification, the device will not boot. Contact Allied Telesis support if this happens.
- If the device is not in Secure Mode and the boot-up firmware file fails verification, the device will display the following warning message after booting: "% Verification Failed". If this occurs because the saved hash is incorrect, use this command to replace the hash. If this occurs because the firmware file is corrupted or may have been interfered with, ensure that your device is secure, then replace the failed file with a known good file and reboot.
- If you use the **gui** parameter and the GUI fails verification, the device will boot up but the GUI will be disabled (the **service http** command will be disabled).
- If any other file fails verification, the device will display the following warning message after booting: "% Verification Failed"

You can use the **show hash** command to see the current hash of a file.

Use the **no** variant of this command to remove a verified filename/hash combination from the running configuration.

**Syntax**

```
crypto verify <filename> <hash-value>  
crypto verify gui <hash-value>  
no crypto verify <filename>
```

| Parameter    | Description   |
|--------------|---|
| <filename>   | The AlliedWare Plus file that you want to verify  |
| gui          | Verify the current Device GUI file  |
| <hash-value> | The known correct checksum of the file. For firmware and GUI files, the correct checksum is listed in the sha256sum file that is available from the Allied Telesis Download Center. |

**Default** No default

**Mode** Global Configuration

**Usage notes** All models of a particular series run the same firmware file and therefore have the same checksum for that firmware file. For example, all x930 Series switches have the same checksum.

If your network has extremely strict security requirements, such as FIPS compliance, you may need to verify the bootloader on boot-up and use signature verification for the firmware file. To configure these, use the commands [crypto verify bootrom](#) and [crypto verify signed](#). These commands make it difficult to upgrade the bootloader or firmware, so only use them if necessary.

**Examples** To verify the firmware file for 5.5.3-0.1 on an x930 Series switch, use the commands:

```
awplus# configure terminal
awplus(config)# crypto verify x930-5.5.3-0.1.rel
7f22d8a30c991a4ddc0a2aed47246282b23b4e4a865e07f79795c0959c47de
78
```

**Related commands**

- [crypto secure-mode](#)
- [crypto verify bootrom](#)
- [crypto verify signed](#)
- [show hash](#)
- [show secure-mode](#)

**Command changes** Version 5.5.3-0.1: **gui** parameter added; **<filename>** parameter expanded to cover all file types

# crypto verify bootrom

**Overview** Use this command to compare the SHA256 checksum hash value of a bootloader with its correct checksum. This confirms that the bootloader has not been corrupted or interfered with.

If the verification fails, contact Allied Telesis customer support.

If the device is in Secure Mode, running **crypto verify bootrom** also stores the hash value permanently. When in Secure Mode, we recommend only using this command in networks with extremely strict security requirements, such as in FIPS-compliant networks. This is because you can only remove the hash value by erasing flash memory (for example, by using the [erase factory-default](#) command).

If the device is not in Secure Mode, you can use the **write** command to save the hash value to the boot configuration file. The device will verify the checksum every time it boots up and will warn you if it fails the verification.

When not in Secure Mode, you can use the **no** variant of this command to remove the bootrom/hash combination from the running configuration.

**Syntax** `crypto verify bootrom <hash-value>`  
`no crypto verify <filename>`

| Parameter                       | Description  |
|---------------------------------|--|
| <code>&lt;hash-value&gt;</code> | The known correct checksum of the bootloader. To see the correct hash value, run the command <b>show hash bootrom</b> straight after you first boot the device up, or check the Deployment Guide for the device. |

**Default** No default

**Mode** Global Configuration

**Usage notes** All models of a particular series run the same bootloader file and therefore have the same checksum. For example, all x930 Series switches have the same bootloader checksum.

**Examples** To verify the bootrom file, use the commands:

```
awplus# configure terminal
awplus(config)# crypto verify bootrom
5e80e70b6a2200965abf5f62f72af1bdc1654f3726bdff554afcbd76270c91
```

Note that the hash in this example is an example only; it is not the hash of the device's bootloader.

**Related commands** [crypto secure-mode](#)  
[crypto verify](#)  
[crypto verify signed](#)

`show hash`

`show secure-mode`

# crypto verify signed

**Overview** Use this command to compare the HMAC-SHA checksum hash value of a firmware file with its correct checksum. This confirms that the firmware has not been corrupted or interfered with. When the device is in Secure Mode, this command also forces the device to check the hash whenever it boots up, and prevents the device from booting if the verification fails.

**Caution:**

If the device is in Secure Mode, this command makes it difficult to upgrade the device's firmware file. Therefore, only use this command if the device is in Secure Mode and you have extremely strict security requirements, such as in FIPS-compliant networks. Otherwise, use the [crypto verify](#) command. See the Usage Notes below for more detail.

If the verification fails, contact Allied Telesis customer support.

**Syntax** `crypto verify signed <filename> <hash-value>`

| Parameter    | Description  |
|--------------|--|
| <filename>   | The AlliedWare Plus file that you want to verify   |
| <hash-value> | The known correct checksum of the file. This is a keyed HMAC-SHA hash. This is available in a .sig file, which you can get from your Allied Telesis customer representative. |

**Default** No default

**Mode** Global Configuration

**Usage notes** **Caution:**

If the device is in Secure Mode, and if the firmware file verified is the boot release and signed verification succeeds, then the device stores the signed hash and uses it to verify the firmware file on all subsequent reboots. This means that if you change the firmware version, the switch will not boot up. You can only change the firmware version if you reset the switch to the factory defaults **before** changing the firmware version, by using the command [erase factory-default](#).

If the device is not in Secure Mode, you can use the **write** command to save the hash value to the boot configuration file. The device will verify the checksum every time it boots up and will warn you if it fails the verification.

All models of a particular series run the same release file and therefore have the same checksum. For example, all x930 Series switches have the same checksum.

**Examples** To use signature verification to verify the firmware file for 5.5.3-0.1 on an x930 Series switch, use the commands:

```
awplus# configure terminal
awplus(config)# crypto verify signed x930-5.5.3-0.1.rel
3f50420644aebd277dd48b3aee30639801348896fffce231fc5615995ecde5
d9
```

**Related commands**

- [crypto verify](#)
- [crypto verify bootrom](#)
- [show hash](#)
- [show secure-mode](#)

# enrollment (ca-trustpoint)

**Overview** Use this command to declare how certificates will be added to the system for the current trustpoint.

**Syntax** `enrollment {selfsigned|terminal}`

| Parameter               | Description  |
|-------------------------|--|
| <code>selfsigned</code> | Sets the enrollment mode for the current trustpoint to selfsigned. |
| <code>terminal</code>   | Sets the enrollment mode for the current trustpoint to terminal.   |

**Mode** Trustpoint Configuration

**Usage notes** If the enrollment is set to **selfsigned**, then the system will generate a root CA certificate and its associated key when the **crypto pki authenticate** command is issued. It will generate a server certificate (signed by the root CA certificate) when the **crypto pki enroll** command is issued.

If the enrollment is set to **terminal**, then the system will prompt the user to paste the root CA certificate Privacy Enhanced Mail (PEM) file at the terminal, when the **crypto pki authenticate** command is issued. It will create a Certificate Signing Request (CSR) file for the local server when the **crypto pki enroll** command is issued. The server certificate received from the external CA should be imported using the **crypto pki import pem** command.

The trustpoint named "local" may only use the **selfsigned** enrollment setting.

If no enrollment mode is specified, the **crypto pki authenticate** command will fail for the trustpoint.

**Example** To configure the trustpoint named "example" and set its enrollment to **selfsigned**, use the following commands:

```
awplus> enable
awplus# configure terminal
awplus(config)# crypto pki trustpoint example
awplus(ca-trustpoint)# enrollment selfsigned
```

**Related commands** [crypto pki enroll](#)

# fingerprint (ca-trustpoint)

**Overview** Use this command to declare that certificates with the specified fingerprint should be automatically accepted, when importing certificates from an external certificate authority. This can affect the behavior of the **crypto pki authenticate** and **crypto pki import pem** commands.

Use the **no** variant of this command to remove the specified fingerprint from the pre-accepted list.

**Syntax** `fingerprint <word>`  
`no fingerprint <word>`

| Parameter                 | Description   |
|---------------------------|---|
| <code>&lt;word&gt;</code> | The fingerprint as a series of 40 hexadecimal characters, optionally separated into multiple character strings. |

**Default** By default, no fingerprints are pre-accepted for the trustpoint.

**Mode** Trustpoint Configuration

**Usage notes** Specifying a fingerprint adds it to a list of pre-accepted fingerprints for the trustpoint. When a certificate is imported, if it matches any of the pre-accepted values, then it will be saved in the system automatically. If the imported certificate's fingerprint does not match any pre-accepted value, then the user will be prompted to verify the certificate contents and fingerprint visually.

This command is useful when certificates from an external certificate authority are being transmitted over an insecure channel. If the certificate fingerprint is delivered via a separate messaging channel, then pre-entering the fingerprint value via cut-and-paste may be less errorprone than attempting to verify the fingerprint value visually.

The fingerprint is a series of 40 hexadecimal characters. It may be entered as a continuous string, or as a series of up to multiple strings separated by spaces. The input format is flexible because different certificate authorities may provide the fingerprint string in different formats.

**Example** To configure a fingerprint "5A81D34C 759CC4DA CFCA9F65 0303AD83 410B03AF" for the trustpoint named "example", use the following commands:

```
awplus> enable
awplus# configure terminal
awplus(config)# crypto pki trustpoint example
awplus(ca-trustpoint)# fingerprint 5A81D34C 759CC4DA CFCA9F65
0303AD83 410B03AF
```

**Related commands** [crypto pki authenticate](#)

## crypto pki import pem

# no crypto pki certificate

**Overview** Use this command to delete a certificate with the specified fingerprint from the specified trustpoint.

**Syntax** `no crypto pki certificate <trustpoint> <word>`

| Parameter                       | Description   |
|---------------------------------|---|
| <code>&lt;trustpoint&gt;</code> | The name of the trustpoint.   |
| <code>&lt;word&gt;</code>       | The fingerprint as a series of 40 hexadecimal characters, optionally separated into multiple character strings. |

**Default** By default, no fingerprints are pre-accepted for the trustpoint.

**Mode** Privileged Exec

**Usage notes** The fingerprint can be found in the output of the **show crypto pki certificates** command. If there are dependent certificates in the trustpoint (i.e., if other certificates were signed by the specified certificate), the command will be rejected. If the specified certificate is the root CA certificate and the trustpoint represents a locally selfsigned CA, then the corresponding private key is also deleted from the system. Deleting the root CA certificate effectively resets the trustpoint to an unauthenticated state.

**Example** To delete a certificate with the fingerprint "594EDEF9 C7C4308C 36D408E0 77E784F0 A59E8792" from the trustpoint "example", use the following commands:

```
awplus> enable
awplus# no crypto pki certificate example
594EDEF9 C7C4308C 36D408E0 77E784F0 A59E8792
```

**Related commands** [no crypto pki trustpoint](#)  
[show crypto pki certificates](#)

# rsakeypair (ca-trustpoint)

**Overview** Use this command to declare which RSA key pair should be used to enroll the local server with the trustpoint. Note that this defines the key pair used with the server certificate, not the key pair used with the root CA certificate.

Use the **no** variant of this command to restore the default value, "server-default".

**Syntax** `rsakeypair <keylabel> [<1024-4096>]`  
`no rsakeypair`

| Parameter                      | Description   |
|--------------------------------|---|
| <code>&lt;keylabel&gt;</code>  | The key to be used with the server certificate for this trustpoint. The name must start with an alphanumeric character, and may only contain alphanumeric characters, underscores, dashes, or periods. The maximum length of the name is 63 characters. |
| <code>&lt;1024-4096&gt;</code> | The bit length for the key, to be used if the key is implicitly generated during server enrollment.   |

**Default** The default value for **keylabel** is "server-default".  
The default value for the key bit length is 2048.

**Mode** Trustpoint Configuration

**Usage notes** If the label specified does not refer to an existing key created by the **crypto key generate rsa** command, the key will be implicitly generated when the **crypto pki enroll** command is issued to generate the server certificate or the server certificate signing request. The optional numeric parameter defines the bit length for the key, and is only applicable for keys that are implicitly created during enrollment.

This command does not affect server certificates or server certificate signing requests that have already been generated. The trustpoint's server certificate is set to use whatever key pair was specified for the trustpoint at the time the **crypto pki enroll** command is issued.

The default key pair is "server-default". The default bit length is 2048 bits.

**Example** To configure trustpoint "example" to use the key pair "example-server-key" with a bit length of 2048, use the following commands:

```
awplus> enable
awplus# configure terminal
awplus(config)# crypto pki trustpoint example
awplus(ca-trustpoint)# rsakeypair example-server-key 2048
```

**Related commands** [crypto key generate rsa](#)

# show crypto key mypubkey rsa

**Overview** Use this command to display information about the specified Rivest-Shamir-Adleman encryption key.

**Syntax** `show crypto key mypubkey rsa [<keylabel>]`

| Parameter  | Description                                    |
|------------|--|
| <keylabel> | The name of the key to be shown, if specified. |

**Default** By default, all keys will be shown.

**Mode** Privileged Exec

**Usage notes** If no key label is specified, information about all keys is shown. The command displays the bit length of the key, a key fingerprint (a hash of the key contents to help uniquely identify a key), and a list of trustpoints in which the server certificate is using the key.

The specified keys must exist.

**Example** To show all keys, use the following commands:

```
awplus> enable
awplus# show crypto key mypubkey rsa
```

**Output** Figure 49-1: Example output from **show crypto key mypubkey rsa**

```
awplus#show crypto key mypubkey rsa
-----
RSA Key Pair "example-server-key":
  Key size      : 2048 bits
  Fingerprint   : 1A605D73 C2274CB7 853886B3 1C802FC6 7CDE45FB
  Trustpoints   : example
-----
RSA Key Pair "server-default":
  Key size      : 2048 bits
  Fingerprint   : 34AC4D2D 5249A168 29D426A3 434FFC59 C4A19901
  Trustpoints   : local
```

**Related commands** [crypto key generate rsa](#)

# show crypto pki certificates

**Overview** Use this command to display information about existing certificates for the specified trustpoint.

**Syntax** `show crypto pki certificates [<trustpoint>]`

| Parameter                       | Description  |
|---------------------------------|--|
| <code>&lt;trustpoint&gt;</code> | The trustpoint for which the certificates are to be shown. |

**Default** By default, the certificates for all trustpoints are shown.

**Mode** Privileged Exec

**Usage notes** If no trustpoint is specified, certificates for all trustpoints are shown. The command displays the certificates organized into certificate chains. It starts with the server certificate and then displays its issuer, and continues up the issuer chain until the root CA certificate is reached.

For each certificate, the command displays the certificate type, the subject's distinguished name (the entity identified by the certificate), the issuer's distinguished name (the entity that signed the certificate), the validity dates for the certificate, and the fingerprint of the certificate. The fingerprint is a cryptographic hash of the certificate contents that uniquely identifies the certificate.

The specified trustpoints must already exist.

**Example** To show the certificates for the trustpoint "example", use the following command:

```
awplus> enable
awplus# show crypto pki certificates example
```

**Output** Figure 49-2: Example output from **show crypto pki certificates**

```
awplus>enable
awplus#show crypto pki certificates example
-----
Trustpoint "example" Certificate Chain
-----

  Valid To     : May 12 18:12:10 2025 GMT
  Fingerprint  : 594EDEF9 C7C4308C 36D408E0 77E784F0 A59E8792
```

**Related commands** [crypto pki trustpoint](#)

# show crypto pki enrollment user

**Overview** Use this command to display a list of trustpoints for which RADIUS user enrollments have been performed, using the **crypto pki enroll user** command. This indicates that PKCS#12 files for the user are available for export for the given trustpoints, using the **crypto pki export pkcs12** command.

**Syntax** `crypto pki enrollment user <username>`

| Parameter                     | Description                                     |
|-------------------------------|---|
| <code>&lt;username&gt;</code> | The user for which enrollments are to be shown. |

**Mode** Privileged Exec

**Example** To show the list of trustpoints to which user "exampleuser1" is enrolled, use the following commands:

```
awplus> enable
awplus(config)# show crypto pki enrollment user exampleuser1
```

**Output** Figure 49-3: Example output from **show crypto pki enrollment user**

```
awplus> enable
awplus# show crypto pki enrollment user exampleuser1
User "exampleuser1" is enrolled to the following trustpoints:
local,example
```

**Related commands** [crypto pki enroll user](#)  
[crypto pki export pkcs12](#)

# show crypto pki trustpoint

**Overview** Use this command to display information about the specified trustpoint.

**Syntax** `show crypto pki trustpoint [<trustpoint>]`

| Parameter                       | Description                            |
|---------------------------------|--|
| <code>&lt;trustpoint&gt;</code> | The name of the trustpoint to be shown |

**Default** By default, all trustpoints are shown.

**Mode** Privileged Exec

**Usage notes** If no trustpoint is specified, information about all trustpoints is shown. The command displays the authentication status of the trustpoint, the fingerprint of the root CA certificate (if it exists), the enrollment status of the local server with the trustpoint, a list of any applications that are configured to use the trustpoint, and the trustpoint parameters that were configured from trustpoint-configuration mode.

The specified trustpoints must already exist.

**Example** To show the details of the trustpoint "example", use the following commands:

```
awplus> enable
awplus# show crypto pki trustpoint example
```

**Output** Figure 49-4: Example output from **show crypto pki trustpoint**

```
awplus> enable
awplus# show crypto pki trustpoint example
-----
Trustpoint "example"
  Type           : Self-signed certificate authority
  Root Certificate: 50C1856B EEC7555A 0F3A61F6 690D9463 67DF74D1
  Local Server   : The server is enrolled to this trustpoint.
  Server Key     : example-server-key
  Applications   : RADIUS

Authentication and Enrollment Parameters:
  Enrollment     : selfsigned
  RSA Key Pair   : example-server-key (2048 bits)
-----
```

**Related commands** [crypto pki trustpoint](#)  
[show crypto pki certificates](#)

# show hash

**Overview** Use this command to display the hash for a specified file on the device, or for the device's current bootloader.

**Syntax** `show hash <filename>`  
`show hash bootrom`

| Parameter                     | Description                                   |
|-------------------------------|---|
| <code>&lt;filename&gt;</code> | The name of the file to display the hash for. |
| <code>bootrom</code>          | Display the hash for the current bootloader.  |

**Mode** Privileged Exec

**Examples** To show the hash for the GUI file named `awplus-gui_552_27.gui`, use the command:

```
awplus# show hash awplus-gui_552_27.gui
```

To show the hash for a file named 'example.txt', which is in the folder named 'example' in flash memory, use the command:

```
awplus# show hash flash://example/example.txt
```

To show the hash for the bootloader, use the command:

```
awplus# show hash bootrom
```

**Output** Figure 49-5: Example output from **show hash**

```
awplus#show hash awplus-gui_552_27.gui  
b793e2c7fc5580513472017f964316f3bb0e79fbf1ddfd6f3844a2a8311c5c64
```

**Related commands** [crypto secure-mode](#)  
[crypto verify](#)  
[crypto verify bootrom](#)

**Command changes** Version 5.5.3-0.1: command added

# show secure-mode

**Overview** Use this command to see whether secure mode is enabled or not. Secure mode disables a number of insecure features, such as Telnet.

**Syntax** `show secure-mode`

**Mode** User Exec/Privileged Exec

**Example** To see if secure mode is enabled, use the command:

```
awplus# show secure-mode
```

**Output** Figure 49-6: Example output from **show secure-mode**

```
awplus#show secure-mode  
Secure mode is enabled
```

**Related commands** [crypto secure-mode](#)

# subject-name (ca-trustpoint)

**Overview** Use this command to specify the distinguished name string that should be used for the subject field in the server certificate, when enrolling the server (generating the server certificate or server certificate signing request).

**Syntax** `subject-name <word>`

| Parameter                 | Description   |
|---------------------------|---|
| <code>&lt;word&gt;</code> | Specify the subject name as a distinguished name string. Complex strings (e.g., strings containing spaces) should be surrounded with double-quote characters. |

**Default** If no subject name is specified for the trustpoint, then the system automatically builds a name of the form `"/O=AlliedWare Plus/CN=xxxx.yyyy.zzz"`, where `"xxxx"` is the hostname of the system and `"yyy.zzz"` is the default search domain for the system.

**Mode** Trustpoint Configuration

**Usage notes** The subject name is specified as a variable number of fields, where each field begins with a forward-slash character (`/`). Each field is of the form `"XX=value"`, where `"XX"` is the abbreviation of the node type in the tree.

Common values include:

- `"C"` (country),
- `"ST"` (state),
- `"L"` (locality),
- `"O"` (organization),
- `"OU"` (organizational unit), and
- `"CN"` (common name).

Of these fields, `"CN"` is usually the most important.

**NOTE:** For a server certificate, many applications require that the network name of the server matches the common name in the server's certificate.

**Example** To configure the trustpoint named "example" and set its subject name, use the following commands:

```
awplus> enable
awplus# configure terminal
awplus(config)# crypto pki trustpoint example
awplus(ca-trustpoint)# subject-name "/O=My
Company/CN=192.168.1.1
```

**Related  
commands** `crypto pki enroll`

# TACACS+ Commands

## Introduction

**Overview** This chapter provides an alphabetical reference for commands used to configure the device to use TACACS+ servers. For more information about TACACS+, see the [TACACS+ Feature Overview and Configuration Guide](#).

TACACS+ is not available in Secure Mode (see the [crypto secure-mode](#) command).

- Command List**
- [“aaa authorization commands”](#) on page 2546
  - [“aaa authorization config-commands”](#) on page 2548
  - [“authorization commands”](#) on page 2549
  - [“ip tacacs source-interface”](#) on page 2551
  - [“show tacacs+”](#) on page 2552
  - [“tacacs-server host”](#) on page 2554
  - [“tacacs-server key”](#) on page 2556
  - [“tacacs-server timeout”](#) on page 2557

# aaa authorization commands

**Overview** This command configures a method list for commands authorization that can be applied to console or VTY lines. When command authorization is enabled for a privilege level, only authorized users can executed commands in that privilege level.

Use the **no** variant of this command to remove a named method list or disable the default method list for a privilege level.

**Syntax**

```
aaa authorization commands <privilege-level>
{default|<list-name>} group tacacs+ [none]

no aaa authorization commands <privilege-level>
{default|<list-name>}
```

| Parameter         | Description   |
|-------------------|---|
| <privilege-level> | The privilege level of the set of commands the method list will be applied to.<br>AlliedWare Plus defines three sets of commands, that are indexed by a level value:<br><b>Level = 1:</b> All commands that can be accessed by a user with privilege level between 1 and 6 inclusive<br><b>Level = 7:</b> All commands that can be accessed by a user with privilege level between 7 and 14 inclusive<br><b>Level = 15:</b> All commands that can be accessed by a user with privilege level 15 |
| group             | Specify the server group where authorization messages are sent. Only the <code>tacacs+</code> group is available for this command.  |
| tacacs+           | Use all TACACS+ servers configured by the <code>tacacs-server host</code> command.  |
| default           | Configure the default authorization commands method list.   |
| <list-name>       | Configure a named authorization commands method list  |
| none              | If specified, this provides a local fallback to command authorization so that if authorization servers become unavailable then the device will accept all commands normally allowed for the privilege level of the user.  |

**Mode** Global Configuration

**Usage notes** TACACS+ command authorization provides centralized control of the commands available to a user of an AlliedWare Plus device. Once enabled:

- The command string and username are encrypted and sent to the first available configured TACACS+ server (the first server configured) for authorization.

- The TACACS+ server decides if the user is authorized to execute the command and returns the decision to the AlliedWare Plus device.
- Depending on this decision the device will then either execute the command or notify the user that authorization has failed.

If multiple TACACS+ servers are configured, and the first server is unreachable or does not respond, the other servers will be queried, in turn, for an authorization decision. If all servers are unreachable and a local fallback has been configured, with the **none** parameter, then commands are authorized based on the user's privilege level; the same behavior as if command authorization had not been configured. If, however, the local fallback is not configured and all servers become unreachable then all commands except **logout**, **exit**, and **quit** will be denied.

The **default** method list is defined with a local fallback unless configured differently using this command.

**Example** To configure a commands authorization method list, named TAC15, using all TACACS+ servers to authorize commands for privilege level 15, with a local fallback, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa authorization commands 15 TAC15 group
tacacs+ none
```

To configure the default method list to authorize commands for privilege level 7, with no local fallback, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa authorization commands 7 default group
tacacs+
```

To remove the authorization method list TAC15, use the following commands:

```
awplus# configure terminal
awplus(config)# no aaa authorization commands 15 TAC15
```

**Related commands** [aaa authorization config-commands](#)  
[authorization commands](#)  
[tacacs-server host](#)

**Command changes** Version 5.4.6-2.1: command added

# aaa authorization config-commands

**Overview** Use this command to enable command authorization on configuration mode commands. By default, command authorization applies to commands in exec mode only.

Use the **no** variant of this command to disable command authorization on configuration mode commands.

**Syntax** `aaa authorization config-commands`  
`no aaa authorization config-commands`

**Default** By default, command authorization is disabled on configuration mode commands.

**Mode** Global Configuration

**Usage notes** If authorization of configuration mode commands is not enabled then all configuration commands are accepted by default, including command authorization commands.

**NOTE:** *Authorization of configuration commands is required for a secure TACACS+ command authorization configuration as it prevents the feature from being disabled to gain access to unauthorized exec mode commands.*

**Example** To enable command authorization for configuration mode commands, use the commands:

```
awplus# configure terminal
awplus(config)# aaa authorization config-commands
```

To disable command authorization for configuration mode commands, use the commands:

```
awplus# configure terminal
awplus(config)# no aaa authorization config-commands
```

**Related commands** [aaa authorization commands](#)  
[authorization commands](#)  
[tacacs-server host](#)

**Command changes** Version 5.4.6-2.1: command added

# authorization commands

**Overview** This command applies a command authorization method list, defined using the [aaa authorization commands](#) command, to console and VTY lines.

Use the **no** variant of this command to reset the command authorization configuration on the console and VTY lines.

**Syntax** `authorization commands <privilege-level> {default|<list-name>}`  
`no authorization commands <privilege-level>`

| Parameter                            | Description   |
|--------------------------------------|---|
| <code>&lt;privilege-level&gt;</code> | The privilege level of the set of commands the method list will be applied to.<br>AlliedWare Plus defines three sets of commands, that are indexed by a level value:<br><b>Level = 1:</b> All commands that can be accessed by a user with privilege level between 1 and 6 inclusive<br><b>Level = 7:</b> All commands that can be accessed by a user with privilege level between 7 and 14 inclusive<br><b>Level = 15:</b> All commands that can be accessed by a user with privilege level 15 |
| <code>default</code>                 | Configure the default authorization commands method list.   |
| <code>&lt;list-name&gt;</code>       | Configure a named authorization commands method list  |

**Default** The **default** method list is applied to each console and VTY line by default.

**Mode** Line Configuration

**Usage notes** If the specified method list does not exist users will not be able to execute any commands in the specified method list on the specified VTY lines.

**Example** To apply the TAC15 command authorization method list with privilege level 15 to VTY lines 0 to 5, use the following commands:

```
awplus# configure terminal
awplus(config)# line vty 0 5
awplus(config-line)# authorization commands 15 TAC15
```

To reset the command authorization configuration with privilege level 15 on VTY lines 0 to 5, use the following commands:

```
awplus# configure terminal
awplus(config)# line vty 0 5
awplus(config-line)# no authorization commands 15
```

**Related commands** [aaa authorization commands](#)

aaa authorization config-commands

tacacs-server host

**Command changes** Version 5.4.6-2.1: command added

# ip tacacs source-interface

**Overview** This command sets the source interface, or IP address, to use for all TACACS+ packets sent from the device. By default, TACACS+ packets use the source IP address of the egress interface.

Use the **no** variant of this command to remove the source interface configuration and use the source IP address of the egress interface.

**Syntax** `ip tacacs source-interface {<interface>|<ip-address>}`  
`no ip tacacs source-interface`

| Parameter                       | Description                                      |
|---------------------------------|--|
| <code>&lt;interface&gt;</code>  | Interface name.                                  |
| <code>&lt;ip-address&gt;</code> | IP address in the dotted decimal format A.B.C.D. |

**Default** The source IP address of outgoing TACACS+ packets default to the IP address of the egress interface.

**Mode** Global Configuration

**Usage notes** Setting the source interface ensures that all TACACS+ packets sent from the device will have the same source IP address. Once configured this affects all TACACS+ packets, namely accounting, authentication, and authorization.

If the specified interface is down or there is no IP address on the interface, then the source IP address of outgoing TACACS+ packets will default to the IP address of the egress interface.

**Example** To configure all outgoing TACACS+ packets to use the IP address of the loop-back "lo" interface as the source IP address, use the following commands:

```
awplus# configure terminal
awplus(config)# ip tacacs source-interface lo
```

To reset the source interface configuration for all TACACS+ packets, use the following commands:

```
awplus# configure terminal
awplus(config)# no ip tacacs source-interface
```

**Related commands** [tacacs-server host](#)  
[show tacacs+](#)

**Command changes** Version 5.4.6-2.1: command added

# show tacacs+

**Overview** This command displays the current TACACS+ server configuration and status.

**Syntax** show tacacs+

**Mode** User Exec and Privileged Exec

**Example** To display the current status of TACACS+ servers, use the command:

```
awplus# show tacacs+
```

**Output** Figure 50-1: Example output from the **show tacacs+** command

```
TACACS+ Global Configuration
  Source Interface      : not configured
  Timeout              : 5 sec

Server Host/          Server
IP Address            Status
-----
192.168.1.10         Alive
192.168.1.11         Unknown
```

**Table 1:** Parameters in the output of the **show tacacs+** command

| Output Parameter       | Meaning  |  |
|------------------------|--|--|
| Source Interface       | IP address of source interface if set with <code>ip tacacs source-interface</code> . |  |
| Timeout                | A time interval in seconds.  |  |
| Server Host/IP Address | TACACS+ server hostname or IP address.   |  |
| Server Status          | The status of the authentication port.   |  |
|                        | Alive  | The server is alive.   |
|                        | Dead   | The server has timed out.  |
|                        | Error  | The server is not responding or there is an error in the key string entered. |
|                        | Unknown  | The server is never used or the status is unknown.                           |
|                        | Unreachable  | The server is unreachable.   |
|                        | Unresolved   | The server name can not be resolved.   |

**Command changes** Version 5.4.6-2.1: **Source Interface** parameter added

# tacacs-server host

**Overview** Use this command to specify a remote TACACS+ server host for authentication, authorization and accounting, and to set the shared secret key to use with the TACACS+ server. The parameters specified with this command override the corresponding global parameters for TACACS+ servers.

Use the **no** variant of this command to remove the specified server host as a TACACS+ authentication and authorization server.

**Syntax** `tacacs-server host {<host-name>|<ip-address>} [key [8] <key-string>]`

`no tacacs-server host {<host-name>|<ip-address>}`

| Parameter                       | Description   |
|---------------------------------|---|
| <code>&lt;host-name&gt;</code>  | Server host name. The DNS name of the TACACS+ server host.  |
| <code>&lt;ip-address&gt;</code> | The IP address of the TACACS+ server host, in dotted decimal notation A.B.C.D.  |
| <code>key</code>                | Set shared secret key with TACACS+ servers.   |
| <code>8</code>                  | Specifies that you are entering a password as a string that has already been encrypted instead of entering a plain text password. The running config displays the new password as an encrypted string even if password encryption is turned off.  |
| <code>&lt;key-string&gt;</code> | Shared key string applied, a value in the range 1 to 64 characters. Specifies the shared secret authentication or encryption key for all TACACS+ communications between this device and the TACACS+ server. This key must match the encryption used on the TACACS+ server. This setting overrides the global setting of the <code>tacacs-server key</code> command. If no key value is specified, the global value is used. |

**Default** No TACACS+ server is configured by default.

**Mode** Global Configuration

**Usage** A TACACS+ server host cannot be configured multiple times like a RADIUS server.

As many as four TACACS+ servers can be configured and consulted for login authentication, enable password authentication and accounting. The first server configured is regarded as the primary server and if the primary server fails then the backup servers are consulted in turn. A backup server is consulted if the primary server fails, not if a login authentication attempt is rejected. The reasons a server would fail are:

- it is not network reachable
- it is not currently TACACS+ capable

- it cannot communicate with the switch properly due to the switch and the server having different secret keys

**Examples** To add the server tac1.company.com as the TACACS+ server host, use the following commands:

```
awplus# configure terminal
awplus(config)# tacacs-server host tac1.company.com
```

To set the secret key to 'secret' on the TACACS+ server 192.168.1.1, use the following commands:

```
awplus# configure terminal
awplus(config)# tacacs-server host 192.168.1.1 key secret
```

To remove the TACACS+ server tac1.company.com, use the following commands:

```
awplus# configure terminal
awplus(config)# no tacacs-server host tac1.company.com
```

**Related commands**

- [aaa accounting commands](#)
- [aaa authentication login](#)
- [tacacs-server key](#)
- [tacacs-server timeout](#)
- [show tacacs+](#)

**Command changes** Version 5.5.2-1.1: **vrf** parameter added for products that support VRF

# tacacs-server key

**Overview** This command sets a global secret key for TACACS+ authentication, authorization and accounting. The shared secret text string is used for TACACS+ communications between the switch and all TACACS+ servers.

Note that if no secret key is explicitly specified for a TACACS+ server with the [tacacs-server host](#) command, the global secret key will be used for the shared secret for the server.

Use the **no** variant of this command to remove the global secret key.

**Syntax** `tacacs-server key [8] <key-string>`  
`no tacacs-server key`

| Parameter    | Description   |
|--------------|---|
| 8            | Specifies a string in an encrypted format instead of plain text. The running config will display the new password as an encrypted string even if password encryption is turned off.   |
| <key-string> | Shared key string applied, a value in the range 1 to 64 characters. Specifies the shared secret authentication or encryption key for all TACACS+ communications between this device and all TACACS+ servers. This key must match the encryption used on the TACACS+ server. |

**Mode** Global Configuration

**Usage notes** Use this command to set the global secret key shared between this client and its TACACS+ servers. If no secret key is specified for a particular TACACS+ server using the [tacacs-server host](#) command, this global key is used.

**Examples** To set the global secret key to `secret` for TACACS+ server, use the following commands:

```
awplus# configure terminal  
awplus(config)# tacacs-server key secret
```

To delete the global secret key for TACACS+ server, use the following commands:

```
awplus# configure terminal  
awplus(config)# no tacacs-server key
```

**Related commands** [tacacs-server host](#)  
[show tacacs+](#)

# tacacs-server timeout

**Overview** Use this command to specify the TACACS+ global timeout value. The timeout value is how long the device waits for a reply to a TACACS+ request before considering the server to be dead.

Note that this command configures the **timeout** parameter for TACACS+ servers globally.

The **no** variant of this command resets the transmit timeout to the default (5 seconds).

**Syntax** tacacs-server timeout <seconds>  
no tacacs-server timeout

| Parameter | Description  |
|-----------|--|
| <seconds> | TACACS+ server timeout in seconds, in the range 1 to 1000. |

**Default** The default timeout value is 5 seconds.

**Mode** Global Configuration

**Examples** To set the timeout value to 3 seconds, use the following commands:

```
awplus# configure terminal  
awplus(config)# tacacs-server timeout 3
```

To reset the timeout period for TACACS+ servers to the default, use the following commands:

```
awplus# configure terminal  
awplus(config)# no tacacs-server timeout
```

**Related commands** [tacacs-server host](#)

# DHCP Snooping Commands

## Introduction

**Overview** This chapter gives detailed information about the commands used to configure DHCP snooping. For detailed descriptions of related ACL commands, see [IPv4 Hardware Access Control List \(ACL\) Commands](#). For more information about DHCP snooping, see the [DHCP Snooping Feature Overview and Configuration Guide](#).

DHCP snooping can operate on static link aggregators (e.g. sa2) and dynamic link aggregators (e.g. po2), as well as on switch ports (e.g. port1.0.2).

# arp security

**Overview** Use this command to enable ARP security on untrusted ports in the VLANs, so that the switch only responds to/forwards ARP packets if they have recognized IP and MAC source addresses.

Use the **no** variant of this command to disable ARP security on the VLANs.

**Syntax** `arp security`  
`no arp security`

**Default** Disabled

**Mode** Interface Configuration (VLANs)

**Usage** Enable ARP security to provide protection against ARP spoofing. DHCP snooping must also be enabled on the switch ([service dhcp-snooping](#) command), and on the VLANs ([ip dhcp snooping](#) command).

**Example** To enable ARP security on VLANs 2 to 4, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2-vlan4
awplus(config-if)# arp security
```

**Related commands** [arp security violation](#)  
[show arp security](#)  
[show arp security interface](#)  
[show arp security statistics](#)

# arp security drop link-local-arps

**Overview** Use this command to enable ARP security on a per-port basis. This means that IPv4 link-local ARPs will be dropped without causing an ARP security violation when received.

Use the **no** variant of this command to return to the default setting of disabled.

**Syntax** `arp security drop link-local-arps`  
`no arp security drop link-local-arps`

**Default** Disabled by default.

**Mode** Interface Configuration

**Usage notes** Hosts that implement RFC 3927 may automatically assign themselves link-local IPv4 addresses in the subnet 169.254.0.0/16, if they are configured to learn their IP addresses via DHCP but are unable to contact a DHCP server. This is common behavior for all versions of Microsoft Windows since Windows XP. In an attempt to avoid IP address collision with other devices on the local network, the host will broadcast ARP probes for its randomly selected link-local IP address.

By default, ARP security will treat these ARP probes as violations and carry out the configured violation action on the port they are received on. If the violation action is configured as link-down, this will result in the host being disconnected from the network, which will interrupt any DHCP IP address discovery that was in progress.

Use this command to configure ARP Security to drop these ARP probes, and any other ARPs that contain link-local IP addresses, without raising a violation on the affected port. The count of ARPs dropped in this manner can be seen in the output of **show arp security statistics detail**.

**Example** To configure ARP security to drop IPv4 link local ARPs on port1.0.1 to port1.0.4, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1-port1.0.4
awplus(config-if)# arp security drop link-local-arps
```

**Related commands** [arp security](#)  
[arp security violation](#)  
[show arp security statistics](#)

**Command changes** Version 5.4.9-1.1: command added.

# arp security violation

**Overview** Use this command to specify an additional action to perform if an ARP security violation is detected on the ports. ARP security must also be enabled ([arp security](#) command).

Use the **no** variant of this command to remove the specified action, or all actions. Traffic violating ARP security will be dropped, but no other action will be taken.

**Syntax** `arp security violation {log|trap|link-down} ...`  
`no arp security violation [log|trap|link-down] ...`

| Parameter | Description  |
|-----------|--|
| log       | Generate a log message. To display these messages, use the <a href="#">show log</a> command.   |
| trap      | Generate an SNMP notification (trap). To send SNMP notifications, SNMP must also be configured, and DHCP snooping notifications must be enabled using the <a href="#">snmp-server enable trap</a> command. Notifications are limited to one per second and to one per source MAC and violation reason. Additional violations within a second of a notification being sent will not result in further notifications. Default: disabled. |
| link-down | Shut down the port that received the packet. Default: disabled.  |

**Default** When the switch detects an ARP security violation, it drops the packet. By default, it does not perform any other violation actions.

**Mode** Interface Configuration (switch ports, static or dynamic aggregated links)

**Usage notes** When the switch detects an ARP security violation on an untrusted port in a VLAN that has ARP security enabled, it drops the packet. This command sets the switch to perform additional actions in response to ARP violations.

If a port has been shut down in response to a violation, to bring it back up again after any issues have been resolved, use the [shutdown](#) command.

**Example** To send SNMP notifications for ARP security violations on ports 1.0.1 to 1.0.6, use the commands:

```
awplus# configure terminal
awplus(config)# snmp-server enable trap dhcpsnooping
awplus(config)# interface port1.0.1-port1.0.6
awplus(config-if)# arp security violation trap
```

**Related commands**

- arp security
- show arp security interface
- show arp security statistics
- show log
- snmp-server enable trap

# clear arp security statistics

**Overview** Use this command to clear ARP security statistics for the specified ports, or for all ports.

**Syntax** `clear arp security statistics [interface <port-list>]`

| Parameter                      | Description   |
|--------------------------------|---|
| <code>&lt;port-list&gt;</code> | The ports to clear statistics for. If no ports are specified, statistics are cleared for all ports. The ports may be switch ports, or static or dynamic link aggregators. |

**Mode** Privileged Exec

**Example** To clear statistics for ARP security on interface port1.0.1, use the command:

```
awplus# clear arp security statistics interface port1.0.1
```

**Related commands**

- [arp security violation](#)
- [show arp security](#)
- [show arp security statistics](#)

# clear ip dhcp snooping binding

**Overview** Use this command to remove one or more DHCP Snooping dynamic entries from the DHCP Snooping binding database. If no options are specified, all entries are removed from the database.

**CAUTION:** *If you remove entries from the database for current clients, they will lose IP connectivity until they request and receive a new DHCP lease. If you clear all entries, all clients connected to untrusted ports will lose connectivity.*

**Syntax** `clear ip dhcp snooping binding [<ipaddr>] [interface <port-list>] [vlan <vid-list>]`

| Parameter   | Description  |
|-------------|--|
| <ipaddr>    | Remove the entry for this client IP address.   |
| <port-list> | Remove all entries for these ports. The port list may contain switch ports, and static or dynamic link aggregators (channel groups). |
| <vid-list>  | Remove all entries associated with these VLANs.  |

**Mode** Privileged Exec

**Usage** This command removes dynamic entries from the database. Note that dynamic entries can also be deleted by using the **no** variant of the [ip dhcp snooping binding](#) command.

Dynamic entries can individually be restored by using the [ip dhcp snooping binding](#) command.

To remove static entries, use the **no** variant of the [ip source binding](#) command.

**Example** To remove a dynamic lease entry from the DHCP snooping database for a client with the IP address 192.168.1.2, use the command:

```
awplus# clear ip dhcp snooping binding 192.168.1.2
```

**Related commands**

- [ip dhcp snooping binding](#)
- [ip source binding](#)
- [show ip dhcp snooping binding](#)

# clear ip dhcp snooping statistics

**Overview** Use this command to clear DHCP snooping statistics for the specified ports, or for all ports.

**Syntax** `clear ip dhcp snooping statistics [interface <port-list>]`

| Parameter   | Description  |
|-------------|--|
| <port-list> | The ports to clear statistics for. If no ports are specified, statistics are cleared for all ports. The port list can contain switch ports, or static or dynamic link aggregators. |

**Mode** Privileged Exec

**Example** To clear statistics for the DHCP snooping on interface port1.0.1, use the command:

```
awplus# clear ip dhcp snooping statistics interface port1.0.1
```

**Related commands**

- [clear arp security statistics](#)
- [show ip dhcp snooping](#)
- [show ip dhcp snooping statistics](#)

# debug arp security

**Overview** Use this command to enable ARP security debugging.  
Use the **no** variant of this command to disable debugging for ARP security.

**Syntax** debug arp security  
no debug arp security

**Default** Disabled

**Mode** Privileged Exec

**Example** To enable ARP security debugging, use the commands:

```
awplus# debug arp security
```

**Related commands** [show debugging arp security](#)  
[show log](#)  
[terminal monitor](#)

# debug ip dhcp snooping

**Overview** Use this command to enable the specified types of debugging for DHCP snooping. Use the **no** variant of this command to disable the specified types of debugging.

**Syntax** `debug ip dhcp snooping {all|acl|db|packet [detail]}`  
`no debug ip dhcp snooping {all|acl|db|packet [detail]}`

| Parameter | Description  |
|-----------|--|
| all       | All DHCP snooping debug.   |
| acl       | DHCP snooping access list debug.   |
| db        | DHCP snooping binding database debug.  |
| packet    | DHCP snooping packet debug. For the <b>no</b> variant of this command, this option also disables detailed packet debug, if it was enabled. |
| detail    | Detailed packet debug.   |

**Default** Disabled

**Mode** Privileged Exec

**Example** To enable access list debugging for DHCP snooping, use the commands:

```
awplus# debug ip dhcp snooping acl
```

**Related commands**

- [debug arp security](#)
- [show debugging ip dhcp snooping](#)
- [show log](#)
- [terminal monitor](#)

# ip dhcp snooping

**Overview** Use this command to enable DHCP snooping on one or more VLANs.  
Use the **no** variant of this command to disable DHCP snooping on the VLANs.

**Syntax** `ip dhcp snooping`  
`no ip dhcp snooping`

**Default** DHCP snooping is disabled on VLANs by default.

**Mode** Interface Configuration (VLANs)

**Usage notes** **Enabling DHCP snooping**

For DHCP snooping to operate on a VLAN, you must:

- enable the service on the switch by using the [service dhcp-snooping](#) command, and
- enable DHCP snooping on the particular VLAN by using the [ip dhcp snooping](#) command, and
- if there is an external DHCP server, configure the port connected to the server as a trusted port, by using the [ip dhcp snooping trust](#) command

**Disabling DHCP snooping**

Use **no service dhcp-snooping** to disable DHCP snooping.

Disabling DHCP snooping removes all DHCP snooping configuration from the running configuration, except for:

- any DHCP snooping maximum bindings settings ([ip dhcp snooping max-bindings](#)), and
- any additional DHCP snooping-based ACLs you have created for filtering on untrusted ports.

You must remove any such additional DHCP snooping-based ACLs, using the **no access-group** command. This is because these ACLs block all traffic except for traffic that matches DHCP snooping entries. Once you have disabled DHCP snooping, these ACLs will block all traffic. Note that if you disable DHCP snooping on particular VLANs (using the **no ip dhcp snooping** command), you need to make sure you remove any such additional ACLs that apply to those VLANs.

If you re-enable the service, the switch repopulates the DHCP snooping database from the dynamic lease entries in the database backup file (see the [ip dhcp snooping database](#) command). It also updates the lease expiry times.

**Examples** To enable DHCP snooping on VLANs 2 to 4, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2-vlan4
awplus(config-if)# ip dhcp snooping
```

To disable DHCP snooping on the switch, use the command:

```
awplus# configure terminal
awplus(config)# interface vlan2-vlan4
awplus(config-if)# no ip dhcp snooping
```

**Related  
commands**

[ip dhcp snooping trust](#)  
[service dhcp-snooping](#)  
[show ip dhcp snooping](#)

# ip dhcp snooping agent-option

**Overview** Use this command to enable DHCP Relay Agent Option 82 information insertion on the switch. When this is enabled, the switch:

- inserts DHCP Relay Agent Option 82 information into DHCP packets that it receives on untrusted ports
- removes DHCP Relay Agent Option 82 information from DHCP packets that it sends to untrusted ports.

Use the **no** variant of this command to disable DHCP Relay Agent Option 82 insertion.

**Syntax** `ip dhcp snooping agent-option`  
`no ip dhcp snooping agent-option`

**Default** DHCP Relay Agent Option 82 insertion is enabled by default when DHCP snooping is enabled.

**Mode** Global Configuration

**Usage notes** DHCP snooping must also be enabled on the switch ([service dhcp-snooping](#) command), and on the VLANs ([ip dhcp snooping](#) command).

If a subscriber ID is configured for the port ([ip dhcp snooping subscriber-id](#) command), the switch includes this in the DHCP Relay Agent Option 82 information it inserts into DHCP packets received on the port.

**Example** To disable DHCP Relay Agent Option 82 on the switch, use the commands:

```
awplus# configure terminal
awplus(config)# no ip dhcp snooping agent-option
```

**Related commands** [ip dhcp snooping](#)  
[ip dhcp snooping agent-option allow-untrusted](#)  
[ip dhcp snooping subscriber-id](#)  
[service dhcp-snooping](#)  
[show ip dhcp snooping](#)

# ip dhcp snooping agent-option allow-untrusted

**Overview** Use this command to enable DHCP Relay Agent Option 82 information reception on untrusted ports. When this is enabled, the switch accepts incoming DHCP packets that contain DHCP Relay Agent Option 82 information on untrusted ports.

Use the **no** variant of this command to disable DHCP Relay Agent Option 82 information reception on untrusted ports.

**Syntax** `ip dhcp snooping agent-option allow-untrusted`  
`no ip dhcp snooping agent-option allow-untrusted`

**Default** Disabled

**Mode** Global Configuration

**Usage notes** If the switch is connected via untrusted ports to edge switches that insert DHCP Relay Agent Option 82 information into DHCP packets, you may need to allow these DHCP packets through the untrusted ports, by using this command.

When this is disabled (default), the switch treats incoming DHCP packets on untrusted ports that contain DHCP Relay Agent Option 82 information as DHCP snooping violations: it drops them and applies any violation action specified by the [ip dhcp snooping violation](#) command. The switch stores statistics for packets dropped; to display these statistics, use the [show ip dhcp snooping statistics](#) command.

**Example** To enable DHCP snooping Option 82 information reception on untrusted ports, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp snooping agent-option allow-untrusted
```

**Related commands** [ip dhcp snooping agent-option](#)  
[ip dhcp snooping violation](#)  
[show ip dhcp snooping](#)  
[show ip dhcp snooping statistics](#)

# ip dhcp snooping agent-option circuit-id vlantriplet

**Overview** Use this command to specify the Circuit ID sub-option of the DHCP Relay Agent Option 82 field as the VLAN ID and port number. The Circuit ID specifies the switch port and VLAN ID that the client-originated DHCP packet was received on.

Use the **no** variant of this command to set the Circuit ID to the default, the VLAN ID and Ifindex (interface number).

**Syntax** `ip dhcp snooping agent-option circuit-id vlantriplet`  
`no ip dhcp snooping agent-option circuit-id`

**Default** By default, the Circuit ID is the VLAN ID and Ifindex (interface number).

**Mode** Interface Configuration for a VLAN interface.

**Usage** The Circuit ID sub-option is included in the DHCP Relay Agent Option 82 field of forwarded client DHCP packets:

- DHCP snooping Option 82 information insertion is enabled ([ip dhcp snooping agent-option](#) command; enabled by default), and
- DHCP snooping is enabled on the switch ([service dhcp-snooping](#)) and on the VLAN to which the port belongs ([ip dhcp snooping](#))

**Examples** To set the Circuit ID to `vlantriplet` for client DHCP packets received on `vlan1`, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan1
awplus(config-if)# ip dhcp snooping agent-option circuit-id
vlantriplet
```

To return the Circuit ID format to the default for `vlan1`, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan1
awplus(config-if)# no ip dhcp snooping agent-option circuit-id
```

**Related commands** [ip dhcp snooping agent-option](#)  
[ip dhcp snooping agent-option remote-id](#)  
[show ip dhcp snooping](#)  
[show ip dhcp snooping agent-option](#)

# ip dhcp snooping agent-option remote-id

**Overview** Use this command to specify the Remote ID sub-option of the DHCP Relay Agent Option 82 field. The Remote ID identifies the device that inserted the Option 82 information. If a Remote ID is not specified, the Remote ID sub-option is set to the switch's MAC address.

Use the **no** variant of this command to set the Remote ID to the default, the switch's MAC address.

**Syntax** `ip dhcp snooping agent-option remote-id <remote-id>`  
`no ip dhcp snooping agent-option remote-id`

| Parameter                      | Description  |
|--------------------------------|--|
| <code>&lt;remote-id&gt;</code> | An alphanumeric (ASCII) string, 1 to 63 characters in length. If the Remote ID contains spaces, it must be enclosed in double quotes. Wildcards are not allowed. |

**Default** The Remote ID is set to the switch's MAC address by default.

**Mode** Interface Configuration for a VLAN interface.

**Usage** The Remote ID sub-option is included in the DHCP Relay Agent Option 82 field of forwarded client DHCP packets:

- DHCP snooping Option 82 information insertion is enabled ([ip dhcp snooping agent-option](#) command; enabled by default), and
- DHCP snooping is enabled on the switch ([service dhcp-snooping](#)) and on the VLAN to which the port belongs ([ip dhcp snooping](#))

**Examples** To set the Remote ID to `myid` for client DHCP packets received on `vlan1`, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan1
awplus(config-if)# ip dhcp snooping agent-option remote-id myid
```

To return the Remote ID format to the default for `vlan1`, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan1
awplus(config-if)# no ip dhcp snooping agent-option remote-id
```

**Related commands** [ip dhcp snooping agent-option](#)  
[ip dhcp snooping agent-option circuit-id vlantriplet](#)  
[show ip dhcp snooping](#)  
[show ip dhcp snooping agent-option](#)

# ip dhcp snooping binding

**Overview** Use this command to manually add a dynamic-like entry (with an expiry time) to the DHCP snooping database. Once added to the database, this entry is treated as a dynamic entry, and is stored in the DHCP snooping database backup file. This command is not stored in the switch's running configuration.

Use the **no** variant of this command to delete a dynamic entry for an IP address from the DHCP snooping database, or to delete all dynamic entries from the database.

**CAUTION: If you remove entries from the database for current clients, they will lose IP connectivity until they request and receive a new DHCP lease. If you clear all entries, all clients connected to untrusted ports will lose connectivity.**

**Syntax** `ip dhcp snooping binding <ipaddr> [<macaddr>] vlan <vid>  
interface <port> expiry <expiry-time>  
no ip dhcp snooping binding [<ipaddr>]`

| Parameter     | Description  |
|---------------|--|
| <ipaddr>      | Client's IP address.   |
| <macaddr>     | Client's MAC address in HHHH.HHHH.HHHH format.   |
| <vid>         | The VLAN ID for the entry, in the range 1 to 4094.   |
| <port>        | The port the client is connected to. The port can be a switch port, or a static or dynamic link aggregation (channel group). |
| <expiry-time> | The expiry time for the entry, in the range 5 to 2147483647 seconds.   |

**Mode** Privileged Exec

**Usage notes** Note that dynamic entries can also be deleted from the DHCP snooping database by using the [clear ip dhcp snooping binding](#) command.

To add or remove static entries from the database, use the [ip source binding](#) command.

**Example** To restore an entry in the DHCP snooping database for a DHCP client with the IP address 192.168.1.2, MAC address 0001.0002.0003, on port1.0.6 of vlan6, and with an expiry time of 1 hour, use the commands:

```
awplus# ip dhcp snooping binding 192.168.1.2 0001.0002.0003  
vlan 6 interface port1.0.6 expiry 3600
```

**Related commands** [clear ip dhcp snooping binding](#)  
[ip source binding](#)  
[show ip dhcp snooping binding](#)

# ip dhcp snooping database

**Overview** Use this command to set the location of the file to which the dynamic entries in the DHCP snooping database are written. This file provides a backup for the DHCP snooping database.

Use the **no** variant of this command to set the database location back to the default, **nvs**.

**Syntax** `ip dhcp snooping database {nvs|flash|usb}`  
`no ip dhcp snooping database`

| Parameter | Description   |
|-----------|---|
| nvs       | The switch checks the database and writes the file to non-volatile storage (NVS) on the switch at 2 second intervals if it has changed.     |
| flash     | The switch checks the database and writes the file to Flash memory on the switch at 60 second intervals if it has changed.                  |
| usb       | The switch checks the database and writes the file to a USB storage device installed in the switch at 2 second intervals if it has changed. |

**Default** nvs

**Mode** Global Configuration

**Usage notes** If the location of the backup file is changed by using this command, a new file is created in the new location, and the old version of the file remains in the old location. This can be removed if necessary (hidden file: **.dhcp.dsn.gz**).

**Example** To set the location of the DHCP snooping database to Flash memory, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp snooping database flash
```

**Related commands** [show ip dhcp snooping](#)

# ip dhcp snooping delete-by-client

**Overview** Use this command to set the switch to remove a dynamic entry from the DHCP snooping database when it receives a valid DHCP release message with matching IP address, VLAN ID, and client hardware address on an untrusted port, and to discard release messages that do not match an entry in the database.

Use the **no** variant of this command to set the switch to forward DHCP release messages received on untrusted ports without removing any entries from the database.

**Syntax** `ip dhcp snooping delete-by-client`  
`no ip dhcp snooping delete-by-client`

**Default** Enabled: by default, DHCP lease entries are deleted from the DHCP snooping database when matching DHCP release messages are received.

**Mode** Global Configuration

**Usage** DHCP clients send a release message when they no longer wish to use the IP address they have been allocated by a DHCP server. Use this command to enable DHCP snooping to use the information in these messages to remove entries from its database immediately. Use the **no** variant of this command to ignore these release messages. Lease entries corresponding to ignored DHCP release messages eventually time out when the lease expires.

**Examples** To set the switch to delete DHCP snooping lease entries from the DHCP snooping database when a matching release message is received, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp snooping delete-by-client
```

To set the switch to forward and ignore the content of any DHCP release messages it receives, use the commands:

```
awplus# configure terminal
awplus(config)# no ip dhcp snooping delete-by-client
```

**Related commands** [show ip dhcp snooping](#)

# ip dhcp snooping delete-by-linkdown

**Overview** Use this command to set the switch to remove a dynamic entry from the DHCP snooping database when its port goes down. If the port is part of an aggregated link, the entries in the database are only deleted if all the ports in the aggregated link are down.

Use the **no** variant of this command to set the switch not to delete entries when ports go down.

**Syntax** `ip dhcp snooping delete-by-linkdown`  
`no ip dhcp snooping delete-by-linkdown`

**Default** Disabled: by default DHCP Snooping bindings are not deleted when an interface goes down.

**Mode** Global Configuration

**Examples** To set the switch to delete DHCP snooping lease entries from the DHCP snooping database when links go down, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp snooping delete-by-linkdown
```

To set the switch not to delete DHCP snooping lease entries from the DHCP snooping database when links go down, use the commands:

```
awplus# configure terminal
awplus(config)# no ip dhcp snooping delete-by-linkdown
```

**Related commands** [show ip dhcp snooping](#)

# ip dhcp snooping disable-l2-flooding

**Overview** Use this command to disable Layer 2 flooding of DHCP packets on the specified VLANs. These should be VLANs that you have **not** enabled DHCP snooping on.

You need to do this if you have enabled DHCP snooping on a subset of your VLANs and you are using Q-in-Q (VLAN stacking or VLAN double-tagging). Otherwise, the switch may forward two copies of some DHCP packets on the non-snooping VLANs, with one copy being single-tagged instead of double-tagged.

Use the **no** variant of this command to enable Layer 2 flooding of DHCP packets again.

**Syntax** `ip dhcp snooping disable-l2-flooding`  
`no ip dhcp snooping disable-l2-flooding`

**Default** The **no** variant, so Layer 2 flooding of DHCP packets is enabled

**Mode** Interface Configuration for a VLAN interface.

**Example** To disable Layer 2 flooding on VLANs 10-20, which DHCP snooping is **not** enabled on, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan10-vlan20
awplus(config-if)# ip dhcp snooping disable-l2-flooding
```

**Related commands** [service dhcp-snooping](#)

# ip dhcp snooping max-bindings

**Overview** Use this command to set the maximum number of DHCP lease entries that can be stored in the DHCP snooping database for each of the ports. Once this limit has been reached, no further DHCP lease allocations made to devices on the port are stored in the database.

Use the **no** variant of this command to reset the maximum to the default, 1.

**Syntax** `ip dhcp snooping max-bindings <0-520>`  
`no ip dhcp snooping max-bindings`

| Parameter | Description   |
|-----------|---|
| <0-520>   | The maximum number of bindings that will be stored for the port in the DHCP snooping binding database. If 0 is specified, no entries will be stored in the database for the port. |

**Default** The default for maximum bindings is 1.

**Mode** Interface Configuration (port)

**Usage notes** The maximum number of leases cannot be changed for a port while there are DHCP snooping Access Control Lists (ACL) associated with the port. Before using this command, remove any DHCP snooping ACLs associated with the ports. To display ACLs used for DHCP snooping, use the [show ip dhcp snooping acl](#) command.

In general, the default (1) will work well on an edge port with a single directly connected DHCP client. If the port is on an aggregation switch that is connected to an edge switch with multiple DHCP clients connected through it, then use this command to increase the number of lease entries for the port.

If there are multiple VLANs configured on the port, the limit is shared between all the VLANs on this port. For example, the default only allows one lease to be stored for one VLAN. To allow connectivity for the other VLANs, use this command to increase the number of lease entries for the port.

**Example** To set the maximum number of bindings to be stored in the DHCP snooping database to 10 per port for ports 1.0.1 to 1.0.6, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1-port1.0.6
awplus(config-if)# ip dhcp snooping max-bindings 10
```

**Related commands** [access-group](#)  
[show ip dhcp snooping acl](#)  
[show ip dhcp snooping interface](#)

# ip dhcp snooping subscriber-id

**Overview** Use this command to set a Subscriber ID for the ports.  
Use the **no** variant of this command to remove Subscriber IDs from the ports.

**Syntax** `ip dhcp snooping subscriber-id [<sub-id>]`  
`no ip dhcp snooping subscriber-id`

| Parameter | Description  |
|-----------|--|
| <sub-id>  | The Subscriber ID; an alphanumeric (ASCII) string 1 to 50 characters in length. If the Subscriber ID contains spaces, it must be enclosed in double quotes. Wildcards are not allowed. |

**Default** No Subscriber ID.

**Mode** Interface Configuration (port)

**Usage notes** The Subscriber ID sub-option is included in the DHCP Relay Agent Option 82 field of client DHCP packets forwarded from a port if:

- a Subscriber ID is specified for the port using this command, and
- DHCP snooping Option 82 information insertion is enabled ([ip dhcp snooping agent-option](#) command; enabled by default), and
- DHCP snooping is enabled on the switch ([service dhcp-snooping](#)) and on the VLAN to which the port belongs ([ip dhcp snooping](#))

**Examples** To set the Subscriber ID for port 1.0.3 to **room\_534**, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.3
awplus(config-if)# ip dhcp snooping subscriber-id room_534
```

To remove the Subscriber ID from port 1.0.3, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.3
awplus(config-if)# no ip dhcp snooping subscriber-id
```

**Related commands** [ip dhcp snooping agent-option](#)  
[show ip dhcp snooping interface](#)

# ip dhcp snooping trust

**Overview** Use this command to set the ports to be DHCP snooping trusted ports. Use the **no** variant of this command to return the ports to their default as untrusted ports.

**Syntax** `ip dhcp snooping trust`  
`no ip dhcp snooping trust`

**Default** All ports are untrusted by default.

**Mode** Interface Configuration (port)

**Usage notes** Typically, ports connecting the switch to trusted elements in the network (towards the core) are set as trusted ports, while ports connecting untrusted network elements are set as untrusted. Configure ports connected to DHCP servers as trusted ports.

**Example** To set switch ports 1.0.1 and 1.0.2 to be trusted ports, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1-port1.0.2
awplus(config-if)# ip dhcp snooping trust
```

**Related commands** [show ip dhcp snooping interface](#)

# ip dhcp snooping verify mac-address

**Overview** Use this command to verify that the source MAC address and client hardware address match in DHCP packets received on untrusted ports.

Use the **no** variant of this command to disable MAC address verification.

**Syntax** `ip dhcp snooping verify mac-address`  
`no ip dhcp snooping verify mac-address`

**Default** Enabled—source MAC addresses are verified by default.

**Mode** Global Configuration

**Usage** When MAC address verification is enabled, the switch treats DHCP packets with source MAC address and client hardware address that do not match as DHCP snooping violations: it drops them and applies any other violation action specified by the [ip dhcp snooping violation](#) command. To bring the port back up again after any issues have been resolved, use the [shutdown](#) command.

**Example** To disable MAC address verification on the switch, use the commands:

```
awplus# configure terminal
awplus(config)# no ip dhcp snooping verify mac-address
```

**Related commands** [ip dhcp snooping violation](#)  
[show ip dhcp snooping](#)  
[show ip dhcp snooping statistics](#)

# ip dhcp snooping violation

**Overview** Use this command to specify the action the switch will take when it detects a DHCP snooping violation by a DHCP packet on the ports.

Use the **no** variant of this command to disable the specified violation actions, or all violation actions.

**Syntax** `ip dhcp snooping violation {log|trap|link-down} ...`  
`no ip dhcp snooping violation [{log|trap|link-down} ...]`

| Parameter | Description  |
|-----------|--|
| log       | Generate a log message. To display these messages, use the <a href="#">show log</a> command.<br>Default: disabled.   |
| trap      | Generate an SNMP notification (trap). To send SNMP notifications, SNMP must also be configured, and DHCP snooping notifications must be enabled using the <a href="#">snmp-server enable trap</a> command. Notifications are limited to one per second and to one per source MAC and violation reason.<br>Default: disabled. |
| link-down | Set the port status to link-down.<br>Default: disabled.  |

**Default** By default, DHCP packets that violate DHCP snooping are dropped, but no other violation action is taken.

**Mode** Interface Configuration (port)

**Usage notes** If a port has been shut down in response to a violation, to bring it back up again after any issues have been resolved, use the [shutdown](#) command.

IP packets dropped by DHCP snooping filters do not result in other DHCP snooping violation actions.

**Example** To set the switch to send an SNMP notification and set the link status to link-down if it detects a DHCP snooping violation on switch ports 1.0.1 to 1.0.4, use the commands:

```
awplus# configure terminal
awplus(config)# snmp-server enable trap dhcpsnooping
awplus(config)# interface port1.0.1-port1.0.4
awplus(config-if)# ip dhcp snooping violation trap link-down
```

**Related commands** [show ip dhcp snooping interface](#)  
[show log](#)  
[snmp-server enable trap](#)

# ip source binding

**Overview** Use this command to add or replace a static entry in the DHCP snooping database. Use the **no** variant of this command to delete the specified static entry or all static entries from the database.

**Syntax** `ip source binding <ipaddr> [<macaddr>] vlan <vid> interface <port>`  
`no ip source binding [<ipaddr>]`

| Parameter | Description  |
|-----------|--|
| <ipaddr>  | Client's IP address. If there is already an entry in the DHCP snooping database for this IP address, then this command replaces it with the new entry. |
| <macaddr> | Client's MAC address in HHHH.HHHH.HHHH format.   |
| <vid>     | The VLAN ID associated with the entry.   |
| <port>    | The port the client is connected to.   |

**Mode** Global Configuration

**Usage notes** This command removes static entries from the database. To remove dynamic entries, use the [clear ip dhcp snooping binding](#) command or the **no** variant of the [ip dhcp snooping binding](#) command.

**Examples** To add a static entry to the DHCP snooping database for a client with the IP address 192.168.1.2, MAC address 0001.0002.0003, on port1.0.6 of vlan6, use the command:

```
awplus# configure terminal
awplus(config)# ip source binding 192.168.1.2 0001.0002.0003
vlan 6 interface port1.0.6
```

To remove the static entry for IP address 192.168.1.2 from the database, use the commands:

```
awplus# configure terminal
awplus(config)# no ip source binding 192.168.1.2
```

To remove all static entries from the database, use the commands:

```
awplus# configure terminal
awplus(config)# no ip source binding
```

**Related commands**

- clear ip dhcp snooping binding
- ip dhcp snooping binding
- show ip dhcp snooping binding
- show ip source binding

# service dhcp-snooping

**Overview** Use the **service dhcp-snooping** command to enable the DHCP snooping service globally on the switch. As well, you need to enable it on the desired VLANs, using the **ip dhcp snooping** command. The switch creates a global DHCP snooping Access Control list (ACL) the first time you use the **ip dhcp snooping** command, to send DHCP packets to the CPU for processing. Note that the switch will forward all DHCP traffic to the CPU, no matter what VLAN it belongs to.

Alternatively, you can use the **service dhcp-snooping per-vlan** command instead of the **service dhcp-snooping** command. This option only creates ACLs for the VLANs that you configure with the **ip dhcp snooping** command. This limits the amount of DHCP traffic that is forwarded to the CPU. However, using this option creates 2 ACLs for each VLAN that DHCP snooping is enabled on, so it is most suitable if you have a small number of VLANs. Use the **show platform classifier statistics utilization brief** command to see the number of ACLs available for your switch.

Use the **no** variant of this command to disable the DHCP snooping service on the switch.

**Syntax**

```
service dhcp-snooping
service dhcp-snooping per-vlan
no service dhcp-snooping
```

| Parameter | Description   |
|-----------|---|
| per-vlan  | This optional parameter only enables DHCP snooping for the VLANs configured using the command <b>ip dhcp snooping</b> . Using this option creates ACL entries for only the VLANs that DHCP snooping is enabled on. This limits the DHCP traffic forwarded to the CPU. |

**Default** Disabled

**Mode** Global Configuration

## Usage notes **Enabling DHCP snooping**

For DHCP snooping to operate on a VLAN, you must:

- enable the service on the switch by using this command, and
- enable DHCP snooping on the particular VLAN by using the **ip dhcp snooping** command, and
- if there is an external DHCP server, configure the port connected to the server as a trusted port, by using the **ip dhcp snooping trust** command

## Disabling DHCP snooping

Use **no service dhcp-snooping** to disable DHCP snooping.

Disabling DHCP snooping removes all DHCP snooping configuration from the running configuration, except for:

- any DHCP snooping maximum bindings settings (`ip dhcp snooping max-bindings`), and
- any additional DHCP snooping-based ACLs you have created for filtering on untrusted ports.

You must remove any such additional DHCP snooping-based ACLs, using the **no access-group** command. This is because these ACLs block all traffic except for traffic that matches DHCP snooping entries. Once you have disabled DHCP snooping, these ACLs will block all traffic. Note that if you disable DHCP snooping on particular VLANs (using the **no ip dhcp snooping** command), you need to make sure you remove any such additional ACLs that apply to those VLANs.

If you re-enable the service, the switch repopulates the DHCP snooping database from the dynamic lease entries in the database backup file (see the `ip dhcp snooping database` command). It also updates the lease expiry times.

### Per-VLAN DHCP snooping

This mode only enables DHCP snooping for the VLANs configured using the command `ip dhcp snooping`. It minimizes the amount of DHCP traffic forwarded to the CPU. However, it creates 2 ACL entries for each VLAN that DHCP snooping is enabled on, so it is most suitable if you have a small number of VLANs. Use the `show platform classifier statistics utilization brief` command to see the number of ACLs available for your switch.

If you use this mode and you are also using Q-in-Q (VLAN stacking or VLAN double-tagging), then you need to disable Layer 2 flooding on VLANs that do not have DHCP snooping configured. Otherwise, the switch may forward two copies of some DHCP packets on the non-snooping VLANs, with one copy being single-tagged instead of double-tagged. To turn off L2 flooding, use the `ip dhcp snooping disable-l2-flooding` command.

**Examples** To enable the DHCP snooping service on only the VLANs that have DHCP snooping enabled, use the commands:

```
awplus# configure terminal
awplus(config)# service dhcp-snooping
```

To disable the DHCP snooping service on the switch, use the commands:

```
awplus# configure terminal
awplus(config)# no service dhcp-snooping
```

**Command  
changes**

Version 5.4.9-2.1: **per-vlan** parameter added for SBx8100, x530, and x320 series.

Version 5.4.9-2.1: **per-vlan** parameter added for IE510, IE340, IE300, SBx908 GEN2, x950, x930, and x510 series.

# show arp security

**Overview** Use this command to display ARP security configuration.

**Syntax** show arp security

**Mode** User Exec and Privileged Exec

**Example** To display ARP security configuration on the switch use the command:

```
awplus# show arp security
```

**Table 1:** Example output from the **show arp security** command

```
awplus# show arp security

ARP Security Information:
  Total VLANs enabled ..... 2
  Total VLANs disabled ..... 11
  vlan1 ..... Disabled
  vlan2 ..... Disabled
  vlan3 ..... Disabled
  vlan4 ..... Disabled
  vlan5 ..... Disabled
  vlan100 ..... Disabled
  vlan101 ..... Disabled
  vlan102 ..... Disabled
  vlan103 ..... Disabled
  vlan104 ..... Disabled
  vlan105 ..... Enabled
  vlan1000 ..... Disabled
  vlan1001 ..... Enabled
```

**Table 2:** Parameters in the output from the **show arp security** command

| Parameter            | Description  |
|----------------------|--|
| Total VLANs enabled  | The number of VLANs that have ARP security enabled.  |
| Total VLANs disabled | The number of VLANs that have ARP security disabled. |

**Related commands**

- [arp security](#)
- [show arp security interface](#)
- [show arp security statistics](#)

# show arp security interface

**Overview** Use this command to display ARP security configuration for the specified ports or all ports.

**Syntax** `show arp security interface [<port-list>]`

| Parameter                      | Description  |
|--------------------------------|--|
| <code>&lt;port-list&gt;</code> | The ports to display ARP security information about. The port list can include switch ports, and static or dynamic aggregated links. |

**Mode** User Exec and Privileged Exec

**Example** To display ARP security configuration for ports, use the command:

```
awplus# show arp security interface
```

**Table 3:** Example output from the **show arp security interface** command

```
awplus#show arp security interface

Arp Security Port Status and Configuration:

  Port: Provisioned ports marked with brackets, e.g. (portx.y.z)
KEY:   LG = Log
       TR = Trap
       LD = Link down

Port          Action
-----
port1.0.1    -- -- --
port1.0.2    -- -- --
port1.0.3    LG TR LD
port1.0.4    LG -- --
port1.0.5    LG -- --
port1.0.6    LG TR --
port1.0.7    LG -- LD
...
```

**Table 4:** Parameters in the output from the **show arp security interface** command

| Parameter     | Description  |
|---------------|--|
| Action        | The action the switch takes when it detects an ARP security violation on the port. |
| Port          | The port. Parentheses indicate that ports are configured for provisioning.         |
| LG, Log       | Generate a log message   |
| TR, Trap      | Generate an SNMP notification (trap).  |
| LD, Link down | Shut down the link.  |

**Related commands**

- arp security violation
- show arp security
- show arp security statistics
- show log
- snmp-server enable trap

# show arp security statistics

**Overview** Use this command to display ARP security statistics for the specified ports or all ports.

**Syntax** `show arp security statistics [detail] [interface <port-list>]`

| Parameter                                | Description  |
|--|--|
| <code>detail</code>                      | Display detailed statistics.   |
| <code>interface &lt;port-list&gt;</code> | Display statistics for the specified ports. The port list can include switch ports, and static or dynamic aggregated links |

**Mode** User Exec and Privileged Exec

**Example** To display the brief statistics for the ARP security, use the command:

```
awplus# show arp security statistics
```

**Table 5:** Example output from the **show arp security statistics** command

```
awplus# show arp security statistics

DHCP Snooping ARP Security Statistics:
  Interface      In      In
                Packets Discards
-----
port1.0.3       20      20
port1.0.4       30      30
port1.0.12     120      0
```

**Table 6:** Parameters in the output from the **show arp security statistics** command

| Parameter   | Description   |
|-------------|---|
| Interface   | A port name. Parentheses indicate that ports are configured for provisioning.             |
| In Packets  | The total number of incoming ARP packets that are processed by DHCP Snooping ARP Security |
| In Discards | The total number of ARP packets that are dropped by DHCP Snooping ARP Security.           |

**Table 7:** Example output from the **show arp security statistics detail** command

```
awplus#show arp security statistics detail

DHCP Snooping ARP Security Statistics:
Interface ..... port1.0.3
  In Packets ..... 20
  In Discards ..... 20
  No Lease ..... 20
  Bad Vlan ..... 0

# show ip dhcp snooping acl

**Overview** Use this command to display information about the Access Control Lists (ACL) that are using the DHCP snooping database.

**Syntax** `show ip dhcp snooping acl`  
`show ip dhcp snooping acl [detail|hardware] [interface`  
`<interface-list>]`

| Parameter        | Description                                  |
|------------------|--|
| detail           | Detailed DHCP Snooping ACL information.      |
| hardware         | DHCP Snooping hardware ACL information.      |
| interface        | ACL Interface information.                   |
| <interface-list> | The interfaces to display information about. |

**Mode** User Exec and Privileged Exec

**Example** To display DHCP snooping ACL information, use the command:

```
awplus# show ip dhcp snooping acl
```

**Table 52:** Example output from the `show ip dhcp snooping acl` command

```
awplus#show ip dhcp snooping acl
```

DHCP Snooping Based Filters Summary:

| Interface    | Bindings | Maximum Bindings | Template Filters | Attached Hardware Filters |
|--------------|----------|------------------|------------------|---------------------------|
| port1.0.1    | 1        | 520              | 0                | 0                         |
| port1.0.2    | 1        | 3                | 2                | 6                         |
| port1.0.3    | 1        | 2                | 4                | 8                         |
| port1.0.4    | 1        | 2                | 7                | 14                        |
| port1.0.5    | 0        | 2                | 6                | 12                        |
| port1.0.6    | 0        | 1                | 0                | 0                         |
| port1.0.7    | 0        | 1                | 0                | 0                         |
| port1.0.8    | 0        | 1                | 0                | 0                         |
| port1.0.9    | 0        | 1                | 0                | 0                         |
| port1.0.10   | 0        | 1                | 0                | 0                         |
| port1.0.11   | 0        | 1                | 0                | 0                         |
| port1.0.12   | 0        | 1                | 0                | 0                         |
| (port2.0.1 ) | 0        | 520              | 0                | 0                         |
| (port2.0.2 ) | 0        | 1                | 0                | 0                         |

To display DHCP snooping hardware ACL information, use the command:

```
awplus# show ip dhcp snooping acl hardware
```

**Table 53:** Example output from the **show ip dhcp snooping acl hardware** command

```
awplus#show ip dhcp snooping acl hardware
```

DHCP Snooping Based Filters in Hardware:

| Interface | Access-list(/ClassMap) | Source IP   | Source MAC     |
|-----------|------------------------|-------------|----------------|
| port1.0.2 | dhcpsn1                | 10.10.10.10 | aaaa.bbbb.cccc |

# show ip dhcp snooping agent-option

**Overview** Use this command to display DHCP snooping Option 82 information for all interfaces, a specific interface or a range of interfaces.

**Syntax** `show ip dhcp snooping agent-option [interface <interface-list>]`

| Parameter                           | Description                              |
|-------------------------------------|--|
| <code>interface</code>              | Specify the interface.                   |
| <code>&lt;interface-list&gt;</code> | The name of the interface or interfaces. |

**Mode** User Exec and Privileged Exec

**Examples** To display DHCP snooping Option 82 information for all interfaces, use the command:

```
awplus# show ip dhcp snooping agent-option
```

To display DHCP snooping Option 82 information for vlan1, use the command:

```
awplus# show ip dhcp snooping agent-option interface vlan1
```

To display DHCP snooping Option 82 information for port1.0.1, use the command:

```
awplus# show ip dhcp snooping agent-option interface port1.0.1
```

**Output** Figure 51-1: Example output from the **show ip dhcp snooping agent-option** command

```
awplus#show ip dhcp snooping agent-option

DHCP Snooping Option 82 Configuration:

# show ip dhcp snooping interface

**Overview** Use this command to display information about DHCP snooping configuration and leases for the specified ports, or all ports.

**Syntax** `show ip dhcp snooping interface [<port-list>]`

| Parameter                      | Description  |
|--------------------------------|--|
| <code>&lt;port-list&gt;</code> | The ports to display DHCP snooping configuration information for. If no ports are specified, information for all ports is displayed. |

**Mode** User Exec and Privileged Exec

**Example** To display DHCP snooping information for all ports, use the command:

```
awplus# show ip dhcp snooping interface
```

**Table 57:** Example output from the **show ip dhcp snooping interface** command

```
awplus#show ip dhcp snooping interface

DHCP Snooping Port Status and Configuration:

Port: Provisioned ports marked with brackets, e.g. (portx.y.z)
Action: LG = Log
        TR = Trap
        LD = Link down
```

| Port       | Status    | Full Leases | Max Leases | Action   | Subscriber-ID      |
|------------|-----------|-------------|------------|----------|--------------------|
| port1.0.1  | Untrusted | 1           | 1          | LG -- -- |                    |
| port1.0.2  | Untrusted | 0           | 50         | LG TR LD | Building 1 Level 1 |
| port1.0.3  | Untrusted | 0           | 50         | LG -- -- |                    |
| port1.0.4  | Untrusted | 0           | 50         | LG -- -- | Building 1 Level 2 |
| port1.0.5  | Untrusted | 0           | 50         | LG -- LD | Building 2 Level 1 |
| port1.0.6  | Untrusted | 0           | 1          | LG -- -- |                    |
| port1.0.7  | Untrusted | 0           | 1          | LG -- -- |                    |
| port1.0.8  | Untrusted | 0           | 1          | LG -- -- |                    |
| port1.0.9  | Untrusted | 0           | 1          | -- TR -- |                    |
| port1.0.10 | Untrusted | 0           | 1          | -- -- LD |                    |
| port1.0.11 | Trusted   | 0           | 1          | -- -- -- |                    |
| port1.0.12 | Trusted   | 0           | 1          | -- -- -- |                    |

**Table 58:** Parameters in the output from the **show ip dhcp snooping interface** command

| Parameter     | Description  |
|---------------|--|
| Port          | The port interface name.   |
| Status        | The port status: untrusted (default) or trusted.   |
| Full Leases   | The number of entries in the DHCP snooping database for the port.  |
| Max Leases    | The maximum number of entries that can be stored in the database for the port.   |
| Action        | The DHCP snooping violation actions for the port.  |
| Subscriber ID | The subscriber ID for the port. If the subscriber ID is longer than 34 characters, only the first 34 characters are displayed. To display the whole subscriber ID, use the command <b>show running-config dhcp</b> . |

# show ip dhcp snooping statistics

**Overview** Use this command to display DHCP snooping statistics.

**Syntax** `show ip dhcp snooping statistics [detail] [interface <interface-list>]`

| Parameter                  | Description  |
|----------------------------|--|
| detail                     | Display detailed statistics.   |
| interface <interface-list> | Display statistics for the specified interfaces. The interface list can contain switch ports, static or dynamic link aggregators (channel groups), or VLANs. |

**Mode** User Exec and Privileged Exec

**Example** To show the current DHCP snooping statistics for all interfaces, use the command:

```
awplus# show ip dhcp snooping statistics
```

**Table 59:** Example output from the **show ip dhcp snooping statistics** command

```
awplus# show ip dhcp snooping statistics
```

| DHCP Snooping Statistics: |                     |                      |               |                |
|---------------------------|---------------------|----------------------|---------------|----------------|
| Interface                 | In BOOTP<br>Packets | In BOOTP<br>Requests | In<br>Replies | In<br>Discards |
| vlan1                     | 444                 | 386                  | 58            | 223            |
| port1.0.1                 | 386                 | 386                  | 0             | 223            |
| port1.0.2                 | 0                   | 0                    | 0             | 0              |
| port1.0.3                 | 0                   | 0                    | 0             | 0              |
| port1.0.4                 | 0                   | 0                    | 0             | 0              |
| port1.0.5                 | 0                   | 0                    | 0             | 0              |
| port1.0.6                 | 58                  | 0                    | 58            | 0              |

**Table 60:** Example output from the **show ip dhcp snooping statistics detail** command

```
awplus# show ip dhcp snooping statistics detail

DHCP Snooping Statistics:
Interface ..... port1.0.1, All counters 0

Interface ..... port1.0.6, All counters 0
```

**Table 61:** Parameters in the output from the **show ip dhcp snooping statistics** command

| Parameter                 | Description  |
|---------------------------|--|
| Interface                 | The interface name.  |
| In Packets                | The total number of incoming packets that are processed by DHCP Snooping.                    |
| In BOOTP Requests         | The total number of incoming BOOTP Requests.   |
| In BOOTP Replies          | The total number of incoming BOOTP Replies.  |
| In Discards               | The total number of incoming packets that have been discarded.                               |
| Invalid BOOTP Information | Packet contained invalid BOOTP information, such as an invalid BOOTP.OPCode.                 |
| Invalid DHCP ACK          | A DHCP ACK message was discarded, for reasons such as missing Server Option or Lease Option. |

**Table 61:** Parameters in the output from the **show ip dhcp snooping statistics** command (cont.)

| Parameter                            | Description   |
|--------------------------------------|---|
| Invalid DHCP Release or Decline      | A DHCP Release or Decline message was discarded, for reasons such as mismatch between received interface and current binding information. |
| Invalid IP/UDP Header                | A problem was detected in the IP or UDP header of the packet.   |
| Max Bindings Exceeded                | Accepting the packet would cause the maximum number of bindings on a port to be exceeded.   |
| Option 82 Insert Error               | An error occurred while trying to insert DHCP Relay Agent Option 82 information.  |
| Option 82 Received Invalid           | The DHCP Relay Agent Option 82 information received did not match the information inserted by DHCP Snooping.                              |
| Option 82 Received On Untrusted Port | A packet containing DHCP Relay Agent Option 82 information was received on an untrusted port.   |
| Option 82 Transmit On Untrusted Port | A packet containing DHCP Relay Agent Option 82 information was to be sent on an untrusted port.   |
| Reply Received On Untrusted Port     | A BOOTP reply was received on an untrusted port.  |
| Source MAC/CHADDR Mismatch           | The L2 Source MAC address of the packet did not match the client hardware address field (BOOTP.CHADDR).                                   |
| Static Entry Already Exists          | An entry could not be added as a static entry already exists.   |

# show ip source binding

**Overview** Use this command to display static entries in the DHCP snooping database. These are the entries that have been added by using the [ip source binding](#) command.

**Syntax** `show ip source binding`

**Mode** User Exec and Privileged Exec

**Example** To display static entries in the DHCP snooping database information, use the command:

```
awplus# show ip source binding
```

**Table 62:** Example output from the **show ip source binding** command

```
awplus# show ip source binding

IP Source Bindings:

Client      MAC
IP Address  Address          VLAN  Port           Expires
-----
1.1.1.1     0000.1111.2222  1     port1.0.1      Infinite  Static
```

**Table 63:** Parameters in the output from the **show ip source binding** command

| Parameter         | Description  |
|-------------------|--|
| Client IP Address | The IP address of the DHCP client.   |
| MAC Address       | The MAC address of the DHCP client.  |
| VLAN              | The VLAN ID the packet is received on.   |
| Port              | The Layer 2 port name the packet is received on.   |
| Expires (sec)     | Always infinite for static bindings, or when the leave time in the DHCP message was 0xffffffff (infinite). |
| Type              | DHCP Snooping binding type: Static   |

# openflow

**Overview** Use this command to specify a port or static aggregator as a data plane port. The ingress and egress traffic on the data plane port become controlled by the OpenFlow Controller. A data plane port number is assigned to the port automatically.

Use the **no** variant of this command to cancel the setting of a port as a data plane port.

**Syntax** openflow  
no openflow

**Default** All the ports are non-data plane ports by default.

**Mode** Interface mode for a switch port (e.g. port1.0.1) or static aggregator (e.g. sa1)

**Example** To specify port1.0.1 as a data plane port:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# openflow
```

**Related commands** [show openflow config](#)

**Command changes**

- Version 5.4.6-1.1: command added
- Version 5.4.7-1.1: command added to GS900MX, XS900MX, x550 series products
- Version 5.4.7-2.1: command added to IE300, IE500 series products
- Version 5.4.8-0.2: added to SBx908 GEN2
- Version 5.4.8-1.1: added to IE210L series products

# openflow controller

**Overview** Use this command to specify the name, address, and port number of the OpenFlow Controller. If you do not specify a controller name, a name will automatically be created using the following format: 'ocxx', where 'xx' is a sequential number starting from 1.

You can specify one or more OpenFlow Controllers to the switch.

Use the **no** variant of this command to delete one or more OpenFlow Controllers specified to the switch.

You can delete a controller by specifying only the controller name. If you do not know the controller name, you can identify it from the **show openflow config** command output.

**Syntax**

```
openflow controller <protocol> <address> <port>
openflow controller <controller-name> <protocol> <address>
<port> [in-band]
no openflow controller <controller-name>
```

| Parameter         | Description   |
|-------------------|---|
| <controller-name> | The user specified or auto-generated (in the case of legacy syntax) controller name that can contain alphanumeric and/or special characters other than the following set of characters: ':', '=', ',', '[', ']', '{', '}', ' ', '<', '>'  |
| <protocol>        | The protocol type to communicate with the OpenFlow Controller.<br>There are two options, TCP and SSL:<br>Use <b>TCP</b> for an insecure connection.<br>Use <b>SSL</b> for a connection protected by TLS.<br>OpenFlow switches support TLSv1.2 and v1.3. The TLS version used between an OpenFlow switch and OpenFlow Controller is determined by peer negotiation. The peer negotiation will select the highest version supported by both ends. |
| <address>         | The IPv4 address of the Controller.   |
| <port>            | Port number used to communicate with the Controller. The IANA has assigned the number 6653 for this purpose, but a different number can be used for local reasons.  |
| in-band           | Optional: Specifies that the controller be set up as an in-band controller. Out-of-band is the alternative choice (denoted by leaving out the in-band parameter) and is the default.  |

**Default** No OpenFlow Controller is configured by default.

**Mode** Global Configuration

**Usage notes** The older version of this command is supported. If you enter the legacy CLI syntax (without the controller name), it will automatically adapt and display in the running configuration as the newer syntax.

For example, entering the legacy command:

```
awplus(config)# openflow controller tcp 192.168.1.2 6653
```

Displays as following in the running-config:

```
awplus(config)# openflow controller ocl tcp 192.168.1.2 6653
```

**Examples** To add an OpenFlow Controller with the address 10.1.1.1 using the TCP protocol and the IANA assigned port number of 6653, use the commands:

```
awplus# configure terminal
```

```
awplus(config)# openflow controller tcp 10.1.1.1 6653
```

To add an OpenFlow Controller for the switch whose name is 'controller1', with the address 10.1.2.1 using the TCP protocol on port number 6653, use the commands:

```
awplus# configure terminal
```

```
awplus(config)# openflow controller controller1 tcp 10.1.2.1  
6653
```

To add on OpenFlow Controller for the switch whose name is 'controller1', with the address 10.1.2.1, using the TCP protocol on port number 6653. This is also an in-band Controller.

```
awplus# configure terminal
```

```
awplus(config)# openflow controller controller1 tcp 10.1.2.1  
6653 in-band
```

To delete an OpenFlow Controller whose name is 'controller1', use the commands:

```
awplus# configure terminal
```

```
awplus(config)# no openflow controller controller1
```

**Related commands** [show openflow config](#)

**Command changes**

- Version 5.4.7-1.1: command added
- Version 5.4.7-2.1: command added to IE300, IE500 series products
- Version 5.4.8-0.2: command added to SBx908 GEN2
- Version 5.4.8-1.1: command added to IE210L series products
- Version 5.4.8-2.1: <controller-name> parameter added
- Version 5.5.3-0.1: TLSv1.0 and 1.2 support removed
- Version 5.5.3-1.1: TLSv1.3 support added
- Version 5.5.3-1.2: **in-band** parameter added

# openflow datapath-id

**Overview** Use this command to change the Datapath Identifier (DPID) of the OpenFlow switch.

Use the **no** variant of this command to revert back to the default DPID.

**Syntax** `openflow datapath-id <dpid>`  
`no openflow datapath-id`

| Parameter | Description   |
|-----------|---|
| <dpid>    | The DPID field consists of 16 Hex digits. If you specify a DPID less than 16 Hex digits, then the upper bits are padded out with zeros. |

**Default** Each OpenFlow instance on a switch is identified by a Datapath Identifier. This is a 64 bit number. By default, the lower 48 bits are configured based on the switch MAC address. The top 16 bits are padded with zeros.

**Mode** Global Configuration

**Usage notes** This command changes the DPID, which is used as the OpenFlow switch ID in OpenFlow Controller(s).

**Example** To change the DPID to "0000000000000001", use the commands:

```
awplus# configure terminal  
awplus(config)# openflow datapath-id 1
```

To revert back to the default DPID, use the commands:

```
awplus# configure terminal  
awplus(config)# no openflow datapath-id
```

**Related commands** [show openflow status](#)

**Command changes**  
Version 5.4.7-1.1: command added  
Version 5.4.7-2.1: command added to IE300, IE500 series products  
Version 5.4.8-0.2: added to SBx908 GEN2  
Version 5.4.8-1.1: added to IE210L series products

# openflow failmode

**Overview** Use this command to set the operation mode for the switch when the Controller connection fails or no Controllers are defined.

Use the **no** variant of this command to return to the default mode.

**Syntax**

```
openflow failmode secure non-rule-expired
openflow failmode standalone
no openflow failmode
```

| Parameter               | Description   |
|-------------------------|---|
| secure non-rule-expired | Set the mode to secure non-rule-expired. See the Usage section for details. |
| standalone              | Set the mode to standalone. See the Usage section for details.              |

**Default** Secure mode, without the **non-rule-expired** option

**Mode** Global Configuration

**Usage notes** If an OpenFlow switch loses contact with all Controllers as a result of echo request timeouts, then the OpenFlow switch goes into **fail mode**. There are three fail modes available:

- In **standalone** mode, if no message is received from the OpenFlow Controller for three times the inactivity probe interval, then OpenFlow will take over responsibility for setting up flows. OpenFlow will cause the switch to act like an ordinary MAC-learning switch, but continue to retry connecting to the Controller in the background. When the connection succeeds, it will discontinue its standalone behavior.

**NOTE:** If the OpenFlow switch is in fail mode, and you change the configured fail mode to or from standalone mode, OpenFlow will flush all existing rules.

- In **secure** mode, OpenFlow will not set up new flows on its own when the Controller connection fails or when no Controllers are defined, but all existing flows are left in place. The switch will continue to retry connecting to any defined Controllers forever, unless a rule timeout causes it to expire.

This mode is the default, and you can also set it by using the command **no openflow failmode**.

- In **secure non-rule-expired** mode, OpenFlow will not set up new flows on its own when the Controller connection fails or when no Controllers are defined, but all existing flows are left in place. The switch will continue to retry connecting to any defined Controllers forever. The **non-rule-expired** parameter means that existing rules won't be expired regardless of their timeouts while under fail mode. In other words, the OpenFlow switch will

ignore timeout values of both idle timeout and hard timeout in existing rules.

**Example** To set the fail mode to **standalone** mode, use the commands:

```
awplus# configure terminal
awplus(config)# openflow failmode standalone
```

To set the fail mode to **secure non-rule-expired** mode, use the commands:

```
awplus# configure terminal
awplus(config)# openflow failmode secure non-rule-expired mode
```

To revert the fail mode to the default mode, use the commands:

```
awplus# configure terminal
awplus(config)# no openflow failmode
```

**Related commands** [openflow controller](#)

**Command changes**

- Version 5.4.7-1.1: command added
- Version 5.4.7-2.1: command added to IE300, IE500 series products
- Version 5.4.8-0.1: non-rule-expired parameter added
- Version 5.4.8-0.2: added to SBx908 GEN2
- Version 5.4.8-1.1: added to IE210L series products

# openflow inactivity

**Overview** Use this command to set the value of the Controller inactivity timeout.  
Use the **no** variant of this command to reset the inactivity timeout value to its default.

**Syntax** `openflow inactivity <5-2073600>`  
`no openflow inactivity`

| Parameter                      | Description                            |
|--------------------------------|--|
| <code>&lt;5-2073600&gt;</code> | Specifies the timeout value in seconds |
| <code>inactivity</code>        | OpenFlow inactivity probe              |

**Default** 10 seconds.

**Mode** Global Configuration

**Usage notes** OpenFlow uses the inactivity probe timer to monitor its connection to Controller(s). If no message is received from any Controller for three times the inactivity probe interval, then OpenFlow will take over responsibility for setting up flows, if in standalone mode.

**Example** To configure the inactivity probe timeout to 20 seconds, enter the commands:

```
awplus# configure terminal  
awplus(config)# openflow inactivity 20
```

To reset the inactivity probe timeout to its default value of 10 seconds, enter the commands:

```
awplus# configure terminal  
awplus(config)# no openflow inactivity
```

**Related commands** [openflow controller](#)

**Command changes**  
Version 5.4.7-1.1: command added  
Version 5.4.7-2.1: command added to IE300, IE500 series products  
Version 5.4.8-0.2: added to SBx908 GEN2  
Version 5.4.8-1.1: added to IE210L series products

# openflow native vlan

**Overview** Use this command to specify a VLAN as a native VLAN for the data plane ports. You must create a VLAN (using the [vlan database](#) command) before specifying the VLAN as a native VLAN.

The OpenFlow native VLAN **must** be different from the native VLAN of the control plane. This prevents the OpenFlow ports from receiving any broadcast or multicast traffic flooded on the control plane native VLAN.

The VLAN used as the OpenFlow native VLAN should not be used on non-OpenFlow ports.

Use the **no** variant of this command to change the native VLAN for the data plane ports back to the default VLAN 1.

**Syntax** `openflow native vlan <vlan-id>`  
`no openflow native vlan`

| Parameter | Description                   |
|-----------|-------------------------------|
| <vlan-id> | VLAN ID in the range <1-4090> |

**Default** The native VLAN for the data plane ports is VLAN 1 by default.

**Mode** Global Configuration

**Example** To specify VLAN 100 as a native VLAN for the data plane ports:

```
awplus# configure terminal
awplus(config)# openflow native vlan 100
```

To change the native VLAN for the data plane ports back to the VLAN 1:

```
awplus# configure terminal
awplus(config)# no openflow native vlan
```

**Related commands** [show openflow config](#)

**Command changes**

- Version 5.4.6-1.1: command added
- Version 5.4.7-1.1: command added to GS900MX, XS900MX, x550 series products
- Version 5.4.7-2.1: command added to IE300, IE500 series products
- Version 5.4.8-0.2: added to SBx908 GEN2
- Version 5.4.8-1.1: added to IE210L series products

# openflow ssl peer certificate

**Overview** Use this command to enable a peer certificate to be sent from the machine that the OpenFlow Controller is running.

Use the **no** variant of this command to disable a peer certificate from being sent from the machine that the OpenFlow Controller is running.

**Syntax** `openflow ssl peer certificate {<file>|bootstrap}`  
`no openflow ssl peer certificate`

| Parameter                 | Description  |
|---------------------------|--|
| <code>&lt;file&gt;</code> | The CA certificate of an OpenFlow Controller must be in PEM format and specified with an absolute path using the format <code>flash:cacert.pem</code> . You must copy the file from the machine on which the OpenFlow Controller is running beforehand to the OpenFlow switch. |
| <code>bootstrap</code>    | In bootstrap mode, when the switch first connects to the OpenFlow Controller, it accepts and saves to RAM a self-signed CA certificate sent from the Controller. Thereafter, the OpenFlow switch will only connect to OpenFlow Controllers signed by the same CA certificate.  |

**Default** Peer certificate validation is disabled by default.

**Mode** Global Configuration

**Usage notes** This command enables or disables peer certification on an OpenFlow Controller.

**Example** To validate a peer certificate using the bootstrap mode, use the commands:

```
awplus# configure terminal
awplus(config)# openflow ssl peer certificate bootstrap
```

To disable peer certificate validation, use the commands:

```
awplus# configure terminal
awplus(config)# no openflow ssl peer certificate
```

# openflow ssl trustpoint

**Overview** Use this command to configure the local trustpoint to be used for authentication. Use the **no** variant of this command to disable the local trustpoint.

**Syntax** `openflow ssl trustpoint local`  
`no openflow ssl trustpoint local`

**Default** There is no trustpoint configured by default.

**Mode** Global Configuration mode.

**Usage notes** Use this command to specify a local self-signed certificate authority trustpoint for authentication. You must first create the trustpoint using the **crypto pki trustpoint** command.

**Example** To configure a local trustpoint, use the commands:

```
awplus# configure terminal
awplus(config)# openflow ssl trustpoint local
```

To delete the local trustpoint, use the command:

```
awplus(config)# no openflow ssl trustpoint
```

# openflow version

**Overview** Use this command to change the supported OpenFlow version numbers on the switch. You can specify a list of version numbers.

Use the **no** variant of this command to change the version number of the OpenFlow protocol back to the default version 1.3.

**Syntax** `openflow version <version-list>`  
`no openflow version`

| Parameter                         | Description  |
|-----------------------------------|--|
| <code>&lt;version-list&gt;</code> | Specifies a list of version numbers separated by a space. The version numbers are 1.0 and 1.3. |

**Default** The OpenFlow version is set to 1.3 by default.

**Mode** Global Configuration

**Usage notes** This command overwrites any previously configured OpenFlow versions with the default OpenFlow version 1.3.

**Example** To change the OpenFlow protocol version to 1.0 and 1.3:

```
awplus(config)# openflow version 1.0 1.3
```

To change the OpenFlow protocol version to the default 1.3:

```
awplus(config)# no openflow version
```

# show openflow config

**Overview** Use this command to display the OpenFlow configuration database on the switch.

**Syntax** show openflow config

**Mode** User Exec/Privileged Exec

**Example** To show the contents of the OpenFlow configuration database on the switch:

```
awplus# show openflow config
```

**Output** Figure 52-1: Example output from **show openflow config**

```
awplus# show openflow config
258a3d74-d349-4d18-9d75-09ab66e19d81
  Bridge of0
    Controller "tcp:192.168.1.2:6653"
      is_connected: true
    fail_mode: standalone

```

Table 52-1: Parameters in the output from **show openflow config**

| Parameter          | Description   |
|--------------------|---|
| First line         | The switch ID   |
| Bridge of0         | The configuration of the OpenFlow bridge.   |
| Controller         | The address of the OpenFlow Controller and SSL port number  |
| is_connected: true | Indicates that the switch is connected to the OpenFlow Controller. If the switch is not connected to the Controller, "is_connected" is not displayed. |

Table 52-1: Parameters in the output from **show openflow config** (cont.)

| Parameter | Description   |
|-----------|---|
| fail_mode | The fail mode. When the fail mode is "secure," OpenFlow on the switch does not set up flows when the OpenFlow Controller fails.<br>When the fail mode is "standalone", OpenFlow on the switch sets up flows to work as a Layer 2 switch when the OpenFlow Controller fails. |
| Port      | The port information  |
| Interface | The interface of the port.  |
| type:     | The type of the port  |
| options:  | The options for the port  |

# show openflow coverage

**Overview** Use this command to display the OpenFlow counters from the Open vSwitch.

**Syntax** show openflow coverage

**Mode** User Exec/Privileged Exec

**Usage** The information displayed by this command is for troubleshooting. Contact Allied Telesis Technical Support for assistance.

**Example** To show OpenFlow counters:

```
awplus# show openflow coverage
```

**Output** Figure 52-2: Example output from **show openflow coverage**

```
awplus# show openflow coverage
Event coverage, avg rate over last: 5 seconds, last minute, last hour,

# show openflow flows

**Overview** Use this command to display all the entries in the switch's flow tables that resulted from receiving packets on OpenFlow ports.

**Syntax** `show openflow flows`

**Mode** Privileged Exec

**Usage notes** The switch uses OpenFlow rules from the Controller to create a rule table that tells the switch what to do with packets. From the rules, the switch creates a software flow table to process packets. From the software flow table, the switch creates entries in its silicon hardware flow tables, when possible. When silicon table entries exist, the switch uses them to switch packets. When silicon table entries do not exist, the switch uses the software flow table to process packets.

See the "Communication and Packet Processing" section of the OpenFlow Feature Overview and Configuration Guide for a detailed explanation of how the switch puts entries into the software and silicon flow tables.

This command displays flows in both the software and silicon flow tables. A symbol at the start of each flow output indicates whether it is a silicon or software table entry:

- # indicates silicon flow table entries, and
- ~ indicates software flow table entries

**Example** To show the entries of the flow tables on the switch:

```
awplus# show openflow flows
```

**Output** Where possible, the switch uses OpenFlow rules from the Controller to create entries in its silicon hardware flow tables, and switches packets according to the silicon flow tables.

In the following example output, the OpenFlow ports are port1.0.14, port1.0.15, port1.0.16, port1.0.33 and sa3 (port1.0.27 and port1.0.38). As LOCAL and LAG ports are now supported, the first OpenFlow port number is used as the local port.

OpenFlow port numbering becomes:

- port1.0.14 is OpenFlow port number 2
- port1.0.15 is OpenFlow port number 3
- port1.0.33 is OpenFlow port number 5
- sa3 is OpenFlow port number 6

The clients are connected to port1.0.15 and port1.0.33 in this scenario and sa3 is used as OpenFlow ports for the uplink. The **show openflow flows** command shows the following:

Figure 52-3: Example output from **show openflow flows**

```
awplus# show openflow flows

~recirc_id(0),in_port(3),eth(src=08:00:27:9a:b6:7f,dst=08:00:27:4b:ef:3b),eth_type(0x0800),ipv4(frag=no), packets:0, bytes:0, used:never, actions:push_vlan(vid=79,pcp=0),6

~recirc_id(0),in_port(6),eth(dst=08:00:27:96:2d:48),eth_type(0x8100),vlan(vid=79,pcp=0),encap(eth_type(0x0806)), packets:1, bytes:64, used:8.990s, actions:pop_vlan,5

~recirc_id(0),in_port(6),eth(dst=08:00:27:9a:b6:7f),eth_type(0x8100),vlan(vid=79,pcp=0),encap(eth_type(0x0800),ipv4(frag=no)), packets:1, bytes:346, used:3.938s, actions:pop_vlan,3

#recirc_id(0),in_port(6),eth(dst=ff:ff:ff:ff:ff:ff/01:00:00:00:00:00),eth_type(0x0800),ipv4(frag=no), packets:28, bytes:2019, used:2.110s, actions:drop

~recirc_id(0),in_port(5),eth(src=08:00:27:96:2d:48,dst=08:00:27:4b:ef:3b),eth_type(0x0806), packets:0, bytes:0, used:never, actions:push_vlan(vid=79,pcp=0),6
```

**NOTE:** This output includes added line spacing for readability purposes

Table 52-3: Parameters in the output from **show openflow flows**

| Parameter | Description   |
|-----------|---|
| recirc_id | Used to select the next packet processing steps among multiple instances of recirculation. Packets initially enter the process with an ID of 0, which indicates no recirculation. |
| in_port   | The OpenFlow port number  |
| eth       | The source and destination MAC address of the packet  |
| eth_type  | The Ethernet type   |
| ipv4      | The information in the IPv4 header  |
| packets   | The number of matched packets   |
| bytes     | The number of matched bytes   |
| actions   | A set of actions for the packets that match the key   |

- Version 5.4.8-1.1: added to IE210L series products

# show openflow status

**Overview** Use this command to display the status of each data plane port and the OpenFlow protocol messages queried by the OpenFlow Controller.

**Syntax** show openflow status

**Mode** Privileged Exec

**Example** To show the status of a switch with four OpenFlow ports, enter the command:

```
awplus# show openflow status
```

**Output** Figure 52-6: Example output from **show openflow status**

```
awplus#show openflow status
 OFPT_FEATURES_REPLY (OF1.3) (xid=0x2): dpid:0000eccd6dc421bd
 n_tables:254, n_buffers:0

Table 52-5: Parameters in the output from **show openflow status**

| Parameter                                    | Description   |
|--|---|
| OFPT_FEATURES_REPLY (OF1.3)<br>(xid=0x2):    | Indicates that the following information is from the OpenFlow version 1.3 Feature reply.  |
| dpid:  | The datapath ID   |
| n_tables                                     | The number of tables supported by the switch  |
| n_buffers                                    | The maximum number of packets that the switch can buffer when sending packets to the OpenFlow controller  |
| capabilities                                 | A list of the OpenFlow capabilities: FLOW_STATS (flow statistics), TABLE_STATS (table statistics), PORT_STATS (port statistics), IP_REASM (IP fragments reassemble), QUEUE_STATS (queue statistics), and GROUP_STATS (group statistics) |
| OFPT_PORT_DESC replay (OF1.3)<br>(xid=0x3):  | Indicates that the following information is from the OpenFlow version 1.3 Port Description Reply.   |
| 1 (port1.0.1):<br>addr:ec:cd:6d:c4:<br>21:bd | The port number and MAC address.  |
| config:                                      | The port status: 0 (the port is up) or PORT_DOWN (the port is down.)  |
| state:                                       | The link status: 0 (the link is up) or LINK_DOWN (the link is down.)  |
| current:                                     | The current feature status.   |
| supported:                                   | A list of the supported features: 1GB-FD, 10GB-FD, AUTO-NEG, etc.<br>Not displayed from software release 5.4.7 onwards for interfaces that do not have this capability, i.e. static LAG interfaces or the of0 bridge interface.         |
| speed:                                       | The current port speed and maximum speed.   |
| OFPT_GET_CONFIG_REPLY (OF1.3)<br>(xid=0x5):  | Indicates that the switch responds to a configuration request by an OFPT_GET_CONFIG_REPLY message with the following information.   |

Table 52-5: Parameters in the output from **show openflow status** (cont.)

| Parameter        | Description  |
|------------------|--|
| frags:           | The action for the IP fragments: normal, dropped, or reassembled. Normal means that an attempt should be made to pass the fragments through the OpenFlow tables. |
| miss_send_len=0: | The number of bytes of each packet that was sent to the OpenFlow controller when a flow table fails or reaches the controller                                    |

# advertisement-interval

**Overview** Use this command to configure the advertisement interval of the virtual router. This is the length of time, in seconds, between each advertisement sent from the master to its backup(s).

IPv6 VRRP advertisements are sent to the multicast address assigned to the VRRP group (ff02:0:0:0:0) and a backup virtual router has to join all multicast groups within this range. VRRP advertisements are sent to a multicast address (ff02::12) every second by default.

Use the **no** variant of this command to remove an advertisement interval of the virtual router, which has been set using the **advertisement-interval** command, and revert to the default advertisement interval of 1 second.

**Syntax** advertisement-interval [`<1-255>`|csec `<1-4095>`]  
no advertisement-interval

| Parameter                   | Description   |
|-----------------------------|---|
| <code>&lt;1-255&gt;</code>  | Specifies the advertisement interval in seconds.                    |
| csec                        | Use centiseconds instead of seconds for the advertisement interval. |
| <code>&lt;1-4095&gt;</code> | Specifies the advertisement interval in centiseconds.               |

**Default** The default advertisement interval is 1 second.

**Mode** Router Configuration

**Usage notes** See the [VRRP Feature Overview and Configuration Guide](#) for more information about:

- setting the advertisement-interval when configuring VRRP
- using seconds for VRRPv2 host compatibility whenever you use [transition-mode](#) to upgrade or transition from VRRPv2 to VRRPv3
- VRRPv3 IPv4 configuration details
- VRRPv3 IPv6 configuration details

**Examples** The example below shows you how to configure the advertisement interval to 6 seconds for the VRRP IPv4 session with VR ID 5 on interface vlan2:

```
awplus# configure terminal
awplus(config)# router vrrp 5 vlan2
awplus(config-router)# advertisement-interval 6
```

The example below shows you how to reset the advertisement interval to the default of 1 second for the VRRP IPv4 session with VR ID 5 on interface vlan2:

```
awplus# configure terminal
awplus(config)# router vrrp 5 vlan2
awplus(config-router)# no advertisement-interval
```

The example below shows you how to configure the advertisement interval to 6 seconds for the VRRPv3 IPv6 session with VR ID 5 on interface vlan2:

```
awplus# configure terminal
awplus(config)# router ipv6 vrrp 5 vlan2
awplus(config-router)# advertisement-interval 6
```

**Related commands** [router vrrp \(interface\)](#)  
[router ipv6 vrrp \(interface\)](#)

**Command changes** Version 5.5.2-2.1: command added on 10GbE UTM Firewall and AR4000S-Cloud

# alternate-checksum-mode

**Overview** Use this command to enable an alternate checksum mode for VRRPv3 to allow inter-operability with some other vendors' products. The IPv4 checksum for VRRPv3 advertisements will then use a pseudo header in the calculation.

This mode may be required if the other product indicates checksum errors on VRRP packets sent by AlliedWare Plus devices.

Use the **no** variant of this command to disable the alternate checksum mode.

**Syntax** `alternate-checksum-mode`  
`no alternate-checksum-mode`

**Default** Disabled

**Mode** Router Configuration

**Example** To turn on the alternate checksum mode for VRRP instance 1 on VLAN1, use the commands:

```
awplus# configure terminal
awplus(config)# router vrrp 1 vlan1
awplus(config-router)# alternate-checksum-mode
```

To turn off the alternate checksum mode for VRRP instance 1 on VLAN1, use the commands:

```
awplus# configure terminal
awplus(config)# router vrrp 1 vlan1
awplus(config-router)# no alternate-checksum-mode
```

**Related commands** [show running-config](#)

**Command changes** Version 5.5.2-2.1: command added on 10GbE UTM Firewall and AR4000S-Cloud  
Version 5.4.7-1.1: command added

# circuit-failover

**Overview** Use this command to enable the VRRP circuit failover feature.

Circuit failover enables the device to take action if the uplink interface goes down, so that the VRRP backup, whose uplink interface is still active, takes over as VRRP master. See the Usage section below and the [VRRP Feature Overview and Configuration Guide](#) for more information.

Use the **no** variant of this command to disable this feature.

**Syntax** `circuit-failover <interface> <1-253>`  
`no circuit-failover [<interface> <1-253>]`

| Parameter                      | Description  |
|--------------------------------|--|
| <code>&lt;interface&gt;</code> | The interface of the router that is monitored. The interface must exist on the router, and is usually an upstream interface. Should the interface go down, then another router that is configured as a backup router in the group takes over as the master. You should configure the circuit failover on an interface other than the active VRRP interface - generally the uplink interface. |
| <code>&lt;1-253&gt;</code>     | Delta value. The value by which virtual routers decrement their priority value during a circuit failover event. Configure this value to be greater than the difference of priorities on the master and backup routers. In the case of failover, this priority delta value is subtracted from the current VR Master Router priority value.  |

**Mode** Router Configuration

**Usage notes** You can use Circuit Failover to monitor up to 32 interfaces per VRRP instance. If a VRRP instance is configured to monitor multiple interfaces, the VRRP priority will be cumulatively decremented by the configured delta for each interface as it goes down.

For example, if VRRP is configured to monitor VLAN2 and VLAN3 with the commands:

```
awplus# configure terminal
awplus(config)# interface vlan1
awplus(config-if)# ip address 192.168.1.1/24
awplus(config-if)# exit
awplus(config)# router vrrp 1 vlan1
awplus(config-router)# virtual-ip 192.168.1.10 backup
awplus(config-router)# priority 100
awplus(config-router)# circuit-failover vlan2 10
awplus(config-router)# circuit-failover vlan3 20
```

then the following examples explain the effect of each VLAN going down:

- If only VLAN2 fails, then the VRRP priority will be decremented by 10. VRRP priority would be adjusted to become 90, because  $100 - 10 = 90$ .
- If only VLAN3 fails, then the VRRP priority will be decremented by 20. VRRP priority would be adjusted to become 80, because  $100 - 20 = 80$ .
- If both VLAN2 and VLAN3 fail, then the VRRP priority will be decremented by the cumulative delta values of all monitored interfaces. VRRP priority would therefore be adjusted to become 70, because  $100 - 10 - 20 = 70$ .

As each monitored interface recovers, the VRRP priority is incremented by the same delta value.

When you configure the delta values of the monitored interfaces, make sure their sum is high enough to ensure that the VRRP priority stays above zero if all the interfaces go down.

**Examples** To configure circuit failover on an IPv4 VRRP instance on interface VLAN2, so that if VLAN3 goes down, then the priority of VRRP instance 1 is reduced by 30, use the commands:

```
awplus# configure terminal
awplus(config)# router vrrp 1 vlan2
awplus(config-router)# circuit-failover vlan3 30
```

To remove all configured circuit failovers for the VRRP IPv4 session with VR ID 1 on interface VLAN2, use the commands:

```
awplus# configure terminal
awplus(config)# router vrrp 1 vlan2
awplus(config-router)# no circuit-failover
```

To configure circuit failover on a VRRPv3 IPv6 session with VR ID 1 on interface VLAN2, so that when interface VLAN3 goes down, the priority of VRRP instance 1 is reduced by 30, use the commands:

```
awplus# configure terminal
awplus(config)# router ipv6 vrrp 1 vlan2
awplus(config-router)# circuit-failover vlan3 30
```

To remove all configured circuit failovers for the VRRPv3 IPv6 session with VR ID 1 on interface VLAN2, use the commands:

```
awplus# configure terminal
awplus(config)# router ipv6 vrrp 1 vlan2
awplus(config-router)# no circuit-failover
```

**Related commands** [router vrrp \(interface\)](#)  
[router ipv6 vrrp \(interface\)](#)

**Command changes** Version 5.5.2-2.1: command added on 10GbE UTM Firewall and AR4000S-Cloud

# debug vrrp

**Overview** Use this command to specify debugging options for VRRP. The **all** parameter turns on all the debugging options.

Use the **no** variant of this command to disable this function.

**Syntax** `debug vrrp [all]`  
`no debug vrrp [all]`

**Mode** Privileged Exec and Global Configuration

**Usage notes** See the [VRRP Feature Overview and Configuration Guide](#) for more information about VRRPv3 debugging details.

**Examples** The example below shows you how to enable all debugging for VRRP:

```
awplus# configure terminal
awplus(config)# debug vrrp all
```

The example below shows you how to disable all debugging for VRRP:

```
awplus# configure terminal
awplus(config)# no debug vrrp all
```

**Related commands** [show debugging vrrp](#)  
[undebug vrrp](#)

# debug vrrp events

**Overview** Use this command to specify debugging options for VRRP event troubleshooting. Use the **no** variant of this command to disable this function.

**Syntax** `debug vrrp events`  
`no debug vrrp events`

**Mode** Privileged Exec and Global Configuration

**Usage notes** The **debug vrrp events** command enables the display of debug information related to VRRP internal events.  
See the [VRRP Feature Overview and Configuration Guide](#) for more information about VRRPv3 debugging details.

**Examples** The example below shows you how to enable events debugging for VRRP:

```
awplus# configure terminal
awplus(config)# debug vrrp events
```

The example below shows you how to disable events debugging for VRRP:

```
awplus# configure terminal
awplus(config)# no debug vrrp events
```

**Related commands** [show debugging vrrp](#)  
[undebug vrrp events](#)

# debug vrrp packet

**Overview** Use this command to specify debugging options for VRRP packets.  
Use the **no** variant of this command to disable this function.

**Syntax** debug vrrp packet [send|recv]  
no debug vrrp packet [send|recv]

| Parameter | Description  |
|-----------|--|
| send      | Specifies the debug option set for sent packets.     |
| recv      | Specifies the debug option set for received packets. |

**Mode** Privileged Exec and Global Configuration

**Usage notes** The **debug vrrp packet** command enables the display of debug information related to the sending and receiving of packets.

See the [VRRP Feature Overview and Configuration Guide](#) for more information about VRRPv3 debugging details.

**Examples** The example below shows you how to enable received and sent packet debugging for VRRP:

```
awplus# configure terminal
awplus(config)# debug vrrp packet
```

The example below shows you how to enable only received packet debugging for VRRP:

```
awplus# configure terminal
awplus(config)# debug vrrp packet recv
```

The example below shows you how to enable only sent packet debugging for VRRP:

```
awplus# configure terminal
awplus(config)# debug vrrp packet send
```

The example below shows you how to disable packet debugging for VRRP:

```
awplus# configure terminal
awplus(config)# no debug vrrp packet
```

**Related commands** [show debugging vrrp](#)  
[undebug vrrp packet](#)

# disable (VRRP)

**Overview** Use this command to disable a VRRP IPv4 session or a VRRPv3 IPv6 session on the router to stop it participating in virtual routing. Note that when this command is configured then a backup router assumes the role of master router depending on its priority. See the [enable \(VRRP\)](#) command to enable a VRRP IPv4 session or a VRRPv3 IPv6 session on the router.

**Syntax** `disable`

**Mode** Router Configuration

**Usage notes** See the [VRRP Feature Overview and Configuration Guide](#) for more information about VRRPv3 IPv4 and IPv6 configuration details.

**Examples** The example below shows you how to disable the VRRP session for VRRP VR ID 5 on vlan2:

```
awplus# configure terminal
awplus(config)# router vrrp 5 vlan2
awplus(config-router)# disable
```

The example below shows you how to disable the VRRPv3 session for VRRPv3 VR ID 3 on vlan1:

```
awplus# configure terminal
awplus(config)# router ipv6 vrrp 3 vlan1
awplus(config-router)# disable
```

**Related commands**

- [enable \(VRRP\)](#)
- [router vrrp \(interface\)](#)
- [router ipv6 vrrp \(interface\)](#)
- [show vrrp](#)

**Command changes** Version 5.5.2-2.1: command added on 10GbE UTM Firewall and AR4000S-Cloud

# enable (VRRP)

**Overview** Use this command to enable the VRRP session on the router to make it participate in virtual routing. To make changes to the VRRP configuration, first disable the router from participating in virtual routing using the [disable \(VRRP\)](#) command.

**Syntax** enable

**Mode** Router Configuration

**Usage notes** You must configure the virtual IP address and define the interface for the VRRP session (using the [virtual-ip](#) or [virtual-ipv6](#) and the [router vrrp \(interface\)](#) or [router ipv6 vrrp \(interface\)](#) commands) before using this command.

See the [VRRP Feature Overview and Configuration Guide](#) for more information about VRRPv3 IPv4 and IPv6 configuration details.

**Examples** To enable the VRRP session for VRRP VR ID 5 on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# router vrrp 5 vlan2
awplus(config-router)# enable
```

To enable the VRRPv3 session for VRRPv3 VR ID 3 on vlan1, use the commands:

```
awplus# configure terminal
awplus(config)# router ipv6 vrrp 3 vlan1
awplus(config-router)# enable
```

**Related commands** [disable \(VRRP\)](#)  
[router vrrp \(interface\)](#)  
[router ipv6 vrrp \(interface\)](#)  
[show vrrp](#)  
[virtual-ip](#)  
[virtual-ipv6](#)

**Command changes** Version 5.5.2-2.1: command added on 10GbE UTM Firewall and AR4000S-Cloud

# preempt-mode

**Overview** Use this command to configure preempt mode. If preempt-mode is set to **true**, then the highest priority backup will always be the master when the default master is unavailable.

If preempt-mode is set to **false**, then a higher priority backup will not preempt a lower priority backup who is acting as master.

If preempt-mode is set to **true**, an extra parameter is available called **delay-time**. If the delay-time parameter is used, a VRRP router with a higher priority will wait the configured length of time before it preempts the lower priority VRRP router to take over as master.

**Syntax** `preempt-mode {true|false}[delay-time <0-3600>]`

| Parameter  | Description   |
|------------|---|
| true       | Preemption is enabled.  |
| false      | Preemption is disabled.   |
| delay-time | Enable preempting but delay the preempt by the amount of seconds specified by the delay-time value. Note, a delay-time of 0 means delayed preempting is disabled. |

**Default** The default is **true**.

**Mode** Router Configuration

**Usage notes** When the master router fails, the backup routers come online in priority order—highest to lowest. Preempt mode means that a higher priority backup router will take over the master role from a lower priority backup. Preempt mode set to **true** allows a higher priority backup router to relieve a lower priority backup router.

By default, a preemptive scheme is enabled whereby a higher priority backup virtual router that becomes available takes over from the backup virtual router that was previously elected to become the master virtual router.

This preemptive scheme can be disabled using the **preempt-mode false** command. If preemption is disabled on a backup virtual router that is starting up, and this router has a higher priority than the current master, the higher priority backup will not preempt the current master, and the lower priority master will stay in the master role.

See the [VRRP Feature Overview and Configuration Guide](#) for more information about:

- VRRPv3 IPv4 configuration details
- VRRPv3 IPv6 configuration details
- preempt mode and preempt delay-time

**Examples** The example below shows you how to configure preempt-mode as true for VRRP VR ID 5 on vlan2:

```
awplus# configure terminal
awplus(config)# router vrrp 5 vlan2
awplus(config-router)# preempt-mode true
```

The example below shows you how to configure preempt-mode as false for VRRP VR ID 5 on vlan2:

```
awplus# configure terminal
awplus(config)# router vrrp 5 vlan2
awplus(config-router)# preempt-mode false
```

The example below shows you how to configure preempt-mode as true for VRRPv3 VR ID 3 on vlan1:

```
awplus# configure terminal
awplus(config)# router ipv6 vrrp 3 vlan1
awplus(config-router)# preempt-mode true
```

The example below shows you how to configure preempt-mode as false for VRRPv3 VR ID 3 on vlan1:

```
awplus# configure terminal
awplus(config)# router ipv6 vrrp 3 vlan1
awplus(config-router)# preempt-mode false
```

The example below shows you how to configure delay-time as 20 seconds for VRRPv3 VR ID 5 on vlan5:

```
awplus# configure terminal
awplus(config)# router ipv6 vrrp 5 vlan5
awplus(config-router)# preempt-mode true delay-time 20
```

**Related commands**

- [circuit-failover](#)
- [priority](#)
- [router vrrp \(interface\)](#)
- [router ipv6 vrrp \(interface\)](#)

**Command changes** Version 5.5.2-2.1: command added on 10GbE UTM Firewall and AR4000S-Cloud

# priority

**Overview** Use this command to configure the VRRP router priority within the virtual router. The highest priority router is Master (unless [preempt-mode](#) is false).

Use the **no** variant of this command to remove the VRRP router priority within the virtual router, which has been set using the **priority** command.

**Syntax** `priority <1-255>`  
`no priority`

| Parameter | Description   |
|-----------|---|
| <1-255>   | The priority. For the master router, use 255 for this parameter; otherwise use any number from the range <1-254>. |

**Default** On a master router default priority is 255; on a backup router, default priority is 100.

**Mode** Router Configuration

**Usage notes** Priority determines the role that each VRRP router plays and what happens if the master virtual router fails. If a VRRP router owns the IP address of the virtual router and the IP address of the interface, then this VRRP router functions as the master virtual router.

Priority also determines whether a VRRP router functions as a backup virtual router and the order of ascendancy to becoming a master virtual router if the master virtual router fails. Configure the priority of each backup virtual router with a value of 1 through 254.

See the [VRRP Feature Overview and Configuration Guide](#) for more information about VRRPv3 IPv4 and IPv6 configuration details.

**Examples** The example below shows you how to configure 101 as the priority for VRRP VR ID 5 on vlan2:

```
awplus# configure terminal
awplus(config)# router vrrp 5 vlan2
awplus(config-router)# priority 101
```

The example below shows you how to remove the priority configured for VRRP VR ID 5 on vlan2:

```
awplus# configure terminal
awplus(config)# router vrrp 5 vlan2
awplus(config-router)# no priority
```

The example below shows you how to configure 101 as the priority for VRRPv3 VR ID 3 on vlan1:

```
awplus# configure terminal
awplus(config)# router ipv6 vrrp 3 vlan1
awplus(config-router)# priority 101
```

The example below shows you how to remove the configured priority for VRRPv3 VR ID 3 on vlan1:

```
awplus# configure terminal
awplus(config)# router ipv6 vrrp 3 vlan1
awplus(config-router)# no priority
```

[preempt-mode](#)

**Command changes** Version 5.5.2-2.1: command added on 10GbE UTM Firewall and AR4000S-Cloud

# router ipv6 vrrp (interface)

**Overview** Use this command to configure VRRPv3 for IPv6 and define the interface that will participate in virtual routing to send and receive advertisement messages. This command allows you to enter the Router Configuration mode.

Use the **no** variant of this command to remove the VRRPv3 for IPv6 configuration. Disable the VRRP session before using the **no** variant of this command.

**Syntax** `router ipv6 vrrp <vrid> <interface>`  
`no router ipv6 vrrp <vrid> <interface>`

| Parameter   | Description  |
|-------------|--|
| <vrid>      | <1-255> The ID of the virtual router VRRPv3 IPv6 session to create.  |
| <interface> | Specify the name of the interface that will participate in the virtual routing. The interface must exist on the router. The interface specified sends and receives VRRPv3 IPv6 advertisement messages. |

**Mode** Global Configuration

**Usage notes** Use the required <interface> placeholder to define the interface that will participate in virtual routing. This interface is used for two purposes - to send/receive advertisement messages and to forward on behalf of the virtual router when in master state.

**NOTE:** *Configuring a high number of instances may adversely affect the device's performance, depending on the device CPU, the other protocols it is running, and whether you set the advertisement interval to less than 1 second.*

See the [VRRP Feature Overview and Configuration Guide](#) for more information about VRRPv3 IPv6 configuration details.

**Examples** The example below shows you how to enable a VRRPv3 session with VR ID 3 on vlan2:

```
awplus# configure terminal
awplus(config)# router ipv6 vrrp 3 vlan2
awplus(config-router)# enable
```

The example below shows you how to disable a VRRPv3 session with VR ID 3 on vlan2:

```
awplus(config-router)# disable
awplus(config-router)# exit
awplus(config)# no router ipv6 vrrp 3 vlan2
```

**Related commands** [advertisement-interval](#)  
[circuit-failover](#)

**Command changes** Version 5.5.2-2.1: command added on 10GbE UTM Firewall and AR4000S-Cloud

# router vrrp (interface)

**Overview** Use this command to configure VRRP IPv4 and define the interface that will participate in virtual routing to send and receive advertisement messages. This command allows you to enter the Router Configuration mode.

Use the **no** variant of this command to remove the VRRP IPv4 configuration. Disable the VRRP session before using the **no** variant of this command.

**Syntax** `router vrrp <vrid> <interface>`  
`no router vrrp <vrid> <interface>`

| Parameter                      | Description  |
|--------------------------------|--|
| <code>&lt;vrid&gt;</code>      | <code>&lt;1-255&gt;</code> The ID of the virtual router VRRP IPv4 session to create.   |
| <code>&lt;interface&gt;</code> | Specify the name of the interface that will participate in the virtual routing. The interface must exist on the router. The interface specified sends and receives VRRP IPv4 advertisement messages. |

**Mode** Global Configuration

**Usage notes** Use the required `<interface>` placeholder to define the interface that will participate in virtual routing. This interface is used for two purposes - to send/receive advertisement messages and to forward on behalf of the virtual router when in master state.

**NOTE:** *Configuring a high number of instances may adversely affect the device's performance, depending on the device CPU, the other protocols it is running, and whether you set the advertisement interval to less than 1 second.*

See the [VRRP Feature Overview and Configuration Guide](#) for more information about VRRPv3 IPv4 configuration details.

**Examples** To enable a VRRP session with VR ID 5 on vlan1, use the commands:

```
awplus# configure terminal
awplus(config)# router vrrp 5 vlan1
awplus(config-router)# enable
```

To disable a VRRP session with VR ID 5 on vlan1, use the commands:

```
awplus(config-router)# disable
awplus(config-router)# exit
awplus(config)# no router vrrp 5 vlan1
```

**Related commands** advertisement-interval  
circuit-failover  
disable (VRRP)  
enable (VRRP)

**Command changes** Version 5.5.2-2.1: command added on 10GbE UTM Firewall and AR4000S-Cloud

# show debugging vrrp

**Overview** Use this command to display the set VRRP debugging option. Use the terminal monitor command to display output on the console otherwise debug output is in the log file.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

See the [VRRP Feature Overview and Configuration Guide](#) for more information about VRRPv3 debugging details.

**Syntax** `show debugging vrrp`

**Mode** User Exec and Privileged Exec

**Example** The example below shows you how to display VRRP debugging:

```
awplus# show debugging vrrp
```

**Related commands**

- [debug vrrp](#)

# show running-config router ipv6 vrrp

**Overview** Use this command to show the running configuration for VRRPv3 IPv6.  
For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).  
See the [VRRP Feature Overview and Configuration Guide](#) for more information about VRRPv3 IPv6 configuration details.

**Syntax** `show running-config router vrrp`

**Mode** Privileged Exec, Global Configuration, Line Configuration, and Interface Configuration.

**Example** The example below shows you how to display the running configuration for VRRPv3 IPv6:

```
awplus# show running-config router ipv6 vrrp
```

**Output** Figure 53-1: Example output from the **show running-config router ipv6 vrrp** command

```
!  
router ipv6 vrrp 3 vlan3  
  virtual-ip fe80::202:b3ff:fed5:983e master  
  circuit-failover vlan3 3  
  advertisement-interval 6  
  preempt-mode false  
!
```

**Command changes** Version 5.5.2-2.1: command added on 10GbE UTM Firewall and AR4000S-Cloud

# show running-config router vrrp

**Overview** Use this command to show the running configuration for VRRP IPv4.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

See the [VRRP Feature Overview and Configuration Guide](#) for more information about VRRPv3 IPv4 configuration details.

**Syntax** `show running-config router vrrp`

**Mode** Privileged Exec, Global Configuration, Line Configuration, and Interface Configuration.

**Example** The example below shows you how to display the running configuration for VRRP IPv4:

```
awplus# show running-config router vrrp
```

**Output** Figure 53-2: Example output from the **show running-config router vrrp** command

```
!  
router vrrp 2 vlan2  
  circuit-failover vlan2 2  
  advertisement-interval 4  
  preempt-mode true  
!
```

**Command changes** Version 5.5.2-2.1: command added on 10GbE UTM Firewall and AR4000S-Cloud

# show vrrp

**Overview** Use this command to display information about all VRRP IPv4 sessions. This command shows a summary when the optional **brief** parameter is used.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

See the [VRRP Feature Overview and Configuration Guide](#) for more information about VRRPv3 IPv4 configuration details.

**Syntax** `show vrrp [brief]`

| Parameter | Description                     |
|-----------|---------------------------------|
| brief     | Brief summary of VRRP sessions. |

**Mode** User Exec and Privileged Exec

**Example** To display information about all VRRP IPv4 sessions, enter the command:

```
awplus# show vrrp
```

To display brief summary output about VRRP IPv4 sessions, enter the command:

```
awplus# show vrrp brief
```

**Output** Figure 53-3: Example output from the **show vrrp** command

```
awplus#show vrrp
VMAC enabled
Address family IPv4
VRRP Id: 1 on interface: vlan2
State: AdminUp - Master
Virtual IP address: 192.168.1.2 (Not-owner)
Priority is 100
Advertisement interval: 100 centiseconds
Preempt mode: TRUE
Multicast membership on IPv4 interface vlan2: JOINED
Transition mode: FALSE
Accept mode: FALSE
Master address: 192.168.1.3
```

Figure 53-4: Example output from the **show vrrp brief** command

```
awplus#show vrrp brief
Interface      Grp  Prio  Own  Pre  State      Master addr      Group addr
vlan10         1    200   N    P    Master     192.168.10.4     192.168.10.253
vlan10         2    150   N    P    Backup    192.168.10.4     192.168.10.254
vlan11         3    200   N    P    Master     192.168.11.4     192.168.11.253
vlan11         4    150   N    P    Backup    192.168.11.4     192.168.11.254
```

**Related commands**    enable (VRRP)  
                              disable (VRRP)

**Command changes**    Version 5.5.2-2.1: command added on 10GbE UTM Firewall and AR4000S-Cloud

# show vrrp counters

**Overview** This command displays VRRP SNMP counters on the console, as described in the VRRP MIB and RFC2787, for debugging use while you configure VRRP with commands in this chapter.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show vrrp counters`

**Mode** User Exec and Privileged Exec

**Usage notes** The output has a section for global counters and a section of counters for each VRRP instance configured. See the descriptions of the counters below the sample output as per RFC2787.

**NOTE:** Note that the counters displayed with this commands are the same counters as described in RFC 2787, except for the “Monitored Circuit Up” and “Monitored Circuit Down” counters, which are additions beyond the MIB.

**Example** To display information about VRRP SNMP counters on the console, enter the command:

```
awplus# show vrrp counters
```

Figure 53-5: Example output from the **show vrrp counters** command

```
awplus#show vrrp counters
VRRP Global Counters:
  Checksum Errors .... 230
  Version Errors ..... 0
  VRID Errors ..... 230

VRRP IPv4 counters for VR 10/vlan10:
  Master Transitions ..... 0
  Received Advertisements ... 0
  Internal Errors ..... 0
  TTL Errors ..... 0
  Received Priority 0 Pkt ... 0
  Sent Priority 0 Pkt ..... 0
  Received Invalid Type ..... 0
  Address List Errors ..... 0
  Packet Length Errors ..... 0
  Monitored Circuit Up ..... 0
  Monitored Circuit Down..... 0
```

```
VRRP IPv4 counters for VR 100/vlan100:
Master Transitions ..... 1
Received Advertisements ... 1614
Internal Errors ..... 0
TTL Errors ..... 0
Received Priority 0 Pkt ... 0
Sent Priority 0 Pkt ..... 0
Received Invalid Type ..... 0
Address List Errors ..... 0
Packet Length Errors ..... 0
Monitored Circuit Up ..... 0
Monitored Circuit Down.... 2
```

**Table 1:** Global counters with descriptions for the **show vrrp counters** command:

| Counter         | Description  |
|-----------------|--|
| Checksum Errors | The total number of VRRP packets received with an invalid VRRP checksum value.           |
| Version Errors  | The total number of VRRP packets received with an unknown or unsupported version number. |
| VRID Errors     | The total number of VRRP packets received with an invalid VRID for this virtual router.  |

**Table 2:** Per VR counters with descriptions for the **show vrrp counters** command:

| Counter                 | Description   |
|-------------------------|---|
| Master Transitions      | The total number of times that this virtual router's state has transitioned to MASTER.  |
| Received Advertisements | The total number of VRRP advertisements received by this virtual router.  |
| Internal Errors         | The total number of VRRP advertisement packets received for which the advertisement interval is different than the one configured for the local virtual router. |
| TTL Errors              | The total number of VRRP packets received by the virtual router with IP TTL (Time-To-Live) not equal to 255.  |
| Received Priority 0 Pkt | The total number of VRRP packets received by the virtual router with a priority of '0'.   |
| Sent Priority 0 Pkt     | The total number of VRRP packets sent by the virtual router with a priority of '0'.   |
| Received Invalid Type   | The number of VRRP packets received by the virtual router with an invalid value in the 'type' field.  |
| Address List Errors     | The total number of packets received for which the address list does not match the locally configured list for the virtual router.                              |

**Table 2:** Per VR counters with descriptions for the **show vrrp counters** command: (cont.)

| Counter                | Description  |
|------------------------|--|
| Packet Length Errors   | The total number of packets received with a packet length less than the length of the VRRP header. |
| Monitored Circuit Up   | The total number of times the monitored circuit has generated the UP event.                        |
| Monitored Circuit Down | The total number of times the monitored circuit has generated the down event.                      |

**Command changes**

Version 5.5.2-2.1: command added on 10GbE UTM Firewall and AR4000S-Cloud

# show vrrp ipv6

**Overview** Use this command to display information about all configured VRRPv3 IPv6 sessions for all interfaces, or all VRRPv3 IPv6 sessions for a given interface with the optional parameter.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

See the [VRRP Feature Overview and Configuration Guide](#) for more information about VRRPv3 IPv6 configuration details.

**Syntax** `show vrrp ipv6 [<interface>]`

| Parameter   | Description  |
|-------------|--|
| <interface> | Specify the name of the interface that will participate in the virtual routing. The interface must exist on the router. The interface specified sends and receives VRRPv3 IPv6 advertisement messages. |

**Mode** User Exec and Privileged Exec

**Example** To display information about all VRRPv3 IPv6 sessions, enter the command:

```
awplus# show vrrp ipv6
```

**Output** Figure 53-6: Example output from the **show vrrp ipv6** command for a specific interface

```
awplus#show vrrp ipv6 vlan2
VrId <1>
State is Master
Virtual IP is fe80::202:b3ff:fed5:983e (Owner)
Interface is vlan2
Priority is 255
Advertisement interval is 4 sec
Preempt mode is FALSE
```

**Related commands** [enable \(VRRP\)](#)  
[disable \(VRRP\)](#)

**Command changes** Version 5.5.2-2.1: command added on 10GbE UTM Firewall and AR4000S-Cloud

# show vrrp (session)

**Overview** Use this command to display information for a particular VRRP session.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

See the [VRRP Feature Overview and Configuration Guide](#) for more information about VRRPv3 IPv4 configuration details.

**Syntax** `show vrrp <vrid> <interface>`

| Parameter                      | Description  |
|--------------------------------|--|
| <code>&lt;vrid&gt;</code>      | <code>&lt;1-255&gt;</code> The virtual router ID for which to display information. Session must already exist. |
| <code>&lt;interface&gt;</code> | The interface to display information about.  |

**Mode** User Exec and Privileged Exec

**Example** To display information about VRRP session 1 configured on vlan2, use the command:

```
awplus# show vrrp 1 vlan2
```

**Output** Figure 53-7: Example output from the **show vrrp** command for a specific interface

```
awplus#show vrrp 1 vlan2
Address family IPv4
VrId <1>
  Interface is vlan2
  State is Initialize
  Virtual IP address is 10.10.11.250 (Not IP owner)
  Priority is 100
  Advertisement interval is 1 sec
```

In this example, the output shows that a Virtual IP address has been set.

**Command changes** Version 5.5.2-2.1: command added on 10GbE UTM Firewall and AR4000S-Cloud

# transition-mode

**Overview** Use this command to configure the IPv4 transition mode. Transition mode allows you to upgrade from VRRPv2 to VRRPv3 and gives interoperability between VRRPv2 and VRRPv3.

If transition-mode is set to **true**, then the IPv4 transition mode is enabled and VRRPv2 and VRRPv3 advertisements are sent allowing VRRPv2 and VRRPv3 interoperability. Received VRRPv2 advertisement packets are accepted and processed when transition-mode is true.

If transition-mode is set to **false**, then the IPv4 transition mode is disabled and only VRRPv3 advertisements are sent. Received VRRPv2 advertisement packets are dropped.

Note the [advertisement-interval](#) should not be configured to less than 1 second when using transition-mode. VRRPv2 can only use advertisements in whole second intervals.

**Syntax** `transition-mode {true|false}`

| Parameter | Description   |
|-----------|---|
| true      | Transition mode is enabled. This results in VRRPv2 and VRRPv3 IPv4 advertisements being sent. Transition mode is only available on VRRPv3 for interoperability with VRRPv2 while upgrading to VRRPv3. |
| false     | Transition mode is disabled. This stops VRRPv2 IPv4 advertisements being sent. Only VRRPv3 advertisements are sent when disabled. Disable transition-mode after upgrading from VRRPv2 to VRRPv3.      |

**Default** The default is **false**.

**Mode** Router Configuration

**Usage notes** See the [VRRP Feature Overview and Configuration Guide](#) for more information about:

- VRRPv3 IPv4 configuration details
- VRRPv3 IPv6 configuration details
- configuring transition mode to upgrade from VRRPv2 to VRRPv3.

**Examples** The example below shows you how to configure IPv4 transition-mode as true for VRRP VR ID 5 on vlan2:

```
awplus# configure terminal
awplus(config)# router vrrp 5 vlan2
awplus(config-router)# transition-mode true
```

The example below shows you how to configure IPv4 transition-mode as false for VRRP VR ID 5 on vlan2:

```
awplus# configure terminal
awplus(config)# router vrrp 5 vlan2
awplus(config-router)# transition-mode false
```

**Related commands** [router vrrp \(interface\)](#)

**Command changes** Version 5.5.2-2.1: command added on 10GbE UTM Firewall and AR4000S-Cloud

# undebug vrrp

**Overview** Use this command to disable all VRRP debugging.

**Syntax** undebug vrrp all

**Mode** Privileged Exec

**Example** The example below shows you how to disable all VRRP debugging:

```
awplus# undebug vrrp all
```

**Related commands** [debug vrrp](#)

# undebug vrrp events

**Overview** Use this command to disable debugging options for VRRP event troubleshooting.

**Syntax** `undebug vrrp events`

**Mode** Privileged Exec

**Example** The example below shows you how to disable VRRP event debugging:

```
awplus# undebug vrrp events
```

**Related commands** [debug vrrp events](#)

# undebbug vrrp packet

**Overview** Use this command to disable debugging options for VRRP packets.

**Syntax** `undebbug vrrp packet [send|recv]`

| Parameter | Description  |
|-----------|--|
| send      | Disable the debug option set for sent packets.     |
| recv      | Disable the debug option set for received packets. |

**Mode** Privileged Exec

**Examples** The example below shows you how to disable VRRP sent packet debugging:

```
awplus# undebbug vrrp packet send
```

The example below shows you how to disable VRRP received packet debugging:

```
awplus# undebbug vrrp packet recv
```

The example below shows you how to disable all VRRP packet debugging:

```
awplus# undebbug vrrp packet
```

**Related commands** [debug vrrp packet](#)

# virtual-ip

**Overview** Use this command to set the virtual IP address for the VRRP session. This is the IP address of the virtual router that end hosts set as their default gateway.

Use the **no** variant of this command to disable this feature.

**Syntax** `virtual-ip <ip-address> [master|backup|owner]`  
`no virtual-ip`

| Parameter                       | Description   |
|---------------------------------|---|
| <code>&lt;ip-address&gt;</code> | The virtual IPv4 address of the virtual router, entered in dotted decimal format A.B.C.D.   |
| <code>master</code>             | Sets the default state of the VRRP router within the Virtual Router as <b>master</b> . For master, the router must own the Virtual IP address. Specify the <b>owner</b> option before using <b>master</b> option. |
| <code>backup</code>             | Sets the default state of the VRRP router within the Virtual Router as <b>backup</b> .  |
| <code>owner</code>              | Sets the IPv6 address of the VRRP router within the Virtual Router as the <b>owner</b> . Specify this before using the <b>master</b> option.  |

**Mode** Router Configuration

**Usage notes** The VRRP master and owner of the virtual IPv4 address for the VRRP session only responds to the packets destined to the virtual IPv4 address. The VRRP master that is not an owner of the virtual IPv4 address for the VRRP session does not respond to the packets destined to the virtual IPv4 address, but forwards packets with a VMAC as the destination address. See the [vrrp vmac](#) command to enable and disable this feature.

See the [VRRP Feature Overview and Configuration Guide](#) for more information about VRRPv3 IPv4 configuration details.

**Examples** The example below shows you how to set the virtual IP address for VRRP VR ID 5 and the router as the VRRP master:

```
awplus# configure terminal
awplus(config)# router vrrp 5 vlan2
awplus(config-router)# virtual-ip 192.0.2.30 master
```

The example below shows you how to set the virtual IPv4 address for VRRP VR ID 5 and the router as the VRRP backup:

```
awplus# configure terminal
awplus(config)# router vrrp 5 vlan2
awplus(config-router)# virtual-ip 192.0.2.30 backup
```

The example below shows you how to set the virtual IPv4 address for VRRP VR ID 5 and the router as owner of the virtual IPv4 address:

```
awplus# configure terminal
awplus(config)# router vrrp 5 vlan2
awplus(config-router)# virtual-ip 192.0.2.30 owner
```

The example below shows you how to disable the virtual IPv4 address for VRRP VR ID 5

```
awplus# configure terminal
awplus(config)# router vrrp 5 vlan2
awplus(config-router)# no virtual-ip
```

**Related  
commands**

[router vrrp \(interface\)](#)  
[enable \(VRRP\)](#)  
[vrrp vmac](#)

**Command  
changes**

Version 5.5.2-2.1: command added on 10GbE UTM Firewall and AR4000S-Cloud

# virtual-ipv6

**Overview** Use this command to set the virtual IPv6 address for the VRRPv3 session. This is the IPv6 address of the virtual router that end hosts set as their default gateway.

Note that the primary IPv6 address specified is an IPv6 link-local address. See the Usage note below for further information.

Use the **no** variant of this command to disable this feature.

**Syntax**

```
virtual-ipv6 <ipv6-address> [master|backup]
[primary|secondary]

no virtual-ipv6
```

| Parameter      | Description  |
|----------------|--|
| <ipv6-address> | The IPv6 address of the virtual router, entered in hexadecimal, in the format X:X::X.X.  |
| master         | Sets <b>master</b> to be the default state of the VRRPv3 router within the Virtual Router. For <b>master</b> , we recommend using a Virtual IP address that is not owned by any of the VRRP routers in the same grouping (that share the same VRID). |
| backup         | Sets <b>backup</b> to be the default state of the VRRPv3 router within the Virtual Router.   |
| primary        | Sets the specified address as the primary IPv6 address. The primary address must be a link-local IPv6 address.   |
| secondary      | Sets the specified address as the secondary IPv6 address. Normally this would be a globally-routable IPv6 address. This enables you to specify a globally-routable address as the default gateway address for all the hosts on an interface.         |

**Mode** Router Configuration

**Usage notes** The virtual router will reply to ping, telnet, and SSH requests to the virtual IP address. The virtual router will reply even if it does not own the virtual IP address.

The AlliedWare Plus VRRPv3 implementation supports one IPv6 virtual link local address per virtual router ID. Note that in the command examples fe80::1 is an IPv6 link-local address. An IPv6 link-local address is used because IPv6 link-local addresses are used by IPv6 ND (Neighbor Discovery). A host's default route to a router points to the IPv6 link-local address, not a specific global IPv6 address for the router. For the host's traffic to switch over to a backup router, the IPv6 link-local address of the router is used by VRRPv3.

See the [VRRP Feature Overview and Configuration Guide](#) for more information about VRRPv3 IPv6 configuration details.

**Examples** The example below shows you how to set the virtual IPv6 address for VRRPv3 VR ID 3 and the router as the VRRPv3 master:

```
awplus# configure terminal
awplus(config)# router ipv6 vrrp 3 vlan1
awplus(config-router)# virtual-ipv6 fe80::1 master
```

The example below shows you how to set the virtual IPv6 address for VRRPv3 VR ID 3 and the router as the VRRPv3 backup:

```
awplus# configure terminal
awplus(config)# router ipv6 vrrp 3 vlan1
awplus(config-router)# virtual-ipv6 fe80::1 backup
```

The example below shows you disable the virtual IPv6 address for VRRPv3 VR ID 3:

```
awplus# configure terminal
awplus(config)# router ipv6 vrrp 3 vlan1
awplus(config-router)# no virtual-ipv6
```

**Command changes** Version 5.5.2-2.1: command added on 10GbE UTM Firewall and AR4000S-Cloud

## vrrp vmac

**Overview** Use this command to enable or disable the VRRP Virtual MAC feature. This feature is used by VRRP to make the hosts use the virtual MAC address as the physical hardware address of their gateway.

A VRRP router master will use the virtual MAC address for any ARP responses associated with the virtual IP address, or any gratuitous ARPs sent on behalf of the virtual IP address.

All VRRP advertisements are sent using this virtual MAC address as the source MAC address.

The virtual MAC address has the form 00:00:5e:00:01:<VRID>, where VRID is the ID of the Virtual Router.

**Syntax** `vrrp vmac {enable|disable}`

**Mode** Global Configuration

**Examples** To enable Virtual MAC enter:

```
awplus# configure terminal
awplus(config)# vrrp vmac enable
```

To disable Virtual MAC enter:

```

# debug epsr

**Overview** This command enables EPSR debugging.  
The **no** variant of this command disables EPSR debugging.

**Syntax** `debug epsr {info|msg|pkt|state|timer|all}`  
`no debug epsr {info|msg|pkt|state|timer|all}`

| Parameter | Description  |
|-----------|--|
| info      | Send general EPSR information to the console.<br>Using this parameter with the <b>no debug epsr</b> command will explicitly exclude the above information from being sent to the console.                                |
| msg       | Send the decoded received and transmitted EPSR packets to the console.<br>Using this parameter with the <b>no debug epsr</b> command will explicitly exclude the above packets from being sent to the console.           |
| pkt       | Send the received and transmitted EPSR packets as raw ASCII text to the console.<br>Using this parameter with the <b>no debug epsr</b> command will explicitly exclude the above packets from being sent to the console. |
| state     | Send EPSR state transitions to the console.<br>Using this parameter with the <b>no debug epsr</b> command will explicitly exclude state transitions from being sent to the console.                                      |
| timer     | Send EPSR timer information to the console.<br>Using this parameter with the <b>no debug epsr</b> command will explicitly exclude timer information from being sent to the console.                                      |
| all       | Send all EPSR debugging information to the console.<br>Using this parameter with the <b>no debug epsr</b> command will explicitly exclude any debugging information from being sent to the console.                      |

**Mode** Privileged Exec and Global Configuration

**Examples** To enable state transition debugging, use the command:

```
awplus# debug epsr state
```

To disable EPSR packet debugging, use the command:

```
awplus# no debug epsr pkt
```

**Related commands** [undebug epsr](#)

# epsr

**Overview** This command sets the timer values for an EPSR instance. These are only valid for master nodes.

**NOTE:** This command will only run on switches that are capable of running as an EPSR master node. However, even if your switch cannot function as an EPSR master node, you still may need to configure this command on whatever switch is the master within your EPSR network.

**Syntax** `epsr <epsr-instance> {hellotime <1-32767>|failovertime <2-65535> ringflaptime <0-65535>}`  
`no epsr <epsr-instance>`

**CAUTION:** Using the no variant of this command will remove the specified EPSR instance.

| Parameter                                 | Description  |
|---|--|
| <code>&lt;epsr-instance&gt;</code>        | Name of the EPSR instance.   |
| <code>hellotime &lt;1-32767&gt;</code>    | The number of seconds between the transmission of health check messages.   |
| <code>failovertime &lt;2-65535&gt;</code> | The number of seconds that a master waits for a returning health check message before entering the failed state. <b>The failover time should be greater than twice the hellotime.</b> This is to force the master node to wait until it detects the absence of two sequential healthcheck messages before entering the failed state. |
| <code>ringflaptime &lt;0-65535&gt;</code> | The minimum number of seconds that a master must remain in the failed state.   |

**Mode** EPSR Configuration

**Examples** To set the hellotimer to 5 seconds for the EPSR instance called blue, use the command:

```
awplus(config-epsr)# epsr blue hellotime 5
```

To delete the EPSR instance called blue, use the command:

```
awplus(config-epsr)# no epsr blue
```

**Related commands** [epsr mode master controlvlan primary port](#)  
[epsr mode transit controlvlan](#)  
[epsr configuration](#)  
[epsr datavlan](#)  
[epsr state](#)

`epsr trap`

`show epsr`

# epsr configuration

**Overview** Use this command to enter EPSR Configuration mode so that EPSR can be configured.

**Syntax** `epsr configuration`

**Mode** Global Configuration

**Example** To change to EPSR mode, use the command:

```
awplus(config)# epsr configuration
```

**Related commands** [epsr mode master controlvlan primary port](#)  
[epsr](#)  
[show epsr](#)

# epsr datavlan

**Overview** This command adds a data VLAN or a range of VLAN identifiers to a specified EPSR instance.

The **no** variant of this command removes a data VLAN or data VLAN range from an EPSR instance.

**Syntax** `epsr <epsr-instance> datavlan {<vlanid>|<vlanid-range>}`  
`no epsr <epsr-instance> datavlan {<vlanid>|<vlanid-range>}`

| Parameter                          | Description  |
|------------------------------------|--|
| <code>&lt;epsr-instance&gt;</code> | Name of the EPSR instance.   |
| <code>datavlan</code>              | Adds a data VLAN to be protected by the EPSR instance.   |
| <code>&lt;vlanid&gt;</code>        | The VLAN's VID - a number between 1 and 4094 excluding the number selected for the control VLAN. |
| <code>&lt;vlanid-range&gt;</code>  | Specify a range of VLAN identifiers using a hyphen to separate identifiers.                      |

**Mode** EPSR Configuration

**Usage notes** We recommend you

- set the EPSR control VLAN to `vlan2`, using the [epsr mode master controlvlan primary port](#) and [epsr mode transit controlvlan](#) commands, then
- set the EPSR data VLAN between to be a value between 3 and 4094, using the [epsr datavlan](#) command.

**Examples** To add `vlan3` to the EPSR instance called `blue`, use the command:

```
awplus(config-epsr)# epsr blue datavlan vlan3
```

To add `vlan2` and `vlan3` to the EPSR instance called `blue`, use the command:

```
awplus(config-epsr)# epsr blue datavlan vlan2-vlan3
```

To remove `vlan3` from the EPSR instance called `blue`, use the command:

```
awplus(config-epsr)# no epsr blue datavlan vlan3
```

To remove `vlan2` and `vlan3` from the EPSR instance called `blue`, use the command:

```
awplus(config-epsr)# no epsr blue datavlan vlan2-vlan3
```

**Related commands** [epsr mode master controlvlan primary port](#)  
[epsr mode transit controlvlan](#)  
[show epsr](#)

# epsr enhancedrecovery enable

**Overview** This command enables EPSR's enhanced recovery mode. Enhanced recovery mode enables a ring to apply additional recovery procedures when a ring with more than one break partially mends. For more information, see the [EPSR Feature Overview and Configuration Guide](#).

The **no** variant of this command disables the enhanced recovery mode.

**Syntax** `epsr <epsr-instance> enhancedrecovery enable`  
`no epsr <epsr-instance> enhancedrecovery enable`

| Parameter                          | Description                |
|------------------------------------|----------------------------|
| <code>&lt;epsr-instance&gt;</code> | Name of the EPSR instance. |

**Default** Default is that enhanced recovery mode disabled.

**Mode** EPSR Configuration

**Example** To apply enhanced recovery on the EPSR instance called `blue`, use the command:

```
awplus(config-epsr)# epsr blue enhancedrecovery enable
```

**Related commands** `show epsr`

# epsr flush-type

**Overview** Use this command to set how EPSR flushes Layer 2 entries when a topology change occurs. It can be configured to flush all Layer 2 entries on its EPSR interfaces or only flush the Layer 2 entries on its EPSR data VLANs.

Use the **no** variant of this command to revert to the default setting.

**Syntax** `epsr <epsr-name> flush-type {interface|vlan}`  
`no epsr <epsr-name> flush-type`

| Parameter   | Description  |
|-------------|--|
| <epsr-name> | The name of the EPSR instance to set the flush-type for.                             |
| interface   | Flush all Layer 2 entries from the EPSR interface on a topology change.              |
| vlan        | Flush the Layer 2 entries on the EPSR interface and data VLANs on a topology change. |

**Default** The default flush-type is vlan

**Mode** EPSR Configuration

**Usage notes** To flush all entries on the EPSR interface (including non-EPSR data VLANs) the flush-type command must be explicitly configured on the EPSR ring with the **interface** parameter.

Select **interface** as the flush-type to help reduce latency caused during EPSR topology changes. This type of flushing is quicker and less granular than flushing per data vlan, as flushing on a data **vlan** may incur a higher overhead, reducing EPSR responsiveness to ring topology changes.

Interface flushing can be used to optimize EPSR rings with a large number of VLANs. It will however also require relearning on any VLANs that are on an EPSR interface but not part of the EPSR configuration.

**Example** To configure the behavior of EPSR ring 'red' transit node on topology changes to flush all Layer 2 entries on its EPSR ring interfaces, use the following commands:

```
awplus# configure terminal
awplus(config)# epsr configuration
awplus(config-epsr)# epsr red mode transit controlvlan 10
awplus(config-epsr)# epsr red datavlan 20-29
awplus(config-epsr)# epsr red flush-type interface
awplus(config-epsr)# epsr red state enable
```

**Related commands** [show epsr](#)

**Command changes** Version 5.4.9-1.1: command added

# epsr mode master controlvlan primary port

**Overview** This command creates a master EPSR instance.

**NOTE:** This command will only run on switches that are capable of running as an EPSR master node. However, even if your switch cannot function as an EPSR master node, you still need to configure this command on whatever switch is the master within your EPSR network.

**Syntax** `epsr <epsr-instance> mode master controlvlan <2-4094>  
primaryport <port>`

| Parameter                          | Description   |
|------------------------------------|---|
| <code>&lt;epsr-instance&gt;</code> | Name of the EPSR instance.  |
| <code>mode</code>                  | Determines the node is acting as a master.  |
| <code>master</code>                | Sets switch to be the master node for the named EPSR ring.  |
| <code>controlvlan</code>           | The VLAN that will transmit EPSR control frames.  |
| <code>&lt;2-4094&gt;</code>        | VLAN id.  |
| <code>primaryport</code>           | Primary port for the EPSR instance.   |
| <code>&lt;port&gt;</code>          | The primary port. The port may be a switch port (e.g. port1.0.4) or a static channel group (e.g. sa3). It cannot be a dynamic (LACP) channel group. |

**NOTE:** The software allows you to configure more than two ports or static channel groups to the control VLAN within a single switch. However, we advise against this because in certain situations it can produce unpredictable results.

**Mode** EPSR Configuration

**Example** To create a master EPSR instance called blue with vlan2 as the control VLAN and port1.0.1 as the primary port, use the command:

```
awplus(config-epsr)# epsr blue mode master controlvlan vlan2  
primaryport port1.0.1
```

**Related commands** [epsr mode transit controlvlan](#)  
[show epsr](#)

# epsr mode transit controlvlan

**Overview** This command creates a transit EPSR instance.

**Syntax** `epsr <epsr-instance> mode transit controlvlan <2-4094>`

| Parameter                          | Description   |
|------------------------------------|---|
| <code>&lt;epsr-instance&gt;</code> | Name of the EPSR instance.                                  |
| <code>mode</code>                  | Determines the node is acting as a transit node.            |
| <code>transit</code>               | Sets switch to be the transit node for the named EPSR ring. |
| <code>controlvlan</code>           | The VLAN that will transmit EPSR control frames.            |
| <code>&lt;2-4094&gt;</code>        | VLAN id.  |

**NOTE:** The software allows you to configure more than two ports or static channel groups to the control VLAN within a single switch. However, we advise against this because in certain situations it can produce unpredictable results.

If the control VLAN contains more than two ports (or static channels) an algorithm selects the two ports or channels with the lowest number to be the ring ports. However if the switch has only one channel group is defined to the control vlan, EPSR will not operate on the secondary port.

EPSR does not support Dynamic link aggregation (LACP).

**Mode** EPSR Configuration

**Example** To create a transit EPSR instance called `blue` with `vlan2` as the control VLAN, use the command:

```
awplus(config-epsr)# epsr blue mode transit controlvlan vlan2
```

**Related commands**

- [epsr mode master controlvlan primary port](#)
- [epsr mode transit controlvlan](#)
- [show epsr](#)

# epsr priority

**Overview** This command sets the priority of an EPSR instance on an EPSR node. Priority is used to prevent “superloops” forming under fault conditions with particular ring configurations. Setting a node to have a priority greater than one turns on **superloop protection**.

The **no** variant of this command returns the priority of the EPSR instance back to its default value of 0, which also disables EPSR Superloop prevention.

**Syntax** `epsr <epsr-instance> priority <0-127>`  
`no <epsr-instance> priority`

| Parameter                          | Description   |
|------------------------------------|---|
| <code>&lt;epsr-instance&gt;</code> | Name of the EPSR instance.  |
| <code>priority</code>              | The priority of the ring instance selected by the epsr-name parameter.                        |
| <code>&lt;0-127&gt;</code>         | The priority to be applied (0 is the lowest priority and represents no superloop protection). |

**Default** The default priority of an EPSR instance on an EPSR node is 0. The negated form of this command resets the priority of an EPSR instance on an EPSR node to the default value.

**Mode** EPSR Configuration

**Example** To set the priority of the EPSR instance called ‘blue’ to the highest priority (127), use the command:

```
awplus(config-epsr)# epsr blue priority 127
```

To reset the priority of the EPSR instance called ‘blue’ to the default (0), use the command:

```
awplus(config-epsr)# no epsr blue priority
```

**Related commands** [epsr configuration](#)

# epsr state

**Overview** This command enables or disables an EPSR instance.

**Syntax** `epsr <epsr-instance> state {enabled|disabled}`

| Parameter                          | Description                        |
|------------------------------------|------------------------------------|
| <code>&lt;epsr-instance&gt;</code> | The name of the EPSR instance.     |
| <code>state</code>                 | The operational state of the ring. |
| <code>enabled</code>               | EPSR instance is enabled.          |
| <code>disabled</code>              | EPSR instance is disabled.         |

**Mode** EPSR Configuration

**Usage notes** In a super-loop protection scenario, if you have:

- a device on the common segment acting as the master node for multiple EPSR rings,
- and you disable the rings and later re-enable them (e.g., when doing EPSR configuration changes),
- then you must re-enable the ring with the highest EPSR SLP priority **last**.

If you do not re-enable the rings in that order, the primary port may end up permanently in a blocking state. If the primary port does end up in a permanent blocking state, recover by disabling and re-enabling the EPSR ring that has the highest priority.

**Example** To enable the EPSR instance called 'blue', use the command:

```
awplus(config-epsr)# epsr blue state enabled
```

**Related commands** [epsr mode master controlvlan primary port](#)  
[epsr mode transit controlvlan](#)

# epsr topology-change

**Overview** Use this command to allow the given EPSR instance to accept notifications from other topology protocols, namely G.8032, for Topology Change Notifications (TCN).

Use the **no** variant of this command to return the EPSR instance to where it does not accept TCNs from the other specified protocol, and as a result does not send out a “flush FDB” message.

**Syntax** `epsr <epsr-name> topology-change g8032`  
`no epsr <epsr-name> topology-change g8032`

| Parameter                      | Description   |
|--------------------------------|---|
| <code>&lt;epsr-name&gt;</code> | The name of the EPSR instance for which the topology-change applies to.   |
| <code>topology-change</code>   | The topology-change value to be set for the instance.   |
| <code>g8032</code>             | Specify that G.8032 is the other protocol that the topology-change notifications are allowed to be accepted from in order to send "flush FDB" messages to other EPSR nodes in the ring. |

**Default** The default value is no notifications are accepted and in turn no “flush FDB” messages are sent.

**Mode** EPSR Configuration

**Usage notes** The purpose of this command is to allow EPSR to accept notifications from other topology protocols, namely G.8032, about Topology Change Notifications (TCN). Once EPSR accepts the TCN, it will in turn notify the other nodes on the EPSR ring to perform an FDB flush.

**Example** To configure an EPSR instance named “red” to accept G.8032 TCNs, use the following command:

```
awplus(config-epsr)# epsr red topology-change g8032
```

To configure an EPSR instance named “red” to no longer accept G.8032 TCNs, use the following command:

```
awplus(config-epsr)# no epsr red topology-change g8032
```

**Related commands** [show epsr](#)  
[show g8032 erp-instance](#)

**Command changes** Version 5.4.7-1.1: command added

# epsr trap

**Overview** This command enables SNMP traps for an EPSR instance. The traps will be sent when the EPSR instance changes state.

The **no** variant of this command disables SNMP traps for an EPSR instance. The traps will no longer be sent when the EPSR instance changes state.

**Syntax** `epsr <epsr-instance> trap`  
`no epsr <epsr-instance> trap`

| Parameter                          | Description                      |
|------------------------------------|----------------------------------|
| <code>&lt;epsr-instance&gt;</code> | Name of the EPSR instance.       |
| <code>trap</code>                  | SNMP trap for the EPSR instance. |

**Mode** EPSR Configuration

**Example** To enable traps for the EPSR instance called `blue`, use the command:

```
awplus(config-epsr)# epsr blue trap
```

To disable traps for the EPSR instance called `blue`, use the command:

```
awplus(config-epsr)# no epsr blue trap
```

**Related commands** [epsr mode master controlvlan primary port](#)  
[epsr mode transit controlvlan](#)  
[show epsr](#)

# show debugging epsr

**Overview** This command shows the debugging modes enabled for EPSR.

**Syntax** `show debugging epsr`

**Mode** User Exec and Privileged Exec

**Example** To show the enabled debugging modes, use the command:

```
awplus# show debugging epsr
```

**Related commands** [debug epsr](#)

# show epsr

**Overview** This command displays information about all EPSR instances.

**Syntax** show epsr

**Mode** User Exec and Privileged Exec

**Example** To show the current settings of all EPSR instances, use the command:

```
awplus# show epsr
```

**Output:** The following examples show the output display for a non-superloop topology network.  
**non-superloop topology**

**Table 1:** Example output from the **show epsr** command run on a transit node

```
-----
EPSR Information
-----
Name ..... test2
Mode ..... Transit
Status ..... Enabled
State ..... Links-Up
Control Vlan ..... 2
Data VLAN(s) ..... 10
Interface Mode ..... Ports Only
First Port ..... port1.0.1
First Port Status ..... Down
First Port Direction ..... Unknown
Second Port ..... port1.0.2
Second Port Status ..... Down
Second Port Direction ..... Unknown
Trap ..... Enabled
Master Node ..... Unknown
Enhanced Recovery ..... Disabled
-----
```

**Table 2:** Example output from the **show epsr** command run on a master node

```
EPSR Information
-----
Name ..... test4
Mode ..... Master
Status ..... Enabled
State ..... Complete
Control Vlan ..... 4
Data VLAN(s) ..... 20
Interface Mode ..... Ports Only
Primary Port ..... port1.0.3
Primary Port Status ..... Forwarding
Secondary Port ..... port1.0.4
Secondary Port Status ..... Forwarding
Hello Time ..... 1 s
Failover Time ..... 2 s
Ring Flap Time ..... 0 s
Trap ..... Enabled
Enhanced Recovery ..... Disabled
-----
```

**Table 5:** Parameters displayed in the output of the **show epsr** command

| Parameter on Master Node | Parameter on Transit Node | Description   |
|--------------------------|---------------------------|---|
| Name                     | Name                      | The name of the EPSR instance.  |
| Mode                     | Mode                      | The mode in which the EPSR instance is configured - either Master or Transit  |
| Status                   | Status                    | Indicates whether the EPSR instance is enabled or disabled  |
| State                    | State                     | Indicates state of the EPSR instance's state machine. Master states are: Idle, Complete, and Failed. Transit states are Links-Up, Links-Down, and Pre-Forwarding. |
| Control Vlan             | Control Vlan              | Displays the VID of the EPSR instance's control VLAN.   |
| Data VLAN(s)             | Data VLAN(s)              | The VID(s) of the instance's data VLANs.  |
| Interface Mode           | Interface Mode            | Whether the EPSR instance's ring ports are both physical ports (Ports Only) or are both static aggregators (Channel Groups Only).                                 |
| Primary Port             | First Port                | The EPSR instance's primary ring port.  |

**Table 5:** Parameters displayed in the output of the **show epsr** command (cont.)

| Parameter on Master Node | Parameter on Transit Node | Description  |
|--------------------------|---------------------------|--|
| - Status                 | - Status                  | Whether the ring port is forwarding (Forwarding) or blocking (Blocked), or has link down (Down), and if forwarding or blocking, "(logical)" indicates the instance has only logically set the blocking state of the port because it does not have physical control of it.  |
|                          | - Direction               | The ring port on which the last EPSR control packet was received is indicated by "Upstream". The other ring port is then "Downstream"  |
| - Is On Common Segment   | - Is On Common Segment    | Whether the ring port is on a shared common segment link to another node, and if so, "(highest rank)" indicates it is the highest priority instance on that common segment.  |
| - Blocking Control       | - Blocking Control        | Whether the instance has "physical" or "logical" control of the ring port's blocking in the instance's data VLANs.   |
| Secondary Port           | Second Port               | The EPSR instance's secondary port.  |
| - Status                 | - Status                  | Whether the ring port is forwarding (Forwarding) or blocking (Blocked), or has link down (Down), and if forwarding or blocking, "(logical)" indicates the instance has only logically set the blocking state of the port, because it does not have physical control of it. Note that on a master configured for SuperLoop Prevention (non-zero priority) its secondary ring port can be physically forwarding, but logically blocking. This situation arises when it is not the highest priority node in the topology (and so does not receive LINKS-DOWN messages upon common segment breaks) and a break on a common segment in its ring is preventing reception of its own health messages. |
|                          | - Direction               | The ring port on which the last EPSR control packet was received is indicated by "Upstream". The other ring port is then "Downstream"  |
| - Is On Common Segment   | - Is On Common Segment    | Whether the ring port is on a shared common segment link to another node, and if so, "(highest rank)" indicates it is the highest priority instance on that common segment   |
| - Blocking Control       | - Blocking Control        | Whether the instance has "physical" or "logical" control of the ring port's blocking in the instance's data VLANs  |
| Hello Time               |                           | The EPSR instance's setting for the interval between transmissions of health check messages (in seconds)   |
| Failover Time            |                           | The time (in seconds) the EPSR instance waits to receive a health check message before it decides the ring is down   |
| Ring Flap Time           |                           | The minimum time the EPSR instance must remain in the failed state   |
| Trap                     | Trap                      | Whether the EPSR instance has EPSR SNMP traps enabled  |

**Table 5:** Parameters displayed in the output of the **show epsr** command (cont.)

| Parameter on Master Node | Parameter on Transit Node | Description  |
|--------------------------|---------------------------|--|
| Enhanced Recovery        | Enhanced Recovery         | Whether the EPSR instance has enhanced recovery mode enabled |
| SLP Priority             | SLP Priority              | The EPSR instance's priority (for SuperLoop Prevention)      |

# show epsr common segments

**Overview** This command displays information about all the superloop common segment ports on the switch.

**Syntax** `show epsr common segments`

**Example** To display information about all the superloop common segment ports on the switch, use the command:

```
awplus# show epsr common segments
```

**Table 6:** Example output from the **show epsr common segments** command

| EPSR Common Segments    |                  |         |      |              |                       |                     |
|-------------------------|------------------|---------|------|--------------|-----------------------|---------------------|
| Common Seg<br>Ring Port | EPSR<br>Instance | Mode    | Prio | Port<br>Type | Phys Ctrl<br>of Port? | Ring<br>Port Status |
| port1.0.4               | test_inst_Red    | Transit | 127  | Second       | Yes                   | Fwding              |
|                         | test_inst_Blue   | Transit | 126  | Second       | No                    | Fwding (logical)    |
|                         | test_inst_Green  | Transit | 125  | First        | No                    | Fwding (logical)    |

|                         | testB            | Transit | 14   | Second       | No                    | Fwding (logical)    |
| sa5                     | test_55          | Transit | 8    | First        | Yes                   | Down                |
|                         | test_77          | Transit | 7    | First        | No                    | Down                |

**Related commands**

- [show epsr](#)
- [show epsr summary](#)
- [show epsr counters](#)

# show epsr config-check

**Overview** This command checks the configuration of a specified EPSR instance, or all EPSR instances.

If an instance is enabled, this command will check for the following errors or warnings:

- The control VLAN has the wrong number of ports.
- There are no data VLANs.
- Some of the data VLANs are not assigned to the ring ports.
- The instance is a master with its secondary port on a common segment.

**Syntax** `show epsr [<instance>] config-check`

| Parameter  | Description                            |
|------------|--|
| <instance> | Name of the EPSR instance to check on. |

**Mode** User Exec and Privileged Exec

**Example** To check the configuration of all EPSR instances and display the results, use the command:

```
awplus# show epsr config-check
```

Table 54-1: Example output from **show epsr config-check**

```
EPSR      Status  Description
Instance
-----
red       OK.
white    OK.
blue     Warning Primary port is not in data VLANs 29-99.
orange   OK.

Don't forget to check that this node's configuration is consistent with all
other nodes in the ring.
-----
```

**Related commands** [show epsr](#)

# show epsr <epsr-instance>

**Overview** This command displays information about the specified EPSR instance.

**Syntax** `show epsr <epsr-instance>`

| Parameter                          | Description                |
|------------------------------------|----------------------------|
| <code>&lt;epsr-instance&gt;</code> | Name of the EPSR instance. |

**Mode** User Exec and Privileged Exec

**Example** To show the current settings of the EPSR instance called `blue`, use the command:

```
awplus# show epsr blue
```

**Related commands**

- [epsr mode master controlvlan primary port](#)
- [epsr mode transit controlvlan](#)
- [show epsr counters](#)

# show epsr <epsr-instance> counters

**Overview** This command displays counter information about the specified EPSR instance.

**Syntax** `show epsr <epsr-instance> counters`

| Parameter                          | Description                |
|------------------------------------|----------------------------|
| <code>&lt;epsr-instance&gt;</code> | Name of the EPSR instance. |

**Mode** User Exec and Privileged Exec

**Example** To show the counters of the EPSR instance called `blue`, use the command:

```
awplus# show epsr blue counters
```

**Related commands**

- [epsr mode master controlvlan primary port](#)
- [epsr mode transit controlvlan](#)
- [show epsr](#)

# show epsr counters

**Overview** This command displays counter information about all EPSR instances.

**Syntax** `show epsr counters`

**Mode** User Exec and Privileged Exec

**Example** To show the counters of all EPSR instances, use the command:

```
awplus# show epsr counters
```

**Related commands**

- [epsr mode master controlvlan primary port](#)
- [epsr mode transit controlvlan](#)
- [show epsr](#)

# show epsr summary

**Overview** This command displays summary information about all EPSR instances on the switch

**Syntax** show epsr summary

**Mode** User Exec and Privileged Exec

**Example** To display EPSR summary information, use the command:

```
awplus# show epsr summary
```

**Table 55:** Example output from the **show epsr summary** command

```
EPSR Summary Information

Abbreviations:
M = Master node
T = Transit node
C = is on a common segment with other instances
P = instance on a common segment has physical control of the shared port's
  data VLAN blocking
LB = ring port is Logically Blocking - applicable to master only
```

| EPSR Instance | Mode | Status   | State      | Ctrl VLAN | Prio | Primary/1st Port Status | Secondary/2nd Port Status |
|---------------|------|----------|------------|-----------|------|-------------------------|---------------------------|
| test-12345    | T    | Enabled  | Links-Down | 6         | 127  | Blocking (C,P)          | Blocking (C,P)            |

# cfm-sf-notify

**Overview** Use this command to configure this ERP instance to receive signal fail notifications from a Local MEP(s). This command can be used multiple times to allow multiple Local MEPs to be specified.

Use the **no** variant of this command to remove a Local MEP from sending notifications to this G.8032 ERP instance.

**Syntax** `cfm-sf-notify mep mpid <mep-id> domain <domain-name> service <ma-name>`  
`no cfm-sf-notify mep mpid <mep-id> domain <domain-name> service <ma-name>`

| Parameter     | Description  |
|---------------|--|
| mep           | Specify that a Local Maintenance End Point (MEP) is to provide the Signal Fail notification to this G.8032 ERP instance. |
| mpid          | Specify that the Local MEP is to be identified by MEP-id.  |
| <mep-id>      | 1-8191. Specify the Local MEP's ID.  |
| domain        | Specify the Maintenance Domain that the Local MEP is associated with.  |
| <domain-name> | Specify the Maintenance Domain's CLI instance name.  |
| service       | Specify the Maintenance Association that the Local MEP is associated with.   |
| <ma-name>     | Specify the Maintenance Association's CLI instance name.   |

**Mode** G8032 Configure Switch

**Usage notes** CFM and Continuity Check Messaging (CCM) can be configured to detect link faults on the East or West interface ports as a whole, or faults on the R-APS VLAN on the East or West interface. In this situation CFM Local MEPs can notify G.8032 of defects it detects. G.8032 will treat these notifications as a Signal Fail (SF) for that East or West ring port. Similarly, CFM Local MEPs can notify G.8032 that the fault has cleared. When this command is used, this G.8032 ERP instance will ensure that the specified Local MEP is a Down MEP for the East or West interface used by this instance or for the R-APS VLAN on the East or West interface used by this instance.

**Example** To configure an ERP instance to receive signal fail notifications from a local MEP with an MEP ID of "12", an MD named "MD-INST1", and an MA named "MA-INST1-1", use the following commands:

```
awplus(config)# g8032 erp-instance ring2  
awplus(g8032-config-switch)# cfm-sf-notify mep mpid 12 domain  
MD-INST1 service MA-INST1-1
```

**Related commands**

- ethernet cfm domain-name
- ethernet cfm mep
- g8032 erp-instance
- service ma-name
- show g8032 erp-instance

**Command changes**

- Version 5.4.7-0.1: command added
- Version 5.4.7-1.1: added to x310 series products
- Version 5.4.7-2.1: added to x550 series products
- Version 5.4.8-0.2: added to SBx8100 series products
- Version 5.4.8-1.1: added to SBx908 GEN2 series products

# clear g8032 erp-instance

**Overview** Use this command to:

- trigger a reversion immediately, without waiting for timers to expire, or
- clear a forced-switch or manual-switch command that was previously successfully entered on a G.8032 Ethernet Ring Protection (ERP) instance.

**Syntax** `clear g8032 erp-instance <erp-instance-name>`

| Parameter                              | Description                         |
|--|-------------------------------------|
| <code>&lt;erp-instance-name&gt;</code> | The name of the G.8032 ERP instance |

**Mode** Privileged Exec

**Usage notes** This command can be used after a protection switch has occurred and the failure has cleared. If reversion is enabled, this command will trigger a reversion immediately, without having to wait for certain timers to expire (such as WTB or WTR). If reversion has been disabled, this command will trigger a reversion.

Alternatively, this command can be used on an ERP instance where a forced-switch or manual-switch command has been successfully entered to clear that action. The command will be ignored if a force-switch or manual-switch command had not been previously entered successfully, even if such node is in the FORCED\_SWITCH or MANUAL\_SWITCH state.

**Examples** To trigger a reversion immediately without waiting for a timer to expire on an ERP instance named "blue", use the following command:

```
awplus# clear g8032 erp-instance blue
```

Alternatively, to clear a previously applied forced-switch from an ERP instance named "blue", use the following command:

```
awplus# clear g8032 erp-instance blue
```

The forced-switch would be created using a command like this one, which forces a protection switch on the East interface of an ERP instance named "blue":

```
awplus# g8032 forced-switch erp-instance blue east-interface
```

**Related commands** [g8032 erp-instance](#)  
[g8032 forced-switch erp-instance](#)  
[g8032 manual-switch erp-instance](#)

**Command changes** Version 5.4.7-0.1: command added  
Version 5.4.7-1.1: added to x310 series products  
Version 5.4.7-2.1: added to x550 series products

Version 5.4.8-0.2: added to SBx8100 series products

Version 5.4.8-1.1: added to SBx908 GEN2 series products

# clear g8032 erp-instance statistics

**Overview** Use this command to clear the statistics data being collected by a G.8032 Ethernet Ring Protection (ERP) instance.

**Syntax** `clear g8032 erp-instance <erp-instance-name> statistics`

| Parameter                              | Description                                |
|--|--|
| <code>&lt;erp-instance-name&gt;</code> | The name of a specific G.8032 ERP instance |

**Mode** Privileged Exec

**Usage notes** A G.8032 ERP instance keeps statistical data as counts on a variety of data such as the number of certain types of Ring-Automatic Protection Switching (R-APS) messages sent and received over its ring port(s) and error conditions detected. Use this command to clear the statistics data.

**Example** To clear the statistics for an ERP instance named "blue", use the following command:

```
awplus# clear g8032 erp-instance blue statistics
```

**Related commands** [g8032 erp-instance](#)  
[show g8032 erp-instance statistics](#)

**Command changes**  
Version 5.4.7-0.1: command added  
Version 5.4.7-1.1: added to x310 series products  
Version 5.4.7-2.1: added to x550 series products  
Version 5.4.8-0.2: added to SBx8100 series products  
Version 5.4.8-1.1: added to SBx908 GEN2 series products

# data-traffic

**Overview** Use this command to add a data traffic VLAN or a range of VLANs to be protected by this G.8032 Ethernet Ring Protection (ERP) instance.

Use the **no** variant of this command to remove a data traffic VLAN or a range of VLANs.

**Syntax** `data-traffic <vid-list>`  
`no data-traffic <vid-list>`

| Parameter                     | Description   |
|-------------------------------|---|
| <code>&lt;vid-list&gt;</code> | The data traffic VLAN ID(s). This can be a single VLAN ID, or can be a range of VLAN IDs separated by hyphen, or a comma separated list of VLAN IDs and ranges. Each VLAN ID can take on the range of 1 to 4094 |

**Mode** G8032 Configure Switch

- Usage notes**
- A G.8032 ERP instance can protect 0, 1 or more VLANs carrying data traffic.
  - This ERP instance must be associated with a physical ring instance.
  - Other ERP instances using the same physical ring instance are not allowed to have the same data traffic VLAN(s) as this ERP instance.
  - The data VLAN(s) must already exist.
  - The data VLAN(s)' port members should be members of the ring interface(s), but it is not enforced.
  - When a data traffic VLAN(s) is removed, any blocks that were in place on the ring ports for this VLAN(s) are removed. The user should make sure when removing the VLAN(s) from the ERP instance that a loop is not formed.
  - Data traffic VLAN(s) can be added or removed while the ERP instance is enabled or disabled.

**Example** To add a data traffic VLAN with a VLAN ID of "103" to an ERP instance named "blue", use the following commands:

```
awplus(config)# g8032 erp-instance blue  
awplus(g8032-config-switch)# data-traffic 103
```

**Related commands** [g8032 erp-instance](#)  
[show g8032 erp-instance](#)

**Command changes**  
Version 5.4.7-0.1: command added  
Version 5.4.7-1.1: added to x310 series products  
Version 5.4.7-2.1: added to x550 series products

Version 5.4.8-0.2: added to SBx8100 series products

Version 5.4.8-1.1: added to SBx908 GEN2 series products

# debug g8032

**Overview** Use this command to enable G.8032 debugging.  
Use the **no** variant of this command to disable G.8032 debugging.

**Syntax** `debug g8032 {all|event|rx|tx}`  
`no debug g8032 {all|event|rx|tx}`

| Parameter | Description                       |
|-----------|-----------------------------------|
| all       | Turn on all G.8032 debugging      |
| event     | Turn on G.8032 Event debugging    |
| rx        | Turn on G.8032 Receive debugging  |
| tx        | Turn on G.8032 Transmit debugging |

**Mode** Privileged Exec

**Example** To enable all G.8032 debugging, use the following command:

```
awplus# debug g8032 all
```

**Related commands** [show debugging](#)  
[show debugging g8032](#)  
[undebug g8032](#)

**Command changes** Version 5.4.7-0.1: command added  
Version 5.4.7-1.1: added to x310 series products  
Version 5.4.7-2.1: added to x550 series products  
Version 5.4.8-0.2: added to SBx8100 series products  
Version 5.4.8-1.1: added to SBx908 GEN2 series products

# enable (g8032-profile)

**Overview** Use this command to change the revertive or non-revertive operation of the associated G.8032 Ethernet Ring Protection (ERP) instance.

**Syntax** `enable {revertive|non-revertive}`

| Parameter                  | Description   |
|----------------------------|---|
| <code>revertive</code>     | This allows the ERP instance associated with this profile to operate in revertive mode.     |
| <code>non-revertive</code> | This allows the ERP instance associated with this profile to operate in non-revertive mode. |

**Default** By default, the mode of operation is revertive.

**Mode** G8032 Profile Configuration

**Usage notes** An ERP instance uses a profile which contains timer configurations and configurations for revertive modes of operation. Once a ring failure has abated, a G.8032 ring instance will check its mode of operation, and if the mode is revertive, it will attempt to revert back to where the RPL-Owner controls the blocking of the ring. Otherwise, it operates in non-revertive mode.

**Example** To enable revertive mode for a profile named "prof\_1", use the following commands:

```
awplus(config)# g8032 profile prof_1
awplus(g8032-profile-config)# enable revertive
```

**Related commands** [g8032 profile](#)  
[show g8032 profile](#)

**Command changes** Version 5.4.7-0.1: command added  
Version 5.4.7-1.1: added to x310 series products  
Version 5.4.7-2.1: added to x550 series products  
Version 5.4.8-0.2: added to SBx8100 series products  
Version 5.4.8-1.1: added to SBx908 GEN2 series products

# epsr topology-change

**Overview** Use this command to allow the given EPSR instance to accept notifications from other topology protocols, namely G.8032, for Topology Change Notifications (TCN).

Use the **no** variant of this command to return the EPSR instance to where it does not accept TCNs from the other specified protocol, and as a result does not send out a "flush FDB" message.

**Syntax** `epsr <epsr-name> topology-change g8032`  
`no epsr <epsr-name> topology-change g8032`

| Parameter                      | Description   |
|--------------------------------|---|
| <code>&lt;epsr-name&gt;</code> | The name of the EPSR instance for which the topology-change applies to.   |
| <code>topology-change</code>   | The topology-change value to be set for the instance.   |
| <code>g8032</code>             | Specify that G.8032 is the other protocol that the topology-change notifications are allowed to be accepted from in order to send "flush FDB" messages to other EPSR nodes in the ring. |

**Default** The default value is no notifications are accepted and in turn no "flush FDB" messages are sent.

**Mode** EPSR Configuration

**Usage notes** The purpose of this command is to allow EPSR to accept notifications from other topology protocols, namely G.8032, about Topology Change Notifications (TCN). Once EPSR accepts the TCN, it will in turn notify the other nodes on the EPSR ring to perform an FDB flush.

**Example** To configure an EPSR instance named "red" to accept G.8032 TCNs, use the following command:

```
awplus(config-epsr)# epsr red topology-change g8032
```

To configure an EPSR instance named "red" to no longer accept G.8032 TCNs, use the following command:

```
awplus(config-epsr)# no epsr red topology-change g8032
```

**Related commands** [show epsr](#)  
[show g8032 erp-instance](#)

**Command changes** Version 5.4.7-1.1: command added

# erp-instance

**Overview** Use this command to enable or disable a G.8032 Ethernet Ring Protection (ERP) instance.

**Syntax** `erp-instance {enabled|disabled}`

| Parameter | Description                         |
|-----------|-------------------------------------|
| enabled   | The G.8032 ERP instance is enabled  |
| disabled  | The G.8032 ERP instance is disabled |

**Default** The ERP instance is disabled.

**Mode** G8032 Configure Switch

**Usage notes** Once a G.8032 ERP instance has been configured with the correct parameter settings or defaults, it can be enabled to run the G.8032 protocol. To change certain ERP instance parameters, the instance may need to be disabled.

When enabled, the instance is restarted back to the G8032\_ST\_INIT state. In this state, if the node has an RPL-Owner or RPL-Neighbor port, it will be blocked. Otherwise the node will block one of its ring ports. All the nodes will send Ring-Automatic Protection Switching (R-APS) messages initially. The G.8032 protocol and state machines will transition the ring into another more appropriate state.

When disabled, the ERP instance will no longer process incoming R-APS messages for that instance, nor send any R-APS messages. The raps-channel VLAN and any data-traffic VLANs used by this instance will be put in the forwarding state for its physical ring ports. Caution should be taken to avoid loops when disabling an ERP instance.

**Example** To enable an ERP instance named "blue", use the following commands:

```
awplus(config)# g8032 erp-instance blue
awplus(g8032-config-switch)# erp-instance enabled
```

# g8032 erp-instance

**Overview** Use this command to create a G.8032 Ethernet Ring Protection (ERP) instance, or to enter an existing instance's context.

Use the **no** variant of this command to destroy the specified instance.

**Syntax** `g8032 erp-instance <erp-instance-name>`  
`no g8032 erp-instance <erp-instance-name>`

| Parameter                              | Description   |
|--|---|
| <code>&lt;erp-instance-name&gt;</code> | The name of the G.8032 ERP instance. This can be up to 32 characters. |

**Mode** Global Configuration

**Usage notes** The ERP protocol in AlliedWare Plus™ can run one or more instances. A G.8032 ERP instance is made up of:

- two ERP ring ports,
- a Control VLAN that carries Ring-Automatic Protection Switching (R-APS) messages, and
- zero, one, or more Protected traffic data VLANs that the instance protects when the ring fails.

An ERP instance must be associated with a G.8032 physical ring and a G.8032 profile.

**Example** To enter the context of an instance named "blue", use the following commands:

```
awplus(config)# g8032 erp-instance blue
awplus(g8032-config-switch)#
```

# g8032 forced-switch erp-instance

**Overview** Use this command to force a protection switch on a G.8032 Ethernet Ring Protection (ERP) instance ring port.

**Syntax** `g8032 forced-switch erp-instance <erp-instance-name>  
{east-interface|west-interface|terminating-interface}`

| Parameter                              | Description                                     |
|--|---|
| <code>&lt;erp-instance-name&gt;</code> | The name of the G.8032 ERP instance             |
| <code>east-interface</code>            | The G.8032 ERP instance's East ring port        |
| <code>west-interface</code>            | The G.8032 ERP instance's West ring port        |
| <code>terminating-interface</code>     | The G.8032 ERP instance's Terminating ring port |

**Mode** Privileged Exec

**Usage notes** G.8032 supports a Forced Protection Switch action initiated by the operator. A Forced Protection Switch command is to be issued at a given G.8032 node and given port in the ring. This results in a block being applied at that ring port (and an unblock on the opposite ring port), and a R-APS designated Forced Switch message to flow around the ring causing the RPL to become unblocked.

Multiple Forced Switch actions can take place along a G.8032 ring. Care must be taken when using the Force Switch command as it can only be undone by issuing a Clear command and not by a failure nor the clearing of a failure. If a node that was issued a Force Switch command later fails, then it becomes difficult to remove the Force Switch condition from the ring. In this situation, the operator has to go to the nodes that are adjacent to the failed node, and for each one, issue a Forced Switch command on the ring link facing the failed node followed by a Clear command.

If the G.8032 Physical Ring instance associated with the specified ERP instance is set to terminating-interface, then only one ring port is available and terminating-interface must be used in this command, otherwise specify the east-interface or the west-interface.

To clear this action command, use the [clear g8032 erp-instance](#) command.

**Example** To issue a Forced Protection Switch on the East interface of an ERP instance named "blue", use the following command:

```
awplus# g8032 forced-switch erp-instance blue east-interface
```

**Related commands** [clear g8032 erp-instance](#)  
[g8032 erp-instance](#)

**Command changes** Version 5.4.7-0.1: command added  
Version 5.4.7-1.1: added to x310 series products

Version 5.4.7-2.1: added to x550 series products

Version 5.4.8-1.1: added to SBx908 GEN2 series products

# g8032 manual-switch erp-instance

**Overview** Use this command to manually cause a protection switch on a G.8032 Ethernet Ring Protection (ERP) instance ring port.

**Syntax** `g8032 manual-switch erp-instance <erp-instance-name>  
{east-interface|west-interface|terminating-interface}`

| Parameter                              | Description                                     |
|--|---|
| <code>&lt;erp-instance-name&gt;</code> | The name of the G.8032 ERP instance             |
| <code>east-interface</code>            | The G.8032 ERP instance's East ring port        |
| <code>west-interface</code>            | The G.8032 ERP instance's West ring port        |
| <code>terminating-interface</code>     | The G.8032 ERP instance's Terminating ring port |

**Mode** Privileged Exec

**Usage notes** G.8032 supports a Manual Protection Switch action initiated by the operator. A Manual Protection Switch command is to be issued at a given G.8032 node and given port in the ring. This results in a block being applied at that ring port (and an unblock on the opposite ring port), and a R-APS designated Manual Switch message to flow around the ring causing the RPL to become unblocked.

The difference between a Manual switch and a Forced switch is that the Manual Switch will be ignored under various conditions. In particular, only one Manual Switch is allowed on a G.8032 ring at a time.

If the G.8032 Physical Ring instance associated with the specified ERP instance is set to terminating-interface, then only one ring port is available and terminating-interface must be used in this command, otherwise specify the east-interface or the west-interface.

To clear this action command, use the [clear g8032 erp-instance](#) command.

**Example** To issue a Manual Protection Switch on the East interface of an ERP instance named "blue", use the following command:

```
awplus# g8032 manual-switch erp-instance blue east-interface
```

**Related commands** [clear g8032 erp-instance](#)  
[g8032 erp-instance](#)

**Command changes** Version 5.4.7-0.1: command added  
Version 5.4.7-1.1: added to x310 series products

Version 5.4.8-1.1: added to SBx908 GEN2 series products

# g8032 physical-ring

**Overview** Use this command to create a G.8032 Ethernet Ring Protection (ERP) physical ring profile which specifies the Ethernet ports that will be used as G.8032 ring ports.

**Syntax** `g8032 physical-ring <physical-ring-name> {east-interface <interface-name1> west-interface <interface-name2>| terminating-interface <interface-name>}`  
`no g8032 physical-ring <physical-ring-name>`

| Parameter                               | Description   |
|---|---|
| <code>&lt;physical-ring-name&gt;</code> | The name of the profile (up to 37 characters)   |
| <code>east-interface</code>             | The East G.8032 ring port   |
| <code>&lt;interface-name1&gt;</code>    | The name of the switch interface, either port or channel group, for the East ring port. It must differ from the West ring port. |
| <code>west-interface</code>             | The West G.8032 ring port   |
| <code>&lt;interface-name2&gt;</code>    | The name of the switch interface, either port or channel group, for the West ring port. It must differ from the East ring port. |
| <code>terminating-interface</code>      | The Terminating ring port. This should only be used for G.8032 ERP instance that is at the end of a sub-ring.                   |
| <code>&lt;interface-name&gt;</code>     | The name of the switch interface, either port or channel group, for the Terminating ring port.                                  |

**Mode** Global Configuration

**Usage notes** Each ERP instance will be associated with a physical ring profile. A physical ring profile is made up of two physical Ethernet ports or aggregated interfaces, unless it is the terminating point of a sub-ring in which case only one port is needed. When two ports are used, they are referred to as East and West ports. When only a single port is used, it is referred to as a Terminating port.

**Example** To create a physical ring profile named "red" where the East interface port is port1.0.4 and the West interface port is port1.0.8, use the following commands:

```
awplus# configure terminal
awplus(config)# g8032 physical-ring red east-interface
port1.0.4 west-interface port1.0.8
```

# g8032 profile

**Overview** Use this command to create a G.8032 Ethernet Ring Protection (ERP) instance profile, or to enter that instance's profile context.

Use the **no** variant of this command to destroy the specified instance.

**Syntax** `g8032 profile {<erp-profile-name>|default-profile}`  
`no g8032 profile <erp-profile-name>`

| Parameter                             | Description  |
|---------------------------------------|--|
| <code>&lt;erp-profile-name&gt;</code> | The name of the G.8032 profile. This can be up to 32 characters.   |
| <code>default-profile</code>          | The name of the system's default profile for G.8032. This profile is created by the system automatically and can not be destroyed. |

**Default** A profile with the name "default-profile" will exist in the system and is used by default by an ERP instance. All the parameters in the default profile take on the default values.

**Mode** Global Configuration

**Example** To enter the context of a profile named "prof\_1", use the following commands:

```
awplus(config)# g8032 profile prof_1  
awplus(g8032-profile-config)#
```

**Related commands** [enable \(g8032-profile\)](#)  
[profile name](#)  
[show g8032 profile](#)

**Command changes** Version 5.4.7-0.1: command added  
Version 5.4.7-1.1: added to x310 series products  
Version 5.4.7-2.1: added to x550 series products  
Version 5.4.8-0.2: added to SBx8100 series products  
Version 5.4.8-1.1: added to SBx908 GEN2 series products

# level (g8032-switch)

**Overview** Use this command to configure the level for Ring-Automatic Protection Switching (R-APS) messages.

**Syntax** level <0-7>

| Parameter | Description                                |
|-----------|--|
| <0-7>     | The level used by the G.8032 ERP instance. |

**Default** The default level is 0.

**Mode** G8032 Configure Switch

**Usage notes** Inside the R-APS messages is the Level field. The G.8032 Ethernet Ring Protection (ERP) instance will use the configured level for sending R-APS messages, and is the level that the instance expects to receive. If the node receives an R-APS message with the improper level then the message will not be processed.

The ERP instance must be disabled to change the level, otherwise the setting is denied.

**Example** To set the R-APS message level field for an ERP instance named "blue" to 3, use the following commands:

```
awplus(config)# g8032 erp-instance blue  
awplus(g8032-config-switch)# level 3
```

**Related commands** [g8032 erp-instance](#)  
[show g8032 erp-instance](#)

**Command changes** Version 5.4.7-0.1: command added  
Version 5.4.7-1.1: added to x310 series products  
Version 5.4.7-2.1: added to x550 series products  
Version 5.4.8-0.2: added to SBx8100 series products  
Version 5.4.8-1.1: added to SBx908 GEN2 series products

# physical-ring

**Overview** Use this command to specify which G.8032 physical ring instance is to be used by this G.8032 Ethernet Ring Protection (ERP) instance.

**Syntax** `physical-ring <physical-ring-name>`

| Parameter                               | Description                             |
|---|---|
| <code>&lt;physical-ring-name&gt;</code> | The name of the physical ring instance. |

**Mode** G8032 Configure Switch

**Usage notes** A G.8032 ERP instance in general has two ring ports, unless it is at the end of a sub-ring in which case it has only one ring port. Ring port(s) are specified using a G.8032 physical ring instance.

This command can only be accepted when the ERP instance is disabled.

**Example** To configure an ERP instance named "blue" to use a physical ring instance named "red", use the following commands:

```
awplus(config)# g8032 erp-instance blue
awplus(g8032-config-switch)# physical-ring red
```

# profile name

**Overview** Use this command to associate a G.8032 profile instance with this G.8032 Ethernet Ring Protection (ERP) instance.

**Syntax** `profile name <erp-profile-name>`

| Parameter                             | Description                    |
|---------------------------------------|--------------------------------|
| <code>&lt;erp-profile-name&gt;</code> | The name of the G.8032 profile |

**Default** If this command is not used, a profile with the name "default-profile" will be used for this G.8032 ERP instance.

**Mode** G8032 Configure Switch Mode

**Usage notes** A G.8032 ERP instance uses a profile which contains timer configurations and configurations for revertive modes of operation. This configuration can be accepted regardless of the ERP instance being disabled or enabled. Any parameters from a changed profile will take effect the next time the G.8032 state machine uses the parameters in the updated profile.

**Example** To associate a G.8032 profile named "prof\_1" with a G.8032 ERP instance named "blue", use the following commands:

```
awplus(config)# g8032 erp-instance blue  
awplus(g8032-config-switch)# profile name prof_1
```

**Related commands**

- Version 5.4.8-1.1: added to SBx908 GEN2 series products

# raps-channel

**Overview** Use this command to specify which VLAN to use as a channel for G.8032 Ring-Automatic Protection Switching (R-APS) messages sent and received by this G.8032 Ethernet Ring Protection (ERP) instance.

Use the **no** variant of this command to remove the VLAN from being used as the R-APS channel VLAN.

**Syntax** `raps-channel <vid>`  
`no raps-channel`

| Parameter                | Description                              |
|--------------------------|--|
| <code>&lt;vid&gt;</code> | A single VLAN-id in the range 2 to 4094. |

**Mode** G8032 Configure Switch

**Usage notes** For a G.8032 ERP instance, a VLAN is used as a channel for carrying an R-APS message. This VLAN is also used to identify the proper ring instance to all the other nodes in the ring.

The VLAN must be tagged members of the G.8032 physical ring instance associated with this ERP instance. A G.8032 physical ring instance must be associated with this ERP instance. The ERP instance can not be enabled until this raps-channel VLAN has been configured properly.

The ERP instance must be disabled when using the **no** variant.

**Example** To configure a VLAN with a VLAN-id of "103" as a R-APS channel for an ERP instance named "blue", use the following commands:

```
awplus(config)# g8032 erp-instance blue
awplus(g8032-config-switch)# raps-channel 103
```

**Related commands** [g8032 erp-instance](#)

**Command changes**

- Version 5.4.7-0.1: command added

- Version 5.4.8-1.1: added to SBx908 GEN2 series products

# service onm

**Overview** Use this command to enable the ONM service, which underlies CFM and G.8032. Use the **no** version of the command to disable the unused ONM service.

**Syntax** `service onm`  
`no service onm`

**Default** Enabled

**Mode** Global Configuration

**Usage notes** Disabling the service can reduce memory usage on the switch, particularly when many VLANs are configured on ports.

Disabling the service will only take effect after you save the configuration and restart the device.

**Example** To disable the ONM service, use the commands:

```
awplus# configure terminal
awplus(config)# no service onm
```

**Output** Figure 55-1: Example output from **no service onm**

```
awplus(config)#no service onm
% Save the config and restart the device for this change to take
effect
```

**Command changes** Version 5.5.0-2.1: command added

# rpl role

**Overview** Use this command to specify the role of each G.8032 Ethernet Ring Protection (ERP) ring port (also known as a link). The role can be specified as to whether it is a Ring Protection Link (RPL) or not, and if it is an RPL, whether it is the Owner or Neighbor end of an RPL.

Use the **none** variant of this command to set all the ERP instance's ring ports' RPL role to **none**.

**Syntax** `rpl role {owner|neighbor}{east-interface|west-interface|terminating-interface}`  
`rpl role none`

| Parameter             | Description  |
|-----------------------|--|
| owner                 | This sets the specified ring port to be an RPL Owner           |
| neighbor              | This sets the specified ring port to be an RPL Neighbor        |
| east-interface        | The ring port's east-interface.                                |
| west-interface        | The ring port's west-interface.                                |
| terminating-interface | The ring port's terminating-interface                          |
| none                  | This sets all the ERP instance's ring ports' RPL role to none. |

**Default** A RPL role of "none" is the default.

**Mode** G8032 Configure Switch

**Usage notes** If a node has one of its ring ports set to Owner or Neighbor, then **none** is automatically set on any other ring port as **none** is the only possible setting for the other ring port.

When using this command to set the RPL role to **none**, an interface need not be specified, as this command will set all the ring ports RPL role to **none**.

The command can only be accepted when the G.8032 ERP Instance is disabled, and the ERP instance must also have an association to a ERP Physical Ring instance.

As in the case of a sub-ring with only one physical ring port, use **terminating-interface** when specifying the RPL role as Owner or Neighbor.

**Example** To configure the east-interface of a ring port named "blue" to be an RPL Owner, use the following commands:

```
awplus(config)# g8032 erp-instance blue  
awplus(g8032-config-switch)# rpl role owner east-interface
```

# show g8032 erp-instance

**Overview** Use this command to show one or all G.8032 Ethernet Ring Protection (ERP) instance(s) configuration and dynamic state data.

**Syntax** `show g8032 erp-instance {<erp-instance-name>|all}`

| Parameter                              | Description                                 |
|--|---|
| <code>&lt;erp-instance-name&gt;</code> | The name of a specific G.8032 ERP instance. |
| <code>all</code>                       | Use this to show all instances.             |

**Mode** User Exec and Privileged Exec

**Example** To show the configuration and dynamic state data for an ERP instance named "blue", use the following command:

```
awplus# show g8032 erp-instance blue
```

**Output** Figure 55-3: Example output from the **show g8032 erp-instance** command.

```
awplus#show g8032 erp-instance blue
-----
Instance Name       : blue
Admin State        : enabled
G.8032 State       : IDLE
Failure of Proto-TO : false
Phy Ring           : R1 - East (port2.0.25) : West (sa1)

**Table 1:** Parameters in the output from the **show g8032 erp-instance** command.

| Parameter                       | Description   |
|---------------------------------|---|
| Instance name                   | The configured <erp-instance-name> for this instance.   |
| Admin State                     | The configured administrative state of this instance, either enabled or disabled. When the ERP instance is disabled, all dynamic data for other parameters in this table will be shown as "-", except for the East Link or West Link which will show the last known block or unblocked state. |
| G.8032 State                    | A dynamic parameter showing the current state of the instance per the G.8032 state machine. If the ERP Instance is disabled, it will be in the INIT state.  |
| Phy Ring                        | Shows the Physical Ring Instance name that this ERP Instance is associated with along with the East/West or Terminating Interface used by the Physical Ring Instance.   |
| East Link or West Link          | A dynamic variable showing whether the instance's ring port and its VLANs are blocked or not. In the special case of an interconnection node where a sub-ring terminates, both the East Link and the West Link are the same.  |
| RPL Role East Link or West Link | Shows the configuration of the link's role.   |

**Table 1:** Parameters in the output from the **show g8032 erp-instance** command. (cont.)

| Parameter            | Description   |
|----------------------|---|
| CFM MEP East or West | Identifies the configured MEP, if any, that is being used to provide a CFM based Signal Fail indication to this instance. The MEP is identified by its direction (Up or Down), its MEP-id, and the Maintenance Domain (MD) and Maintenance Association (MA) it is associated with by name.  |
| ERP Profile          | Identifies the ERP Profile instance that was configured for use by this ERP Ring instance.  |
| Level                | The Level that was configured for R-APS messages that are used by this ERP Ring instance.   |
| Ring-ID              | The Ring-ID that is to be used by this ERP instance.  |
| RAPS-Channel VLAN    | The VLAN-id that is configured used for sending and receiving R-APS messages for this ERP instance.   |
| Sub-ring             | Specifies whether the ring is operating as a Sub-ring or otherwise as a Major ring.   |
| Virtual Channel      | Specifies whether the sub-ring is operating with a virtual channel or not.  |
| Data Traffic VLANs   | A comma-separated list of configured VLAN-ids (individually, or range) that are used for data-traffic and protected by this ERP instance.   |
| TCN To Inst          | A comma-separated list of protocols and their instances that are to be notified when a Topology Change Notification occurs for this ERP instance. This only applies to a sub-ring with a Terminating interface and in which case "-" will be displayed if no target instances have been identified. Otherwise a "-" is displayed anyway. Identifies the protocol to notify. Only "G8032" will be supported initially. <instance-name> - Identifies the instance to notify for the given protocol. |
| TCN Flush Event      | Specifies if this instance as a target instance is to send out Flush FDB messages upon TCN notifications by a detecting instance. Identifies the notifying protocol allowed. Only "G8032" will be supported initially. If no protocols have been configured then display "-".   |
| SNMP Traps           | Indicates whether SNMP traps have been enabled or disabled for this ERP instance.   |

**Table 1:** Parameters in the output from the **show g8032 erp-instance** command. (cont.)

| Parameter           | Description  |
|---------------------|--|
| Signal Fail         | Indicates whether a Signal Fail condition is being received over the East or West ring interface. <signal-fail> consists of:<br>"-" no Signal Fail is being indicated<br>"Link" - indicates the interface port or LAG has gone operationally down.<br>"CFM MEP <mep-id>" - indicates that a local CFM MEP has indicated a Signal Fail, and which MEP by mep-id.  |
| Failure of Protocol | Indicates that there are defects in the receipt of an R-APS message. There are the following types:<br>FOP-PM (Provisioning Mismatch) - "true" indicates per G.8032,that the RPL-Owner is receiving R-APS(NR,RB) messages with a node-id not of itself. In addition, since the initial implementation does not support version 1, any R-APS messages with version 1 will also indicate a FOP-PM error. The FOP-PM error can occur on an East or a West Port.<br>FOP-TO (Time Out) - "true" indicates that a node has not received an R-APS message on any of its ring ports for 3.5 times the R-APS message interval even though one or both ring ports are capable of receiving R-APS messages (no SF, Admin Up). |
| Version             | The version of the R-APS message that is being received or sent over the East or West ring interface. An R-APS message version of "1" corresponds to G.8032 version 2.   |
| Request             | Indicates the protection switch request being sent or received in the R-APS message. Consists of one of: NR - No Request for protection switching SF - Signal Fail MS - Manual Switch request FS - Force Switch request Event - Request a Flush to be performed. Note this is a transient condition.   |
| RPL Block           | Indicates whether the RPL is being blocked or not. consists of one of the following: "RB" - RPL Block is being applied by the RPL-Owner. "-" - No RPL Block is being applied by the RPL-Owner, or the R-APS message originated from a non-RPL-Owner.   |
| DNF                 | Indicates the value of the Do Not Flush bit in the R-APS message. The value is either "0" or "1".  |
| Block Port Ref      | Block Port Reference refers to the node's East or West port that is being blocked and shows as "0" or "1" in accordance to G.8032.   |
| Node-ID             | The MAC address of this Node or the MAC address used in sending/receiving R-APS messages.  |

**Table 1:** Parameters in the output from the **show g8032 erp-instance** command. (cont.)

| Parameter                    | Description  |
|------------------------------|--|
| East Sending or West Sending | If this local node is not sending R-APS, then all the fields are shown as "-"  |
| Timers                       | Wait-to-Restore - "Running" indicates this timer is active, otherwise is "-".Wait-to-Block - "Running" indicates this timer is active, otherwise is "-".Hold Off Timer - "Running" indicates this timer is active, otherwise is "-". |

# show g8032 erp-instance statistics

**Overview** Use this command to show the G.8032 Ethernet Ring Protection (ERP) instance statistics.

**Syntax** `show g8032 erp-instance <erp-instance-name> statistics`

| Parameter                              | Description                                |
|--|--|
| <code>&lt;erp-instance-name&gt;</code> | The name of a specific G.8032 ERP instance |

**Mode** User Exec and Privileged Exec

**Example** To show the statistics for an ERP instance named "blue", use the following command:

```
awplus# show g8032 erp-instance blue statistics
```

**Output** Figure 55-4: Example output from the **show g8032 erp-instance statistics** command.

```
awplus#show g8032 erp-instance blue statistics
-----

-----
```

**Table 2:** Parameters in the output from the **show g8032 erp-instance statistics** command

| Parameter     | Description   |
|---------------|---|
| Instance Name | The configured <erp-instance-name> for this instance.   |
| Local clear   | The number of Clear commands invoked locally.   |
| FOP-TO        | The number of Failure of Protocol Time Out events seen locally.   |
| RAPS NR       | The number of R-APS messages with a No Request (NR) being received or sent.   |
| RAPS NR-RB    | The number of R-APS messages with a No Request, RPL Blocked (NR,RB) being received or sent.   |
| RAPS SF       | The number of R-APS messages with Signal Fail (SF) being received or sent.  |
| RAPS FS       | The number of R-APS messages with Forced Switch (FS) being received or sent.  |
| RAPS MS       | The number of R-APS messages with Manual Switch (MS) being received or sent.  |
| RAPS Event    | The number of R-APS messages with Event (Flush) being received or sent.   |
| Drop Guard    | The number of R-APS messages discarded due to Guard Timer.  |
| Drop Error    | The number of R-APS messages discarded due to incorrect MAC Address (unmatched Ring-ID), incorrect version, unusable Request/State, or other invalid code point in one of the message fields. |
| Local SF      | The number of Signal Fail events seen locally.  |
| FOP-PM        | The number of Failure of Protocol events seen locally.  |

# show g8032 physical-ring

**Overview** Use this command to show the G.8032 physical ring instance information.

**Syntax** `show g8032 physical-ring {<physical-ring-name>|all}`

| Parameter            | Description  |
|----------------------|--|
| <physical-ring-name> | The name of the physical ring                                    |
| all                  | This shows all physical ring instances that have been configured |

**Mode** User Exec and Privileged Exec

**Example** To show the details of a physical ring instance named "red", use the following command:

```
awplus# show g8032 physical-ring red
```

**Output** Figure 55-5: Example output from the **show g8032 physical-ring** command.

```
awplus#show g8032 physical-ring red
Ring : red
=====
East   : port1.0.4
West   : port1.0.8
ERP Inst : blue
```

**Table 3:** Parameters in the output from the **show g8032 physical-ring** command.

| Parameter               | Description  |
|-------------------------|--|
| Ring                    | The name of the physical ring that was configured for this physical ring instance.   |
| East, West, Terminating | The physical interface port or LAG of the East or West Ring interface, or the Terminating interface that was configured for this physical ring instance. |
| ERP Inst                | A comma-separated list of ERP instances by name that have been configured to use this physical ring instance, or "-" if none.                            |

**Related commands** [g8032 physical-ring](#)

Version 5.4.8-1.1: added to SBx908 GEN2 series products

# show g8032 profile

**Overview** Use this command to show one specific G.8032 profile or all G.8032 profiles, and the configured information within each profile.

**Syntax** `show g8032 profile {<erp-profile-name>|default-profile|all}`

| Parameter                             | Description  |
|---------------------------------------|--|
| <code>&lt;erp-profile-name&gt;</code> | The name of the G.8032 profile that was created by the user.                         |
| <code>default-profile</code>          | The default name of the G.8032 profile that was created automatically by the system. |
| <code>all</code>                      | Using this will show all G.8032 profiles.  |

**Mode** User Exec and Privileged Exec

**Example** To show the profile details for a profile named "prof1", use the following command:

```
awplus# show g8032 profile prof1
```

**Output** Figure 55-6: Example output from the **show g8032 profile** command.

```
awplus#show g8032 profile prof1
Profile : prof1
=====
Wait-To-Restore : 5 mins
Hold Off Timer  : 0 ms
Guard Timer     : 500 ms
Wait-To-Block   : 5500 ms
Protection Type : Revertive
ERP Inst        : blue
```

**Table 4:** Parameters in the output from **show g8032 profile** command.

| Parameter       | Description  |
|-----------------|--|
| Wait-To-Restore | The configured value in <1-12> minutes.  |
| Hold Off Timer  | The configured value but shown instead in milliseconds which ranges from 0 to 10,000 (10s) in 100 ms increments. |
| Guard Timer     | The configured value which ranges from 10 to 2000 in 10 ms increments.   |

**Table 4:** Parameters in the output from **show g8032 profile** command. (cont.)

| Parameter     | Description   |
|---------------|---|
| Wait-To-Block | 5 seconds more than the configured Guard Time. The range is 5010 to 5200.           |
| ERP Inst      | Comma separated list of ERP instances using this profile, or "-" if there are none. |

# sub-ring

**Overview** Use this command to configure the mode of operation for the G.8032 Ethernet Ring Protection (ERP) instance as a sub-ring.

Use the **no** variant of this command to change the mode of operation to that of a normal fully enclosed ring.

**Syntax** `sub-ring`  
`no sub-ring`

**Default** By default the mode is **no sub-ring**.

**Mode** G8032 Configure Switch

**Usage notes** An ERP instance can operate normally as a fully enclosed ring, commonly called a major ring, or as a partially enclosed ring, called a sub-ring. Sub-rings must be attached to either a major ring (one that is fully closed) or to other sub-rings where one of the other sub-rings itself is attached to a major ring.

Setting the mode to sub-ring should also be set for all nodes in the sub-ring, as the G.8032 state machine is different from that of a major ring.

This configuration can only be accepted when the ERP instance is disabled.

When the physical ring instance used by this ERP instance is configured for terminating interface, then this ERP instance will automatically be configured to be in the sub-ring mode and can not be changed.

**Example** To configure an ERP instance named "blue" as a sub-ring, use the following commands:

```
awplus(config)# g8032 erp-instance blue
awplus(g8032-config-switch)# sub-ring
```

Version 5.4.8-1.1: added to SBx908 GEN2 series products

# timer (g8032-profile)

**Overview** Use this command to configure a timer for a specified G.8032 Ethernet Ring Protection (ERP) instance profile.

**Syntax** `timer wait-to-restore {<1-12>|default}`  
`timer hold-off {<0-100>|default}`  
`timer guard-timer {<1-200>|default}`

| Parameter                    | Description   |
|------------------------------|---|
| <code>wait-to-restore</code> | This timer is used to soak signal failure abatement to ensure the signal failure abatement is not intermittent. This timer is only used by the RPL Owner when in the revertive operation, and thus is attempting to restore the ring. It is configurable in steps of 1 to 12 minutes (default is 5 minutes).  |
| <code>hold-off</code>        | This timer allows any other underlying protection schemes to recover before G.8032 reacts to its defect as this gives time for the G.8032 defect to clear. A classic example is when the ERP Physical ring port is carried over a SONET/SDH transmission system that itself has 50ms recovery times. If G.8032 detects a failure, then increasing this timer to some value greater than 50ms would allow the SONET/SDH system to recover and have the defect that G.8032 detected disappear thus preventing the need for G.8032 to try and recover. The Hold Off timer is configurable in 0 to 10 seconds in steps of 100ms (default is 0 ms).  |
| <code>guard-timer</code>     | This is the amount of time that an ERP instance discards most R-APS messages before being allowed to process them. It is used when a clearing condition occurs yet at the same time older messages are still propagating around the ring with failure indications. For example two nodes that just noticed a link failure abatement condition could start clearing and almost immediately one of them could receive an old Signal Fail indication message from the other node (that was still in flight) which in turn causes the receiving node to react to the Signal Fail inadvertently. This timer is particularly useful where R-APS propagation time through the ring is large. Refer to ITU-T G.8032 for more information. The Guard timer is configurable in 10ms steps between 10ms and 2 seconds (default is 50 for 500ms). |

**Mode** G8032 Profile Configuration

**Example** To set the wait-to-restore timer of a profile named "prof\_1" to a value of 1 minute, use the following commands:

```
awplus(config)# g8032 profile prof_1  
awplus(g8032-profile-config)# timer wait-to-restore 1
```

**Related commands** [g8032 profile](#)

Version 5.4.7-1.1: added to x310 series products  
Version 5.4.7-2.1: added to x550 series products  
Version 5.4.8-0.2: added to SBx8100 series products  
Version 5.4.8-1.1: added to SBx908 GEN2 series products

# topology-change

**Overview** Use this command to enable this G.8032 Ethernet Ring Protection (ERP) instance to send a Flush Event message after notification of a Topology Change Notification (TCN) by a detecting instance.

Use the **no** variant of this command to disable the sending of the Flush Event.

**Syntax** `topology-change {g8032}`  
`no topology-change {g8032}`

| Parameter | Description   |
|-----------|---|
| g8032     | Specify that G.8032 is the protocol that is affected by this command. |

**Default** Topology change is enabled by default for G.8032.

**Mode** G8032 Configure Switch

**Usage notes** If this ERP instance is on an interconnecting node, then the ERP instance may need to be notified of a topology change that occurred in another G.8032 sub-ring attached to this node. The former will be termed the "target" ERP instance, and the latter the "detecting" ERP instance.

The criteria for notification is:

- the detecting ERP instance is configured as a sub-ring with a Terminating interface,
- it is protecting the same data VLANs as the target instance, and
- the target ERP instance must have two ring ports.

When the detecting ERP instance detects a topology change on its sub-ring, AlliedWare Plus™ will automatically determine which target ERP instance(s) needs to be notified. It does this by comparing the same data VLANs in the detecting ERP instance with all the other instances.

If target ERP instances are identified and these instances also have both an East and a West interface configured, then those target instances are notified. Upon notification, the target ERP instance has a couple of actions that it has to perform:

- To flush the FDB on both its East and West interfaces for the protected VLANs.
- To send out an R-APS flush event message over its East and West interfaces. The flush event message is sent around the target ring and each node on the target ring will perform an FDB flush of its protected VLANs. The sending of a R-APS flush event may not be needed in some cases and as such it is configurable.

**Example** To enable sending of R-APS flush event messages on an ERP instance named "blue", use the following commands:

```
awplus(config)# g8032 erp-instance blue  
awplus(g8032-config-switch)# topology-change g8032
```

Version 5.4.8-1.1: added to SBx908 GEN2 series products

# trap (g8032-switch)

**Overview** Use this command to enable or disable SNMP traps for a G.8032 Ethernet Ring Protection (ERP) instance.

**Syntax** trap {enabled|disabled}

| Parameter | Description                                      |
|-----------|--|
| enabled   | Enable this ERP instance to generate traps.      |
| disabled  | Disable this ERP instance from generating traps. |

**Default** The SNMP traps for the ERP instance are enabled.

**Mode** G8032 Configure Switch

**Usage notes** Globally, ERP traps are disabled by default but can be enabled globally using the [snmp-server enable trap](#) command.

**Example** To disable the SNMP traps for an ERP instance named "blue", use the following commands:

```
awplus(config)# g8032 erp-instance blue
awplus(g8032-config-switch)# trap disabled
```

**Related commands** [erp-instance](#)

Version 5.4.8-1.1: added to SBx908 GEN2 series products

# undebbug g8032

**Overview** Use this command to turn off debugging for various G.8032 debug attributes.

**Syntax** `undebbug g8032 {all|event|rx|tx}`

| Parameter | Description                          |
|-----------|--------------------------------------|
| all       | All G.8032 debugging                 |
| event     | G.8032 debugging events              |
| rx        | G.8032 debugging Receive activities  |
| tx        | G.8032 debugging Transmit activities |

**Mode** Privileged Exec

**Example** To turn off all G.8032 debugging, use the following command:

```
awplus# undebbug g8032 all
```

**Related commands** [debug g8032](#)

# Media Redundancy Protocol (MRP) Commands

## Introduction

**Overview** This chapter provides an alphabetical list of Media Redundancy Protocol (MRP) commands.

Note that you need a feature license for MRP managers, but not for MRP clients.

For more information, see the [MRP Feature Overview and Configuration Guide](#).

- Command List**
- “[clear counter mrp](#)” on page 2754
  - “[debug mrp](#)” on page 2755
  - “[domain-id \(mrp-ring\)](#)” on page 2756
  - “[domain-name \(mrp-ring\)](#)” on page 2757
  - “[enable \(mrp-ring\)](#)” on page 2758
  - “[lc-react](#)” on page 2759
  - “[mrp ring](#)” on page 2760
  - “[profile \(mrp-ring\)](#)” on page 2762
  - “[role \(mrp-ring\)](#)” on page 2763
  - “[service mrp](#)” on page 2764
  - “[show counter mrp](#)” on page 2765
  - “[show debugging mrp](#)” on page 2769
  - “[show mrp ports](#)” on page 2770
  - “[show mrp ring](#)” on page 2771
  - “[vlan-id \(mrp-ring\)](#)” on page 2774

# clear counter mrp

**Overview** Use this command to clear the MRP counters.

**Syntax** `clear counter mrp [global|ring <ring-id>]`

| Parameter | Description                                      |
|-----------|--|
| global    | Clear only global MRP counters.                  |
| ring      | Clear only MRP counters for a specific MRP ring. |
| <ring-id> | <1-65535>. The ID of an MRP ring.                |

**Mode** Privileged Exec

**Example** To clear all MRP counters, use the command:

```
awplus# clear counter mrp
```

To clear only the global MRP counters, use the command:

```
awplus# clear counter mrp global
```

To clear all MRP counters for MRP ring 1, use the command:

```
awplus# clear counter mrp ring 1
```

**Related commands** [mrp ring](#)  
[show counter mrp](#)

**Command changes** Version 5.5.0-2.1: command added

# debug mrp

**Overview** Use this command to enable debug output for MRP.  
Use the **no** variant of this command to disable debug output.

**Syntax** `debug mrp {all|fdb|fsm|port}`  
`no debug mrp {all|fdb|fsm|port}`

| Parameter | Description   |
|-----------|---|
| all       | Enable all debug output options for MRP.                |
| fdb       | Enable debug output for MRP forwarding database events. |
| fsm       | Enable debug output for MRP state machine events.       |
| port      | Enable debug output for MRP port events.                |

**Default** All MRP debug output is disabled.

**Mode** User Exec

**Usage notes** Note that enabling MRP debug is not saved to the config, so enabling debug output will not be persistent.

**Example** To enable all MRP debug output, use the command:

```
awplus# debug mrp all
```

To disable MRP port event debug output, use the command:

```
awplus# no debug mrp port
```

**Related commands** [mrp ring](#)  
[show debugging mrp](#)

**Command changes** Version 5.5.0-2.1: command added

# domain-id (mrp-ring)

**Overview** Use this command to configure the domain ID of an MRP ring. The domain ID is used to identify the nodes in the ring, and is set in the MRP PDU packets. All nodes in an MRP ring must have the same domain ID.

Use the **no** variant of this command to reset the domain ID to the default.

**Syntax** domain-id <uuid>  
no domain-id <uuid>

| Parameter | Description   |
|-----------|---|
| <uuid>    | A hexadecimal string that identifies the MRP ring, with a format like FFFFFFFF-FFFF-FFFF-FFFF-FFFFFFFFFFFFFF. |

**Default** A hexadecimal string, with the value:  
FFFFFFFF-FFFF-FFFF-FFFF-FFFFFFFFFFFFFF - <Ring ID> + 1

**Mode** MRP Ring Configuration

**Example** To configure the domain ID of MRP ring 1 to FFFFFFFF-FFFF-FFFF-FFFF-FFFFFFFF3210, use the commands:

```
awplus# configure terminal
awplus(config)# mrp ring 1
awplus(config-mrp-ring)# domain-id
FFFFFFFF-FFFF-FFFF-FFFF-FFFFFFFF3210
```

**Related commands**

- [domain-name \(mrp-ring\)](#)
- [enable \(mrp-ring\)](#)
- [mrp ring](#)
- [profile \(mrp-ring\)](#)
- [role \(mrp-ring\)](#)
- [vlan-id \(mrp-ring\)](#)

**Command changes** Version 5.5.0-2.1: command added

# domain-name (mrp-ring)

**Overview** Use this command to set the domain name of an MRP ring.  
Use the **no** variant of this command to remove the domain name of an MRP ring.

**Syntax** domain-name <name>  
no domain-name

| Parameter | Description                       |
|-----------|-----------------------------------|
| <name>    | The domain name for the MRP ring. |

**Default** No domain name is set.

**Mode** MRP Ring Configuration

**Example** To set the domain name of MRP ring 1 to 'ring1', use the commands:

```
awplus# configure terminal
awplus(config)# mrp ring 1
awplus(config-mrp-ring)# domain-name ring1
```

To clear the domain name of MRP ring 1, use the commands:

```
awplus# configure terminal
awplus(config)# mrp ring 1
awplus(config-mrp-ring)# no domain-name
```

**Related commands**

- [domain-id \(mrp-ring\)](#)
- [enable \(mrp-ring\)](#)
- [mrp ring](#)
- [profile \(mrp-ring\)](#)
- [role \(mrp-ring\)](#)
- [vlan-id \(mrp-ring\)](#)

**Command changes** Version 5.5.0-2.1: command added

# enable (mrp-ring)

**Overview** Use this command to enable MRP on an MRP ring.  
Use the **no** variant of this command to disable MRP on an MRP ring.

**Syntax** enable  
no enable

**Default** MRP is enabled.

**Mode** MRP Ring Configuration

**Example** To disable MRP for MRP ring 1, use the commands:

```
awplus# configure terminal
awplus(config)# mrp ring 1
awplus(config-mrp-ring)# no enable
```

**Related commands** [domain-id \(mrp-ring\)](#)  
[domain-name \(mrp-ring\)](#)  
[mrp ring](#)  
[profile \(mrp-ring\)](#)  
[role \(mrp-ring\)](#)  
[vlan-id \(mrp-ring\)](#)

**Command changes** Version 5.5.0-2.1: command added

# lc-react

**Overview** Use this command to configure the media redundancy manager (MRM) to react to MRP\_LinkDown and MRP\_LinkUp frames from media redundancy clients (MRCs). This may result in faster failover and recovery time.

Use the **no** variant of this command to set the MRM back to the default of ignoring those packets, and relying on the test frame interval timeout.

**Syntax** `lc-react`  
`no lc-react`

**Default** The MRM ignores MRP\_LinkDown and MRP\_LinkUp frames from MRCs, and relies on the test frame interval timeout.

**Mode** MRP Ring Manager Configuration

**Example** To configure MRP ring 1 to react to MRP\_LinkDown and MRP\_LinkUp frames, use the commands:

```
awplus# configure terminal
awplus(config)# mrp ring 1
awplus(config-mrp-ring)# role manager
awplus(config-mrp-ring-manager)# lc-react
```

To reset MRP ring 1 to ignore MRP\_LinkDown and MRP\_LinkUp frames, use the commands:

```
awplus# configure terminal
awplus(config)# mrp ring 1
awplus(config-mrp-ring)# role manager
awplus(config-mrp-ring-manager)# no lc-react
```

**Related commands** [mrp ring](#)  
[role \(mrp-ring\)](#)

**Command changes** Version 5.5.0-2.1: command added

# mrp ring

**Overview** Use this command to create an MRP Ring and enter MRP Ring Configuration mode, or to attach a port to an MRP ring.

In Global Configuration mode, this command will create an MRP ring and enter MRP Ring Configuration mode.

In Interface Configuration mode, this command will attach a port to an MRP ring. The MRP ring registers the port's VLAN in the MRP structure. If this is the second port to be attached to the MRP ring, it will first verify that the VLANs match.

Use the **no** variant of this command to remove a port from an MRP ring.

**Syntax** `mrp ring <ring-id>`  
`no mrp ring <ring-id>`

| Parameter                    | Description                        |
|------------------------------|------------------------------------|
| <code>&lt;ring-id&gt;</code> | <1-65535>. The ID of the MRP ring. |

**Mode** Global Configuration mode to enter MRP Ring Configuration mode, or Interface Configuration mode to attach a port to or remove a port from an MRP ring.

**Example** To create MRP ring 1 and enter MRP Ring Configuration mode, use the commands:

```
awplus# configure terminal
awplus(config)# mrp ring 1
awplus(config-mrp-ring)#
```

To attach port1.0.1 to MRP ring 1, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# mrp ring 1
```

To remove port1.0.1 from MRP ring 1, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# no mrp ring 1
```

**Related commands**

- [domain-id \(mrp-ring\)](#)
- [domain-name \(mrp-ring\)](#)
- [enable \(mrp-ring\)](#)
- [profile \(mrp-ring\)](#)
- [role \(mrp-ring\)](#)
- [vlan-id \(mrp-ring\)](#)

**Command changes** Version 5.5.0-2.1: command added

# profile (mrp-ring)

**Overview** Use this command to set the maximum recovery timing profile for an MRP ring. This sets the worst case recovery time to 200ms or 500ms.

Use the **no** variant of this command to return to the default value (200ms).

**Syntax** `profile {200|500}`  
`no profile`

| Parameter | Description                                   |
|-----------|---|
| 200       | The worst-case recovery time is set to 200ms. |
| 500       | The worst-case recovery time is set to 500ms. |

**Default** 200ms.

**Mode** MRP Ring Configuration

**Example** To configure the worst case recovery time for MRP ring 1 to 500ms, use the commands:

```
awplus# configure terminal
awplus(config)# mrp ring 1
awplus(config-mrp-ring)# profile 500
```

To reset the worst case recovery time for MRP ring 1 to the default of 200ms, use the commands:

```
awplus# configure terminal
awplus(config)# mrp ring 1
awplus(config-mrp-ring)# no profile
```

**Related commands**

- [domain-id \(mrp-ring\)](#)
- [domain-name \(mrp-ring\)](#)
- [enable \(mrp-ring\)](#)
- [mrp ring](#)
- [role \(mrp-ring\)](#)
- [vlan-id \(mrp-ring\)](#)

**Command changes** Version 5.5.0-2.1: command added

# role (mrp-ring)

**Overview** Use this command to set the operating role for a node in an MRP ring.

If the node is set to **manager**, it will also set the mode to MRP Ring Manager Configuration mode.

Use the **no** variant of this command to set the operating role to the default (client).

**Syntax** `role {client|manager}`  
`no role [client|manager]`

| Parameter | Description   |
|-----------|---|
| client    | Assigns the operating role of media redundancy client (MRC) to the node.  |
| manager   | Assigns the operating role of media redundancy manager (MRM) to the node. |

**Default** Client.

**Mode** MRP Ring Configuration

**Example** To assign the manager role to a node on MRP ring 1, use the commands:

```
awplus# configure terminal
awplus(config)# mrp ring 1
awplus(config-mrp-ring)# role manager
awplus(config-mrp-ring-manager)#
```

To set the role of a node on MRP ring 1 to the default (client), use the commands:

```
awplus# configure terminal
awplus(config)# mrp ring 1
awplus(config-mrp-ring)# no role
```

**Related commands** [lc-react](#)  
[mrp ring](#)

**Command changes** Version 5.5.0-2.1: command added

# service mrp

**Overview** Use this command to enable the Media Redundancy Protocol (MRP) service. This is required before any other MRP configuration can be entered.

Use the **no** variant of this command to disable the MRP service.

**Syntax** `service mrp`  
`no service mrp`

**Default** The MRP service is disabled.

**Mode** Global Configuration

**Example** To enable the MRP service, use the commands:

```
awplus# configure terminal
awplus(config)# service mrp
```

To disable the MRP service, use the commands:

```
awplus# configure terminal
awplus(config)# no service mrp
```

**Related commands** [mrp ring](#)

**Command changes** Version 5.5.0-2.1: command added

# show counter mrp

**Overview** Use this command to show the MRP counters.

The global counters provide an overall count of protocol packets being sent and received, as well as the timer and dispatcher that show the service has not halted.

The ring counters provide per-ring counters for both ring ports. These count the different types of MRP PDU packets that are sent and received. They also provide topology and port state counters that record events on the ring.

**Syntax** `show counter mrp [global|ring <ring-id>]`

| Parameter | Description                                     |
|-----------|---|
| global    | Show only global MRP counters.                  |
| ring      | Show only MRP counters for a specific MRP ring. |
| <ring-id> | <1-65535>. The ID of an MRP ring.               |

**Mode** User Exec

**Example** To show all MRP counters, use the command:

```
awplus# show counter mrp
```

To show only the global MRP counters, use the command:

```
awplus# show counter mrp global
```

To show all MRP counters for MRP ring 1, use the command:

```
awplus# show counter mrp ring 1
```

Table 56-1: Parameters in the output from **show counter mrp**

| Parameter                        | Description   |
|----------------------------------|---|
| MRP Started                      | The number of times the MRP service has been started with the service mrp command. This counter increases each time it is stopped and started.              |
| MRP Dispatcher<br>MRP Timer Tick | Internal timer tick that provides timing for the protocol and the dispatcher. This is called to process timing events, packet reception, and state changes. |
| MRP Packet RX                    | The number of MRP protocol packets received.  |
| MRP Packet RX Error              | The number of failures when receiving a packet.   |
| MRP Packet TX                    | The number of MRP protocol packets sent.  |
| MRP Packet TX Error              | The number of failures when sending a packet.   |
| MRP_Test                         | The number of test frames sent and received by the Media Redundancy Manager (MRM) to test if the ring is open or closed.                                    |
| MRP_TopologyChange               | The number of topology change frames sent from the MRM to indicate ring topology changes to Media Redundancy Clients (MRC).                                 |
| MRP_LinkUp<br>MRP_LinkDown       | The number of Link Up/Down frames sent from MRC to indicate a link state change on one of its ring ports.   |
| State Changes                    | The number of changes in the protocol state. These are triggered by test packets detecting the ring opening or closing, and MRP ring port link changes.     |
| Port Blocked Set                 | The number of times a ring port has been set to blocking.   |

Table 56-1: Parameters in the output from **show counter mrp** (cont.)

| Parameter           | Description  |
|---------------------|--|
| Port Forwarding Set | The number of times a ring port has been set to forwarding.  |
| Multiple Manager    | A misconfiguration detected by the MRM that another manager is on the ring. This is detected from information in the MRP PDU frames. |

**Related commands** [clear counter mrp](#)  
[mrp ring](#)

**Command changes** Version 5.5.0-2.1: command added

# show debugging mrp

**Overview** Use this command to show which debug options are enabled for MRP logging.

**Syntax** `show debugging mrp`

**Mode** User Exec

**Example** To show the enabled MRP debugging options, use the command:

```
awplus# show debugging mrp
```

**Output** Figure 56-4: Example output from **show debugging mrp**

```
awplus#show debugging mrp
MRP debugging status:
  MRP Port debugging: On
  MRP FSM debugging: Off
  MRP FDB debugging: Off
```

Table 56-2: Parameters in the output from **show debugging mrp**

| Parameter          | Description                                      |
|--------------------|--|
| MRP Port debugging | Debug output for MRP port events.                |
| MRP FSM debugging  | Debug output for MRP state machine events.       |
| MRP FDB debugging  | Debug output for MRP forwarding database events. |

**Related commands** [debug mrp](#)  
[mrp ring](#)

**Command changes** Version 5.5.0-2.1: command added

# show mrp ports

**Overview** Use this command to show a summary of all ports that are configured for MRP rings.

**Syntax** `show mrp ports`

**Mode** User Exec

**Example** To show a summary of the ports configured for MRP rings, use the command:

```
awplus# show mrp ports
```

**Output** Figure 56-5: Example output from **show mrp ports**

```
awplus#show mrp ports
Media Redundancy Protocol - Port Information

Connection          Port          State
-----
Ring 1              port1.0.23    Blocking
Ring 1              port1.0.24    Forwarding
```

Table 56-3: Parameters in the output from **show mrp ports**

| Parameter  | Description  |
|------------|--|
| Connection | The name of the MRP ring.  |
| Port       | The ID of the port.  |
| State      | The state of the port:<br>Disabled - all packets received by the port are dropped.<br>Blocking - all packets received by the port are dropped, with the exception of MRP protocol packets.<br>Forwarding - all packets received by the port are forwarded. |

**Related commands** [mrp ring](#)

**Command changes** Version 5.5.0-2.1: command added

# show mrp ring

**Overview** Use this command to show the MRP ring settings for a specific ring, or for all rings.

**Syntax** show mrp ring [*<ring-id>*]

| Parameter              | Description            |
|------------------------|------------------------|
| <i>&lt;ring-id&gt;</i> | The ID of an MRP ring. |

**Mode** Privileged Exec

**Example** To show the settings for all MRP rings, use the command:

```
awplus# show mrp ring
```

To show the settings for MRP ring 1, use the command:

```
awplus# show mrp ring 1
```

**Output** Figure 56-6: Example output from **show mrp ring** for a Manager

```
awplus#show mrp ring
Media Redundancy Protocol - Ring Information
MRP Ring 1
  Domain ID:                ffffffff-ffff-ffff-ffff-ffffffffffff
  Domain Name:
  Ring Status:              Enabled
  Operating Mode:          CLI
  Role:                    Manager
  Network Status:         Open
  Port1:                  port1.0.25
    Status:                Forwarding
  Port2:                  port1.0.29
    Status:                Forwarding
  Vlan ID:
  React on Link Change:    No
  Profile:                 200ms
    Topology Change Interval: 10ms
    Topology Change Count:   3
    Short Test Frame Interval: 10ms
    Default Test Frame Interval: 20ms
    Test Monitoring Interval Count: 3
    Test Monitoring Ext Interval Count: 0
  Non-blocking MRC Supported: No
```

**Output** Figure 56-7: Example output from **show mrp ring** for a Client

```
awplus#show mrp ring
Media Redundancy Protocol - Ring Information
MRP Ring 1
  Domain ID:                ffffffff-ffff-ffff-ffff-ffffffffffffff
  Domain Name:
  Ring Status:              Enabled
  Running State:           Stopped
  Role:                    Client
  Port1:                   port1.0.3
    Status:                Forwarding
  Port2:                   port1.0.4
    Status:                Forwarding
  Vlan ID:
  Profile:                 200ms
  Link Down Interval:     20ms
  Link Up Interval:       20ms
  Link Change Count:      4
  Blocked port state supported: Yes
```

Table 56-4: Parameters in the output from **show mrp ring**

| Parameter      | Description  |
|----------------|--|
| Domain ID      | The UUID that identifies the ring.<br>The Domain ID is used in MRP PDU packets.  |
| Domain Name    | Description of the ring that can be set by the user.   |
| Ring Status    | Whether the ring is Enabled or Disabled.   |
| Operating Mode | CLI - the MRP ring is configured and controlled from the command line.   |
| Role           | Whether the node is a Manager (MRM) or Client (MRC).   |
| Network Status | Whether the MRP ring is Open or Closed (MRM only).   |
| Port Status    | The state of the port:<br>Disabled - all packets received by the port are dropped.<br>Blocking - all packets received by the port are dropped, with the exception of MRP protocol packets.<br>Forwarding - all packets received by the port are forwarded. |
| Vlan ID        | If the MRP ring is configured with a trunked VLAN, this shows the configured VLAN ID.  |
| Profile        | Whether it is configured for 200ms or 500ms.   |

**Related commands** [mrp ring](#)

**Command changes** Version 5.5.0-2.1: command added

# vlan-id (mrp-ring)

**Overview** Use this command to assign a VLAN to an MRP ring.

**Syntax** `vlan-id <vlan>`

| Parameter                 | Description  |
|---------------------------|--|
| <code>&lt;vlan&gt;</code> | <code>&lt;1-4094&gt;</code> The ID of the VLAN to be assigned. |

**Mode** MRP Ring Configuration

**Usage notes** This is only possible if the ports attached to the MRP ring are set to trunked mode. In access mode, MRP will automatically set this to the VLAN of the port. Both ports must be in the same VLAN.

**Example** To assign VLAN 2 to MRP ring 1, use the commands:

```
awplus# configure terminal
awplus(config)# mrp ring 1
awplus(config-mrp-ring)# vlan-id 2
```

- [enable \(mrp-ring\)](#)
- [mrp ring](#)
- [profile \(mrp-ring\)](#)
- [role \(mrp-ring\)](#)

**Command changes** Version 5.5.0-2.1: command added

# Part 7: Network Management

# 57

# AMF and AMF Plus Commands

## Introduction

**Overview** This chapter provides an alphabetical reference for AMF and AMF Plus commands. AMF is the Allied Telesis Autonomous Management Framework™, and AMF Plus is an expanded version of AMF. Both AMF and AMF Plus are a suite of features that combine to simplify network management across all supported network equipment from the core to the edge. They also integrate with Vista Manager, our graphical monitoring and management platform.

On the AlliedWare Plus command line, AMF and AMF Plus are identical. The difference between them is in Vista Manager, where AMF Plus includes additional AMF Plus intent-based networking features.

**In the rest of this chapter, we use 'AMF' to refer to both AMF and AMF Plus.**

**AMF master nodes** Every AMF network must have at least one master node, which acts as the core of the AMF network. Not all AlliedWare Plus devices are capable of acting as a AMF master. See the [AMF Feature Overview and Configuration Guide](#) for information about master support.

**AMF edge** AlliedWare Plus CentreCOM® Series switches can only be used as edge switches in an AMF network. The full management power and convenience of AMF is available on these switches, but they can only link to one other AMF node. They cannot form cross-links or virtual links.

**AMF naming convention** When AMF is enabled on a device, it will automatically be assigned a host name. If a host name has already been assigned, by using the command [hostname](#) on page 281, this will remain. If however, no host name has been assigned, then the name applied will be the prefix, **host\_** followed (without a space) by the MAC address of the device. For example, a device whose MAC address is **0016.76b1.7a5e** will have the name **host\_0016\_76b1\_7a5e** assigned to it.

To efficiently manage your network using AMF, we strongly advise that you devise a naming convention for your network devices, and apply an appropriate hostname to each device in your AMF network.

---

**AMF and STP** On AR-Series UTM firewalls and Secure VPN routers, you cannot use STP at the same time as AMF.

# application-proxy ip-filter

**Overview** Use this command to enable global IP filtering on a device. Once enabled the device will add a global ACL in response to a threat message from an AMF Security (AMF-Sec) Controller.

Use the **no** variant of this command to disable global IP filtering.

**Syntax** `application-proxy ip-filter`  
`no application-proxy ip-filter`

**Default** Global IP filtering is disabled by default.

**Mode** Global Configuration

**Usage notes** For this feature to work, the AMF Application Proxy service needs to be enabled on your network, using the command [service atmf-application-proxy](#).

**Example** To enable global IP filtering, use the commands:

```
awplus# configure terminal
awplus(config)# application-proxy ip-filter
```

To disable global IP filtering, use the commands:

```
awplus# configure terminal
awplus(config)# no application-proxy ip-filter
```

**Related commands** [application-proxy redirect-url](#)  
[application-proxy threat-protection](#)  
[clear application-proxy threat-protection](#)  
[service atmf-application-proxy](#)  
[show application-proxy threat-protection](#)

**Command changes** Version 5.4.7-2.5: command added

# application-proxy quarantine-vlan

**Overview** Use this command to set the quarantine VLAN to use when an AMF Security (AMF-Sec) Controller detects a threat. The port/s on which the threat is detected are moved to this VLAN if the [application-proxy threat-protection](#) action is set to **quarantine**.

Use the **no** variant of this command to delete the quarantine VLAN. If no quarantine VLAN is specified then no quarantine action will be performed.

**Syntax** `application-proxy quarantine-vlan <vlan-id>`  
`no application-proxy quarantine-vlan`

| Parameter                    | Description                                     |
|------------------------------|---|
| <code>&lt;vlan-id&gt;</code> | The ID of the VLAN to use. In the range 1-4094. |

**Default** By default, no quarantine VLAN is configured.

**Mode** Global Configuration

**Example** To configure VLAN 100 as the quarantine VLAN, use the commands:

```
awplus# configure terminal
awplus(config)# application-proxy quarantine-vlan 100
```

To delete the quarantine VLAN, use the commands:

```
awplus# configure terminal
awplus(config)# no application-proxy quarantine-vlan
```

**Related commands** [application-proxy threat-protection](#)

[clear application-proxy threat-protection](#)

[application-proxy threat-protection send-summary](#)

[service atmf-application-proxy](#)

[show application-proxy threat-protection](#)

**Command changes** Version 5.4.7-2.2: command added

# application-proxy redirect-url

**Overview** Use this command to redirect a user to a helpful URL when they are blocked because of an [application-proxy ip-filter](#).

Use the **no** variant of this command to remove the URL redirect.

**Syntax** `application-proxy redirect-url <url>`  
`no application-proxy redirect-url`

| Parameter                | Description                  |
|--------------------------|------------------------------|
| <code>&lt;url&gt;</code> | URL to redirect the user to. |

**Default** No URL is configured by default.

**Mode** Global Configuration

**Example** To configure a redirect URL, use the command:

```
awplus# application-proxy redirect-url http://my.dom/help.html
```

To remove a redirect URL, use the command:

```
awplus# no application-proxy redirect-url
```

**Related commands** [application-proxy ip-filter](#)  
[application-proxy threat-protection](#)  
[clear application-proxy threat-protection](#)  
[service atmf-application-proxy](#)  
[show application-proxy threat-protection](#)

**Command changes** Version 5.4.9-0.1: command added

# application-proxy threat-protection

**Overview** Use this command to set the blocking action to take when a threat detected message is received from an AMF Security (AMF-Sec) Controller.

Use the **no** variant of this command to disable threat protection blocking actions on the port.

**Syntax** application-proxy threat-protection  
{drop|link-down|quarantine|log-only}  
no application-proxy threat-protection

| Parameter  | Description  |
|------------|--|
| drop       | Drop the traffic that generates the threat reports. This is a Layer 2 drop. Note that the device will only drop packets that arrive at the port, not packets sent from the port. |
| link-down  | Take the link down in response to threats, by setting it to error disabled.  |
| quarantine | Move the offending port to a quarantine VLAN.  |
| log-only   | Log when a threat is detected.   |

**Default** Threat protection is disabled by default.

**Mode** Interface Configuration

**Example** To set the threat protection blocking action on port1.0.4 to drop, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.4
awplus(config-if)# application-proxy threat-protection drop
```

To disable threat protection blocking actions on port1.0.4, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.4
awplus(config-if)# no application-proxy threat-protection
```

**Related commands**

- [application-proxy threat-protection send-summary](#)
- [clear application-proxy threat-protection](#)
- [service atmf-application-proxy](#)
- [show application-proxy threat-protection](#)

**Command changes** Version 5.5.2-0.1: added to switch ports on AR series devices  
Version 5.4.9-0.1: **log-only** parameter added  
Version 5.4.7-2.2: command added

# application-proxy threat-protection send-summary

**Overview** Use this command to send a summary of all current threat-protection blocking requests to all AMF Application Proxy service nodes. This command can only be performed on an AMF master.

**Syntax** `application-proxy threat-protection send-summary`

**Mode** Privileged Exec

**Example** To send a summary of all current threat-protection blocking requests to all AMF Application Proxy service nodes, use the command:

```
awplus# application-proxy threat-protection send-summary
```

**Related commands**

- [application-proxy quarantine-vlan](#)
- [application-proxy threat-protection](#)
- [clear application-proxy threat-protection](#)
- [service atmf-application-proxy](#)
- [show application-proxy threat-protection](#)

**Command changes** Version 5.4.7-2.2: command added

# application-proxy whitelist advertised-address

**Overview** Use this command to register a Layer 3 interface, and the IPv4 address that is attached to this interface, as the advertised application-proxy whitelist address for a device.

Use the **no** variant of this command to stop advertising the Layer 3 interface and its associated IPv4 address.

**Syntax** `application-proxy whitelist advertised-address <interface>`  
`no application-proxy whitelist advertised-address`

| Parameter                      | Description   |
|--------------------------------|---|
| <code>&lt;interface&gt;</code> | Layer 3 interface to configure as the advertised address. |

**Default** No address advertised by default.

**Mode** Global Configuration

**Example** To configure the IPv4 address attached to VLAN 1 as the advertised address, use the commands:

```
awplus# configure terminal
awplus(config)# application-proxy whitelist advertised-address
vlan1
```

To remove the advertised address, use the commands:

```
awplus# configure terminal
awplus(config)# no application-proxy whitelist
advertised-address
```

**Related commands** [application-proxy whitelist server](#)  
[show application-proxy whitelist advertised-address](#)

**Command changes** Version 5.4.9-1.1: command added

# application-proxy whitelist enable

**Overview** Use this command to enable application-proxy whitelist based authentication on an interface.

Use the **no** variant of this command to disable the whitelist authentication.

**Syntax** application-proxy whitelist enable  
no application-proxy whitelist enable

**Default** Application-proxy whitelist is disabled by default.

**Mode** Interface Configuration

**Usage notes** When **port-control** is set to **auto**, the 802.1X authentication feature is executed on the interface, but only if the **aaa authentication dot1x** command has been issued.

If you attempt to change the authentication configuration on an interface that has threat protection quarantine configured, you will see the following error message:

```
% portx.x.x: Application Proxy quarantine configuration must be removed before port authentication is changed
```

Before changing the interface's authentication configuration you must either:

- remove the interface's threat protection configuration, or
- shut down the interface.

**Example** To enable application-proxy whitelist authentication on the interface port1.0.4, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.4
awplus(config-if)# application-proxy whitelist enable
```

To disable application-proxy whitelist authentication on the interface port1.0.4, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.4
awplus(config-if)# no application-proxy whitelist enable
```

**Related commands** application-proxy whitelist server  
show application-proxy whitelist interface  
show application-proxy whitelist server  
show application-proxy whitelist supplicant

**Command changes** Version 5.4.9-0.1: command added

# application-proxy whitelist protection tls

**Overview** Use this command to configure the application-proxy whitelist control channel to use TLS protection. If no trustpoint is specified then TLS will operate without authentication.

Use the **no** variant of this command to stop using TLS.

**Syntax** application-proxy whitelist protection tls [trustpoint <name>]  
no application-proxy whitelist protection tls

| Parameter  | Description   |
|------------|---|
| trustpoint | Specify an optional trustpoint. If no trustpoint is specified then TLS will operate without authentication. |
| <name>     | Name of the trustpoint.   |

**Default** TLS is disabled by default.

**Mode** Global Configuration

**Example** To configure an AMF application-proxy whitelist to use TLS with the trustpoint 'corpca', use the commands:

```
awplus# configure terminal
awplus(config)# application-proxy whitelist protection tls
trustpoint corpca
```

To configure an AMF application-proxy whitelist to stop using TLS, use the commands:

```
awplus# configure terminal
awplus(config)# no application-proxy whitelist protection tls
```

**Related commands** [application-proxy whitelist enable](#)  
[application-proxy whitelist server](#)  
[show application-proxy whitelist server](#)

**Command changes** Version 5.5.0-2.1: command added

# application-proxy whitelist server

**Overview** Use this command to set an AMF master to act as a whitelist authentication proxy between AMF members, acting as Network Access Servers, and an external whitelist RADIUS server.

Use the **no** variant of this command to disable the whitelist proxy functionality.

**Syntax** `application-proxy whitelist server <ip-address> key <key>`  
`[auth-port <1-65535>]`

`no application-proxy whitelist server`

| Parameter                              | Description  |
|--|--|
| <code>&lt;ip-address&gt;</code>        | IPv4 address of the upstream RADIUS server in dotted decimal format A.B.C.D.                           |
| <code>key &lt;key&gt;</code>           | Set the shared secret encryption key for communication with the upstream RADIUS server.                |
| <code>auth-port &lt;1-65535&gt;</code> | Set the RADIUS server UDP port. This is only necessary if you don't want to use the default port 1812. |

**Default** Disabled by default.

**Mode** Global Configuration

**Example** To configure an AMF master to work as a proxy to the external RADIUS server 192.168.1.10, with shared secret 'mysecurekey', on port 1822, use the commands:

```
awplus# configure terminal
awplus(config)# application-proxy whitelist server 192.168.1.10
key mysecurekey auth-port 1822
```

To configure an AMF master to work as a proxy to the external RADIUS server 192.168.1.10, with shared secret 'mysecurekey', on the default port (1812), use the commands:

```
awplus# configure terminal
awplus(config)# application-proxy whitelist server 192.168.1.10
key mysecurekey
```

To disable the whitelist proxy, use the commands:

```
awplus# configure terminal
awplus(config)# no application-proxy whitelist server
```

**Related commands** [application-proxy whitelist enable](#)

[service atmf-application-proxy](#)

[show application-proxy whitelist interface](#)

[show application-proxy whitelist server](#)

show application-proxy whitelist supplicant

**Command changes** Version 5.4.9-0.1: command added

# application-proxy whitelist trustpoint (deprecated)

**Overview** This command has been deprecated. It has been replaced by the [application-proxy whitelist protection tls](#) command.

This command sets the trustpoint to use when communicating with the external whitelist RADIUS server. This enables RADIUS over TLS (RadSec) protection.

**Syntax** `application-proxy whitelist trustpoint <name>`  
`no application-proxy whitelist trustpoint`

**Command changes** Version 5.4.9-1.1: command added  
Version 5.5.0-2.1: command deprecated

# area-link

**Overview** Use this command to create an area-link between a Virtual AMF Appliance (VAA) host controller and an AMF container.

An AMF container is an isolated instance of AlliedWare Plus with its own network interfaces, configuration, and file system. The features available inside an AMF container are a sub-set of the features available on the host VAA. These features enable the AMF container to function as a uniquely identifiable AMF master and allows for multiple tenants (up to 60) to run on a single VAA host. See the [AMF Feature Overview and Configuration Guide](#) for more information on running multiple tenants on a single VAA host.

Use the **no** variant of this command to remove an area-link from a container.

**Syntax** `area-link <area-name>`  
`no area-link`

| Parameter                      | Description                            |
|--------------------------------|--|
| <code>&lt;area-name&gt;</code> | AMF area name of the container's area. |

**Mode** AMF Container Configuration

**Usage notes** The AMF area-link connects the AMF controller on a VAA host to the AMF container. Once a container has been created with the [atmf container](#) command and an area-link configured with the **area-link** command, it can be enabled using the [state](#) command.

You can only configure a single area-link on a container. You will see the following message if you try and configure a second one:

```
% AreaLink already configured for this container
```

Each container has two virtual interfaces:

- Interface eth0, used to connect to the AMF controller on the VAA host via an AMF area-link, configured using this area-link command.
- Interface eth1, used to connect to the outside world using a bridged L2 network link, configured using the [bridge-group \(amf-container\)](#) command.

See the [AMF Feature Overview and Configuration\\_Guide](#) for more information on these virtual interfaces and links.

**Example** To create the area-link to "wlg" on container "vac-wlg-1", use the commands:

```
awplus# configure terminal
awplus(config)# atmf container vac-wlg-1
awplus(config-atmf-container)# area-link wlg
```

To remove an area-link from container "vac-wlg-1", use the commands:

```
awplus# configure terminal
awplus(config)# atmf container vac-wlg-1
awplus(config-atmf-container)# no area-link
```

**Related  
commands**

[atmf container](#)  
[show atmf container](#)

**Command  
changes**

Version 5.4.7-0.1: command added

# atmf-arealink

**Overview** This command to enable an Eth interface, on an AR-series device, as an AMF area link. AMF area links are designed to operate between two nodes in different areas in an AMF network. This command is only available if your network is running in AMF secure mode (see [atmf secure-mode](#) for more information on AMF secure mode).

Use the **no** variant of this command to remove any AMF area links that may exist for the selected Eth interface.

**Syntax** `atmf-arealink remote-area <area-name> vlan <2-4094>`  
`no atmf-arealink`

| Parameter   | Description  |
|-------------|--|
| <area-name> | The name of the remote area that the interface is connecting to.   |
| <2-4094>    | The VLAN ID for the link. This VLAN cannot be used for any other purpose, and the same VLAN ID must be used at each end of the link. |

**Default** By default, no area links are configured

**Mode** Eth interface on an AR-series device.

**Usage notes** Run this command on the interface at both ends of the link.

Each area must have the area-name configured, and the same area password must exist on both ends of the link.

Running this command will synchronize the area information stored on the two nodes.

You can configure multiple area links between two area nodes, but only one area link at any time will be in use. All other area links will block information, to prevent network storms.

**NOTE:** See the [switchport atmf-arealink](#) command to configure an AMF area link on an a switch port or link aggregator

**Example** To configure eth1 as an AMF area link to the 'Auckland' area on VLAN 6, use the following commands:

```
master_1# configure terminal
master_1(config)# interface eth1
master_1(config-if)# atmf-arealink remote-area Auckland vlan 6
```

To remove eth1 as an AMF area link, use the following commands:

```
master_1# configure terminal
master_1(config)# interface eth1
master_1(config-if)# no atmf-arealink
```

**Related commands** [atmf area](#)  
[atmf area password](#)  
[atmf virtual-link](#)  
[show atmf links](#)

**Command changes** Version 5.5.0-1.1: command added

# atmf-link

**Overview** Use this command to enable an Eth interface on an AR-series device as an up/down AMF link. This command is only available if your network is running in AMF secure mode (see [atmf secure-mode](#) for more information on AMF secure mode).

Use the **no** variant of this command to remove any AMF link that may exist for the selected Eth interface.

**Syntax** atmf-link  
no atmf-link

**Mode** Eth interface on an AR-series device.

**Usage notes** Up/down links and virtual links interconnect domains in a vertical hierarchy, with the highest domain being the core domain. In effect, they form a tree of interconnected AMF domains. This tree must be loop-free. Therefore you must configure your up/down and virtual links so that no loops are formed.

If you run the command and AMF secure mode is not enabled, you will see the following error message:

```
Node_1(config)#int eth1
Node_1(config-if)#atmf-link
% Cannot configure eth1 because atmf secure-mode is not enabled.
```

**NOTE:** See the [switchport atmf-link](#) command to configure an AMF up/down link on an a switch port or link aggregator

**Example** To configure eth1 as an AMF up/down link, use the following commands:

```
Node_1# configure terminal
Node_1(config)# interface eth1
Node_1(config-if)# atmf-link
```

To remove eth1 as an AMF up/down link, use the following commands:

```
Node_1# configure terminal
Node_1(config)# interface eth1
Node_1(config-if)# no atmf-link
```

**Related commands** [atmf recover over-eth](#)

[switchport atmf-link](#)

**Command changes** Version 5.5.0-1.1: command added

# atmf amfplus-license-only

**Overview** Use this command if you want to use the AMF Plus features in Vista Manager EX, and you have a mixture of AMF and AMF Plus licenses on your master node. This command sets the AMF network to only count **AMF Plus** licensed nodes.

Use the **no** variant of this command to include both AMF and AMF Plus licenses when calculating the number of licensed nodes in an area count.

**Syntax** `atmf amfplus-license-only`  
`no atmf amfplus-license-only`

**Default** The **no** version is the default. That is, consider both AMF and AMF Plus licenses when calculating the number of licensed nodes.

**Mode** Global Configuration

**Usage notes** From software version 5.5.2-2.3 onwards, AMF licenses are no longer available to purchase. Instead, AMF Plus licenses become available. Existing AMF licenses remain valid. You only need to change to AMF Plus licenses if you want to manage more nodes, or use the new AMF Plus menu in Vista Manager.

**CAUTION:** *If the network has more AMF nodes than are licensed with AMF Plus:*

- AMF Plus will still be enabled in Vista Manager EX (provided there is no AMF license)
- any AMF nodes above the license count won't join the AMF network.

The AMF Plus menu replaces the AOI menu in Vista Manager EX when all the AMF Masters and Controllers have:

- An AMF Plus Controller/Master license on all Masters and Controllers, and
- No AMF Controller/Master licenses applied, or AMF Controller/Master licenses disabled with this command.

**Example** To set the AMF network to only count AMF Plus licensed nodes, use the commands:

```
awplus#configure terminal
awplus(config)#atmf amfplus-license-only
```

**Output** Figure 57-1: Example using **atmf amfplus-license-only**

```
ATMF Summary Information:

Total number of licensed nodes available is 12
```

**Related commands** [show atmf](#)

**Command changes** Version 5.5.3-0.1: command added

# atmf area

**Overview** This command creates an AMF area and gives it a name and ID number. Use the **no** variant of this command to remove the AMF area. This command is only valid on AMF controllers, master nodes and gateway nodes.

**Syntax** `atmf area <area-name> id <1-4094> [local]`  
`no atmf area <area-name>`

| Parameter   | Description   |
|-------------|---|
| <area-name> | The AMF area name. The area name can be up to 15 characters long. Valid characters are:<br>a..z<br>A..Z<br>0..9<br>-<br>_ |
| <1-4094>    | An ID number that uniquely identifies this area.  |
| local       | Set the area to be the local area. The local area contains the device you are configuring.                                |

**Mode** Global Configuration

**Usage notes** This command enables you to divide your AMF network into areas. Each area is managed by at least one AMF master node. Each area can have up to 120 nodes, depending on the license installed on that area's master node.

The whole AMF network is managed by up to 8 AMF controllers. Each AMF controller can communicate with multiple areas. The number of areas supported on a controller depends on the license installed on that controller.

You must give each area in an AMF network a unique name and ID number.

Only one local area can be configured on a device. You must specify a local area on each controller, remote AMF master, and gateway node.

**Example** To create the AMF area named New-Zealand, with an ID of 1, and specify that it is the local area, use the command:

```
controller-1(config)# atmf area New-Zealand id 1 local
```

To configure a remote area named Auckland, with an ID of 100, use the command:

```
controller-1(config)# atmf area Auckland id 100
```

**Related commands**

- atmf area password
- show atmf area
- show atmf area summary
- show atmf area nodes
- switchport atmf-arealink

**Command changes** Version 5.5.1-2.1: area **id** maximum increased to 4094

# atmf area password

**Overview** This command sets a password on an AMF area.

Use the **no** variant of this command to remove the password.

This command is only valid on AMF controllers, master nodes and gateway nodes. The area name must have been configured first.

**Syntax** `atmf area <area-name> password [8] <password>`  
`no atmf area <area-name> password`

| Parameter   | Description   |
|-------------|---|
| <area-name> | The AMF area name.  |
| 8           | This parameter is displayed in <b>show running-config</b> output to indicate that it is displaying the password in encrypted form. You should not enter <b>8</b> on the CLI yourself. |
| <password>  | The password is between 8 and 32 characters long. It can include spaces.  |

**Mode** Global Configuration

**Usage notes** You must configure a password on each area that an AMF controller communicates with, except for the controller's local area. The areas must already have been created using the `atmf area` command.

Enter the password identically on both of:

- the area that locally contains the controller, and
- the remote AMF area masters

The command **show running-config atmf** will display the encrypted version of this password. The encryption keys will match between the controller and the remote AMF master.

If multiple controller and masters exist in an area, they must all have the same area configuration.

**Example** To give the AMF area named *Auckland* a password of "secure#1" use the following command on the controller:

```
controller-1(config)# atmf area Auckland password secure#1
```

and also use the following command on the master node for the Auckland area:

```
auck-master(config)# atmf area Auckland password secure#1
```

**Related  
commands**

- atmf area
- show atmf area
- show atmf area summary
- show atmf area nodes
- switchport atmf-arealink

# atmf authorize

**Overview** On an AMF network, with secure mode enabled, use this command on an AMF master to authorize an AMF node to join the network. AMF nodes waiting to be authorized appear in the pending authorization queue, which can be examined using the [show atmf authorization](#) command with the **pending** parameter.

Use the **no** variant of this command to revoke authorization for an AMF node on an AMF master.

**Syntax** `atmf authorize {<node-name> [area <area-name>]|all-pending}`  
`no atmf authorize <node-name> [area <area-name>]`

| Parameter   | Description  |
|-------------|--|
| <node-name> | The name of the node to be authorized or have its authorization revoked. |
| area        | Specify an AMF area.   |
| <area-name> | This is the name of the area the node belongs to.                        |
| all-pending | Authorize all nodes in the pending queue.                                |

**Mode** Privileged Exec

**Usage notes** On an AMF controller, AMF remote-area masters must be authorized by the controller, and the AMF remote-area masters will also need to authorized access from the AMF controller.

**Example** To authorize all AMF nodes in the pending authorization queue on an AMF master, use the command:

```
awplus# atmf authorize all-pending
```

To authorize a node called "node2" in remote AMF area "area3", use the command:

```
awplus# atmf authorize node2 area "area3"
```

To authorize a node called "node4" on an AMF master, use the command:

```
awplus# atmf authorize node4
```

To revoke authorization for a node called "node4" on an AMF master, use the command:

```
awplus# no atmf authorize node4
```

**Related commands**

- [clear atmf secure-mode certificates](#)
- [show atmf authorization](#)
- [show atmf secure-mode](#)

show atmf secure-mode certificates

show atmf secure-mode statistics

**Command changes** Version 5.4.7-0.3: command added

# atmf authorize provision

**Overview** Use this command from an AMF controller or AMF master to pre-authorize a node on an AMF network running in secure mode. This allows a node to join the AMF network the moment the `atmf secure-mode` command is run on that node.

Use the **no** variant of this command to remove a provisional authorization from and AMF controller or AMF master.

**Syntax**

```
atmf authorize provision [timeout <minutes>] node <node-name>  
interface <interface-name> [area <area-name>]  
  
atmf authorize provision [timeout <minutes>] mac <mac-address>  
  
atmf authorize provision [timeout <minutes>] all  
  
no atmf authorize provision node <node-name> interface  
<interface-name> [area <area-name>]  
  
no atmf authorize provision mac <mac-address>  
  
no atmf authorize provision all
```

| Parameter        | Description  |
|------------------|--|
| timeout          | Timeout for provisional authorization. Authorization for provisioned nodes expires after the timeout period specified. |
| <minutes>        | Timeout in minutes. A value between 1 and 6000 is permissible with the default being 60 minutes.                       |
| node             | Specify a node to provision by node name.  |
| <node-name>      | The name of the node to provisionally authorize.   |
| interface        | Specify the interface the node will connect on.  |
| <interface-name> | The name of the interface, this can be a switchport, link aggregator, LACP link, or virtual link.                      |
| area             | Specify the AMF area.  |
| <area-name>      | This is the name of the area the node belongs to.  |
| mac              | Specify a node to provision by MAC address.  |
| <mac-address>    | Enter a MAC address to provisionally authorize in the format HHHH.HHHH.HHHH.   |
| all              | Provision authorization for all secure mode capable nodes.   |

**Default** The default timeout is 60 minutes.

**Mode** Privileged Exec

**Example** To provisionally authorize all non-secure AMF nodes, use the command:

```
awplus# atmf authorize provision all
```

To authorize a node with a MAC address of 0000.cd28.0880 for 2 hours, use the command:

```
awplus# authorize provision timeout 120 mac 0000.cd28.0880
```

To remove all provisional authorization, on an AMF master, use the command:

```
awplus# no atmf authorize provision all
```

**Related commands** [show atmf authorization](#)  
[show atmf secure-mode](#)

**Command changes** Version 5.4.7-0.3: command added

# atmf backup

**Overview** This command can only be applied to a master node. It manually schedules an AMF backup to start at a specified time and to execute a specified number of times per day.

Use the **no** variant of this command to disable the schedule.

**Syntax** `atmf backup {default|<hh:mm> frequency <1-24>}`

| Parameter        | Description  |
|------------------|--|
| default          | Restore the default backup schedule.   |
| <hh:mm>          | Sets the time of day to apply the first backup, in hours and minutes. Note that this parameter uses the 24 hour clock. |
| backup           | Enables AMF backup to external media.  |
| frequency <1-24> | Sets the number of times within a 24 hour period that backups will be taken.   |

**Default** Backups run daily at 03:00 AM, by default

**Mode** Global Configuration

**Usage notes** Running this command only configures the schedule. To enable the schedule, you should then apply the command [atmf backup enable](#).

We recommend using the ext3 or ext4 filesystem on external media that are used for AMF backups.

**Example** To schedule backup requests to begin at 11 am and execute twice per day (11 am and 11 pm), use the following command:

```
node_1# configure terminal
node_1(config)# atmf backup 11:00 frequency 2
```

**CAUTION:** File names that comprise identical text, but with differing case, such as *Test.txt* and *test.txt*, will not be recognized as being different on FAT32 based backup media such as a USB storage device. However, these filenames will be recognized as being different on your Linux based device. Therefore, for good practice, ensure that you apply a consistent case structure for your back-up file names.

**Related commands** [atmf backup enable](#)  
[atmf backup stop](#)  
[show atmf backup](#)

# atmf backup area-masters delete

**Overview** Use this command to delete from external media, a backup of a specified node in a specified area.

Note that this command can only be run on an AMF controller.

**Syntax** `atmf backup area-masters delete area <area-name> node <node-name>`

| Parameter                      | Description   |
|--------------------------------|---|
| <code>&lt;area-name&gt;</code> | The area that contains the node whose backup will be deleted. |
| <code>&lt;node-name&gt;</code> | The node whose backup will be deleted.                        |

**Mode** Privileged Exec

**Example** To delete the backup of the remote area-master named “well-gate” in the AMF area named Wellington, use the command:

```
controller-1# atmf backup area-masters delete area Wellington  
node well-gate
```

**Related commands** [show atmf backup area](#)

# atmf backup area-masters enable

**Overview** Use this command to enable backup of remote area-masters from the AMF controller. This command is only valid on AMF controllers.

Use the **no** form of the command to stop backups of remote area-masters.

**Syntax** `atmf backup area-masters enable`  
`no atmf backup area-masters enable`

**Mode** Global configuration

**Default** Remote area backups are disabled by default

**Usage notes** Use the following commands to configure the remote area-master backups:

- [atmf backup](#) to configure when the backups begin and how often they run
- [atmf backup server](#) to configure the backup server.

We recommend using the ext3 or ext4 filesystem on external media that are used for AMF backups.

**Example** To enable scheduled backups of AMF remote area-masters, use the commands:

```
controller-1# configure terminal
controller-1(config)# atmf backup area-masters enable
```

To disable scheduled backups of AMF remote area-masters, use the commands:

```
controller-1# configure terminal
controller-1(config)# no atmf backup area-masters enable
```

**Related commands** [atmf backup server](#)  
[atmf backup](#)  
[show atmf backup area](#)

# atmf backup area-masters now

**Overview** Use this command to run an AMF backup of one or more remote area-masters from the AMF controller immediately.

This command is only valid on AMF controllers.

**Syntax** `atmf backup area-masters now [area <area-name>|area <area-name>  
node <node-name>]`

| Parameter   | Description                                    |
|-------------|--|
| <area-name> | The area whose area-masters will be backed up. |
| <node-name> | The node that will be backed up.               |

**Mode** Privileged Exec

**Example** To back up all local master nodes in all areas controlled by controller-1, use the command

```
controller-1# atmf backup area-masters now
```

To back up all local masters in the AMF area named Wellington, use the command

```
controller-1# atmf backup area-masters now area Wellington
```

To back up the local master "well-master" in the Wellington area, use the command

```
controller-1# atmf backup area-masters now area Wellington node  
well-master
```

**Related commands** [atmf backup area-masters enable](#)  
[atmf backup area-masters synchronize](#)  
[show atmf backup area](#)

# atmf backup area-masters synchronize

**Overview** Use this command to synchronize backed-up area-master files between the active remote file server and the backup remote file server. Files are copied from the active server to the remote server.

Note that this command is only valid on AMF controllers.

**Syntax** `atmf backup area-masters synchronize`

**Mode** Privileged Exec

**Example** To synchronize backed-up files between the remote file servers for all area-masters, use the command:

```
controller-1# atmf backup area-masters synchronize
```

**Related commands**

- [atmf backup area-masters enable](#)
- [atmf backup area-masters now](#)
- [show atmf backup area](#)

# atmf backup bandwidth

**Overview** This command sets the maximum bandwidth in kilobytes per second (kBps) available to the AMF backup process. This command enables you to restrict the bandwidth that is utilized for downloading file contents during a backup.

**NOTE:** *This command will only run on an AMF master. An error message will be generated if the command is attempted on node that is not a master.*

*Also note that setting the bandwidth value to zero will allow the transmission of as much bandwidth as is available, which can exceed the maximum configurable speed of 1000 kBps. In effect, zero means unlimited.*

Use the **no** variant of this command to reset (to its default value of zero) the maximum bandwidth in kilobytes per second (kBps) available when initiating an AMF backup. A value of zero tells the backup process to transfer files using unlimited bandwidth.

**Syntax** `atmf backup bandwidth <0-1000>`  
`no atmf backup bandwidth`

| Parameter                   | Description                                       |
|-----------------------------|---|
| <code>&lt;0-1000&gt;</code> | Sets the bandwidth in kilobytes per second (kBps) |

**Default** The default value is zero, allowing unlimited bandwidth when executing an AMF backup.

**Mode** Global Configuration

**Examples** To set an atmf backup bandwidth of 750 kBps, use the commands:

```
node2# configure terminal
node2(config)# atmf backup bandwidth 750
```

To set the AMF backup bandwidth to the default value for unlimited bandwidth, use the commands:

```
node2# configure terminal
node2(config)# no atmf backup bandwidth
```

**Related commands** [show atmf backup](#)

# atmf backup delete

**Overview** This command removes the backup file from the external media of a specified AMF node.

Note that this command can only be run from an AMF master node.

**Syntax** `atmf backup delete <node-name>`

| Parameter                      | Description   |
|--------------------------------|---|
| <code>&lt;node-name&gt;</code> | The AMF node name of the backup file to be deleted. |

**Mode** Privileged Exec

**Example** To delete the backup file from node2, use the following command:

```
Node_1# atmf backup delete node2
```

**Related commands**

- [show atmf backup](#)
- [atmf backup now](#)
- [atmf backup stop](#)

# atmf backup enable

**Overview** This command enables automatic AMF backups on the AMF master node that you are connected to. By default, automatic backup starts at 3:00 AM. However, this schedule can be changed by the [atmf backup](#) command. Note that backups are initiated and stored only on the master nodes.

Use the **no** variant of this command to disable any AMF backups that have been scheduled and previously enabled.

**Syntax** `atmf backup enable`  
`no atmf backup enable`

**Default** Automatic AMF backup functionality is enabled on the AMF master when it is configured and external media, i.e. an SD card or a USB storage device or remote server, is detected.

**Mode** Global Configuration

**Usage notes** A warning message will appear if you run the [atmf backup enable](#) command with either insufficient or marginal memory availability on your external storage device.

You can use the command [show atmf backup](#) on page 2961 to check the amount of space available on your external storage device.

We recommend using the ext3 or ext4 filesystem on external media that are used for AMF backups.

**Example** To turn on automatic AMF backup, use the following command:

```
AMF_Master_1# configure terminal
AMF_Master_1(config)# atmf backup enable
```

**Related commands** [show atmf](#)  
[show atmf backup](#)  
[atmf backup](#)  
[atmf backup now](#)  
[atmf enable](#)

# atmf backup guests delete

**Overview** This command removes a guest node's backup files from external media such as a USB drive, SD card, or an external file server.

**Syntax** `atmf backup guests delete <node-name> <guest-port>`

| Parameter                       | Description                          |
|---------------------------------|--------------------------------------|
| <code>&lt;node-name&gt;</code>  | The name of the guest's parent node. |
| <code>&lt;guest-port&gt;</code> | The port number on the parent node.  |

**Mode** User Exec/Privileged Exec

**Example** On a parent node named "node1" (which, in this case, the user has a direct console connection to) use the following command to remove the backup files of the guest node that is directly connected to port1.0.3.

```
node1# atmf backup guests delete node1 port1.0.3
```

**Related Command**

- [atmf backup delete](#)
- [atmf backup area-masters delete](#)
- [show atmf backup guest](#)

# atmf backup guests enable

**Overview** Use this command to enable backups of remote guest nodes from an AMF master. Use the **no** variant of this command to disable the ability of the guest nodes to be backed up.

**Syntax** `atmf backup guests enable`  
`no atmf backup guests enable`

**Default** Guest node backups are enabled by default.

**Mode** Global Config

**Usage notes** We recommend using the ext3 or ext4 filesystem on external media that are used for AMF backups.

**Example** On the AMF master node, enable all scheduled guest node backups:

```
atmf-master# configure terminal
atmf-master(config)# atmf backup guests enable
```

**Related commands** [atmf backup area-masters enable](#)  
[show atmf backup guest](#)  
[atmf backup guests synchronize](#)

# atmf backup guests now

**Overview** This command manually triggers an AMF backup of guest nodes on a AMF Master.

**Syntax** `atmf backup guests now [<node-name>] [<guest-port>]`

| Parameter                       | Description                                      |
|---------------------------------|--|
| <code>&lt;node-name&gt;</code>  | The name of the guest's parent node.             |
| <code>&lt;guest-port&gt;</code> | The port number that connects to the guest node. |

**Default** n/a

**Mode** Privileged Exec

**Example** Use the following command to manually trigger the backup of all guests in the AMF network

```
awplus# atmf backup guests now
```

**Example** To manually trigger the backup of a guest node connected to port 1.0.23 of node1, use the following command:

```
awplus# atmf backup guests now node1 port1.0.23
```

**Related commands** [show atmf backup guest](#)

# atmf backup guests synchronize

**Overview** This command initiates a manual synchronization of all guest backup file-sets across remote file servers and various redundancy backup media, such as USB storage devices. This facility ensures that each device contains the same backup image files. Note that this backup synchronization process will occur as part of the regular backups scheduled by the [atmf backup](#) command.

**Syntax** `atmf backup guests synchronize`

**Default** n/a

**Mode** User Exec/Privileged Exec

**Example** To synchronize backups across remote file servers and storage devices, use the command:

```
Node1#atmf backup guests synchronize
```

**Related commands** [atmf backup redundancy enable](#)  
[show atmf guests](#)  
[atmf backup guests enable](#)

# atmf backup now

**Overview** This command initiates an immediate AMF backup of either all AMF members, or a selected AMF member. Note that this backup information is stored in the external media on the master node of the device on which this command is run, even though the selected AMF member may not be a master node.

Note that this command can only be run on an AMF master node.

**Syntax** `atmf backup now [<nodename>]`

| Parameter                      | Description   |
|--------------------------------|---|
| <nodename><br>or<br><hostname> | The name of the AMF member to be backed up, as set by the command <code>hostname</code> on page 281. Where no name has been assigned to this device, then you must use the default name, which is the word "host", then an underscore, then (without a space) the MAC address of the device to be backed up. For example <code>host_0016_76b1_7a5e</code> . Note that the node-name appears as the command Prompt when in Privileged Exec mode. |

**Default** A backup is initiated for all nodes on the AMF (but stored on the master nodes).

**Mode** Privileged Exec

**Usage notes** Although this command will select the AMF node to be backed-up, it can only be run from any AMF master node.

**NOTE:** *The backup produced will be for the selected node but the backed-up config will reside on the external media of the AMF master node on which the command was run. However, this process will result in the information on one master being more up-to-date. To maintain concurrent backups on both masters, you can apply the backup now command to the master working-set. This is shown in Example 4 below.*

**Example 1** In this example, an AMF member has not been assigned a host name. The following command is run on the AMF\_Master\_2 node to immediately backup the device that is identified by its MAC address of 0016.76b1.7a5e:

```
AMF_Master_2# atmf backup now host_0016_76b1_7a5e
```

**NOTE:** *When a host name is derived from its MAC address, the syntax format entered changes from XXXX.XXXX.XXXX to XXXX\_XXXX\_XXXX.*

**Example 2** In this example, an AMF member has the host name, **office\_annex**. The following command will immediately backup this device:

```
AMF_Master_2# atmf backup now office_annex
```

This command is initiated on the device's master node named **AMF\_Master\_2** and initiates an immediate backup on the device named **office\_annex**.

**Example 3** To initiate from AMF\_master\_1 an immediate backup of all AMF member nodes, use the following command:

```
AMF_Master_1# amf backup now
```

**Example 4** To initiate an immediate backup of the node with the host-name "office\_annex" and store the configuration on both masters, use the following process:

From the AMF\_master\_1, set the working-set to comprise only of the automatic group, master nodes.

```
AMF_Master_1# atmf working-set group master
```

This command returns the following display:

```
=====
AMF_Master_1, AMF_Master_2
=====

Working set join
```

Backup the AMF member with the host name, **office\_annex** on both the master nodes as defined by the working set.

```
AMF_Master[2]# atmf backup now office_annex
```

Note that the [2] shown in the command prompt indicates a 2 node working-set.

**Related commands**

- [atmf backup](#)
- [atmf backup stop](#)
- [hostname](#)
- [show atmf backup](#)

# atmf backup redundancy enable

**Overview** This command is used to enable or disable AMF backup redundancy.

**Syntax** `atmf backup redundancy enable`  
`no atmf backup redundancy enable`

**Default** Disabled

**Mode** Global Configuration

**Usage notes** If the AMF Master or Controller supports any removable media (SD card/USB), it uses the removable media as the redundant backup for the AMF data backup.

This feature is valid only if remote file servers are configured on the AMF Master or Controller.

We recommend using the ext3 or ext4 filesystem on external media that are used for AMF backups.

**Example** To enable AMF backup redundancy, use the commands:

```
awplus# configure terminal
awplus(config)# atmf backup redundancy enable
```

To disable AMF backup redundancy, use the commands:

```
awplus# configure terminal
awplus(config)# no atmf backup redundancy enable
```

**Related commands** [atmf backup synchronize](#)  
[show atmf backup](#)  
[show atmf backup area](#)

# atmf backup server

**Overview** This command configures remote file servers as the destination for AMF backups. Use the **no** variant of this command to remove the destination server(s). When all servers are removed the system will revert to backup from external media.

**Syntax** `atmf backup server id {1|2} <hostlocation> username <username> [path <path>|port <1-65535>]`  
`no atmf backup server id {1|2}`

| Parameter      | Description  |
|----------------|--|
| id             | Remote server backup server identifier.  |
| {1 2}          | The backup server identifier number (1 or 2). Note that there can be up to two backup servers, numbered 1 and 2 respectively, and you would need to run this command separately for each server. |
| <hostlocation> | Either the name or the IP address (IPv4 or IPv6) of the selected backup server (1 or 2).   |
| username       | Configure the username to log in with on the selected remote file server.  |
| <username>     | The selected remote file server's username.  |
| path           | The location of the backup files on the selected remote file server. By default this will be the home directory of the username used to log in with.   |
| <path>         | The directory path utilized to store the backup files on the selected remote file server. No spaces are allowed in the path.   |
| port           | The connection to the selected remote backup file server using SSH. By default SSH connects to a device on TCP port 22 but this can be changed with this command.                                |
| <1-65535>      | A TCP port within the specified range.   |

**Defaults** Remote backup servers are not configured. The default SSH TCP port is 22. The path utilized on the remote file server is the home directory of the username.

**Mode** Global Exec

**Usage notes** The hostname and username parameters must both be configured.

**Examples** To configure server 1 with an IPv4 address and a username of *backup1*, use the commands:

```
AMF_Master_1# configure terminal
AMF_Master_1(config)# atmf backup server id 1 192.168.1.1
username backup1
```

To configure server 1 with an IPv6 address and a username of *backup1*, use the command:

```
AMF_backup1_1# configure terminal
AMF_Master_1(config)# atmf backup server id 1 FFEE::01 username
backup1
```

To configure server 2 with a hostname and username, use the command:

```
AMF_Master_1# configure terminal
AMF_Master_1(config)# atmf backup server id 2 www.example.com
username backup2
```

To configure server 2 with a hostname and username in addition to the optional path and port parameters, use the command:

```
AMF_Master_1# configure terminal
AMF_Master_1(config)# atmf backup server id 2 www.example.com
username backup2 path tokyo port 1024
```

To unconfigure the AMF remote backup file server 1, use the command:

```
AMF_Master_1# configure terminal
AMF_Master_1(config)# no atmf backup server id 1
```

**Related commands** [show atmf backup](#)

# atmf backup stop

**Overview** Running this command stops a backup that is currently running on the master node you are logged onto. Note that if you have two masters and want to stop both, then you can either run this command separately on each master node, or add both masters to a working set, and issue this command to the working set.

Note that this command can only be run on a master node.

**Syntax** `atmf backup stop`

**Mode** Privileged Exec

**Usage notes** This command is used to halt an AMF backup that is in progress. In this situation the backup process will finish on its current node and then stop.

**Example** To stop a backup that is currently executing on master node node-1, use the following command:

```
AMF_Master_1# amf backup stop
```

**Related commands**

- [atmf backup](#)
- [atmf backup enable](#)
- [atmf backup now](#)
- [show atmf backup](#)

# atmf backup synchronize

**Overview** For the master node you are connected to, this command initiates a system backup of files from the node's active remote file server to its backup remote file server. Note that this process happens automatically each time the network is backed up.

Note that this command can only be run from a master node.

**Syntax** `atmf backup synchronize`

**Mode** Privileged Exec

**Example** When connected to the master node `AMF_Master_1`, the following command will initiate a backup of all system related files from its active remote file server to its backup remote file server.

```
AMF_Master_1# atmf backup synchronize
```

**Related commands**

- [atmf backup enable](#)
- [atmf backup redundancy enable](#)
- [show atmf](#)
- [show atmf backup](#)

# atmf cleanup

**Overview** This command is an alias to the [erase factory-default](#) command.

# atmf container

**Overview** Use this command to create or update an AMF container on a Virtual AMF Appliance (VAA) virtual machine.

An AMF container is an isolated instance of AlliedWare Plus with its own network interfaces, configuration, and file system. The features available inside an AMF container are a sub-set of the features available on the host VAA. These features enable the AMF container to function as a uniquely identifiable AMF master and allows for multiple tenants (up to 60) to run on a single VAA host. See the [AMF Feature Overview and Configuration Guide](#) for more information on running multiple tenants on a single VAA host.

Use the **no** variant of this command to remove an AMF container.

**Syntax** `atmf container <container-name>`  
`no atmf container <container-name>`

| Parameter                           | Description   |
|-------------------------------------|---|
| <code>&lt;container-name&gt;</code> | The name of the AMF container to create, update, or remove. |

**Mode** AMF Container Configuration

**Usage notes** You cannot delete a container while it is still running. First use the **state disable** command to stop the container.

**Examples** To create or update the AMF container "vac-wlg-1", use the commands:

```
awplus# configure terminal
awplus(config)# atmf container vac-wlg-1
awplus(config-atmf-container)#
```

To remove the AMF container "vac-wlg-1", use the commands:

```
awplus# configure terminal
awplus(config)# no atmf container vac-wlg-1
```

**Related commands**

- [area-link](#)
- [atmf container login](#)
- [bridge-group \(amf-container\)](#)
- [description \(amf-container\)](#)
- [show atmf container](#)
- [state](#)

**Command changes** Version 5.4.7-0.1: command added

# atmf container login

**Overview** Use this command to login to an AMF container on a Virtual AMF Appliance (VAA).

An AMF container is an isolated instance of AlliedWare Plus with its own network interfaces, configuration, and file system. The features available inside an AMF container are a sub-set of the features available on the host VAA. These features enable the AMF container to function as a uniquely identifiable AMF master and allows for multiple tenants (up to 60) to run on a single VAA host. See the [AMF Feature Overview and Configuration Guide](#) for more information on running multiple tenants on a single VAA host.

**Syntax** `atmf container login <container-name>`

| Parameter                           | Description   |
|-------------------------------------|---|
| <code>&lt;container-name&gt;</code> | The name of the AMF container you wish to login into. |

**Mode** Privileged Exec

**Usage notes** If you try to login to a AMF container that has not been created, or is not running, you will see the following message:

```
% Container does not exist or is not running.
```

To exit from a container and return to the host VAA press `<Ctrl+a q>`.

**Example** To login to container "vac-wlg-1", use the command:

```
awplus# atmf container login vac-wlg-1
```

You will then be presented with a login screen for that container:

```
Connected to tty 1
Type <Ctrl+a q> to exit the console, <Ctrl+a Ctrl+a> to enter Ctrl+a itself

vac-wlg-1 login: manager
Password: friend

AlliedWare Plus (TM) 5.4.7 02/03/17 08:46:12

vac-wlg-1>
```

**Related commands** [atmf container](#)  
[show atmf container](#)

**Command changes** Version 5.4.7-0.1: command added

# atmf controller

**Overview** Use this command to configure the device as an AMF controller. This enables you to split a large AMF network into multiple areas.

AMF controller is a licensed feature. The number of areas supported on a controller depends on the license installed on that controller.

Use the **no** variant of this command to remove the AMF controller functionality.

**Syntax** `atmf controller`  
`no atmf controller`

**Mode** Global configuration

**Usage notes** If a valid AMF controller license is not available on the device, the device will accept this command but will not act as a controller until you install a valid license. The following message will warn you of this:

"An AMF Controller license must be installed before this feature will become active"

**NOTE:** *If the AMF controller functionality is removed from a device using the **no atmf controller** command then the device must be rebooted if it is to function properly as an AMF master.*

**Example** To configure the node named *controller-1* as an AMF controller, use the commands:

```
controller-1# configure terminal
controller-1(config)# atmf controller
```

To stop the node named *controller-1* from being an AMF controller, use the commands:

```
controller-1# configure terminal
controller-1(config)# no atmf controller
```

**Related commands** [atmf area](#)  
[show atmf](#)

# atmf distribute firmware

**Overview** This command can be used to upgrade software one AMF node at a time. A URL can be selected from any media location. The latest compatible release for a node will be selected from this location.

Several procedures are performed to ensure the upgrade will succeed. This includes checking the current node release boots from flash. If there is enough space on flash, the software release is copied to flash on the new location.

The new release name is updated using the **boot system** command. The old release will become the backup release file. If a release file exists in a remote device (such as TFTP or HTTP, for example) then the URL should specify the exact release filename without using a wild card character.

The command will continue to upgrade software until all nodes are upgraded. At the end of the upgrade cycle the command should be used on the working-set.

**Syntax** `atmf distribute firmware <filename>`

| Parameter                     | Description   |
|-------------------------------|---|
| <code>&lt;filename&gt;</code> | The filename and path of the file. See the <a href="#">File Management Feature Overview and Configuration Guide</a> for valid syntax. |

**Mode** Privileged Exec

**Examples** To upgrade nodes in a AMF network with a predefined AMF group called 'teams', use the following command:

```
Team1# atmf working-set group teams
```

```
=====
Team1, Team2, Team3:
=====
Working set join
```

```
ATMF_NETWORK[3]# atmf distribute firmware card:*.rel
```

```
Retrieving data from Team1
Retrieving data from Team2
Retrieving data from Team3

ATMF Firmware Upgrade:

Node Name          New Release File          Status
-----
Team1              x510-5.4.7-1.1.rel       Release ready
Team2              x930-5.4.7-1.1.rel       Release ready
Team3              x930-5.4.7-1.1.rel       Release ready
Continue the rolling reboot ? (y/n):y
=====
Copying Release    : x510-5.4.7-1.1.rel to Team1
Updating Release   : x510-5.4.7-1.1.rel information on Team1
=====
Copying Release    : x930-5.4.7-1.1.rel to Team2
Updating Release   : x930-5.4.7-1.1.rel information on Team2
=====
Copying Release    : x930-5.4.7-1.1.rel to Team3
Updating Release   : x930-5.4.7-1.1.rel information on Team3
=====
New firmware will not take effect until nodes are rebooted.
=====

ATMF_NETWORK[3]#
```

**Related commands** [atmf working-set](#)

# atmf domain vlan

**Overview** The AMF domain VLAN is created when the AMF network is first initiated and is assigned a default VID of 4091. This command enables you to change the VID from this default value on this device.

The AMF domain VLAN is one of AMF's internal VLANs (the management VLAN is the other internal VLAN). AMF uses these internal VLANs to communicate network status information between nodes. These VLANs must be reserved for AMF and not used for other purposes.

An important point conceptually is that although the domain VLAN exists globally across the AMF network, it is assigned separately to each domain. The AMF network therefore can be thought of as comprising a series of domain VLANs each having the same VID and each being applied to a horizontal slice (domain) of the AMF. It follows therefore that the domain VLANs are only applied to ports that form cross-links and not to ports that form uplinks/downlinks.

**CAUTION:** Every member of your AMF network must have the same domain VLAN, management VLAN, and management subnet.

**CAUTION:** If you change the domain VLAN, management VLAN, or management subnet of a node, that change takes effect immediately and the node will immediately leave the AMF network and try to rejoin it. The AMF network will not be complete until you have given all devices the same setting, so they can all rejoin the AMF network.

Use the **no** variant of this command to reset the VLAN ID to its default value of 4091.

**Syntax**

```
atmf domain vlan <2-4090>  
no atmf domain vlan
```

| Parameter | Description                             |
|-----------|---|
| <2-4090>  | The VLAN number in the range 2 to 4090. |

**Default** VLAN 4091

**Mode** Global Configuration

**Usage notes** We recommend you only change the domain VLAN when first creating the AMF network, and only if VLAN 4091 is already being used in your network.

However, if you do need to change the VLAN on an existing AMF network, use the following steps:

- 1) Create a working set of the whole of your AMF network, using the commands:

```
master# atmf working-set group all
```

You must use **working-set group all** if changing the domain VLAN. If you use a different working-set, nodes that are not in that working-set will lose contact with the AMF network.

- 2) The prompt will display the number of nodes in the AMF network. Record this number. In this example, the network is named "test" and has 10 nodes:

```
test[10]#
```

- 3) Enter the new VLAN ID, using the commands:

```
test[10]# configure terminal
```

```
test(config)[10]# atmf domain vlan <2-4090>
```

The nodes will execute the command in parallel, leave the AMF network, and attempt to rejoin through the new VLAN.

- 4) Create the working set again, using the commands:

```
master(config)# exit
```

```
master# atmf working-set group all
```

- 5) Save the configuration, using the command:

```
test[10]# write
```

- 6) The prompt will display the number of nodes in the AMF network. Check that this is the same as the number in step 1. If it is not, you will need to change the VLAN on missing devices by logging into their consoles directly.

**NOTE:** The domain VLAN will automatically be assigned an IP subnet address based on the value configured by the command *atmf management subnet*.

The default VLAN ID lies outside the user-configurable range. If you need to reset the VLAN to the default VLAN ID, use the **no** variant of this command to do so.

**Examples** To change the AMF domain VLAN to 4090 in an existing AMF network, use the following commands:

```
master# atmf working-set group all
```

```
test[10]# configure terminal
```

```
test(config)[10]# atmf domain vlan 4090
```

```
master(config)# exit
```

```
master# atmf working-set group all
```

```
test[10]# write
```

To reset the AMF domain VLAN to its default of 4091 in an existing AMF network, use the following commands:

```
master# atmf working-set group all
test[10]# configure terminal
test(config)[10]# no atmf domain vlan
master(config)# exit
master# atmf working-set group all
test[10]# write
```

**Related commands**

- [atmf management subnet](#)
- [atmf management vlan](#)

# atmf enable

**Overview** This command manually enables (turns on) the AMF feature for the device being configured.

Use the **no** variant of this command to disable (turn off) the AMF feature on the member node.

**Syntax** atmf enable  
no atmf enable

**Default** Once AMF is configured, the AMF feature starts automatically when the device starts up.

**Mode** Global Configuration

**Usage notes** The device does not auto negotiate AMF domain specific settings such as the Network Name. You should therefore, configure your device with any domain specific (non default) settings before enabling AMF.

**Examples** To turn off AMF, use the command:

```
MyNode# config terminal  
MyNode(config)# no atmf enable
```

To turn on AMF, use the command:

```
MyNode(config)# atmf enable
```

This command returns the following display:

```
% Warning: The ATMF network config has been set to enable  
% Save the config and restart the system for this change to take  
effect.
```

# atmf group (membership)

**Overview** This command configures a device to be a member of one or more AMF groups. Groups exist in three forms: Implicit Groups, Automatic Groups, and User-defined Groups.

- Implicit Groups
  - all: All nodes in the AMF
  - current: The current working-set
  - local: The originating node.

Note that the Implicit Groups do not appear in show group output.

- Automatic Groups - These are defined by hardware architecture, e.g. x510, x230, x8100, AR3050S, AR4050S.
- User-defined Groups - These enable you to define arbitrary groups of AMF members based on your own criteria.

Each node in the AMF is automatically assigned membership to the implicit groups, and the automatic groups that are appropriate to its node type, e.g. x230, PoE. Similarly, nodes that are configured as masters are automatically assigned to the master group.

Use the **no** variant of this command to remove the membership.

**Syntax** `atmf group <group-list>`  
`no atmf group <group-list>`

| Parameter                       | Description  |
|---------------------------------|--|
| <code>&lt;group-list&gt;</code> | A list of group names. These should be entered as a comma delimited list without spaces. Names can contain alphanumeric characters, hyphens and underscores. |

**Mode** Global Configuration

**Usage notes** You can use this command to define your own arbitrary groups of AMF members based on your own network's configuration requirements. Applying a node to a non existing group will result in the group automatically being created.

Note that the master nodes are automatically assigned to be members of the pre-existing master group.

The following example configures the device to be members of three groups; two are company departments, and one comprises all devices located in building\_2. To avoid having to run this command separately on each device that is to be added to these groups, you can remotely assign all of these devices to a working-set, then use the capabilities of the working-set to apply the [atmf group \(membership\)](#) command to all members of the working set.

**Example 1** To specify the device to become a member of AMF groups named *marketing*, *sales*, and *building\_2*, use the following commands:

```
node-1# configure terminal
node-1(config)# atmf group marketing,sales,building_2
```

**Example 2** To add the nodes *member\_node\_1* and *member\_node\_2* to groups *building1* and *sales*, first add the nodes to the working-set:

```
master_node# atmf working-set member_node_1,member_node_2
```

This command returns the following output confirming that the nodes *member\_node\_1* and *member\_node\_2* are now part of the working-set:

```
=====
member_node_1, member_node_2
=====

Working set join
```

Then add the members of the working set to the groups:

```
atmf-net[2]# configure terminal
atmf-net[2](config)# atmf group building1,sales
atmf-net[2](config)# exit
atmf-net[2]# show atmf group
```

This command returns the following output displaying the groups that are members of the working-set.

```
=====
member_node_1
=====

AMF group information

building1, sales
```

**Related commands** [show atmf group](#)  
[show atmf group members](#)

# atmf guest-class

**Overview** This modal command creates a guest-class. Guest-classes are modal templates that can be applied to selected guest types. Once you have created a guest-class, you can select it by entering its mode. From here, you can then configure a further set of operational settings specifically for the new guest-class.

These settings can then all be applied to a guest link by running the [switchport atmf-guestlink](#) command. The following settings can be configured from each guest class mode:

- discovery method
- model type
- http-enable setting
- guest port, user name, and password

The **no** variant of this command removes the guest-class. Note that you cannot remove a guest-class that is assigned to a port.

**Syntax** `atmf guest-class <guest-class-name>`  
`no atmf guest-class <guest-class-name>`

| Parameter                             | Description  |
|---------------------------------------|--|
| <code>&lt;guest-class-name&gt;</code> | The name assigned to the guest-class type. This can be chosen from an arbitrary string of up to 15 characters. |

**Mode** Global Configuration

**Example** To create a guest-class named 'camera' use the commands:

```
node1# configure terminal
node1(config)# atmf guest-class camera
node1(config-atmf-guest)#
```

To remove the guest-class named 'camera' use the commands:

```
node1# configure terminal
node1(config)# no atmf guest-class camera
```

**Related commands** [show atmf area guests](#)  
[discovery](#)  
[firmware-url](#)  
[http-enable](#)  
[username \(atmf-guest\)](#)  
[modeltype](#)

```
switchport atmf-guestlink  
show atmf links guest  
show atmf guests  
login-fallback enable
```

# atmf log-verbose

**Overview** This command limits the number of log messages displayed on the console or permanently logged.

Use the **no** variant of this command to reset to the default.

**Syntax** atmf log-verbose <1-3>  
no atmf log-verbose

| Parameter | Description   |
|-----------|---|
| <1-3>     | The verbose limitation (3 = noisiest, 1 = quietest) |

**Default** The default log display is 3.

**Usage** This command is intended for use in large networks where verbose output can make the console unusable for periods of time while nodes are joining and leaving.

**Mode** Global Configuration

**Example** To set the log-verbose to noise level 2, use the command:

```
node-1# configure terminal
node-1(config)# atmf log-verbose 2
```

**Validation Command** `show atmf`

# atmf management subnet

**Overview** This command is used to assign a subnet that will be allocated to the AMF management and domain management VLANs. From the address space defined by this command, two subnets are created, a management subnet component and a domain component, as explained in the Usage section below.

AMF uses these internal IPv4 subnets to communicate network status information between nodes. These subnet addresses must be reserved for AMF and not used for other purposes.

**CAUTION:** Every member of your AMF network must have the same domain VLAN, management VLAN, and management subnet.

**CAUTION:** If you change the domain VLAN, management VLAN, or management subnet of a node, that change takes effect immediately and the node will immediately leave the AMF network and try to rejoin it. The AMF network will not be complete until you have given all devices the same setting, so they can all rejoin the AMF network.

Use the **no** variant of this command to remove the assigned subnet.

**Syntax** `atmf management subnet <a.b.0.0>`  
`no atmf management subnet`

| Parameter                    | Description  |
|------------------------------|--|
| <code>&lt;a.b.0.0&gt;</code> | The IP address selected for the management subnet. Because a mask of 255.255.0.0 (i.e. /16) will be applied automatically, an IP address in the format a.b.0.0 must be selected. Usually this subnet address is selected from an appropriate range from within the private address space of 172.16.0.0 to 172.31.255.255, or 192.168.0.0, as defined in RFC1918. |

**Default** 172.31.0.0. A subnet mask of 255.255.0.0 will automatically be applied.

**Mode** Global Configuration

**Usage notes** Running this command will result in the creation of a further two subnets (within the class B address space assigned) and the mask will extend from /16 to /17.

For example, if the management subnet is assigned the address 172.31.0.0/16, this will result in the automatic creation of the following two subnets:

- 172.31.0.0/17 assigned to the [atmf management vlan](#)
- 172.31.128.0/17 assigned to the [atmf domain vlan](#).

We recommend you only change the management subnet when first creating the AMF network, and only if 172.31.0.0 is already being used in your network.

However, if you do need to change the subnet on an existing AMF network, use the following steps:

- 1) Create a working set of the whole of your AMF network, using the commands:

```
master# atmf working-set group all
```

You must use **working-set group all** if changing the domain VLAN, management VLAN, or management subnet. If you use a different working-set, nodes that are not in that working-set will lose contact with the AMF network.

- 2) The prompt will display the number of nodes in the AMF network. Record this number. In this example, the network is named "test" and has 10 nodes:

```
test[10]#
```

- 3) Enter the new subnet address, using the commands:

```
test[10]# configure terminal
```

```
test(config)[10]# atmf management subnet <a.b.0.0>
```

The nodes will execute the command in parallel, leave the AMF network, and attempt to rejoin through the new subnet.

- 4) Create the working set again, using the commands:

```
master(config)# exit
```

```
master# atmf working-set group all
```

- 5) Save the configuration, using the command:

```
test[10]# write
```

- 6) The prompt will display the number of nodes in the AMF network. Check that this is the same as the number in step 1. If it is not, you will need to change the subnet on missing devices by logging into their consoles directly.

**Examples** To change the AMF management subnet address to 172.25.0.0 in an existing AMF network, use the following commands:

```
master# atmf working-set group all
```

```
test[10]# configure terminal
```

```
test(config)[10]# atmf management subnet 172.25.0.0
```

```
master(config)# exit
```

```
master# atmf working-set group all
```

```
test[10]# write
```

To reset the AMF management subnet address to its default of 172.31.0.0 in an existing AMF network, use the following commands:

```
master# atmf working-set group all
test[10]# configure terminal
test(config)[10]# no atmf management subnet
master(config)# exit
master# atmf working-set group all
test[10]# write
```

**Related commands** [atmf domain vlan](#)  
[atmf management vlan](#)

# atmf management vlan

**Overview** The AMF management VLAN is created when the AMF network is first initiated and is assigned a default VID of 4092. This command enables you to change the VID from this default value on this device.

The AMF management VLAN is one of AMF's internal VLANs (the domain VLAN is the other internal VLAN). AMF uses these internal VLANs to communicate network status information between nodes. These VLANs must be reserved for AMF and not used for other purposes.

**CAUTION:** Every member of your AMF network must have the same domain VLAN, management VLAN, and management subnet.

**CAUTION:** If you change the domain VLAN, management VLAN, or management subnet of a node, that change takes effect immediately and the node will immediately leave the AMF network and try to rejoin it. The AMF network will not be complete until you have given all devices the same setting, so they can all rejoin the AMF network.

Use the **no** variant of this command to restore the VID to the default of 4092.

**Syntax** atmf management vlan <2-4090>  
no atmf management vlan

| Parameter | Description                                  |
|-----------|--|
| <2-4090>  | The VID assigned to the AMF management VLAN. |

**Default** VLAN 4092

**Mode** Global Configuration

**Usage notes** We recommend you only change the management VLAN when first creating the AMF network, and only if VLAN 4092 is already being used in your network.

However, if you do need to change the VLAN on an existing AMF network, use the following steps to ensure you change it on all nodes simultaneously:

- 1) Create a working set of the whole of your AMF network, using the commands:

```
master# atmf working-set group all
```

You must use **working-set group all** if changing the management VLAN. If you use a different working-set, nodes that are not in that working-set will lose contact with the AMF network.

- 2) The prompt will display the number of nodes in the AMF network. Record this number. In this example, the network is named "test" and has 10 nodes:

```
test[10]#
```

- 3) Enter the new VLAN ID, using the commands:

```
test[10]# configure terminal
test(config)[10]# atmf management vlan <2-4090>
```

The nodes will execute the command in parallel, leave the AMF network, and attempt to rejoin through the new VLAN.

- 4) Create the working set again, using the commands:

```
master(config)# exit
master# atmf working-set group all
```

- 5) Save the configuration, using the command:

```
test[10]# write
```

- 6) The prompt will display the number of nodes in the AMF network. Check that this is the same as the number in step 1. If it is not, you will need to change the VLAN on missing devices by logging into their consoles directly.

**NOTE:** The management VLAN will automatically be assigned an IP subnet address based on the value configured by the command [atmf management subnet](#).

The default VLAN ID lies outside the user-configurable range. If you need to reset the VLAN to the default VLAN ID, use the **no** variant of this command to do so.

**Examples** To change the AMF management VLAN to 4090 in an existing AMF network, use the following commands:

```
master# atmf working-set group all
test[10]# configure terminal
test(config)[10]# atmf management vlan 4090
master(config)# exit
master# atmf working-set group all
test[10]# write
```

To reset the AMF management VLAN to its default of 4092 in an existing AMF network, use the following commands:

```
master# atmf working-set group all
test[10]# configure terminal
test(config)[10]# no atmf management vlan
master(config)# exit
master# atmf working-set group all
test[10]# write
```

**Related commands** [atmf domain vlan](#)  
[atmf management subnet](#)

# atmf master

**Overview** This command configures the device to be an AMF master node and automatically creates an AMF master group. The master node is considered to be the core of the AMF network, and must be present for the AMF to form. The AMF master has its node depth set to 0. Note that the node depth vertical distance is determined by the number of uplinks/downlinks that exist between the node and its master.

An AMF master node must be present for an AMF network to form. Up to two AMF master nodes may exist in a network, and they **must** be connected by an AMF crosslink.

**NOTE:** Master nodes are an essential component of an AMF network. In order to run AMF, an AMF License is required for each master node.

If the crosslink between two AMF masters fails, then one of the masters will become isolated from the rest of the AMF network.

Use the **no** variant of this command to remove the device as an AMF master node. The node will retain its node depth of 0 until the network is rebooted.

**NOTE:** Node depth is the vertical distance (or level) from the master node (whose depth value is 0).

**Syntax** `atmf master`  
`no atmf master`

**Default** The device is not configured to be an AMF master node.

**Mode** Global Configuration

**Example** To specify that this node is an AMF master, use the following command:

```
node-1# configure terminal
node-1(config)# atmf master
```

**Related commands** [show atmf](#)  
[show atmf group](#)

# atmf mtu

**Overview** This command configures the AMF network Maximum Transmission Unit (MTU). The MTU value will be applied to the AMF Management VLAN, the AMF Domain VLAN and AMF Area links.

Use the **no** variant of this command to restore the default MTU.

**Syntax** `atmf mtu <1300-1442>`  
`no atmf mtu`

| Parameter   | Description   |
|-------------|---|
| <1300-1442> | The value of the maximum transmission unit for the AMF network, which sets the maximum size of all AMF packets generated from the device. |

**Default** 1300

**Mode** Global Configuration

**Usage notes** The default value of 1300 will work for all AMF networks (including those that involve virtual links over IPsec tunnels). If there are virtual links over IPsec tunnels anywhere in the AMF network, we recommend not changing this default. If there are no virtual links over IPsec tunnels, then this AMF MTU value may be increased for network efficiency.

**Example** To change the ATMF network MTU to 1442, use the command:

```
awplus(config)# atmf mtu 1442
```

**Related commands** [show atmf detail](#)

# atmf network-name

**Overview** This command applies an AMF network name to a (prospective) AMF node. In order for an AMF network to be valid, its network-name must be configured on at least two nodes, one of which must be configured as a master and have an AMF License applied. These nodes may be connected using either AMF downlinks or crosslinks.

For more information on configuring an AMF master node, see the command [atmf master](#).

Use the **no** variant of this command to remove the AMF network name.

**Syntax** `atmf network-name <name>`  
`no atmf network-name`

| Parameter                 | Description  |
|---------------------------|--|
| <code>&lt;name&gt;</code> | The AMF network name. Up to 15 printable characters can be entered for the network-name. |

**Mode** Global Configuration

**Usage notes** This is one of the essential commands when configuring AMF and must be entered on each node that is to be part of the AMF.

A switching node (master or member) may be a member of only one AMF network.

**CAUTION:** *Ensure that you enter the correct network name. Entering an incorrect name will cause the AMF network to fragment (at the next reboot).*

**Example** To set the AMF network name to `amf_net` use the command:

```
Node_1(config)# atmf network-name amf_net
```

# atmf provision (interface)

**Overview** This command configures a specified port on an AMF node to accept a provisioned node, via an AMF link, some time in the future.

Use the **no** variant of this command to remove the provisioning on the node.

**Syntax** `atmf provision <nodename>`  
`no atmf provision`

| Parameter                     | Description   |
|-------------------------------|---|
| <code>&lt;nodename&gt;</code> | The name of the provisioned node that will appear on the AMF network in the future. |

**Mode** Interface Configuration for a switchport, a static aggregator, dynamic channel group or an Eth port on an AR-Series device.

**Usage notes** The port should be configured as an AMF link or cross link and should be 'down' to add or remove a provisioned node.

**Example** To provision an AMF node named node1 for port1.0.1, use the commands:

```
host1(config)# interface port1.0.1
host1(config-if)# atmf provision node1
```

**Related commands**

- `atmf provision node`
- `clone (amf-provision)`
- `configure boot config (amf-provision)`
- `configure boot system (amf-provision)`
- `copy (amf-provision)`
- `create (amf-provision)`
- `delete (amf-provision)`
- `identity (amf-provision)`
- `license-cert (amf-provision)`
- `locate (amf-provision)`
- `show atmf provision nodes`
- `show atmf links`
- `switchport atmf-link`
- `switchport atmf-crosslink`

# atmf provision node

**Overview** Use this command to provision a replacement node for a specified interface. Node provisioning is effectively the process of creating a backup file-set on a master node that can be loaded onto a provisioned node some time in the future. This file-set is created just as if the provisioned node really existed and was connected to the network. Typically these comprise configuration, operating system, and license files etc.

You can optionally provision a node with multiple device-type backups. When a device is then attached to the network, AMF uses its device-type to find the correct configuration to use. For example you can create an x510 and an x530 provisioning configuration for a node called 'node1' and if either an x510 or an x530 is attached to that node the appropriate configuration will be used.

Use the **no** variant of this command to remove a provisioned node.

**Syntax** `atmf provision node <nodename> [device <device-type>]`  
`no atmf provision node <nodename> [device <device-type>]`

| Parameter     | Description   |
|---------------|---|
| <nodename>    | The name of the provisioned node that will appear on the AMF network.   |
| device        | Optionally specify a device type.   |
| <device-type> | Any valid device type e.g. AR3050s, ie200, x950. For a full list of valid device types use the command <b>atmf provision node &lt;nodename&gt; device ?</b> . |

**Mode** Privileged Exec

**Usage notes** This command creates the directory structure for the provisioned node's file-set. It also switches to the AMF provision node prompt so that the nodes backup file-set can be created or updated. This is typically done with the [create \(amf-provision\)](#) or [clone \(amf-provision\)](#) commands.

For more information on AMF provisioning, see the [AMF Feature Overview and Configuration Guide](#)..

**Example** To configure node named 'node1', use the command:

```
awplus# atmf provision node node1  
awplus(atmf-provision) #
```

To configure a node named 'node1' for device type 'x530', use the command:

```
awplus# atmf provision node node1 device x530  
awplus(atmf-provision) #
```

**Related commands**

- atmf provision (interface)
- clone (amf-provision)
- configure boot config (amf-provision)
- configure boot system (amf-provision)
- copy (amf-provision)
- create (amf-provision)
- delete (amf-provision)
- identity (amf-provision)
- license-cert (amf-provision)
- locate (amf-provision)
- show atmf provision nodes

**Command changes** Version 5.4.9-0.1: command added

# atmf reboot-rolling

**Overview** This command enables you to reboot the nodes in an AMF working-set, one at a time, as a rolling sequence in order to minimize downtime. Once a rebooted node has finished running its configuration and its ports are up, it re-joins the AMF network and the next node is rebooted.

By adding the `url` parameter, you can also upgrade your devices' software one AMF node at a time.

The **force** parameter forces the rolling reboot to continue even if a previous node does not rejoin the AMF network. Without the **force** parameter, the unsuitable node will time-out and the rolling reboot process will stop. However, with the **force** parameter applied, the process will ignore the timeout and move on to reboot the next node in the sequence.

This command can take a significant amount of time to complete.

**Syntax** `atmf reboot-rolling [force] [<url>]`

| Parameter                | Description  |
|--------------------------|--|
| <code>force</code>       | Ignore a failed node and move on to the next node. Where a node fails to reboot a timeout is applied based on the time taken during the last reboot. |
| <code>&lt;url&gt;</code> | The path to the software upgrade file.   |

**Mode** Privileged Exec

**Usage notes** You can load the software from a variety of locations. The latest compatible release for a node will be selected from your selected location, based on the parameters and URL you have entered.

For example `usb:/5.5.2-2/x*-5.5.2-2-*.rel` will select from the folder `usb:/5.5.2-2` the latest file that matches the selection `x(wildcard)-5.5.2-2-(wildcard).rel`. Because `x*` is applied, each device type will be detected and its appropriate release file will be installed.

Other allowable entries are:

| Entry                                 | Used when loading software                              |
|---------------------------------------|---|
| <code>card:*.rel:</code>              | from an SD card   |
| <code>tftp:&lt;ip-address&gt;:</code> | from a TFTP server                                      |
| <code>usb:</code>                     | from a USB flash drive                                  |
| <code>flash:</code>                   | from flash memory, e.g. from one x930 switch to another |
| <code>scp:</code>                     | using secure copy                                       |
| <code>http:</code>                    | from an HTTP file server                                |

Several checks are performed to ensure the upgrade will succeed. These include checking the current node release boots from flash. If there is enough space on flash, the software release is copied to flash to a new location on each node as it is processed. The new release name will be updated using the **boot system**<release-name> command, and the old release will become the backup release file.

**NOTE:** If you are using TFTP or HTTP, for example, to access a file on a remote device then the URL should specify the exact release filename without using wild card characters.

On bootup the software release is verified. Should an upgrade fail, the upgrading unit will revert back to its previous software version. At the completion of this command, a report is run showing the release upgrade status of each node.

**NOTE:** Take care when removing external media or rebooting your devices. Removing an external media while files are being written entails a significant risk of causing a file corruption.

**Example 1** To reboot all x530 nodes in an AMF network, use the commands:

```
Bld2_Floor_1# atmf working-set group x530
```

This command returns the following type of screen output:

```
=====
node1, node2, node3:
=====

Working set join

AMF_NETWORK[3]#
```

```
ATMF_NETWORK[3]# atmf reboot-rolling
```

When the reboot has completed, a number of status screens appear. The selection of these screens will depend on the parameters set.

```

Continue upgrading releases ? (y/n):

# atmf recover

**Overview** This command is used to manually initiate the recovery (or replication) of an AMF node, usually when a node is being replaced.

**Syntax** `atmf recover [<node-name> master <node-name>]`  
`atmf recover [<node-name> controller <node-name>]`

| Parameter                           | Description  |
|-------------------------------------|--|
| <i>&lt;node-name&gt;</i>            | The name of the device whose configuration is to be recovered or replicated.   |
| master<br><i>&lt;node-name&gt;</i>  | The name of the master device that holds the required configuration information.<br>Note that although you can omit both the node name and the master name; you cannot specify a master name unless you also specify the node name.      |
| controller <i>&lt;node-name&gt;</i> | The name of the controller that holds the required configuration information.<br>Note that although you can omit both the node name and the controller name; you cannot specify a controller name unless you also specify the node name. |

**Mode** Privileged Exec

**Usage notes** The recovery/replication process involves loading the configuration file for a node that is either about to be replaced or has experienced some problem. You can specify the configuration file of the device being replaced by using the *<node-name>* parameter, and you can specify the name of the master node or controller holding the configuration file.

If the *<node-name>* parameter is not entered then the node will attempt to use one that has been previously configured. If the replacement node has no previous configuration (and has no previously used node-name), then the recovery will fail.

If the master or controller name is not specified then the device will poll all known AMF masters and controllers and execute an election process (based on the last successful backup and its timestamp) to determine which to use. If no valid backup master or controller is found, then this command will fail.

No error checking occurs when this command is run. Regardless of the last backup status, the recovering node will attempt to load its configuration from the specified master node or controller.

If the node has previously been configured, we recommend that you suspend any AMF backup before running this command. This is to prevent corruption of the backup files on the AMF master as it attempts to both backup and recover the node at the same time.

**Example** To recover the AMF node named Node\_10 from the AMF master node named Master\_2, use the following command:

```
Master_2# atmf recover Node_10 master Master_2
```

**Related commands**

- atmf backup stop
- show atmf backup
- show atmf

# atmf recover guest

**Overview** Use this command to initiate a guest node recovery or replacement by reloading its backup file-set that is located within the AMF backup system. Note that this command must be run on the edge node device that connects to the guest node.

**Syntax** `atmf recover guest [<guest-port>]`

| Parameter                       | Description                                      |
|---------------------------------|--|
| <code>&lt;guest-port&gt;</code> | The port number that connects to the guest node. |

**Mode** User Exec/Privileged Exec

**Example** To recover a guest on node1 port1.0.1, use the following command

```
node1# atmf recover guest port1.0.1
```

**Related commands** [show atmf backup guest](#)

# atmf recover led-off

**Overview** This command turns off the recovery failure flashing port LEDs. It reverts the LED's function to their normal operational mode, and in doing so assists with resolving the recovery problem. You can repeat this process until the recovery failure has been resolved. For more information, see the [AMF Feature Overview and Configuration Guide](#).

**Syntax** `atmf recover led-off`

**Default** Normal operational mode

**Mode** Privileged Exec

**Example** To revert the LEDs on Node1 from recovery mode display to their normal operational mode, use the command:

```
Node1# atmf recover led-off
```

**Related commands** [atmf recover](#)

# atmf recover over-eth

**Overview** Use this command to enable AMF recovery over an AR-series device's Eth port. This setting persists even after restoring a device to a 'clean' state with the [erase factory-default](#) or [atmf cleanup](#) command.

Use the **no** variant of this command to disable AMF recover over an Eth port.

**Syntax** `atmf recover over-eth`  
`no atmf recover over-eth`

**Default** Eth ports cannot be used for recovery.

**Mode** Privileged Exec

**Usage notes** AMF links over Eth ports are only available if your network is running in AMF secure mode (see [atmf secure-mode](#) for more information on AMF secure mode).

**Example** To enable AMF recovery over an Eth port, use the command:

```
awplus# atmf recover over-eth
```

To disable AMF recovery over an Eth port, use the commands:

```
awplus# no atmf recover over-eth
```

**Related commands** [atmf-link](#)  
[atmf recover](#)  
[atmf secure-mode](#)  
[erase factory-default](#)  
[show atmf detail](#)

**Command changes** Version 5.5.0-1.1: command added

# atmf recovery-server

**Overview** Use this command on an AMF master to process recovery requests from isolated AMF nodes. An isolated node is an AMF member that is only connected to the rest of the AMF network via a virtual-link.

This option allows these nodes, which have no AMF neighbors, to be identified for recovery or provisioning purposes. They are identified using an identity token which is stored on the AMF master.

Use the **no** variant of this command to disable processing of recovery requests from isolated AMF nodes.

**Syntax** `atmf recovery-server`  
`no atmf recovery-server`

**Default** Recovery-server is disabled by default.

**Mode** Global Configuration

**Usage notes** Once **recovery-server** is enabled on an AMF network, the next time an isolated node is backed up its identity token will be stored in the AMF master's database. Should the device fail it can then be replaced and auto-recovery will occur as long as:

- the AMF master is accessible to the isolated node, and
- either, a DHCP server is configured to send the Uniform Resource Identifier (URI) of the AMF master to the recovering node, or
- a DNS server is configured to resolve the default recovery URI (`https://amfrecovery.alliedtelesis.com`) to the IP address of the AMF master.

Provisioning of isolated nodes is achieved by creating an identity token for the new node using the [identity \(amf-provision\)](#) command.

See the [AMF Feature Overview and Configuration Guide](#) for information on preparing your network for recovering or provisioning isolated nodes.

**Example** To enable recovery-server on an AMF master, use the commands:

```
awplus# configure terminal
awplus(config)# atmf recovery-server
```

To disable recovery-server on an AMF master, use the commands:

```
awplus# configure terminal
awplus(config)# no atmf recovery-server
```

**Related commands**

- [atmf backup](#)
- [atmf cleanup](#)
- [identity \(amf-provision\)](#)
- [atmf virtual-link](#)

**Command changes** Version 5.4.7-2.1: command added

# atmf remote-login

**Overview** Use this command to remotely login to other AMF nodes in order to run commands as if you were a local user of that node.

**Syntax** `atmf remote-login [user <name>] <nodename>`

| Parameter  | Description  |
|------------|--|
| <name>     | The name of a user on the remote node.                 |
| <nodename> | The name of the remote AMF node you are connecting to. |

**Mode** Privileged Exec (This command will only run at privilege level 15)

**Usage notes** You do not need a valid login on the local device in order to run this command. The session will take you to the enable prompt on the new device. If the remote login session exits for any reason (e.g. device reboot) you will be returned to the originating node.

You can create additional user accounts on nodes. AMF's goal is to provide a uniform management plane across the whole network, so we recommend you use the same user accounts on all the nodes in the network.

In reality, though, it is not essential to have the same accounts on all the nodes. Users can remote login from one node to a second node even if they are logged into the first node with a user account that does not exist on the second node (provided that `atmf restricted-login` is disabled and the user account on the first node has privilege level 15).

Moreover, it is possible to use a RADIUS or TACACS+ server to manage user authentication, so users can log into AMF nodes using user accounts that are present on the RADIUS or TACACS+ server, and not present in the local user databases of the AMF nodes.

The software will not allow you to run multiple remote login sessions. You must exit an existing session before starting a new one.

If you disconnect from the VTY session without first exiting from the AMF remote session, the device will keep the AMF remote session open until the `exec-timeout` time expires (10 minutes by default). If the `exec-timeout` time is set to infinity (`exec-timeout 0 0`), then the device is unable to ever close the remote session. To avoid this, we recommend you use the `exit` command to close AMF remote sessions, instead of closing the associated VTY sessions. We also recommend you avoid setting the `exec-timeout` to infinity.

**Example** To remotely login from node Node10 to Node20, use the following command:

```
Node10# atmf remote-login node20
Node20>
```

To close the session on Node20 and return to Node10's command line, use the following command:

```
Node20# exit  
Node10#
```

In this example, user User1 is a valid user of node5. They can remotely login from node5 to node3 by using the following commands:

```
node5# atmf remote-login user User1 node3  
node3> enable
```

**Related commands** [atmf restricted-login](#)

**Command changes** Version 5.4.6-2.1: changes to AMF user account requirements

# atmf restricted-login

**Overview** By default, users who are logged into any node on an AMF network are able to manage any other node by using either working-sets or an AMF remote login. If the access provided by this feature is too wide, or contravenes network security restrictions, it can be limited by running this command, which changes the access so that:

- users who are logged into non-master nodes cannot execute any commands that involve working-sets, and
- from non-master nodes, users can use remote-login, but only to login to a user account that is valid on the remote device (via a statically configured account or RADIUS/TACACS+). Users are also required to enter the password for that user account.

Once entered on any AMF master node, this command will propagate across the network.

Use the **no** variant of this command to disable restricted login on the AMF network. This allows access to the **atmf working-set** command from any node in the AMF network.

**Syntax** `atmf restricted-login`  
`no atmf restricted-login`

**Mode** Privileged Exec

**Default** Master nodes operate with **atmf restricted-login** disabled.  
Member nodes operate with **atmf restricted-login** enabled.

**NOTE:** *The default conditions of this command vary from those applied by its “no” variant. This is because the restricted-login action is only applied by **master** nodes, and in the absence of a master node, the default is to apply the restricted action to all **member** nodes with AMF configured.*

**Usage notes** In the presence of a **master** node, its default of **atmf restricted-login disabled** will propagate to all its member nodes. Similarly, any change in this command’s status that is made on a master node, will also propagate to all its member nodes

Note that once you have run this command, certain other commands that utilize the AMF working-set command, such as the **include**, **atmf reboot-rolling** and **show atmf group members** commands, will operate only on master nodes.

Restricted-login must be enabled on AMF areas with more than 120 nodes.

**Example** To enable restricted login, use the command

```
Node_20(config)# atmf restricted-login node20
```

**Related commands** [atmf remote-login](#)  
[show atmf](#)

**Command changes** Version 5.4.6-2.1: changes to AMF user account requirements

# atmf retry guest-link

**Overview** Use this command to retry an AMF guest-link by restarting AMF guest discovery on a port if it is currently in the failed state.

If no port is specified then all configured AMF guest-link ports that are in the failed state are retried.

If a port is specified then that port will only be retried if it is both:

- configured as an AMF guest-link, and
- it is currently in the failed state.

**Syntax** `atmf retry guest-link [<interface>]`

| Parameter                      | Description  |
|--------------------------------|--|
| <code>&lt;interface&gt;</code> | Name of the interface the guest-link you want to retry is configured on. |

**Mode** Privileged Exec

**Example** To retry all configured AMF guest-link currently in a failed state, use the command:

```
awplus# atmf retry guest-link
```

To retry an AMF guest-link configured on port1.0.2 currently in a failed state, use the command:

```
awplus# atmf retry guest-link port1.0.2
```

**Related commands** [show atmf links guest](#)  
[switchport atmf-guestlink](#)

# atmf secure-mode

**Overview** Use this command to enable AMF secure mode on an AMF node. AMF secure mode makes an AMF network more secure by:

- Adding an authorization mechanism before and AMF member is allowed to join an AMF network.
- The encryption of all AMF packets sent between AMF nodes.
- Adding support for user login authentication by RADIUS or TACACS+, and removing the requirement to have the same privileged user account in the local user database on all devices in the AMF network.
- Adding additional logging which enables network administrators to monitor attempts to gain unauthorized access to the AMF network.

Once the secure mode command is run on all nodes on an AMF network, the AMF masters and AMF controllers manage the addition of AMF nodes and AMF areas to the AMF network.

Use the **no** variant of this command to disable AMF secure mode on an AMF node.

**Syntax** `atmf secure-mode`  
`no atmf secure-mode`

**Default** Secure mode is disabled by default.

**Mode** Global Configuration

**Usage notes** When an AMF network is running in AMF secure mode the [atmf restricted-login](#) feature is automatically enabled. This restricts the [atmf working-set](#) command to users that are logged on to an AMF master. This feature cannot be disabled independently of secure mode.

When AMF secure mode is enabled the AMF controllers and masters in the AMF network form a group of certificate authorities. A node may only join a secure AMF network once it has been authorized by a master or controller. When enabled, all devices in the AMF network must be running in secure mode. Unsecured devices will not be able to join a secure AMF network.

**Example** To enable AMF secure mode on an AMF node, use the commands:

```
awplus# configure terminal
awplus(config)# atmf secure-mode
```

To disable AMF secure mode on an AMF node, use the commands:

```
awplus# configure terminal
awplus(config)# no atmf secure-mode
```

**Related commands** [atmf authorize](#)  
[atmf secure-mode certificate expiry](#)

clear atmf secure-mode certificates

show atmf  
show atmf authorization  
show atmf secure-mode  
show atmf secure-mode certificates  
show atmf secure-mode sa  
show atmf secure-mode statistics

**Command changes** Version 5.4.7-0.3: command added

# atmf secure-mode certificate expire

**Overview** Use this command on an AMF master to expire a secure mode certificate. Running this command will force the removal of the AMF node from the network.

**Syntax** `atmf secure-mode certificate expire <node-name> [area <area-name>]`

| Parameter                      | Description  |
|--------------------------------|--|
| <code>&lt;node-name&gt;</code> | Name of the AMF node you want to expire the certificate for.           |
| <code>area</code>              | Specify an AMF area.   |
| <code>&lt;area-name&gt;</code> | Name of the AMF area you want to expire the AMF nodes certificate for. |

**Mode** Privileged Exec

**Example** To remove an AMF node named "node3" from an AMF network, use the following command on the AMF master:

```
awplus# atmf secure-mode certificate expire node3
```

To remove an AMF node named "node2" in an area named "area2", use the following command on the AMF master:

```
awplus# atmf secure-mode certificate expire node2 area area2
```

**Related commands**

- [atmf secure-mode](#)
- [show atmf secure-mode](#)
- [show atmf secure-mode certificates](#)

**Command changes** Version 5.4.7-0.3: command added

# atmf secure-mode certificate expiry

**Overview** Use this command to set the expiry time of AMF secure mode certificates. Once an AMF node's certificate expires it must re-authorize and obtain a new certificate from the AMF master.

Use the **no** variant of this command to reset the expiry time to 180 days.

**Syntax** `atmf secure-mode certificate expiry {<days>|infinite}`  
`no atmf secure-mode certificate expiry`

| Parameter                 | Description  |
|---------------------------|--|
| <code>&lt;days&gt;</code> | Length of time, in days, that an AMF secure mode certificate remains valid. A value between 1 and 365. |
| <code>infinite</code>     | The authorization certificate does not expire, in other words AMF nodes stay authorized indefinitely.  |

**Default** The default expiry time is 180 days.

**Mode** Global Configuration

**Example** To set AMF secure mode certificate expiry to 7 days, use the commands:

```
awplus# configure terminal
awplus(config)# atmf secure-mode certificate expiry 7
```

To set AMF secure mode certificates to never expire, use the commands:

```
awplus# configure terminal
awplus(config)# atmf secure-mode certificate expiry infinite
```

To reset the certificate expiry to 180 days, use the commands:

```
awplus# configure terminal
awplus(config)# no atmf secure-mode certificate expiry
```

**Related commands** [atmf secure-mode](#)  
[show atmf secure-mode](#)  
[show atmf secure-mode certificates](#)

**Command changes** Version 5.4.7-0.3: command added

# atmf secure-mode certificate renew

**Overview** Use this command to force all local certificates to expire and be renewed on an AMF secure mode network.

Secure mode certificates renew automatically but this command could be used to renew a certificate in a situation where the automatic renewal may happen while the device is not attached to the AMF network.

**Syntax** `atmf secure-mode certificate renew`

**Mode** Privileged Exec

**Example** To renew a local certificate on a AMF member or AMF master, use the command:

```
awplus# atmf secure-mode certificate renew
```

**Related commands** [show atmf secure-mode certificates](#)  
[show atmf secure-mode statistics](#)

**Command changes** Version 5.4.7-0.3: command added

# atmf secure-mode enable-all

**Overview** Use this command to enable AMF secure mode on an entire network. AMF secure mode makes an AMF network more secure by:

- Adding an authorization mechanism before an AMF member is allowed to join an AMF network.
- The encryption of all AMF packets sent between AMF nodes.
- Adding support for user login authentication by RADIUS or TACACS+, and removing the requirement to have the same privileged user account in the local user database on all devices in the AMF network.
- Adding additional logging which enables network administrators to monitor attempts to gain unauthorized access to the AMF network.

Once this command is run on an AMF network, the AMF masters and AMF controllers manage the addition of AMF nodes and AMF areas to the AMF network.

This command can only be run on an AMF master.

Use the **no** variant of this command to disable AMF secure mode on an entire network.

**Syntax** `atmf secure-mode enable-all`  
`no atmf secure-mode enable-all`

**Default** Secure mode is disabled by default.

**Mode** Privileged Exec

**Usage notes** When an AMF network is running in AMF secure mode the [atmf restricted-login](#) feature is automatically enabled. This restricts the [atmf working-set](#) command to users that are logged on to an AMF master. This feature cannot be disabled independently of secure mode.

When AMF secure mode is enabled the AMF controllers and masters in the AMF network form a group of certificate authorities. A node may only join a secure AMF network once it has been authorized by a master or controller. When enabled, all devices in the AMF network must be running in secure mode. Unsecured devices will not be able to join a secure AMF network.

Running **atmf secure-mode enable-all**:

- Groups all AMF members in a working set.
- Executes [clear atmf secure-mode certificates](#) on the working set of members, which removes existing secure mode certificates from all the nodes.
- Groups all the AMF masters in a working set.
- Executes [atmf authorize provision all](#) on the working set of masters, so all masters provision all nodes.
- Groups all AMF nodes in a working set.

- Runs a script which executes `atmf secure-mode` and then writes the configuration file on each node.
- Starts a timer that ticks every 10 seconds, for a maximum of 10 times, and checks if all the secure mode capable nodes rejoin the AMF network.

Running **no atmf secure-mode enable-all**:

- Groups all AMF nodes in a working set.
- Runs a script which executes **no atmf secure-mode** and then writes the configuration file on each node.
- Starts a timer that ticks every 10 seconds, for a maximum of 10 times, and checks if all the secure mode capable nodes rejoin the AMF network.

**NOTE:** Enabling or disabling secure mode on the network saves the running-config on every device.

**Example** To enable AMF secure mode on the entire network, use the command:

```
awplus# atmf secure-mode enable-all
```

You will be prompted to confirm the action:

```
Total number of nodes 21
21 nodes support secure-mode

Enable secure-mode across the AMF network ? (y/n): y
```

To disable AMF secure mode on the entire network, use the command:

```
awplus# no atmf secure-mode enable-all
```

You will be prompted to confirm the action:

```
% Warning: All security certificates will be deleted.
Disable secure-mode across the AMF network ? (y/n): y
```

**Related commands** [aaa authentication auth-web](#)  
[show atmf](#)

**Command changes** Version 5.4.7-0.3: command added

# atmf select-area

**Overview** Use this command to access devices in an area outside the core area on the controller network. This command will connect you to the remote area-master of the specified area.

This command is only valid on AMF controllers.

The **no** variant of this command disconnects you from the remote area-master.

**Syntax** `atmf select-area {<area-name>|local}`  
`no atmf select-area`

| Parameter                      | Description   |
|--------------------------------|---|
| <code>&lt;area-name&gt;</code> | Connect to the remote area-master of the area with this name. |
| <code>local</code>             | Return to managing the local controller area.                 |

**Mode** Privileged Exec

**Usage notes** After running this command, use the [atmf working-set](#) command to select the set of nodes you want to access in the remote area.

**Example** To access nodes in the area Canterbury, use the command

```
controller-1# atmf select-area Canterbury
```

This displays the following output:

```
Test_network[3]#atmf select-area Canterbury
=====
Connected to area Canterbury via host Avensis:
=====
```

To return to the local area for controller-1, use the command

```
controller-1# atmf select-area local
```

Alternatively, to return to the local area for controller-1, use the command

```
controller-1# no atmf select-area
```

**Related commands** [atmf working-set](#)

# atmf topology-gui enable

**Overview** Use this command to enable the operation of Vista Manager EX on the Master device.

Vista Manager EX delivers state-of-the-art monitoring and management for your Autonomous Management Framework™ (AMF) network, by automatically creating a complete topology map of switches, firewalls and wireless access points (APs). An expanded view includes third-party devices such as security cameras.

Use the **no** variant of this command to disable operation of Vista Manager EX.

**Syntax** atmf topology-gui enable  
no atmf topology-gui enable

**Default** Disabled by default on AMF Master and member nodes. Enabled by default on Controllers.

**Mode** Global Configuration mode

**Usage notes** To use Vista Manager EX, you must also enable the HTTP service on all AMF nodes, including all AMF masters and controllers. The HTTP service is enabled by default on AlliedWare Plus switches and disabled by default on AR-Series firewalls. To enable it, use the commands:

```
Node1# configure terminal
Node1(config)# service http
```

On one master in each AMF area in your network, you also need to configure the master to send event notifications to Vista Manager EX. To do this, use the commands:

```
Node1# configure terminal
Node1(config)# log event-host <ip-address> atmf-topology-event
```

**Examples** To enable Vista Manager EX on Node1, use the commands:

```
Node1# configure terminal
Node1(config)# atmf topology-gui enable
```

To disable Vista Manager EX on Node1, use the commands:

```
Node1# configure terminal
Node1(config)# no atmf topology-gui enable
```

**Related commands** [atmf enable](#)  
[log event-host](#)  
[service http](#)

# atmf trustpoint

**Overview** Use this command to set a PKI trustpoint for an AMF network. This command needs to be run on an AMF master or controller.

The self-signed certificate authority (CA) certificate is distributed to every node on the AMF network. It is used to verify client certificates signed by the trustpoint.

Use the **no** variant of this command to remove an AMF trustpoint.

**Syntax** `atmf trustpoint <trustpoint-name>`  
`no atmf trustpoint <trustpoint-name>`

| Parameter                            | Description             |
|--------------------------------------|-------------------------|
| <code>&lt;trustpoint-name&gt;</code> | Name of the trustpoint. |

**Default** No trustpoint is configured by default.

**Mode** Global Configuration

**Usage notes** Before using the **atmf trustpoint** command you will need to establish a trustpoint. For example, you can create a local self-signed trustpoint using the procedure outlined below.

Create a self-signed trustpoint called 'our\_trustpoint' with keypair 'our\_key':

```
awplus# configure terminal
awplus(config)# crypto pki trustpoint our_trustpoint
awplus(ca-trustpoint)# enrollment selfsigned
awplus(ca-trustpoint)# rsakeypair our_key
awplus(ca-trustpoint)# exit
awplus(config)# exit
```

Create the root and server certificates for this trustpoint:

```
awplus# crypto pki authenticate our_trustpoint
awplus# crypto pki enroll our_trustpoint
```

For more information about the AlliedWare Plus implementation of Public Key Infrastructure (PKI), see the [Public Key Infrastructure \(PKI\) Feature Overview and Configuration Guide](#)

**Example** To configure an AMF trustpoint for the trustpoint 'our\_trustpoint', use the commands:

```
awplus# configure terminal
awplus(config)# atmf trustpoint our_trustpoint
```

To remove an AMF trustpoint for the trustpoint 'our\_trustpoint', use the commands:

```
awplus# configure terminal  
awplus(config)# no atmf trustpoint our_trustpoint
```

**Related commands** [crypto pki trustpoint](#)  
[show atmf](#)

**Command changes** Version 5.4.7-2.1: command added

# atmf virtual-crosslink

**Overview** Use this command to create a virtual crosslink. A virtual crosslink connects an AMF master or controller on a physical device to a Virtual AMF Appliance (VAA) master or controller.

All AMF master nodes must reside in the same AMF domain and are required to be directly connected using AMF crosslinks. In order to be able to meet this requirement for AMF masters running on VAAs, a virtual crosslink connects the AMF master or controller on the physical device to the master or controller on the VAA.

Note that AlliedWare Plus CentreCOM Series switches are AMF Edge nodes and do not support virtual links or crosslinks. This is because each edge node can only have a single physical AMF link.

Use the **no** variant of this command to remove a virtual crosslink.

**Syntax**

```
atmf virtual-crosslink id <local-id> ip <local-ip> remote-id <remote-id> remote-ip <remote-ip>
```

```
atmf virtual-crosslink id <local-id> ip <local-ip> remote-id <remote-id> remote-host <domainname>
```

```
no atmf virtual-crosslink id <local-id>
```

| Parameter                | Description   |
|--------------------------|---|
| id <local-id>            | ID of the local tunnel port, a value between 1 and 4094.  |
| ip <local-ip>            | IPv4 address of the local tunnel port in a.b.c.d format.  |
| remote-id <remote-id>    | ID of the remote tunnel port, a value between 1 and 4094. |
| remote-ip <remote-ip>    | IPv4 address of the remote tunnel port in a.b.c.d format. |
| remote-host <domainname> | The domain name of the remote node.                       |

**Default** No AMF virtual crosslinks are created by default.

**Mode** Global Configuration

**Usage notes** This command allows a virtual tunnel to be created between two remote sites over a Layer 3 link. The tunnel encapsulates AMF packets and allows them to be sent transparently across a Wide Area Network (WAN) such as the Internet.

Configuration involves creating a local tunnel ID, a local IP address, a remote tunnel ID, and a remote IP address or domain name. Each side of the tunnel must be configured with the same, but mirrored parameters.

**NOTE:** *Virtual crosslinks are not supported on AMF container masters, therefore if multiple tenants on a single VAA host are configured for secure mode, only a single AMF master is supported per area.*

**Example** To setup a virtual link from a local site, 'siteA', to a remote site, 'siteB', (assuming there is already IP connectivity between the sites), run the following commands at the local site:

```
siteA# configure terminal
siteA(config)# atmf virtual-crosslink id 5 ip 192.168.100.1
remote-id 10 remote-ip 192.168.200.1
```

At the remote site, run the commands:

```
siteB# configure terminal
siteB(config)# atmf virtual-crosslink id 10 ip 192.168.200.1
remote-id 5 remote-ip 192.168.100.1
```

To remove this virtual crosslink, run the following commands on the local site:

```
siteA# configure terminal
siteA(config)# no atmf virtual-crosslink id 5
```

On the remote site, run the commands:

```
siteB# configure terminal
siteB(config)# no atmf virtual-crosslink id 10
```

**Related commands**

**Command changes**

- Version 5.5.2-0.1: **remote-host** parameter added
- Version 5.4.7-0.3: command added

# atmf virtual-link

**Overview** This command creates one or more Layer 2 tunnels that enable AMF nodes to transparently communicate across a wide area network using Layer 2 connectivity protocols.

Once connected through the tunnel, the remote member will have the same AMF capabilities as a directly connected AMF member.

Note that AlliedWare Plus CentreCOM Series switches are AMF Edge nodes and do not support virtual links or crosslinks. This is because each edge node can only have a single physical AMF link.

Use the **no** variant of this command to remove the specified virtual link.

**Syntax**

```
atmf virtual-link id <1-4094> ip <a.b.c.d> remote-id <1-4094>
remote-ip <a.b.c.d> [remote-area <area-name>]

atmf virtual-link id <1-4094> interface <interface-name>
remote-id <1-4094> remote-ip <a.b.c.d> [remote-area
<area-name>]

atmf virtual-link id <1-4094> ip <a.b.c.d> remote-id <1-4094>
remote-host <domainname> [remote-area <area-name>]

atmf virtual-link id <1-4094> interface <interface-name>
remote-id <1-4094> remote-host <domainname> [remote-area
<area-name>]

no atmf virtual-link id <1-4094>
```

| Parameter                  | Description   |
|----------------------------|---|
| id <1-4094>                | ID of the local tunnel point, in the range 1 to 4094.   |
| ip <a.b.c.d>               | Specify the local IP address of the local interface for the virtual-link (alternatively you can specify the interface's name, see below).   |
| interface <interface-name> | Specify the local interface name for the virtual-link. This allows you to use a dynamic, rather than a static, local IP address.  |
| remote-id <1-4094>         | The ID of the (same) tunnel that will be applied by the remote node. Note that this must match the local-id that is defined on the remote node. This means that (for the same tunnel) the local and remote tunnel IDs are reversed on the local and remote nodes. |
| remote-ip <a.b.c.d>        | The IP address of the remote node.  |
| remote-host <domainname>   | The domain name of the remote node.   |
| remote-area <area-name>    | The name of the remote area connected to this virtual-link.   |

**Mode** Global Configuration

**Usage notes** The Layer 2 tunnel that this command creates enables a local AMF session to appear to pass transparently across a Wide Area Network (WAN) such as the Internet. The addresses configured as the local and remote tunnel IP addresses must have IP connectivity to each other. If the tunnel is configured to connect a head office and branch office over the Internet, typically this would involve using some type of managed WAN service such as a site-to-site VPN. Tunnels are only supported using IPv4.

Configuration involves creating a local tunnel ID, a local IP address, a remote tunnel ID and a remote IP address or domain name. A reciprocal configuration is also required on the corresponding remote device. The local tunnel ID must be unique to the device on which it is configured.

If an interface acquires its IP address dynamically then the local side of the tunnel can be specified by using the interface's name instead of using its IP address. When using a dynamic local address the remote address of the other side of the virtual-link must be configured with either:

- the IP address of the NAT device the dynamically configured interface is behind, or
- 0.0.0.0, if the virtual-link is configured as a secure virtual-link.

For instructions on how to configure dynamic IP addresses on virtual-links, see the [AMF Feature Overview and Configuration Guide](#).

The tunneled link may operate via external (non AlliedWare Plus) routers in order to provide wide area network connectivity. However in this configuration, the routers perform a conventional router to router connection. The protocol tunneling function is accomplished by the AMF nodes.

**NOTE:** *AMF cannot achieve zero touch replacement of the remote device that terminates the tunnel connection, because you must pre-configure the local IP address and tunnel ID on that remote device.*

**Example 1** Use the following commands to create the tunnel shown in the figure below.

Figure 57-2: AMF virtual link example

```
Node_10(config)# atmf virtual-link id 1 ip 192.168.1.1
remote-id 2 remote-ip 192.168.2.1

Node_20(config)# atmf virtual-link id 2 ip 192.168.2.1
remote-id 1 remote-ip 192.168.1.1
```

**Example 2** To set up an area virtual link to a remote site (assuming IP connectivity between the sites already), one site must run the following commands:

```
SiteA# configure terminal

SiteA(config)# atmf virtual-link id 5 ip 192.168.100.1
remote-id 10 remote-ip 192.168.200.1 remote-area SiteB-AREA
```

The second site must run the following commands:

```
SiteB# configure terminal

SiteB(config)# atmf virtual-link id 10 ip 192.168.200.1
remote-id 5 remote-ip 192.168.100.1 remote-area SiteA-AREA
```

Before you can apply the above **atmf virtual-link** command, you must configure the area names *SiteB-AREA* and *SiteA-AREA*.

# atmf virtual-link description

**Overview** Use this command to add a description to an existing AMF virtual-link.

Note that AlliedWare Plus CentreCOM Series switches are AMF Edge nodes and do not support virtual links or crosslinks. This is because each edge node can only have a single physical AMF link.

Use the **no** variant of this command to remove a description from an AMF virtual-link.

**Syntax** `atmf virtual-link id <1-4094> description <description>`  
`no atmf virtual-link id <1-4094> description`

| Parameter                        | Description                         |
|----------------------------------|-------------------------------------|
| <code>id &lt;1-4094&gt;</code>   | ID of the local tunnel point.       |
| <code>&lt;description&gt;</code> | A description for the virtual-link. |

**Default** No description is set by default.

**Mode** Global Configuration

**Example** To add a description to the virtual-link with id '5', use the commands:

```
awplus# configure terminal  
awplus(config)# atmf virtual-link id 5 description TO SITE B
```

To remove a description from the virtual-link with id '5', use the commands:

```
awplus# configure terminal  
awplus(config)# no atmf virtual-link id 5
```

**Related commands** [atmf virtual-link](#)  
[show atmf links](#)  
[show atmf virtual-links](#)

# atmf virtual-link protection

**Overview** Use this command to add protection to an existing AMF virtual-link. Secure AMF virtual-links encapsulate the L2TPv3 frames of the virtual-link with IPsec.

Note that AlliedWare Plus CentreCOM Series switches are AMF Edge nodes and do not support virtual links or crosslinks. This is because each edge node can only have a single physical AMF link.

Use the **no** variant of this command to remove protection from an AMF virtual-link.

**Syntax**

```
atmf virtual-link id <1-4094> protection ipsec key [8]
<key-string>

no atmf virtual-link id <1-4094> protection
```

| Parameter    | Description   |
|--------------|---|
| id           | Specify the link ID.  |
| <1-4094>     | Link ID in the range 1 to 4094,   |
| protection   | Protection is on for this link.   |
| ipsec        | Security provided using IPsec.  |
| key          | Set the shared key.   |
| 8            | Specifies a string in an encrypted format instead of plain text. The running config will display the new password as an encrypted string even if password encryption is turned off. |
| <key-string> | Specify the shared key for the link.  |

**Default** Protection is off by default.

**Mode** Global Configuration

**Usage notes** The following limitations need to be considered when creating secure virtual-links.

- Switch devices support a maximum of 20 downstream AMF nodes when using a secure virtual-link as an uplink.
- When there are two or more AMF members behind a shared NAT device, only one of the members will be able to use secure virtual-links.
- An AMF Multi-tenant environment supports a maximum cumulative total of 1200 secure virtual-links across all AMF containers.

Secure virtual-links are only supported on the following device listed in the table below. There is also a limit to the number of links these devices support.

| Device  | Virtual-link Limit |
|---|--------------------|
| AMF Cloud/ VAA  | 300                |
| AR4050S<br>AR3050S<br>AR2050V<br>AR2010V              | 60                 |
| x220<br>x230/x230L<br>x310<br>x510/x510L<br>IX5-28GPX | 2                  |

**Example** To create and configure a virtual link with protection first create the virtual-link:

```
Host-A# configure terminal
```

```
Host-A(config)# atmf virtual-link id 1 ip 192.168.1.1 remote-id  
2 remote-ip 192.168.2.1
```

Enable protection on the virtual link:

```
Host-A(config)# atmf virtual-link id 1 protection ipsec key  
securepassword
```

Repeat these steps on the other side of the link:

```
Host-B(config)# atmf virtual-link id 2 ip 192.168.2.1 remote-id  
1 remote-ip 192.168.1.1
```

```
Host-B(config)# atmf virtual-link id 2 protection ipsec key  
securepassword
```

**Command  
changes** Version 5.4.9-0.1: command added

# atmf working-set

**Overview** Use this command to execute commands across an individually listed set of AMF nodes or across a named group of nodes.

Note that this command can only be run on a master node.

Use the **no** variant of this command to remove members or groups from the current working-set.

**Syntax** `atmf working-set { [<node-list>] | [group <group-list> | all | local | current] }`  
`no atmf working-set { [<node-list>] | [group <group-list>] }`

| Parameter                       | Description  |
|---------------------------------|--|
| <code>&lt;node-list&gt;</code>  | A comma delimited list (without spaces) of nodes to be included in the working-set.  |
| <code>group</code>              | The AMF group.   |
| <code>&lt;group-list&gt;</code> | A comma delimited list (without spaces) of groups to be included in the working-set. Note that this can include either defined groups, or any of the Automatic, or Implicit Groups shown earlier in the bulleted list of groups. |
| <code>all</code>                | All nodes in the AMF.  |
| <code>local</code>              | Local node<br>Running this command with the parameters <b>group local</b> will return you to the local prompt and local node connectivity.   |
| <code>current</code>            | Nodes in current list.   |

**Mode** Privileged Exec

**Usage notes** You can put AMF nodes into groups by using the [atmf group \(membership\)](#) command.

This command opens a session on multiple network devices. When you change the working set to anything other than the local device, the prompt will change to the AMF network name, followed by the size of the working set, shown in square brackets. This command has to be run at privilege level 15.

In addition to the user defined groups, the following system assigned groups are automatically created:

- Implicit Groups
  - local: The originating node.
  - current: All nodes that comprise the current working-set.
  - all: All nodes in the AMF.

- Automatic Groups - These can be defined by hardware architecture, e.g. x510, x610, x8100, AR3050S or AR4050S, or by certain AMF nodal designations such as master.

Note that the Implicit Groups do not appear in `show atmf group` command output. If a node is an AMF master it will be automatically added to the master group.

**Example 1** To add all nodes in the AMF to the working-set, use the command:

```
node1# atmf working-set group all
```

**NOTE:** This command adds the implicit group "all" to the working set, where "all" comprises all nodes in the AMF.

This command displays an output screen similar to the one shown below:

```
=====
node1, node2, node3, node4, node5, node6:
=====

Working set join

ATMF_NETWORK_Name[6]#
```

**Example 2** To return to the local prompt, and connect to only the local node, use the command:

```
ATMF_Network_Name[6]# atmf working-set group local
node1#
```

The following table describes the meaning of the prompts in this example.

| Parameter         | Description  |
|-------------------|--|
| ATMF_Network_Name | The name of the AMF network, as set by the <code>atmf network-name</code> command. |
| [6]               | The number of nodes in the working-set.  |
| node1             | The name of the local node, as set by the <code>hostname</code> command.           |

# bridge-group (amf-container)

**Overview** Use this command to connect an AMF container to a bridge created on a Virtual AMF Appliance (VAA) virtual machine for AMF Cloud. This allows the AMF container to connect to a physical network.

Note that this command is only available on AMF Cloud, not on AlliedWare Plus switches.

An AMF container is an isolated instance of AlliedWare Plus with its own network interfaces, configuration, and file system. The features available inside an AMF container are a sub-set of the features available on the host VAA. These features enable the AMF container to function as a uniquely identifiable AMF master and allows for multiple tenants (up to 60) to run on a single VAA host. See the [AMF Feature Overview and Configuration Guide](#) for more information on running multiple tenants on a single VAA host.

Use the **no** variant of this command to remove a bridge-group from an AMF container.

**Syntax** `bridge-group <bridge-id>`  
`no bridge-group`

| Parameter                      | Description  |
|--------------------------------|--|
| <code>&lt;bridge-id&gt;</code> | The ID of the bridge group to join, a number between 1 and 64. |

**Mode** AMF Container Configuration

**Usage notes** Each container has two virtual interfaces:

- 1) Interface eth0, used to connect to the AMF controller on the VAA host via an AMF area-link, and configured using this [area-link](#) command.
- 2) Interface eth1, used to connect to the outside world using a bridged L2 network link, and configured using the **bridge-group** command.

Before using this command, a bridge must be created with the same bridge-id on the VAA host using the **bridge <bridge-id>** command.

See the [AMF Feature Overview and Configuration Guide](#) for more information on configuring the bridge.

**Example** To assign a bridge group to AMF container 'vac-wlg-1', use the commands:

```
awplus# configure terminal
awplus(config)# atmf container vac-wlg-1
awplus(config-atmf-container)# bridge-group 1
```

**Related commands** [atmf container](#)

**Command changes** Version 5.4.7-0.1: command added

# clear application-proxy threat-protection

**Overview** Use this command to clear the threat protection for a specified address.

**Syntax** `clear application-proxy threat-protection {<ip-address>|<mac-address>|all}`

| Parameter                        | Description   |
|----------------------------------|---|
| <code>&lt;ip-address&gt;</code>  | The IPv4 address you wish to clear the threat for, in A.B.C.D format.       |
| <code>&lt;mac-address&gt;</code> | The MAC address you wish to clear the threat for, in HHHH.HHHH.HHHH format. |
| <code>all</code>                 | Clear the threat for all IPv4 and MAC addresses.                            |

**Mode** Privileged Exec

**Example** To clear the threat for 10.34.199.117, use the command:

```
awplus# clear application-proxy threat-protection 10.34.199.117
```

**Command changes** Version 5.4.7-2.2: command added

# clear atmf links

**Overview** Use this command with no parameters to manually reset all the AMF links on a device. You can optionally specify an interface or range of interfaces to reset the links on.

Certain events or topology changes can cause AMF links to be incorrect or outdated. Clearing the links forces AMF to relearn the information from neighboring nodes and create a fresh, correct, view of the network.

**Syntax** `clear atmf links [<interface-list>]`

| Parameter                           | Description   |
|-------------------------------------|---|
| <code>&lt;interface-list&gt;</code> | <p>The interfaces or ports to perform the reset on. An interface-list can be:</p> <ul style="list-style-type: none"><li>• a switchport (e.g. port1.0.1)</li><li>• a static channel group (e.g. sa2)</li><li>• a dynamic (LACP) channel group (e.g. po2)</li><li>• a local port (e.g. of0)</li><li>• You can specify a continuous range of interfaces separated by a hyphen, or a comma-separated list (e.g. port1.0.1, port1.0.4-port1.0.18).</li></ul> <p>The specified interfaces must exist.<br/>If this parameter is left out then all links of the specified type will be reset on the device.</p> |

**Mode** Privileged Exec

**Example** To clear all AMF links on a device, use the following command:

```
awplus# clear atmf links
```

To clear all AMF links on port1.0.1 to port1.0.4 and static aggregator sa1, use the following command:

```
awplus# clear atmf links port1.0.1-port1.0.4,sa1
```

**Related commands** [clear atmf links virtual](#)  
[show atmf links](#)

**Command changes** Version 5.4.8-2.1: command added

# clear atmf links virtual

**Overview** Use this command with no parameters to manually reset all the AMF virtual links on a device. You can, optionally, specify a comma separated list of virtual links to reset.

Certain events or topology changes can cause AMF links to be incorrect or outdated. Clearing the links forces AMF to relearn the information from neighboring nodes and create a fresh, correct view of the network.

**Syntax** `clear atmf links virtual [<virtuallink-list>]`

| Parameter                             | Description   |
|---------------------------------------|---|
| <code>&lt;virtuallink-list&gt;</code> | A single, or list, of AMF virtual link identifiers to reset. This must be a comma separated list of links e.g. <code>vlink1, vlink2, vlink3</code> . Specifying a link range e.g <code>vlink1-vlink3</code> is not supported. |

**Mode** Privileged Exec

**Example** To clear all AMF virtual links on a device, use the following command:

```
awplus# clear atmf links virtual
```

To clear AMF virtual links `vlink11` and `vlink21`, use the following command:

```
awplus# clear atmf links virtual vlink11,vlink22
```

**Related commands** [clear atmf links](#)  
[show atmf links](#)

**Command changes** Version 5.4.8-2.1: command added

# clear atmf links statistics

**Overview** This command resets the values of all AMF link, port, and global statistics to zero.

**Syntax** `clear atmf links statistics`

**Mode** Privilege Exec

**Example** To reset the AMF link statistics values, use the command:

```
node_1# clear atmf links statistics
```

**Related commands** [show atmf links statistics](#)

# clear atmf recovery-file

**Overview** Use this command to delete all of a node's recovery files. It deletes the recovery files stored on:

- the local node,
- neighbor nodes, and
- external media (USB or SD card).

**Syntax** `clear atmf recovery-file`

**Mode** Privileged Exec

**Usage notes** AMF recovery files are created for nodes with special links. Special links include:

- virtual links,
- area links terminating on an AMF master, and
- area virtual links terminating on an AMF master.

An AMF node with one of these special links pushes its startup configuration to its neighbors and to any attached external media. It then fetches and applies this configuration at recovery time. This configuration enables it to contact the AMF master and initiate a recovery.

Recovery files can become out of date if:

- a node's neighbor is off line when changes are made to its configuration, or
- when a node no longer contains a special link.

**Example** To clear a node's recovery files, use the command:

```
node1# clear atmf recovery-file
```

**Output** Figure 57-3: If AlliedWare Plus detects that a node contains a special link then the following message is displayed

```
node1#clear atmf recovery-file
% Warning: ATMF recovery files have been removed.
ATMF recovery may fail. Please save running-configuration.
```

**Related commands** [show atmf recovery-file](#)

**Command changes** Version 5.4.8-0.2: command added

# clear atmf secure-mode certificates

**Overview** Use this command to remove all certificates from an AMF member or master. AMF nodes will need to be re-authorized once this command has been run.

**Syntax** `clear atmf secure-mode certificates`

**Mode** Privileged Exec

**Example** To clear all certificates from an AMF node, use the command:

```
awplus# clear atmf secure-mode certificates
```

If this is the only master on the network you will see the following warning:

```
% Warning: This node is the only master in the network!  
All the nodes will become isolated and refuse to join any ATMF  
network. The certificates on all the isolated nodes must be  
cleared before rejoining an ATMF network will be possible.  
  
To clear certificates a reboot of the device is required.  
Clear certificates and Reboot ? (y/n):
```

On an AMF member you will see the following message:

```
To clear certificates a reboot of the device is required.  
Clear certificates and Reboot ? (y/n):
```

**Related commands**

- [atmf authorize](#)
- [atmf secure-mode](#)

- [show atmf secure-mode certificates](#)

**Command changes** Version 5.4.7-0.3: command added

# clear atmf secure-mode statistics

**Overview** Use this command to reset all secure mode statistics to 0.

**Syntax** `clear atmf secure-mode statistics`

**Mode** Privileged Exec

**Example** To reset the AMF secure mode statistics information, use the command:

```
awplus# clear atmf secure-mode statistic
```

**Related commands** [show atmf secure-mode](#)  
[show atmf secure-mode statistics](#)

**Command changes** Version 5.4.7-0.3: command added

# clone (amf-provision)

**Overview** This command sets up a space on the backup media for use with a provisioned node and copies into it almost all files and directories from a chosen backup or provisioned node.

Alternatively, you can set up a new, unique provisioned node by using the command [create \(amf-provision\)](#).

**Syntax** `clone <source-nodename>`

| Parameter                            | Description  |
|--------------------------------------|--|
| <code>&lt;source-nodename&gt;</code> | The name of the node whose configuration is to be copied for loading to the clone. |

**Mode** AMF Provisioning

**Usage notes** This command is only available on master nodes in the AMF network.

When using this command it is important to be aware of the following:

- A copy of `<media>:atmf/<atmf_name>/nodes/<source_node>/flash` will be made for the provisioned node and stored in the backup media.
- The directory `<node_backup_dir>/flash/.config/ssh` is excluded from the copy.
- All contents of `<root_backup_dir>/nodes/<nodename>` will be deleted or overwritten.
- Settings for the expected location of other provisioned nodes are excluded from the copy.

The active and backup configuration files are automatically modified in the following ways:

- The **hostname** command is modified to match the name of the provisioned node.
- The **stack virtual-chassis-id** command is removed, if present.

**Example** To copy from the backup of 'device2' to create backup files for the new provisioned node 'device3' use the following command:

```
device1# atmf provision node device3
device1(atmf-provision)# clone device2
```

Figure 57-4: Sample output from the **clone** command

```
device1# atmf provision node device3
device1(atmf-provision)#clone device2
Copying...
Successful operation
```

To confirm that a new provisioned node has been cloned, use the command:

```
device1# show atmf backup
```

The output from this command is shown in the following figure, and shows the details of the new provisioned node 'device3'.

Figure 57-5: Sample output from the **show atmf backup** command

```
device1#show atmf backup

**Command changes**

Version 5.4.9-0.1: syntax change due to new AMF provisioning mode

# configure boot config (amf-provision)

**Overview** This command sets the configuration file to use during the next boot cycle. This command can also set a backup configuration file to use if the main configuration file cannot be accessed for an AMF provisioned node. To unset the boot configuration or the backup boot configuration use the **no boot** command.

**Syntax** `configure boot config [backup] <file-path|URL>`  
`configure no boot config [backup]`

| Parameter       | Description   |
|-----------------|---|
| backup          | Specify that this is the backup configuration file. |
| <file-path URL> | The path or URL and name of the configuration file. |

**Default** No boot configuration files or backup configuration files are specified for the provisioned node.

**Mode** AMF Provisioning

**Usage notes** When using this command to set a backup configuration file, the specified AMF provisioned node must exist. The specified file must exist in the flash directory created for the provisioned node in the AMF remote backup media.

**Examples** To set the configuration file 'branch.cfg' on the AMF provisioned node 'node1', use the command:

```
MasterNodeName# atmf provision node node1
MasterNodeName(atmf-provision)# configure boot config
branch.cfg
```

To set the configuration file 'backup.cfg' as the backup to the main configuration file on the AMF provisioned node 'node1', use the command:

```
MasterNodeName(atmf-provision)# configure boot config backup
usb:/atmf/amf_net/nodes/node1/config/backup.cfg
```

To unset the boot configuration, use the command:

```
MasterNodeName(atmf-provision)# configure no boot config
```

To unset the backup boot configuration, use the command:

```
MasterNodeName(atmf-provision)# configure no boot config backup
```

- [create \(amf-provision\)](#)

delete (amf-provision)  
identity (amf-provision)  
license-cert (amf-provision)  
locate (amf-provision)  
show atmf provision nodes

**Command  
changes**

Version 5.4.9-0.1: syntax change due to new AMF provisioning mode

# configure boot system (amf-provision)

**Overview** This command sets the release file that will load onto a specified provisioned node during the next boot cycle. This command can also set the backup release file to be loaded for an AMF provisioned node. To unset the boot system release file or the backup boot release file use the **no boot** command.

Use the **no** variant of this command to return to the default.

This command can only be run on AMF master nodes.

**Syntax** `configure boot system [backup] <file-path|URL>`  
`configure no boot system [backup]`

| Parameter                          | Description                                   |
|------------------------------------|---|
| <code>&lt;file-path URL&gt;</code> | The path or URL and name of the release file. |

**Default** No boot release file or backup release files are specified for the provisioned node.

**Mode** AMF Provisioning

**Usage notes** When using this command to set a backup release file, the specified AMF provisioned node must exist. The specified file must exist in the flash directory created for the provisioned node in the AMF remote backup media.

**Examples** To set the release file x930-5.4.9-0.1.rel on the AMF provisioned node 'node1', use the command:

```
MasterNodeName# atmf provision node node1
MasterNodeName(atmf-provision)# configure boot system
x930-5.4.9-0.1.rel
```

To set the backup release file x930-5.4.8-2.5.rel as the backup to the main release file on the AMF provisioned node 'node1', use the command:

```
MasterNodeName# atmf provision node node1
MasterNodeName(atmf-provision)# configure boot system backup
card:/atmf/amf_net/nodes/node1/flash/x930-5.4.8-2.5.rel
```

To unset the boot release, use the command:

```
MasterNodeName# atmf provision node node1
MasterNodeName(atmf-provision)# configure no boot system
```

To unset the backup boot release, use the command:

```
MasterNodeName# atmf provision node node1
MasterNodeName(atmf-provision)# configure no boot system backup
```

**Related commands** [atmf provision \(interface\)](#)

atmf provision node  
clone (amf-provision)  
configure boot config (amf-provision)  
create (amf-provision)  
delete (amf-provision)  
identity (amf-provision)  
license-cert (amf-provision)  
locate (amf-provision)  
show atmf provision nodes

**Command changes** Version 5.4.9-0.1: syntax change due to new AMF provisioning mode

# copy (amf-provision)

**Overview** Use this command to copy configuration and release files for the node you are provisioning.

For more information about using the copy command see [copy \(filename\)](#) in the File and Configuration Management chapter.

**Syntax** `copy [force] <source-name> <destination-name>`

| Parameter                             | Description   |
|---------------------------------------|---|
| <code>force</code>                    | This parameter forces the copy command to overwrite the destination file, if it already exists, without prompting the user for confirmation.        |
| <code>&lt;source-name&gt;</code>      | The filename and path of the source file. See the <a href="#">Introduction</a> of the File and Configuration Management chapter for valid syntax.   |
| <code>&lt;destination-name&gt;</code> | The filename and path for the destination file. See <a href="#">Introduction</a> of the File and Configuration Management chapter for valid syntax. |

**Mode** AMF Provisioning

**Example** To copy a configuration file named `current.cfg` from Node\_4's Flash into the `future_node` directory, and set that configuration file to load onto `future_node`, use the following commands:

```
node_4# atmf provision node future_node
node_4(atmf-provision)# create
node_4(atmf-provision)# locate
node_4(atmf-provision)# copy flash:current.cfg
./future_node.cfg
node_4(atmf-provision)# configure boot config future_node.cfg
```

**Related commands**

- [create \(amf-provision\)](#)
- [delete \(amf-provision\)](#)
- [locate \(amf-provision\)](#)
- [show atmf provision nodes](#)

**Command changes** Version 5.4.9-2.1: command added

# create (amf-provision)

**Overview** This command sets up an empty directory on the backup media for use with a provisioned node. This directory can have configuration and release files copied to it from existing devices. Alternatively, the configuration files can be created by the user.

An alternative way to create a new provisioned node is with the command [clone \(amf-provision\)](#).

This command can only run on AMF master nodes.

**Syntax** create

**Mode** AMF Provisioning

**Usage notes** This command is only available on master nodes in the AMF network.

A date and time is assigned to the new provisioning directory reflecting when this command was executed. If there is a backup or provisioned node with the same name on another AMF master then the most recent one will be used.

**Example** To create a new provisioned node named "device2" use the command:

```
device1# atmf provision node device2  
device1(atmf-provision)# create
```

Running this command will create the following directories:

- `<media>:atmf/<atmf_name>/nodes/<node>`
- `<media>:atmf/<atmf_name>/nodes/<node>/flash`

To confirm the new node's settings, use the command:

```
device1# show atmf backup
```

The output for the **show atmf backup** command is shown in the following figure, and shows details for the new provisioned node 'device2'.

Figure 57-6: Sample output from the **show atmf backup** command

```
device1#show atmf backup

**Command changes**

Version 5.4.9-0.1: syntax change due to new AMF provisioning mode

# debug atmf

**Overview** This command enables the AMF debugging facilities, and displays information that is relevant (only) to the current node. The detail of the debugging displayed depends on the parameters specified.

If no additional parameters are specified, then the command output will display all AMF debugging information, including link events, topology discovery messages and all notable AMF events.

The **no** variant of this command disables either all AMF debugging information, or only the particular information as selected by the command's parameters.

**Syntax**

```
debug atmf  
[link|crosslink|arealink|database|neighbor|error|all]  
  
no debug atmf  
[link|crosslink|arealink|database|neighbor|error|all]
```

| Parameter | Description   |
|-----------|---|
| link      | Output displays debugging information relating to uplink or downlink information. |
| crosslink | Output displays all crosslink events.   |
| arealink  | Output displays all arealink events.  |
| database  | Output displays only notable database events.                                     |
| neighbor  | Output displays only notable AMF neighbor events.                                 |
| error     | Output displays AMF error events.   |
| all       | Output displays all AMF events.   |

**Default** All debugging facilities are disabled.

**Mode** User Exec and Global Configuration

**Usage notes** If no additional parameters are specified, then the command output will display all AMF debugging information, including link events, topology discovery messages and all notable AMF events.

**NOTE:** An alias to the **no** variant of this command is [undebbug atmf](#) on page 3042.

**Examples** To enable all AMF debugging, use the command:

```
node_1# debug atmf
```

To enable AMF uplink and downlink debugging, use the command:

```
node_1# debug atmf link
```

To enable AMF error debugging, use the command:

```
node_1# debug atmf error
```

**Related  
commands** [no debug all](#)

# debug atmf packet

**Overview** This command configures AMF Packet debugging parameters. The debug only displays information relevant to the current node. The command has following parameters:

**Syntax** debug atmf packet [direction {rx|tx|both}] [level {1|2|3}]  
[timeout <seconds>] [num-pkts <quantity>]  
[filter {node <name>|interface <ifname>}  
[pkt-type [1][2][3][4][5][6][7][8][9][10][11][12][13]]]

## Simplified Syntax

|                          |  |
|--------------------------|--|
| debug atmf packet        | [direction {rx tx both}]                                   |
|                          | [level {[1][2 3]}]   |
|                          | [timeout <seconds>]  |
|                          | [num-pkts <quantity>]                                      |
| debug atmf packet filter | [node <name>]  |
|                          | [interface <ifname>]                                       |
|                          | [pkt-type<br>[1][2][3][4][5][6][7][8][9][10][11][12][13]]] |

**NOTE:** You can combine the syntax components shown, but when doing so, you must retain their original order.

**Default** Level 1, both Tx and Rx, a timeout of 60 seconds with no filters applied.

**NOTE:** An alias to the **no** variant of this command - *undebug atmf* - can be found elsewhere in this chapter.

**Mode** User Exec and Global Configuration

**Usage notes** If no additional parameters are specified, then the command output will apply a default selection of parameters shown below:

| Parameter | Description  |
|-----------|--|
| direction | Sets debug to packet received, transmitted, or both  |
| rx        | packets received by this node  |
| tx        | Packets sent from this node  |
| 1         | AMF Packet Control header Information, Packet Sequence Number. Enter 1 to select this level. |
| 2         | AMF Detailed Packet Information. Enter 2 to select this level.                               |
| 3         | AMF Packet HEX dump. Enter 3 to select this level.   |
| timeout   | Sets the execution timeout for packet logging  |

| Parameter  | Description   |
|------------|---|
| <seconds>  | Seconds   |
| num-pkts   | Sets the number of packets to be dumped   |
| <quantity> | The actual number of packets  |
| filter     | Sets debug to filter packets  |
| node       | Sets the filter on packets for a particular Node  |
| <name>     | The name of the remote node   |
| interface  | Sets the filter to dump packets from an interface (portx.x.x) on the local node                   |
| <ifname>   | Interface port or virtual-link  |
| pkt-type   | Sets the filter on packets with a particular AMF packet type                                      |
| 1          | Crosslink Hello BPDU packet with crosslink links information. Enter 1 to select this packet type. |
| 2          | Crosslink Hello BPDU packet with downlink domain information. Enter 2 to select this packet type. |
| 3          | Crosslink Hello BPDU packet with uplink information. Enter 3 to select this packet type.          |
| 4          | Downlink and uplink hello BPDU packets. Enter 4 to select this packet type.                       |
| 5          | Non broadcast hello unicast packets. Enter 5 to select this packet type.                          |
| 6          | Stack hello unicast packets. Enter 6 to select this packet type.                                  |
| 7          | Database description. Enter 7 to select this packet type.   |
| 8          | DBE request. Enter 8 to select this packet type.  |
| 9          | DBE update. Enter 9 to select this packet type.   |
| 10         | DBE bitmap update. Enter 10 to select this packet type.   |
| 11         | DBE acknowledgment. Enter 11 to select this packet type.  |
| 12         | Area Hello Packets. Enter 12 to select this packet type.  |
| 13         | Gateway Hello Packets. Enter 13 to select this packet type.                                       |

**Examples** To set a packet debug on node 1 with level 1 and no timeout, use the command:

```
node_1# debug atmf packet direction tx timeout 0
```

To set a packet debug with level 3 and filter packets received from AMF node 1:

```
node_1# debug atmf packet direction tx level 3 filter node_1
```

To enable send and receive 500 packets only on vlink1 for packet types 1, 7, and 11, use the command:

```
node_1# debug atmf packet num-pkts 500 filter interface vlink1  
pkt-type 1 7 11
```

This example applies the **debug atmf packet** command and combines many of its options:

```
node_1# debug atmf packet direction rx level 1 num-pkts 60  
filter node x930 interface port1.0.1 pkt-type 4 7 10
```

# delete (amf-provision)

**Overview** This command deletes files that have been created for loading onto a provisioned node. It can only be run on master nodes.

**Syntax** delete

**Mode** AMF Provisioning

**Usage notes** This command is only available on master nodes in the AMF network. The command will only work if the provisioned node specified in the command has already been set up (although the device itself is still yet to be installed). Otherwise, an error message is shown when the command is run.

You may want to use the **delete** command to delete a provisioned node that was created in error or that is no longer needed.

This command cannot be used to delete backups created by the AMF backup procedure. In this case, use the command [atmf backup delete](#) to delete the files.

**NOTE:** *This command allows provisioned entries to be deleted even if they have been referenced by the [atmf provision \(interface\)](#) command, so take care to only delete unwanted entries.*

**Example** To delete backup files for a provisioned node named device3 use the command:

```
device1# atmf provision node device3  
device1(atmf-provision)# delete
```

To confirm that the backup files for provisioned node device3 have been deleted use the command:

```
device1# show atmf backup
```

The output should show that the provisioned node device3 no longer exists in the backup file, as shown in the figure below:

Figure 57-7: Sample output showing the **show atmf backup** command

```
device1#show atmf backup

Scheduled Backup ..... Enabled

- locate (amf-provision)
- show atmf provision nodes

**Command changes**

Version 5.4.9-0.1: syntax change due to new AMF provisioning mode

# discovery

**Overview** Use this command to specify how AMF learns about guest nodes.

AMF nodes gather information about guest nodes by using one of the internally defined discovery methods: dynamic, static, or agent.

**Dynamic** learning (the default method) means that AMF learns the guest's IP and MAC addresses from LLDP or DHCP snooping. Dynamic learning is only supported when using IPv4. For IPv6, use static learning.

With dynamic learning, ensure that the command [ip dhcp snooping delete-by-linkdown](#) is set.

**Static** learning uses the [switchport atmfguestlink](#) command to specify the guest class name and IP address of the guest node attached to each individual switch port. AMF then learns the MAC addresses of each of the guests of that class from ARP or Neighbor discovery tables.

If you are using the static method, ensure that you have configured the appropriate class type for each of your statically discovered guest nodes.

**Agent** learning uses the AMF agent to retrieve the guest's IP and MAC address. It is only available on guest nodes that support ATMF agent, such as TQ5403 series access points. For step-by-step instructions on using agent discovery for auto-recovery of an TQ5403 series AP, see the [AMF Feature Overview and Configuration Guide](#).

The **no** variant of this command returns the discovery method to **dynamic**.

**Syntax** `discovery [dynamic|static|agent]`  
`no discovery`

| Parameter | Description                          |
|-----------|--------------------------------------|
| dynamic   | Learned from DCHCP Snooping or LLDP. |
| static    | Statically assigned.                 |
| agent     | Learned from the AMF agent.          |

**Default** Dynamic

**Mode** AMF Guest Configuration

**Usage notes** This command is one of several modal commands that are configured and applied for a specific guest-class (mode). Its settings are automatically applied to a guest-node link by the [switchport atmfguestlink](#) command.

**NOTE:** *AMF guest nodes are not supported on ports using the OpenFlow protocol.*

**Example 1** To configure static discovery for the guest-class 'camera', use the following commands:

```
Node1# configure terminal
Node1(config)# atmf guest-class camera
Node1(config-atmf-guest)# discovery static
```

**Example 2** To return the discovery method for the guest class TQ6602 to its default of **dynamic**, use the following commands:

```
Node1# configure terminal
Node1(config)# atmf guest-class TQ6602
Node1(config-atmf-guest)# no discovery
```

**Related commands**

- atmf guest-class
- switchport atmf-guestlink
- show atmf links guest
- show atmf nodes

**Command changes** Version 5.5.3-0.1: **agent** parameter added

# description (amf-container)

**Overview** Use this command to set the description on an AMF container on a Virtual AMF Appliance (VAA).

An AMF container is an isolated instance of AlliedWare Plus with its own network interfaces, configuration, and file system. The features available inside an AMF container are a sub-set of the features available on the host VAA. These features enable the AMF container to function as a uniquely identifiable AMF master and allows for multiple tenants (up to 60) to run on a single VAA host. See the [AMF Feature Overview and Configuration Guide](#) for more information on running multiple tenants on a single VAA host.

Use the **no** variant of this command to remove the description from an AMF container.

**Syntax** `description <description>`  
`no description`

| Parameter                        | Description  |
|----------------------------------|--|
| <code>&lt;description&gt;</code> | Enter up to 128 characters of text describing the AMF container. |

**Mode** AMF Container Configuration

**Example** To set the description for AMF container “vac-wlg-1” to “Wellington area”, use the commands:

```
awplus# configure terminal
awplus(config)# atmf container vac-wlg-1
awplus(config-atmf-container)# description Wellington area
```

To remove the description for AMF container “vac-wlg-1”, use the commands:

```
awplus# configure terminal
awplus(config)# atmf container vac-wlg-1
awplus(config-atmf-container)# no description
```

**Related commands** [atmf container](#)  
[show atmf container](#)

**Command changes** Version 5.4.7-0.1: command added

# erase factory-default

**Overview** This command erases all data from NVS and all data from flash **except** the following:

- the boot release file (a .rel file) and its release setting file
- all license files
- the latest GUI release file

The device is then rebooted and returned to its factory default condition. The device can then be used for AMF automatic node recovery.

**Syntax** `erase factory-default`

**Mode** Privileged Exec

**Usage notes** This command is an alias to the [atmf cleanup](#) command.

**Example** To erase data, use the command:

```
Node_1# erase factory-default
```

```
This command will erase all NVS, all flash contents except for  
the boot release, a GUI resource file, and any license files,  
and then reboot the switch. Continue? (y/n):y
```

**Related commands** [atmf cleanup](#)

# firmware-url

**Overview** Use this command to specify the location of an AP guest node's firmware file when preparing the AP for auto-recovery. AMF cannot back up AP firmware files (only configuration files), so you need to store the firmware file somewhere accessible and use this command to provide the AlliedWare Plus device with the file's location.

For step-by-step instructions for auto-recovery of an TQ5403 series AP, see the [AMF Feature Overview and Configuration Guide](#).

Use the **no** variant of this command to remove the URL.

**Syntax** `firmware-url <name>`  
`no firmware-url`

| Parameter                 | Description   |
|---------------------------|---|
| <code>&lt;name&gt;</code> | The file's directory or filename. We recommend specifying a directory because that makes it easier to keep the firmware file up to date. The following protocols are supported: http, https, tftp, usb, and card. Do not change the firmware file's filename. |

**Default** No URL is configured

**Mode** AMF Guest Configuration

**Example** To specify, on a device named node2, that the firmware file for a TQ5403 AP is stored in the top level of a USB stick, use the commands:

```
node2# configure terminal
node2(config)# atmf guest-class TQ5403
node2(config-guest)# firmware-url usb:
```

To specify, on a device named node2, that the firmware file for a TQ5403 AP is stored on a TFTP server with an address of 192.168.2.1, use the commands:

```
node2# configure terminal
node2(config)# atmf guest-class TQ5403
node2(config-guest)# firmware-url tftp://192.168.2.1/
```

switchport atmf-guestlink

**Command changes** Version 5.5.3-0.1: command added

# http-enable

**Overview** This command is used to enable GUI access to a guest node. When **http-enable** is configured, the port number is set to its default of 80. If the guest node is using a different port for HTTP, you can configure this using the **port** parameter.

This command is used to inform the GUI that this device has an HTTP interface at the specified port number so that a suitable URL can be provided to the user.

Use the **no** variant of this command to disable HTTP.

**Syntax** `http-enable [port <port-number>]`  
`no http-enable`

| Parameter     | Description                       |
|---------------|-----------------------------------|
| port          | TCP port number.                  |
| <port-number> | The port number to be configured. |

**Default** Not set

**Mode** AMF Guest Configuration

**Usage notes** If **http-enable** is selected without a **port** parameter the port number will default to 80.

**Example** To enable HTTP access to a guest node on port 80 (the default), use the following commands:

```
node1# configure terminal
node1(config)# atmf guest-class Camera
node1(config-atmf-guest)# http-enable
```

To enable HTTP access to a guest node on port 400, use the following commands:

```
node1# configure terminal
node1(config)# atmf guest-class Camera
node1(config-atmf-guest)# http-enable port 400
```

To disable HTTP access to a guest node, use the following commands:

```
node1# configure terminal
node1(config)# atmf guest-class Camera
node1(config-atmf-guest)# no http-enable
```

**Related commands** [atmf guest-class](#)  
[switchport atmf-guestlink](#)  
[show atmf links guest](#)

`show atmf nodes`

# identity (amf-provision)

**Overview** Use this command to create an identity token for provisioning an isolated AMF node. An isolated node is an AMF member that is only connected to the rest of the AMF network via a virtual-link.

This command allows these nodes, which have no AMF neighbors, to be identified for provisioning purposes. They are identified using an identity token which is based on either the next-hop MAC address of the provisioned node, or the serial number of the device being provisioned. This identity token is stored on the AMF master.

Use the **no** variant of this command to remove the identity token for a node.

**Syntax**

```
identity mac-address <mac-address> prefix  
<ip-address/prefix-length>  
  
identity serial-number <serial-number> prefix  
<ip-address/prefix-length>  
  
no identity
```

| Parameter                      | Description   |
|--------------------------------|---|
| mac-address                    | Specify the next-hop MAC address of the device being provisioned.                           |
| <mac-address>                  | MAC address of the port the provisioned node is connected to, in the format xxxx.xxxx.xxxx. |
| serial-number                  | Specify the serial number of the device to be provisioned.                                  |
| <serial-number>                | Serial number of the device that is being provisioned.                                      |
| prefix                         | IPv4 address, and prefix length, of the virtual-link interface on the isolated node         |
| <ip-address/<br>prefix-length> | IPv4 address, and prefix length, in A.B.C.D/M format.                                       |

**Mode** AMF Provisioning

**Usage notes** To provision an isolated node, first create a configuration for the node using the [create \(amf-provision\)](#) and/or the [clone \(amf-provision\)](#) commands.

Then create an identity token for the provisioned node by either specifying its next-hop MAC address or by specifying the serial number of the replacement device. The advantage of using the next-hop MAC address is that any device, regardless of its serial number, can be added to the network but using the serial number maybe preferred in situations where the next-hop MAC address is not easy to obtain.

The [atmf recovery-server](#) option must be enabled on the AMF master before attempting to provision the device. This option allows the AMF master to process recovery requests from isolated AMF nodes.

See the [AMF Feature Overview and Configuration Guide](#) for information on preparing your network for recovering or provisioning isolated nodes.

**Example** To create a identity token on your AMF master for a device named “my-x930” with serial number “A10064A172100008”, use the command:

```
awplus# atmf provision node my-x930  
awplus(atmf-provision)# identity serial-number  
A10064A172100008 prefix 192.168.2.25/24
```

To create a identity token on your AMF master for a device named “my-x930” with next-hop MAC address “0000.cd28.0880”, use the command:

```
awplus# atmf provision node my-x930  
awplus(atmf-provision)# identity mac-address 0000.cd28.0880  
prefix 192.168.2.25/24
```

To delete the identity token from your AMF master for a device named “my-x930”, use the command:

```
awplus# atmf provision node my-x930  
awplus(atmf-provision)# no identity
```

changes**

Version 5.4.9-0.1: syntax change due to new AMF provisioning mode  
Version 5.4.7-2.1: command added

# license-cert (amf-provision)

**Overview** This command is used to set up the license certificate for a provisioned node.

The certificate file usually has all the license details for the network, and can be stored anywhere in the network. This command makes a hidden copy of the certificate file and stores it in the space set up for the provisioned node on AMF backup media.

For node provisioning, the new device has not yet been part of the AMF network, so the user is unlikely to know its product ID or its MAC address. When such a device joins the network, assuming that this command has been applied successfully, the copy of the certificate file will be applied automatically to the provisioned node.

Once the new device has been resurrected on the network and the certificate file has been downloaded to the provisioned node, the hidden copy of the certificate file is deleted from AMF backup media.

Use the **no** variant of this command to set it back to the default.

This command can only be run on AMF master nodes.

**Syntax** `license-cert <file-path|URL>`  
`no license-cert`

| Parameter                          | Description   |
|------------------------------------|---|
| <code>&lt;file-path URL&gt;</code> | The name of the certificate file. This can include the file-path of the file. |

**Default** No license certificate file is specified for the provisioned node.

**Mode** AMF Provisioning

**Usage notes** This command is only available on master nodes in the AMF network. It will only operate if the provisioned node specified in the command has already been set up, and if the license certification is present in the backup file. Otherwise, an error message is shown when the command is run.

**Example 1** To apply the license certificate 'cert1.txt' stored on a TFTP server for AMF provisioned node "device2", use the command:

```
device1# atmf provision node device2
device1(atmf-provision)# license-cert
tftp://192.168.1.1/cert1.txt
```

**Example 2** To apply the license certificate 'cert2.txt' stored in the AMF master's flash directory for AMF provisioned node 'host2', use the command:

```
device1# atmf provision node host2
device1(atmf-provision)# license-cert /cert2.txt
```

To confirm that the license certificate has been applied to the provisioned node, use the command `show atmf provision nodes`. The output from this command is shown below, and displays license certification details in the last line.

Figure 57-8: Sample output from the `show atmf provision nodes` command

```
device1#show atmf provision nodes

ATMF Provisioned Node Information:

Backup Media .....: SD (Total 3827.0MB, Free 3481.1MB)

Node Name           : device2
Date & Time         : 06-Oct-2016 & 23:25:44
Provision Path      : card:/atmf/nodes

Boot configuration :
Current boot image  : x510-5.4.6-1.4.rel (file exists)
Backup boot image   : x510-5.4.6-1.3.rel (file exists)
Default boot config : flash:/default.cfg (file exists)
Current boot config : flash:/abc.cfg (file exists)
Backup boot config  : flash:/xyz.cfg (file exists)

Software Licenses :
Repository file     : ../configs/.sw_v2.lic

**Command changes** Version 5.4.9-0.1: syntax change due to new AMF provisioning mode

# locate (amf-provision)

**Overview** This command changes the present working directory to the directory of a provisioned node. This makes it easier to edit files and create a unique provisioned node in the backup.

This command can only be run on AMF master nodes.

**NOTE:** We advise that after running this command, you return to a known working directory, typically `flash`.

**Syntax** `locate`

**Mode** AMF Provisioning

**Example** To change the working directory that happens to be on device1 to the directory of provisioned node device2, use the following command:

```
device1# atmf provision node device2
device1[atmf-provision]# locate
```

The directory of the node device2 should now be the working directory. You can use the command `pwd` to check this, as shown in the following figure.

Figure 57-9: Sample output from the `pwd` command

```
device2#pwd
card:/atmf/building_2/nodes/device2/flash
```

The output above shows that the working directory is now the flash of device2.

**Command changes** Version 5.4.9-0.1: syntax change due to new AMF provisioning mode

# log event-host

**Overview** Use this command to set up an external host to log AMF topology events through Vista Manager. This command is run on the Master device.

Use the **no** variant of this command to disable log events through Vista Manager.

**Syntax** `log event-host [<ipv4-addr>|<ipv6-addr>] atmf-topology-event`  
`no log event-host [<ipv4-addr>|<ipv6-addr>] atmf-topology-event`

| Parameter                      | Description                    |
|--------------------------------|--------------------------------|
| <code>&lt;ipv4-addr&gt;</code> | ipv4 address of the event host |
| <code>&lt;ipv6-addr&gt;</code> | ipv6 address of the event host |

**Default** Log events are disabled by default.

**Mode** Global Configuration

**Usage notes** Event hosts are set so syslog sends the messages out as they come.

Note that there is a difference between log event and log host messages:

- Log event messages are sent out as they come by syslog
- Log host messages are set to wait for a number of messages (20) to send them out together for traffic optimization.

**Example** To enable Node 1 to log event messages from host IP address 192.0.2.31, use the following commands:

```
Node1# configure terminal
```

```
Node1(config)# log event-host 192.0.2.31 atmf-topology-event
```

To disable Node 1 to log event messages from host IP address 192.0.2.31, use the following commands:

```
Node1# configure terminal
```

```
Node1(config)# no log event-host 192.0.2.31 atmf-topology-event
```

**Related commands** [atmf topology-gui enable](#)

# login-fallback enable

**Overview** Use this command to enable login fallback on TQ model AMF guest nodes. This allows AMF to try the factory default username and password if the guest node's saved username and password fail.

Use the **no** variant of this command to disable login fallback.

**Syntax** login-fallback enable  
no login-fallback enable

**Default** Disabled

**Mode** AMF Guest Configuration

**Usage notes** This feature is only supported on TQ model guest nodes.

Login fallback means: if a guest node's saved username and password fail, AMF will try to connect to the node using the factory default username and password (manager/friend). When a new TQ replaces an existing TQ, this allows the new TQ to be discovered and managed as an AMF guest node. AMF can then start the AMF guest node recovery procedure.

**Example** To use the login fallback feature, first create an AMF guest class for TQ model APs. Then enable the login fall back feature.

For example, to enable login fallback on the guest-class AT-TQ5k, use the commands:

```
node1#configuration terminal
node1(config)#atmf guest-class AT-TQ5k
node1(config-atmf-guest)#login-fallback enable
node1(config-atmf-guest)#end
node1#
```

**Related commands** [atmf guest-class](#)  
[modeltype](#)  
[switchport atmf-guestlink](#)  
[show atmf links guest](#)

**Command changes** Version 5.5.0-1.1: command added

# modeltype

**Overview** This command sets the expected model type of the guest node. The model type will default to **other** if nothing is set.

Use the **no** variant of this command to reset the model type to **other**.

**Syntax** `modeltype {alliedware|aw+|onvif|tq|other}`  
`no modeltype`

| Parameter  | Description  |
|------------|--|
| alliedware | A legacy Allied Telesis operating system.                    |
| aw+        | The Allied Telesis AlliedWare Plus operating system.         |
| onvif      | ONVIF (Open Network Video Interface Forum) Profile Q devices |
| tq         | An Allied Telesis TQ Series wireless access point.           |
| other      | Used where the model type is outside the above definitions.  |

**Default** Default to **other**

**Mode** AMF Guest Configuration

**Examples** To assign the model type **tq** to the guest-class called 'tq\_device', use the commands:

```
node1# configure terminal
node1(config)# atmf guest-class tq_device
node1(config-atmf-guest)# modeltype tq
```

To remove the model type **tq** from the guest-class called 'tq\_device', and reset it to the default of **other**, use the commands:

```
node1# configure terminal
node1(config)# atmf guest-class tq_device
node1(config-atmf-guest)# no modeltype
```

**Related commands** [atmf guest-class](#)  
[switchport atmf-guestlink](#)  
[show atmf links guest](#)

**Command changes** Version 5.4.9-2.1: **onvif** parameter added

# service atmf-application-proxy

**Overview** Use this command to enable the AMF Application Proxy service. This service distributes messages across all AMF nodes.

Currently this is used for threat protection. When an AMF Security (AMF-Sec) Controller detects a threat, it issues a request to block the address the threat originated from. The AMF Application Proxy service distributes this message to all AMF nodes. An AMF master accepts this block request and instructs the subordinate AMF node to block the relevant device.

Use the **no** variant of this command to disable the AMF Application Proxy service.

**Syntax** `service atmf-application-proxy`  
`no service atmf-application-proxy`

**Default** The AMF Application Proxy service is disabled by default.

**Mode** Global Configuration

**Usage notes** The AMF master maintains a list of all threats and will send this list to any AMF node, or VCS member, when it boots and joins the AMF network.

In order for this to work the follow must be configured:

- the AMF Application Proxy service on all AMF nodes that need to receive the messages.
- the Hypertext Transfer Protocol (HTTP) service on all nodes that are running the AMF Application Proxy service (see [service http](#)).

**Example** To enable the AMF Application Proxy service, use the commands

```
awplus# configure terminal  
awplus(config)# service atmf-application-proxy
```

To disable the AMF Application Proxy service, use the commands

```
awplus# configure terminal  
awplus(config)# no service atmf-application-proxy
```

**Related commands** [application-proxy threat-protection](#)

**Command changes** Version 5.4.7-2.2: command added

# show application-proxy threat-protection

**Overview** Use this command to list all the IP addresses blocked by the AMF Application Proxy service. It also shows the global threat-detection configuration.

**Syntax** `show application-proxy threat-protection [all]`

| Parameter | Description                               |
|-----------|---|
| all       | Include information for non-local blocks. |

**Mode** Privileged Exec

**Example** To list the addresses blocked by the AMF Application Proxy service, use the command:

```
awplus# show application-proxy threat-protection
```

**Output** Figure 57-10: Example output from **show application-proxy threat-protection**

```
awplus#show application-proxy threat-protection
Quarantine Vlan      : vlan200
Global IP-Filter     : Enabled
IP-Filter Limit Exceeded : 0
Redirect-URL        : http://my.dom/help.html

Client IP           Interface      MAC Address    VLAN    Action
-----
10.34.199.110      -             -             -       link-down
10.34.199.116      port1.0.3     001a.eb93.ec5d 1       drop
10.1.179.1         *             *             *       ip-filter
...
```

Table 57-1: Parameters in the output from **show application-proxy threat-protection**

| Parameter                | Description  |
|--------------------------|--|
| Quarantine Vlan          | The name of the quarantine VLAN.   |
| Global IP-Filter         | The status of global IP filtering.   |
| IP-Filter Limit Exceeded | The number of times an ACL failed to be installed due to insufficient space. |
| Redirect-URL             | The URL a blocked user is redirected to.                                     |

# show application-proxy whitelist interface

**Overview** Use this command to display the status of port authentication on the specified interface.

**Syntax** `show application-proxy whitelist interface [<interface-list>]`

| Parameter                           | Description   |
|-------------------------------------|---|
| <code>&lt;interface-list&gt;</code> | <p>The interfaces or ports to display information about. An interface-list can be:</p> <ul style="list-style-type: none"><li>• a switchport (e.g. port1.0.4)</li><li>• a static channel group (e.g. sa2)</li><li>• a dynamic (LACP) channel group (e.g. po2)</li><li>• a continuous range of ports separated by a hyphen (e.g. port1.0.1-1.0.4)</li><li>• a comma-separated list (e.g. port1.0.1,port1.0.3-1.0.4). Do not mix port types in the same list.</li></ul> <p>The specified interface must exist.</p> |

**Mode** Privileged Exec

**Example** To display the port authentication information for all interfaces, use the command:

```
awplus# show application-proxy whitelist interface
```

To display the port authentication information for port1.0.4, use the command

```
awplus# show application-proxy whitelist interface port1.0.4
```

**Output** Figure 57-12: Example output from **show application-proxy whitelist interface**

```
awplus#sh application-proxy whitelist interface

**Command changes** Version 5.4.9-0.1: command added

# show atmf

**Overview** Displays information about the current AMF node.

**Syntax** `show atmf [summary|tech|nodes|session]`

| Parameter | Description   |
|-----------|---|
| summary   | Displays summary information about the current AMF node.  |
| tech      | Displays global AMF information.                          |
| nodes     | Displays a list of AMF nodes together with brief details. |
| session   | Displays information on an AMF session.                   |

**Default** Only summary information is displayed.

**Mode** User Exec and Privileged Exec

**Usage notes** AMF uses internal VLANs to communicate between nodes about the state of the AMF network. Two VLANs have been selected specifically for this purpose. Once these have been assigned, they are reserved for AMF and cannot be used for other purposes

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Example 1** To show summary information on AMF node\_1 use the following command:

```
node_1# show atmf summary
```

**Table 58:** Output from the **show atmf summary** command

```
node_1#show atmf summary
ATMF Summary Information:

ATMF Status           : Enabled
Network Name          : Test_network
Node Name              : node_1
Role                   : Master
Restricted login       : Disabled
Current ATMF Nodes    : 3
```

**Example 2** To show information specific to AMF nodes use the following command:

```
node_1# show atmf nodes
```

**Example 3** The **show amf session** command displays all CLI (Command Line Interface) sessions for users that are currently logged in and running a CLI session.

To display AMF active sessions, use the following command:

```
node_1# show atmf session
```

For example, in the output below, node\_1 and node\_5 have active users logged in.

**Table 59:** Output from the **show atmf session** command

```
node_1#show atmf session

CLI Session Neighbors

Session ID           : 73518

DBE Request List Length : 0
```

**Example 4** The AMF tech command collects all the AMF commands, and displays them. You can use this command when you want to see an overview of the AMF network.

To display AMF technical information, use the following command:

```
node_1# show atmf tech
```

**Table 60:** Output from the **show atmf tech** command

```
node_1#show atmf tech
ATMF Summary Information:

ATMF Status           : Enabled
Network Name         : ATMF_NET
Node Name            : node_1
Role                 : Master
Current ATMF Nodes   : 8

ATMF Technical information:

Management Domain VLAN : 4091
Management ifindex : 4392
Management VLAN : 4092
```

**Table 61:** Parameter definitions from the **show atmf tech** command

| Parameter    | Definition   |
|--------------|--|
| ATMF Status  | The Node's AMF status, either Enabled or Disabled. |
| Network Name | The AMF network that a particular node belongs to. |

**Table 61:** Parameter definitions from the **show atmf tech** command (cont.)

| Parameter          | Definition   |
|--------------------|--|
| Node Name          | The name assigned to a particular node.  |
| Role               | The role configured for this AMF device, either Master or Member.  |
| Current ATMF Nodes | The count of AMF nodes in an AMF Network.  |
| Node Address       | An address used to access a remotely located node (.atmf).   |
| Node ID            | A unique identifier assigned to a Node on an AMF network.  |
| Node Depth         | The number of nodes in path from this node to level of the AMF root node. It can be thought of as the vertical depth of the AMF network from a particular node to the zero level of the AMF root node.   |
| Domain State       | The state of Node in a Domain in AMF network as Controller/Backup.   |
| Recovery State     | The AMF node recovery status. Indicates whether a node recovery is in progress on this device - Auto, Manual, or None.   |
| Management VLAN    | The VLAN created for traffic between Nodes of different domain (up/down links). <ul style="list-style-type: none"> <li>• VLAN ID - In this example VLAN 4092 is configured as the Management VLAN.</li> <li>• Management Subnet - Network prefix for the subnet.</li> <li>• Management IP Address - The IP address allocated for this traffic.</li> <li>• Management Mask - The subnet mask used to create a subnet for this traffic (255.255.128.0).</li> </ul> |
| Domain VLAN        | The VLAN assigned for traffic between Nodes of same domain (crosslink). <ul style="list-style-type: none"> <li>• VLAN ID - In this example VLAN 4091 is configured as the domain VLAN.</li> <li>• Domain Subnet. The subnet address used for this traffic.</li> <li>• Domain IP Address. The IP address allocated for this traffic.</li> <li>• Domain Mask. The subnet mask used to create a subnet for this traffic (255.255.128.0).</li> </ul>                 |
| Device Type        | The Product Series name.   |
| ATMF Master        | Whether the node is an AMF master node for its area ('Y' if it is and 'N' if it is not).   |
| SC                 | The device configuration, one of C - Chassis (SBx8100 Series), S - Stackable (VCS) or N - Standalone.  |
| Parent             | The node to which the current node has an active uplink.   |
| Node Depth         | The number of nodes in the path from this node to the master node.   |

**Related commands** [show atmf detail](#)

# show atmf area

**Overview** Use this command to display information about an AMF area. On AMF controllers, this command displays all areas that the controller is aware of. On remote AMF masters, this command displays the controller area and the remote local area. On gateways, this command displays the controller area and remote master area.

**Syntax** `show atmf area [detail] [<area-name>]`

| Parameter   | Description   |
|-------------|---|
| detail      | Displays detailed information   |
| <area-name> | Displays information about master and gateway nodes in the specified area only. |

**Mode** Privileged Exec

**Example 1** To show information about all areas, use the command:

```
controller-1# show atmf area
```

The following figure shows example output from running this command on a controller.

**Table 62:** Example output from the **show atmf area** command on a Controller.

```
controller-1#show atmf area

ATMF Area Information:

* = Local area

Area          Area  Local  Remote  Remote  Node
Name          ID    Gateway Gateway Master   Count
-----
* NZ          1     Reachable  N/A     N/A     3
Wellington   2     Reachable  Reachable  Auth OK  120
Canterbury   3     Reachable  Reachable  Auth Error  -
SiteA-AREA   14    Unreachable  Unreachable  Unreachable  -
Auckland     100   Reachable  Reachable  Auth Start  -
Southland    120   Reachable  Reachable  Auth OK    54

Area count:      6                      Area node count:  177
```

The following figure shows example output from running this command on a remote master.

**Table 63:** Example output from the **show atmf area** command on a remote master.

```

Canterbury#show atmf area

  ATMF Area Information:

  * = Local area

  Area          Area  Local      Remote      Remote      Node
  Name          ID   Gateway    Gateway     Master      Count
  -----
  NZ            1    Reachable  N/A         N/A         -
  * Canterbury  3    Reachable  N/A         N/A         40

  Area count:      2                      Local area node count:  40
    
```

**Table 64:** Parameter definitions from the **show atmf area** command

| Parameter       | Definition  |
|-----------------|---|
| *               | Indicates the area of the device on which the command is being run.   |
| Area Name       | The name of each area.  |
| Area ID         | The ID of the area.   |
| Local Gateway   | Whether the local gateway node is reachable or not.   |
| Remote Gateway  | Whether the remote gateway node is reachable or not. This is one of the following: <ul style="list-style-type: none"> <li>Reachable, if the link has been established.</li> <li>Unreachable, if a link to the remote area has not been established. This could mean that a port or vlan is down, or that inconsistent VLANs have been configured using the <a href="#">switchport atmf-arealink</a> command.</li> <li>N/A for the area of the controller or remote master on which the command is being run, because the gateway node on that device is local.</li> <li>Auth Start, which may indicate that the area names match on the controller and remote master, but the IDs do not match.</li> <li>Auth Error, which indicates that the areas tried to authenticate but there is a problem. For example, the passwords configured on the controller and remote master may not match, or a password may be missing on the remote master.?</li> <li>Auth OK, which indicates that area authentication was successful and you can now use the <a href="#">atmf select-area</a> command.</li> </ul> |
| Remote Master   | Whether the remote master node is reachable or not. This is N/A for the area of the controller or remote master on which the command is being run, because the master node on that device is local.   |
| Node Count      | The number of nodes in the area.  |
| Area Count      | The number of areas controlled by the controller.   |
| Area Node Count | The total number of nodes in the area.  |

**Example 2** To show detailed information about the areas, use the command:

```
controller-1# show atmf area detail
```

The following figure shows example output from running this command.

**Table 65:** Output from the **show atmf area detail** command

```
controller-1#show atmf area detail

ATMF Area Detail Information:

Controller distance      : 0

Controller Id           : 21
Backup Available        : FALSE

Area Id                 : 2
Gateway Node Name       : controller-1

# show atmf area guests

**Overview** This command will display details of all guests that the controller is aware of.

**Syntax** `show atmf area guests [<area-name> [<node-name>]]`

| Parameter   | Description                                       |
|-------------|---|
| <area-name> | The area name for guest information               |
| <node-name> | The name of the node that connects to the guests. |

**Default** n/a

**Mode** User Exec/Privileged Exec

**Example 1** To display atmf area guest nodes on a controller, use the command,

```
GuestNode[1]#show atmf area guests
```

**Output** Figure 57-15: Example output from the **show atmf area guests** command

```
main-building Area Guest Node Information:
Device      MAC                               IP/IPv6

main-building guest node count 4

GuestNode[1]#
```

**Table 66:** Parameters in the output from **show atmf area guests** command

| Parameter   | Description   |
|-------------|---|
| Device Type | The device type as read from the guest node.                        |
| MAC Address | The MAC address of the guest-node                                   |
| Parent      | The device that directly connects to the guest-node                 |
| Port        | The port number on the parent node that connects to the guest node. |
| IP/IPv6     | The IP or IPv6 address of the guest node.                           |

**Related  
commands** [show atmf area](#)  
[show atmf area nodes](#)  
[show atmf backup guest](#)  
[show atmf area guests-detail](#)

# show atmf area guests-detail

**Overview** This command displays the local and remote guest information from an AMF controller.

**Syntax** `show atmf area guests-detail [<area-name> [<node-name>]]`

| Parameter                      | Description  |
|--------------------------------|--|
| <code>&lt;area-name&gt;</code> | The name assigned to the AMF area. An area is an AMF network that is under the control of an AMF Controller. |
| <code>&lt;node-name&gt;</code> | The name assigned to the network node.   |

**Default** n/a.

**Mode** Privileged Exec

**Example** To display detailed information for all guest nodes attached to "node1", which is located within the area named "northern", use the following command:

```
AMF_controller#show atmf area guests-detail northern node1
```

**Output** Figure 57-16: Example output from the **show atmf guest detail** command.

```
#show atmf guest detail

**Table 67:** Parameters shown in the output of the **show atmf guest detail** command

| Parameter         | Description  |
|-------------------|--|
| Node Name         | The name of the guest's parent node.   |
| Port Name         | The port on the parent node that connects to the guest.  |
| IFindex           | An internal index number that maps to the port number on the parent node.  |
| Guest Description | A brief description of the guest node as manually entered into the <code>description (interface)</code> command for the guest node port on the parent node.                            |
| Device Type       | The device type as supplied by the guest node itself.  |
| Backup Supported  | Indicates whether AMF supports backup of this guest node.  |
| MAC Address       | The MAC address of the guest node.   |
| IP Address        | The IP address of the guest node.  |
| IPv6 Address      | The IPv6 address of the guest node.  |
| HTTP Port         | The HTTP port enables you to specify a port when enabling http to allow a URL for the http user interface of a Guest Node. This is determined by the <code>http-enable</code> command. |
| Firmware Version  | The firmware version that the guest node is currently running.   |

# show atmf area nodes

**Overview** Use this command to display summarized information about an AMF controller's remote nodes.

Note that this command can only be run from a controller node.

**Syntax** `show atmf area nodes <area-name> [<node-name>]`

| Parameter   | Description   |
|-------------|---|
| <area-name> | Displays information about nodes in the specified area. |
| <node-name> | Displays information about the specified node.          |

**Mode** Privileged Exec

**Usage notes** If you do not limit the output to a single area or node, this command lists all remote nodes that the controller is aware of. This can be a very large number of nodes.

**Example** To show summarized information for all the nodes in area 'Wellington', use the command:

```
controller-1# show atmf area nodes Wellington
```

The following figure shows partial example output from running this command.

**Table 68:** Output from the **show atmf area nodes Wellington** command

```
controller-1#show atmf area nodes Wellington

Wellington Area Node Information:
Node          Device          ATMF          Parent          Node
Name          Type            Master  SC      Domain          Depth
-----
well-gate     x230-18GP       N          N      well-master     1
well-master   AT-x930-28GPX   Y          N      none             0

Wellington node count 2
```

**Table 69:** Parameter definitions from the **show atmf area nodes** command

| Parameter   | Definition   |
|-------------|--|
| Node Name   | The name assigned to a particular node.  |
| Device Type | The Product series name.   |
| ATMF Master | Whether the node is an AMF master node for its area ('Y' if it is and 'N' if it is not). |

**Table 69:** Parameter definitions from the **show atmf area nodes** command

| Parameter     | Definition  |
|---------------|---|
| SC            | The device configuration, one of C - Chassis (SBx8100 series), S - Stackable (VCS) or N - Standalone. |
| Parent Domain | The node to which the current node has an active uplink.  |
| Node Depth    | The number of nodes in the path from this node to the master node.                                    |

**Related commands** [show atmf area](#)  
[show atmf area nodes-detail](#)

# show atmf area nodes-detail

**Overview** Use this command to display detailed information about an AMF controller's remote nodes.

Note that this command can only be run from a controller node.

**Syntax** `show atmf area nodes-detail <area-name> [<node-name>]`

| Parameter                      | Description  |
|--------------------------------|--|
| <code>&lt;area-name&gt;</code> | Displays detailed information about nodes in the specified area. |
| <code>&lt;node-name&gt;</code> | Displays detailed information about the specified node.          |

**Mode** Privileged Exec

**Usage notes** If you do not limit the output to a single area or node, this command displays information about all remote nodes that the controller is aware of. This can be a very large number of nodes.

**Example** To show information for all the nodes in area 'Wellington', use the command:

```
controller-1# show atmf area nodes-detail Wellington
```

The following figure shows partial example output from running this command.

**Table 70:** Output from the **show atmf area nodes-detail Wellington** command

```
controller-1#show atmf area nodes-detail Wellington

Wellington Area Node Information:
Node name well-gate
Parent node name : well-master
Domain id      : well-gate's domain
Board type     : 368
Distance to core : 1
Flags         : 50
Extra flags    : 0x00000006
MAC Address    : 001a.eb56.9020

Node name well-master
Parent node name : none
Domain id      : well-master's domain
Board type     : 333
Distance to core : 0
Flags         : 51
Extra flags    : 0x0000000c
MAC Address    : eccd.6d3f.fef7

...
```

**Table 71:** Parameter definitions from the **show atmf area nodes-detail** command

| Parameter        | Definition  |
|------------------|---|
| Node name        | The name assigned to a particular node.   |
| Parent node name | The node to which the current node has an active uplink.                              |
| Domain id        | The name of the domain the node belongs to.   |
| Board type       | The Allied Telesis code number for the device.  |
| Distance to core | The number of nodes in the path from the current node to the master node in its area. |
| Flags            | Internal AMF information  |
| Extra flags      | Internal AMF information  |
| MAC Address      | The MAC address of the current node   |

**Related commands** [show atmf area](#)  
[show atmf area nodes](#)

# show atmf area summary

**Overview** Use this command to display a summary of IPv6 addresses used by AMF, for one or all of the areas controlled by an AMF controller.

**Syntax** `show atmf area summary [<area-name>]`

| Parameter                      | Description                                       |
|--------------------------------|---|
| <code>&lt;area-name&gt;</code> | Displays information for the specified area only. |

**Mode** Privileged Exec

**Example 1** To show a summary of IPv6 addresses used by AMF, for all of the areas controlled by controller-1, use the command:

```
controller-1# show atmf area summary
```

The following figure shows example output from running this command.

**Table 72:** Output from the **show atmf area summary** command

```
controller-1#show atmf area summary

ATMF Area Summary Information:

Management Information
Local IPv6 Address           : fd00:4154:4d46:1::15

Area Information
Area Name                    : NZ (Local)
Area ID                      : 1
Area Master IPv6 Address     : -

Area Name                    : Wellington
Area ID                      : 2
Area Master IPv6 Address     : fd00:4154:4d46:2::149

Area Name                    : Canterbury
Area ID                      : 3
Area Master IPv6 Address     : fd00:4154:4d46:3::f

Area Name                    : Auckland
Area ID                      : 100
Area Master IPv6 Address     : fd00:4154:4d46:64::17
Interface                    : vlink2000
```

# show atmf authorization

**Overview** Use this command on an AMF master to display the authorization status of other AMF members and masters on the network.

On an AMF controller this command will show the authorization status of remote area AMF masters.

**Syntax** `show atmf authorization {current|pending|provisional}`

| Parameter   | Description   |
|-------------|---|
| current     | Show the status of all authorized nodes.  |
| pending     | Show the status of unauthorized nodes in the pending queue. These are nodes that enabled secure mode with <code>atmf secure-mode</code> but have not yet been authorized with <code>atmf authorize</code> . |
| provisional | Show the status of provisionally authorized nodes. These are nodes that have been provisioned with <code>atmf authorize provision</code> .  |

**Mode** Privileged Exec

**Example** To display all authorized AMF nodes on an AMF controller or AMF master, use the command:

```
awplus# show atmf authorization current
```

To display AMF nodes which are requesting authorization on an AMF controller or AMF master, use the command:

```
awplus# show atmf authorization pending
```

To display AMF nodes which have provisional authorization, use the command:

```
awplus# show atmf authorization provisional
```

**Output** Figure 57-17: Example output from **show atmf authorization current**

| NZ Authorized Nodes: |          |            |
|----------------------|----------|------------|
| Node Name            | Signer   | Expires    |
| -----                | -----    | -----      |
| master_1             | master_1 | 4 Mar 2017 |
| area_1_node_1        | master_1 | 4 Mar 2017 |
| area_1_node_2        | master_1 | 4 Mar 2017 |

Table 57-1: Parameters in the output from **show atmf authorization current**

| Parameter | Description   |
|-----------|---|
| Node Name | AMF node name of the authorized node.   |
| Signer    | Name of the AMF master that authorized the node.  |
| Expires   | Expiry date of the authorization. Authorization expiry time is set using <code>atmf secure-mode certificate expiry</code> . |

**Output** Figure 57-18: Example output from **show atmf authorization pending**

```

Pending Authorizations:

NZ Requests:
Node Name           Product           Parent Node       Interface
-----
area_1_node_3      x230-18GP        master_1          port1.2.9
area_1_node_4      x510-52GTX       master_1          sa1
    
```

Table 57-2: Parameters in the output from **show atmf authorization pending**

| Parameter   | Description  |
|-------------|--|
| Node Name   | Name of the node that is requesting authorization.   |
| Product     | Product name.  |
| Parent Node | Authorization authority of the requesting node.      |
| Interface   | Interface that the authorization request came in on. |

**Output** Figure 57-19: Example output from **show atmf authorization provisional**

```

ATMF Provisional Authorization:

Area - Node Name           Start           Timeout
or MAC Address             Interface       Time           Minutes
-----
3333.4444.5555             5 Sep 2016 02:35:54  3
1111.2222.3333             5 Sep 2016 02:35:24  60
NZ - blue                   port1.0.3      5 Sep 2016 02:35:06  60
    
```

Table 57-3: Parameters in the output from **show atmf authorization provisional**

| Parameter                          | Description  |
|------------------------------------|--|
| Area - Node Name<br>or MAC Address | MAC address or node name of the node that has been provisionally authorized. |
| Interface                          | Interface that the node has been provisioned on.                             |
| Start Time                         | Time the node was provisioned.   |
| Timeout Minutes                    | Length of time from Start Time until the provisional authorization expires.  |

Version 5.4.7-0.3: command added

# show atmf backup

**Overview** This command displays information about AMF backup status for all the nodes in an AMF network. It can only be run on AMF master and controller nodes.

**Syntax**

```
show atmf backup
show atmf backup logs
show atmf backup server-status
show atmf backup synchronize [logs]
```

| Parameter     | Description   |
|---------------|---|
| logs          | Displays detailed log information.  |
| server-status | Displays connectivity diagnostics information for each configured remote file server. |
| synchronize   | Display the file server synchronization status  |
| logs          | For each remote file server, display the logs for the last synchronization            |

**Mode** Privileged Exec

**Example 1** To display the AMF backup information, use the command:

```
node_1# show atmf backup
```

To display log messages to do with backups, use the command:

```
node_1# show atmf backup logs
```

Table 57-4: Output from **show atmf backup**

```
Node_1# show atmf backup
ScheduledBackup .....Enabled
  Schedule.....1 per day starting at 03:00
  Next Backup Time...04 May 2019 03:00

```
Node_1#show atmf backup logs

Backup Redundancy ..... Enabled
Local media ..... SD (Total 3788.0MB, Free 1792.8MB)
State ..... Inactive (Remote file server is not available)

Log File Location: card:/atmf/ATMF/logs/rsync_<node name>.log

Node
Name Log Details
-----
atmf_testbox
2019/05/04 18:16:51 [9045] receiving file list
2019/05/04 18:16:51 [9047] .d..t.... flash/
2019/05/04 18:16:52 [9047] >f+++++++ flash/a.rel
```

**Example 2** To display the AMF backup synchronization status, use the command:

```
node_1# show atmf backup synchronize
```

To display log messages to do with synchronization of backups, use the command:

```
node_1# show atmf backup synchronize logs
```

Table 57-6: Output from **show atmf backup synchronize**

```
Node_1#show atmf backup synchronize

ATMF backup synchronization:

* = Active file server

  Id  Date           Time           Status
-----
  1   04 May 2016    22:25:57     Synchronized
* 2   -              -              Active
```

Table 57-7: Output from **show atmf backup synchronize logs**

```
Node_1#show atmf backup synchronize logs

Id    Log Details
-----
1     2019/05/04 22:25:54 [8039] receiving file list

      2019/05/04 22:25:54 [8039] sent 46 bytes received 39 bytes total size 40
```

**Example 3** To display the AMF backup information with the optional parameter **server-status**, use the command:

```
Node_1# show atmf backup server-status
```

```

Node1#sh atmf backup server-status

Id    Last Check    State
-----
1     186 s        File server ready
2     1 s          SSH no route to host
    
```

**Table 58:** Parameter definitions from the **show atmf backup** command

| Parameter         | Definition  |
|-------------------|---|
| Scheduled Backup  | Indicates whether AMF backup scheduling is enabled or disabled.   |
| Schedule          | Displays the configured backup schedule.  |
| Next Backup Time  | Displays the date and time of the next scheduled.   |
| Backup Media      | The current backup medium in use. This will be one of USB, SD, or NONE. Utilized and available memory (MB) will be indicated if backup media memory is present.   |
| Current Action    | The task that the AMF backup mechanism is currently performing. This will be a combination of either (Idle, Starting, Doing, Stopping), or (manual, scheduled).   |
| Started           | The date and time that the currently executing task was initiated in the format DD MMM YYYY HH:MM   |
| Current Node      | The name of the node that is currently being backed up.   |
| Backup Redundancy | Whether backup redundancy is enabled or disabled.   |
| Local media       | The local media to be used for backup redundancy; SD, USB, INTERNAL, or NONE, and total and free memory available on the media.   |
| State             | Whether SD or USB media is installed and available for backup redundancy. May be Active (if backup redundancy is functional—requires both the local redundant backup media and a remote server to be configured and available) or Inactive. |
| Node Name         | The name of the node that is storing backup data - on its backup media.   |
| Date              | The data of the last backup in the format DD MMM YYYY.  |
| Time              | The time of the last backup in the format HH:MM:SS.   |
| In ATMF           | Whether the node shown is active in the AMF network, (Yes or No).   |
| On Media          | Whether the node shown has a backup on the backup media (Yes or No).  |

**Table 58:** Parameter definitions from the **show atmf backup** command (cont.)

| Parameter         | Definition   |
|-------------------|--|
| Status            | The output can contain one of four values: <ul style="list-style-type: none"><li>• “-” meaning that the status file cannot be found or cannot be read.</li><li>• “Errors” meaning that there are issues - note that the backup may still be deemed successful depending on the errors.</li><li>• “Stopped” meaning that the backup attempt was manually aborted.</li><li>• “Good” meaning that the backup was completed successfully.</li><li>• “In Progress” meaning that the backup is currently running on that node.</li></ul> |
| Log File Location | All backup attempts will generate a result log file in the identified directory based on the node name. In the above example this would be:<br>card:/amf/office/logs/rsync_amf_testbox1.log.   |
| Log Details       | The contents of the backup log file.   |
| server-status     | Displays connectivity diagnostics information for each configured remove file server.  |

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Related commands** [show atmf](#)  
[atmf network-name](#)

# show atmf backup area

**Overview** Use this command to display backup status information for the master nodes in one or more areas.

Note that this command is only available on AMF controllers.

**Syntax** `show atmf backup area [<area-name> [<node-name>]] [logs]`

| Parameter   | Description   |
|-------------|---|
| logs        | Displays the logs for the last backup of each node.     |
| <area-name> | Displays information about nodes in the specified area. |
| <node-name> | Displays information about the specified node.          |

**Mode** Privileged Exec

**Example** To show information about backups for an area, use the command:

```
controller-1# show atmf backup area
```

**Table 59:** Output from the **show atmf backup area** command

```

controller-1#show atmf backup area

# show atmf backup guest

**Overview** This command displays backup status information of guest nodes in an AMF network. This command can only be run on a device configured as an AMF Master and has an AMF guest license.

**Syntax** show atmf backup guest [*<node-name>*] [*<guest-port>*] [logs]

| Parameter                 | Description                        |
|---------------------------|------------------------------------|
| <i>&lt;node-name&gt;</i>  | The name of parent guest node      |
| <i>&lt;guest-port&gt;</i> | The port number on the parent node |

**Mode** User Exec/Privileged Exec

**Example** On the switch named x930-master, to display information about the AMF backup guest status, use the command:

```
x930-master# show atmf backup guest
```

**Output** Figure 57-20: Example output from **show atmf backup guest**

```

Table 57-1: Parameters in the output from **show atmf backup guest**

| Parameter        | Description  |
|------------------|--|
| Guest Backup     | The status of the guest node backup process  |
| Scheduled Backup | The timing configured for guest backups.   |
| Schedule         | Displays the configured backup schedule.   |
| Next Backup Time | The time the next backup process will be initiated.  |
| Backup Bandwidth | The bandwidth limit applied to the backup data flow measured in kilo Bytes /second. Note that unlimited means there is no limit set specifically for the backup data flow. |
| Backup Media     | Detail of the memory media used to store the backup files and the current memory capacity available.   |

# show atmf container

**Overview** Use this command to display information about the AMF containers created on a Virtual AMF Appliance (VAA).

An AMF container is an isolated instance of AlliedWare Plus with its own network interfaces, configuration, and file system. The features available inside an AMF container are a sub-set of the features available on the host VAA. These features enable the AMF container to function as a uniquely identifiable AMF master and allows for multiple tenants (up to 60) to run on a single VAA host. See the [AMF Feature Overview and Configuration Guide](#) for more information on running multiple tenants on a single VAA host.

**Syntax** `show atmf container [detail] [<container-name>]`

| Parameter        | Description  |
|------------------|--|
| detail           | Show detailed information.   |
| <container-name> | The name of the AMF container you wish to display information for. |

**Mode** Privileged Exec

**Output** Figure 57-21: Example output from **show atmf container**

```
awplus#show atmf container
ATMF Container Information:
  Container      Area      Bridge  State   Memory   CPU%
-----
  vac-wlg-1     wlg       br1     running 70.3 MB  1.2
  vac-akl-1     ak1       br2     stopped 0 bytes  0.0
  vac-nsn-1     nsn       br3     running 53.2 MB  0.7
Current ATMF Container count: 3
```

Figure 57-22: Example output from **show atmf container vac-wlg-1**

```
awplus#show atmf container vac-wlg-1
ATMF Container Information:
  Container      Area      Bridge  State   Memory   CPU%
-----
  vac-wlg-1     wlg       br1     running 70.3 MB  1.2
Current ATMF Container count: 1
```

Table 57-2: Parameters in the output from **show atmf container**

| Parameter | Description  |
|-----------|--|
| Container | Name of the AMF container.   |
| Area      | Name of the area the container is in.  |
| Bridge    | Name of the bridge connecting the container to the physical network.   |
| State     | Container state, <code>running</code> or <code>stopped</code> . This is set with the <code>state</code> command. |
| Memory    | The amount of memory the container is using on the VAA host.   |
| CPU%      | The percentage of CPU time the container is using on the VAA, at the time the show command is run.               |

Figure 57-23: Example output from **show atmf container detail vac-wlg-1**

```
awplus#show atmf container detail vac-wlg-1

ATMF Container Information:

Name: vac-wlg-1
State: RUNNING
PID: 980
IP: 172.31.0.1
IP: 192.168.0.2
IP: fd00:4154:4d46:3c::1
CPU use: 3.95 seconds
Memory use: 67.07 MiB
Memory use: 0 bytes
Link: vethP31UFA
TX bytes: 166.01 KiB
RX bytes: 141.44 KiB
Total bytes: 307.45 KiB
Link: vethYCT7BB
TX bytes: 674.27 KiB
RX bytes: 698.27 KiB
Total bytes: 1.34 MiB
```

Table 57-3: Parameters in the output from **show atmf container detail**

| Parameter | Description  |
|-----------|--|
| Name      | Name of the AMF container.   |
| State     | Container state, <code>RUNNING</code> or <code>STOPPED</code> . This is set with the <code>state</code> command. |

Table 57-3: Parameters in the output from **show atmf container detail** (cont.)

| Parameter   | Description   |
|-------------|---|
| PID         | Internal container id.  |
| IP          | This lists the IP addresses used by the container. These include the eth1 IP address and the AMF management IP address.   |
| CPU use     | The CPU usage of the container since it was enabled.  |
| Memory use  | Container memory usage.   |
| Link        | Each container has two links:<br><ol style="list-style-type: none"> <li>1 An AMF area-link, this connects the container to the AMF controller and uses virtual interface eth0 on the AMF container.</li> <li>2 A bridged L2 network link, this connects the container to the outside world and uses the virtual interface eth1 on the AMF container.</li> </ol> See the <a href="#">AMF Feature Overview and Configuration_Guide</a> for more information on these links. |
| TX/RX bytes | Bytes sent and received on a link.  |
| Total bytes | Total bytes transferred on a link.  |

**Command changes**

Version 5.4.7-0.1: command added

# show atmf detail

**Overview** This command displays details about an AMF node. It can only be run on AMF master and controller nodes.

**Syntax** show atmf detail

| Parameter | Description                       |
|-----------|-----------------------------------|
| detail    | Displays output in greater depth. |

**Mode** Privileged Exec

**Example 1** To display the AMF node1 information in detail, use the command:

```
controller-1# show atmf detail
```

A typical output screen from this command is shown below:

```
atmf-1#show atmf detail
ATMF Detail Information:

Network Name           : Test_network
Network Mtu           : 1300
Node Name              : controller-1
Node Address           : controller-1.atmf
Node ID                : 342
Node Depth             : 0
Domain State           : BackupDomainController
Recovery State         : None
Recovery Over ETH Ports : Disabled
Log Verbose Setting    : Verbose
Topology GUI           : Disabled

Management VLAN
VLAN ID                : 4000
Management Subnet      : 172.31.0.0
Management IP Address  : 172.31.1.86
Management Mask        : 255.255.128.0
Management IPv6 Address : fd00:4154:4d46:1::156
Management IPv6 Prefix Length : 64

Domain VLAN
VLAN ID                : 4091
Domain Subnet          : 172.31.128.0
Domain IP Address      : 172.31.129.86
Domain Mask            : 255.255.128.0
```

**Table 58:** Parameter definitions from the **show atmf detail** command

| Parameter               | Definition   |
|-------------------------|--|
| Network MTU             | The network MTU for the ATMF network.  |
| Network Name            | The AMF network that a particular node belongs to.   |
| Node Name               | The name assigned to a particular node.  |
| Node Address            | An address used to access a remotely located node. This is simply the Node Name plus the dotted suffix atmf (.atmf).   |
| Node ID                 | A unique identifier assigned to a node on an AMF network.  |
| Node Depth              | The number of nodes in the path from this node to the level of the AMF root node. It can be thought of as the vertical depth of the AMF network from a particular node to the zero level of the AMF root node.   |
| Domain State            | The state of a node in a Domain in an AMF network as Controller/Backup.  |
| Recovery State          | The AMF node recovery status. Indicates whether a node recovery is in progress on this device - Auto, Manual, or None.   |
| Recovery Over ETH Ports | Allow AMF recovery over the Eth port on an AR-series device.   |
| Log Verbose Setting     | The state of the <code>atmf log-verbose</code> command.  |
| Topology GUI            | This feature allows your AMF network to interact with Vista Manager EX and must be enabled on your AMF master.   |
| Management VLAN         | The VLAN created for traffic between nodes of different domain (up/down links). <ul style="list-style-type: none"> <li>• VLAN ID - in this example VLAN 4092 is configured as the Management VLAN.</li> <li>• Management Subnet - the network prefix for the subnet.</li> <li>• Management IP Address - the IP address allocated for this traffic.</li> <li>• Management Mask - the subnet mask used to create a subnet for this traffic (255.255.128.0).</li> </ul> |
| Domain VLAN             | The VLAN assigned for traffic between nodes of the same domain (crosslink). <ul style="list-style-type: none"> <li>• VLAN ID - in this example VLAN 4091 is configured as the domain VLAN.</li> <li>• Domain Subnet - the subnet address used for this traffic.</li> <li>• Domain IP Address - the IP address allocated for this traffic.</li> <li>• Domain Mask - the subnet mask used to create a subnet for this traffic (255.255.128.0).</li> </ul>              |
| Node Depth              | The number of nodes in the path from this node to the core domain.   |

# show atmf group

**Overview** This command can be used to display the group membership within to a particular AMF node. It can also be used with the working-set command to display group membership within a working set.

Each node in the AMF is automatically added to the group that is appropriate to its hardware architecture, e.g. x510, x230. Nodes that are configured as masters are automatically assigned to the master group.

You can create arbitrary groups of AMF members based on your own selection criteria. You can then assign commands collectively to any of these groups.

**Syntax** `show atmf group [user-defined|automatic]`

| Parameter                 | Description                             |
|---------------------------|---|
| <code>user-defined</code> | User-defined-group information display. |
| <code>automatic</code>    | Automatic group information display.    |

**Default** All groups are displayed

**Mode** Privileged Exec

**Example 1** To display group membership of node2, use the following command:

```
node2# show atmf group
```

A typical output screen from this command is shown below:

```
ATMF group information

master, x510

node2#
```

This screen shows that node2 contains the groups **master** and **x510**. Note that although the node also contains the implicit groups, these do not appear in the show output.

**Example 2** The following commands (entered on *node2*) will display all the automatic groups within the working set containing *node1* and all nodes that have been pre-defined to contain the *sysadmin* group:

First define the working-set:

```
node1# #atmf working-set node1 group sysadmin
```

A typical output screen from this command is shown below:

```

ATMF group information

master, poe, x8100

=====
node1, node2, node3, node4, node5, node6:
=====

ATMF group information

sysadmin, x8100

AMF_NETWORK[6]#
    
```

This confirms that the six nodes (*node1* to *node6*) are now members of the working-set and that these nodes reside within the *AMF-NETWORK*.

Note that to run this command, you must have previously entered the command [atmf working-set](#) on page 2889. This can be seen from the network level prompt, which in this case is *AMF\_NETWORK[6]#*.

**Table 59:** Sample output from the **show atmf group** command for a working set.

```

AMF_NETWORK[6]#show atmf group
=====
node3, node4, node5, node6:
=====

ATMF group information

edge_switches, x510
    
```

**Table 60:** Parameter definitions from the **show atmf group** command for a working set

| Parameter              | Definition  |
|------------------------|---|
| ATMF group information | Displays a list of nodes and the groups that they belong to, for example: <ul style="list-style-type: none"> <li>• master - Shows a common group name for Nodes configured as AMF masters.</li> <li>• Hardware Arch - Shows a group for all Nodes sharing a common Hardware architecture, e.g. x8100, x230, for example.</li> <li>• User-defined - Arbitrary groups created by the user for AMF nodes.</li> </ul> |

# show atmf group members

**Overview** This command will display all group memberships within an AMF working-set. Each node in the AMF working set is automatically added to automatic groups which are defined by hardware architecture, e.g. x510, x230. Nodes that are configured as masters are automatically assigned to the master group. Users can define arbitrary groupings of AMF members based on their own criteria, which can be used to select groups of nodes.

**Syntax** `show atmf group members [user-defined|automatic]`

| Parameter    | Description                            |
|--------------|--|
| user-defined | User defined group membership display. |
| automatic    | Automatic group membership display.    |

**Mode** Privileged Exec

**Example** To display group membership of all nodes in a working-set, use the command:

```
ATMF_NETWORK[9]# show atmf group members
```

**Table 61:** Sample output from the **show atmf group members** command

```
ATMF Group membership
Automatic          Total
Groups            Members  Members
-----
master            1        Building_1
poe               1        HW_Team1
x510              3        SW_Team1 SW_Team2 SW_Team3
x930              1        HW_Team1
x8100             2        Building_1 Building_2

ATMF Group membership
User-defined      Total
Groups           Members  Members
-----
marketing        1        Bld1_Floor_1
software         3        SW_Team1 SW_Team2 SW_Team3
```

**Table 62:** Parameter definitions from the **show atmf group members** command

| Parameter           | Definition   |
|---------------------|--|
| Automatic Groups    | Lists the Automatic Groups and their nodal composition. The sample output shows AMF nodes based on the same Hardware type or belonging to the same Master group. |
| User-defined Groups | Shows the grouping of AMF nodes in user defined groups.  |
| Total Members       | Shows the total number of members in each group.   |
| Members             | Shows the list of AMF nodes in each group.   |

**Related commands**

- [show atmf group](#)
- [show atmf](#)
- [atmf group \(membership\)](#)

# show atmf guests

**Overview** This command is available on any AMF master or controller in the network. It displays a summary of the AMF guest nodes that exist in the AMF network, including device type, parent node, and IP address.

**Syntax** `show atmf guests`

**Mode** User Exec/Privileged Exec

**Usage notes** Use this command to display all guest nodes in a network. If you want to see only the guests attached to a single node, use the `show atmf links guest` command, which shows information about the guest nodes and also about their link to their parent node.

**Example** To display the AMF guest output, use the command:

```
awplus# show atmf guests
```

**Output** Figure 57-24: Example output from the `show atmf guests` command

```
master#show atmf guests

Guest Information:

Device      Device      Parent      Guest      IP/IPv6
Name        Type        Node        Port        Address
-----
node1-2.0.1  x600-24Ts   node1       2.0.1       192.168.2.10
wireless-zone1  AT-TQ4600   node2       1.0.1       192.168.1.10
wireless-zone2  AT-TQ4600   node2       1.0.2       192.168.1.12

Current ATMF guest node count 3
```

**Table 63:** Parameters shown in the output of the `show atmf guests` command

| Parameter   | Description   |
|-------------|---|
| Device Name | The name that is discovered from the device, or failing that, a name that is auto-assigned by AMF. The auto-assigned name consists of: <parent node name>-<attached port number> You can change this by configuring a description on the port.  |
| Device Type | The product name of the guest node, which is discovered from the device. If no device type can be discovered, this shows the name of the AMF guest-class that has been assigned to the guest node by the <code>atmf guest-class</code> command. |

**Table 63:** Parameters shown in the output of the **show atmf guests** command

| Parameter       | Description  |
|-----------------|--|
| Parent Node     | The name of the AMF node that directly connects to the guest node.                                 |
| Guest Port      | The port on the parent node that directly connects to the guest node.                              |
| IP/IPv6 Address | The address discovered from the node, or statically configured on the parent node's attached port. |

**Related  
commands**

[atmf guest-class](#)  
[switchport atmf-guestlink](#)  
[show atmf backup guest](#)  
[show atmf links guest](#)

# show atmf guests detail

**Overview** This command is available on any AMF master in the network. It displays details about the AMF guest nodes that exist in the AMF network, such as device type, IP address, MAC address etc.

**Syntax** `show atmf guests detail [<node-name>] [<guest-port>]`

| Parameter                       | Description                          |
|---------------------------------|--------------------------------------|
| <code>&lt;node-name&gt;</code>  | The name of the guest node's parent. |
| <code>&lt;guest-port&gt;</code> | The port name on the parent node.    |

**Mode** User Exec/Privileged Exec

**Usage notes** If you want to see only the guests attached to a single node, you can use either:

- this command and specify the node name, or
- [show atmf links guest detail](#), which shows information about the guest nodes and also about their link to their parent node.

Note that the parameters that are displayed depend on the guest node's model.

**Example** To display the AMF guest output, use the command:

```
awplus# show atmf guests detail
```

**Output** Figure 57-25: Example output from **show atmf guests detail**

```
master#show atmf guests detail

ATMF Guest Node Information:

Node Name           : master
Port Name           : port1.0.9

| HTTP Port         | : 80             |
| Firmware Version  | : 3.1.0 B01      |

**Table 64:** Parameters in the output from **show atmf guests detail**.

| Parameter         | Description  |
|-------------------|--|
| Node Name         | The name of the parent node, which is the AMF node that directly connects to the guest node.   |
| Port Name         | The port on the parent node that connects to the guest.  |
| IfIndex           | An internal index number that maps to the port number on the parent node.  |
| Guest Description | A description that is discovered from the device, or failing that, auto-assigned by AMF. The auto-assigned name consists of:<br><parent node name>-<attached port number>.<br>You can change this by configuring a description on the port.        |
| Device Type       | The product name of the guest node, which is discovered from the device. If no device type can be discovered, this shows the name of the AMF guest-class that has been assigned to the guest node by the <a href="#">atmf guest-class</a> command. |
| Username          | The user name configured on the guest node.  |
| Backup Supported  | Whether the guest node supports AMF backup functionality.  |
| MAC Address       | The MAC address of the guest node.   |
| IP Address        | The IP address of the guest node.  |
| IPv6 Address      | The IPv6 address of the guest node.  |
| Firmware Version  | The version of the firmware operating on the guest node.   |
| HTTP port         | The HTTP port as specified with the <a href="#">http-enable</a> command when defining a guest class. You can set this if the guest node provides an HTTP user interface on a non-standard port (any port other than port 80).                      |

**Related  
commands**    [atmf guest-class](#)  
                  [switchport atmf-guestlink](#)  
                  [show atmf backup guest](#)

# show atmf links

**Overview** This command displays information about AMF links on a switch. The display output contains link status state information.

**Syntax** `show atmf links [brief]`

| Parameter | Description   |
|-----------|---|
| brief     | A brief summary of AMF links, their configuration and status. |

**Mode** User Exec and Privileged Exec

**Usage notes** The **show atmf links** and **show atmf links brief** commands both produce a table of summarized link information. For a more detailed view use the [show atmf links detail](#) command.

This command does not show links that are configured on provisioned ports.

**Example** To display a brief summary of the AMF links, use the following command:

```
node-1# show atmf links brief
```

Figure 57-26: Example output from **show atmf links brief**

```
Example-core# show atmf links

ATMF Link Brief Information:

Local      Link      Link      ATMF      Adjacent      Adjacent      Link
Port      Type      Status    State     Node          Ifindex       State
-----
1.0.10    Crosslink Down    Init     *crosslink1  -             Blocking
1.0.14    Crosslink Down    Init     *crosslink2  -             Blocking
1.0.1     Downlink  Down    Init     -             -             Blocking

# show atmf links detail

**Overview** This command displays detailed information on all the links configured in the AMF network. It can only be run on AMF master and controller nodes.

**Syntax** `show atmf links detail`

| Parameter | Description                     |
|-----------|---------------------------------|
| detail    | Detailed AMF links information. |

**Mode** User Exec

**Usage notes** For summarized link information see the [show atmf links](#) command.  
This command does not show links that are configured on provisioned ports.

**Example** To display the AMF link details use this command:

```
device1# show atmf links detail
```

The output from this command will display all the internal data held for AMF links. The following example gives details of the links that are summarized in the example in [show atmf links](#).

**Table 58:** Sample output from the **show atmf links detail** command

```
device1# show atmf links detail

**Related  
commands**    no debug all  
                  clear atmf links statistics  
                  show atmf

# show atmf links guest

**Overview** This command displays information about guest nodes visible to an AMF device.

**Syntax** `show atmf links guest [interface <interface-range>]`

| Parameter                      | Description  |
|--------------------------------|--|
| interface<br><interface-range> | Select a specific range of ports to display information about guest nodes. |

**Default** With no parameters specified this command will display its standard output for all ports with guest nodes connected.

**Mode** User Exec/Privileged Exec

**Usage notes** Use this command to display the guest nodes connected to a single parent node. If you want to see a list of all the guests in the AMF network, use [show atmf guests](#).

**Example 1** To display information about AMF guests that are connectible from node1, use the command:

```
node1# show atmf links guest
```

**Output** Figure 57-27: Example output from **show atmf links guest**

```
node1#sh atmf links guest

Guest Link Information:

DC = Discovery configuration
S = static D = dynamic

Local   Guest      Model      MAC      IP / IPv6
Port    Class      Type       DC Address Address
-----
1.0.1   -          other      D 0013.1a1e.4589 192.168.1.2
1.0.2   aastra-phone other      D 0008.5d10.7635 192.168.1.3
1.0.3   cisco-phone2 other      S -              192.168.2.1

```

Table 57-1: Parameters in the output from **show atmf links guest**

| Parameter   | Description  |
|-------------|--|
| Local Port  | The port on the parent node that connects to the guest.  |
| Guest Class | The name of the ATMF guest-class that has been assigned to the guest node by the <a href="#">atmf guest-class</a> command. |

Table 57-1: Parameters in the output from **show atmf links guest** (cont.)

| Parameter         | Description  |
|-------------------|--|
| Model Type        | The model type of the guest node, as entered by the <code>modeltype</code> command. Can be one of the following: <ul style="list-style-type: none"><li>• alliedware</li><li>• aw+</li><li>• tq</li><li>• other</li></ul> |
| DC                | The discovery method as applied by the <code>discovery</code> command. This can be either dynamic (D) or static (S).   |
| MAC Address       | The MAC address of the guest node.   |
| IP / IPv6 Address | The IP address of the guest node.  |

**Related commands**

- `atmf guest-class`
- `discovery`
- `http-enable`
- `username (atmf-guest)`
- `modeltype`
- `switchport atmf-guestlink`
- `show atmf backup guest`

# show atmf links guest detail

**Overview** This command displays detailed information about guest nodes visible to an AMF device.

**Syntax** `show atmf links guest detail [interface <interface-range>]`

| Parameter  | Description  |
|--|--|
| <code>interface</code><br><code>&lt;interface-range&gt;</code> | Select a specific range of ports to display information about guest nodes. |

**Mode** User Exec and Privileged Exec

**Usage notes** Use this command to display the guest nodes connected to a single parent node. If you want to see a list of all the guests in the AMF network, use [show atmf guests detail](#).

Note that the parameters that are displayed depend on the guest node's model and state.

**Example** To display detailed information about AMF guests, use the command:

```
node1# show atmf links guest detail
```

**Output** Figure 57-28: Example output from **show atmf links guest detail**

```

node1#show atmf links guest detail

```

Table 57-2: Parameters in the output from **show atmf links guest detail**

| Parameter  | Description   |
|------------|---|
| Interface  | The port on the parent node that connects to the guest.   |
| Link State | The state of the link to the guest node; one of: <ul style="list-style-type: none"> <li>Down: The physical link is down.</li> <li>Up: The physical link has come up, but it is still during a timeout period that is enforced to allow other links to come up.</li> <li>Learn: The timeout period described above has elapsed, and the link is now learning information from the AMF guest node. You can see what information it is learning from the "Node State" field below.</li> <li>Full: The node connected by this link has joined the AMF network.</li> <li>Fail: The port is physically up but something has prevented the guest node from joining the AMF network.</li> </ul> |
| Class Name | The name of the ATMF guest-class that has been assigned to the guest node by the <code>atmf guest-class</code> command.   |

Table 57-2: Parameters in the output from **show atmf links guest detail** (cont.)

| Parameter        | Description   |
|------------------|---|
| Model Type       | The model type of the guest node, as entered by the <code>modeltype</code> command. The mode type can be one of the following: <ul style="list-style-type: none"> <li>• alliedware</li> <li>• aw+</li> <li>• onvif</li> <li>• tq</li> <li>• other</li> </ul>  |
| Discovery Method | The discovery method as applied by the <code>discovery</code> command. This can be either dynamic or static.  |
| IP Address       | The IP address of the guest node.   |
| Username         | The user name configured on the guest node.   |
| Login Fallback   | Whether the guest node supports Login Fallback. For TQ model guest nodes, when login fallback is enabled, if a guest node is replaced, then AMF logs in to the new TQ using the factory default manager/friend settings. The new TQ is then discovered and managed as an AMF guest node by an AMF master or member. This means any backed up settings for the replaced guest node can also be recovered.  |
| Node state       | The state of the guest node; one of: <ul style="list-style-type: none"> <li>• Down: The initial state when a link to a guest node is first configured. This is also the state if the physical link goes down.</li> <li>• Getting IP: The AMF device is in the process of retrieving the IP address of the guest node.</li> <li>• Getting Mac: The AMF device is in the process of retrieving the MAC address of the guest node.</li> <li>• Getting Info: The AMF device is in the process of retrieving any other available information from the guest (firmware version etc). The information available depends on what device the guest node is.</li> <li>• Full: The AMF device has retrieved all necessary information and the guest node has joined the AMF network. Once this state is reached, the Link State also changes to "Full".</li> <li>• Failure: The physical link is up but the AMF member has failed to retrieve enough information to allow the guest node to join the AMF network.</li> </ul> |
| Backup Supported | Whether the guest node supports AMF backup functionality.   |
| MAC Address      | The MAC address of the guest node.  |

Table 57-2: Parameters in the output from **show atmf links guest detail** (cont.)

| Parameter        | Description   |
|------------------|---|
| Device Type      | Model information for the guest node. This field shows the model information that AMF retrieved from the guest node. In contrast, the Model Type shows what a user entered as the type of device they intended this guest node to be. |
| Description      | By default, this is a concatenation of the guest node's parent node and the port to which it is attached. You can change it by configuring a description on the port.   |
| Serial Number    | The serial number of the guest node.  |
| Firmware Name    | The name of the firmware operating on the guest node.   |
| Firmware Version | The version of the firmware operating on the guest node.  |
| HTTP port        | The HTTP port as specified with the <a href="#">http-enable</a> command when defining a guest class. You can set this if the guest node provides an HTTP user interface on a non-standard port (any port other than port 80).         |

**Command changes**

Version 5.5.0-1.1: **Login Fallback** parameter added

# show atmf links statistics

**Overview** This command displays details of the AMF links configured on the device and also displays statistics about the AMF packet exchanges between the devices.

It is also possible to display the AMF link configuration and packet exchange statistics for a specified interface.

This command can only be run on AMF master and controller nodes

**Syntax** `show atmf links statistics [interface [<port-number>]]`

| Parameter     | Description  |
|---------------|--|
| interface     | Specifies that the command applies to a specific interface (port) or range of ports. Where both the interface and port number are unspecified, full statistics (not just those relating to ports) will be displayed.     |
| <port-number> | Enter the port number for which statistics are required. A port range, a static channel or LACP link can also be specified. Where no port number is specified, statistics will be displayed for all ports on the device. |

**Mode** User Exec

**Example 1** To display AMF link statistics for the whole device, use the command:

```
device1# show atmf links statistics
```

**Table 58:** Sample output from the **show atmf links statistics** command

```
ATMF Statistics:

```

Figure 57-30: Parameter definitions from the **show atmf links statistics** command output

| Parameter            | Definition   |
|----------------------|--|
| Receive              | Shows a count of AMF protocol packets received per message type.       |
| Transmit             | Shows the number of AMF protocol packets transmitted per message type. |
| Database Entries     | Shows the number of AMF elements existing in the distributed database. |
| Database Full Ages   | Shows the number of times the entries aged in the database.            |
| ATMF Packet Discards | Shows the number of discarded packets of each type.                    |

# show atmf nodes

**Overview** This command displays nodes currently configured within the AMF network.

Note that the output also tells you whether or not node map exchange is active. Node map exchange improves the tracking of nodes joining and leaving an AMF network. This improves the efficiency of AMF networks. Node map exchange is only available if every node in your AMF network is running version 5.4.6-2.1 or later. We recommend running the latest version on all nodes in your network, so you receive the advantages of node map exchange and other improvements.

**Syntax** `show atmf nodes [guest|all]`

| Parameter | Description  |
|-----------|--|
| guest     | Display only guest nodes in the AMF network.                 |
| all       | Display all nodes in the AMF network, including guest nodes. |

**Mode** Privileged Exec

**Usage notes** You can use this command to display one of three sets of nodes:

- all nodes except guest nodes, by specifying **show atmf nodes**
- all nodes including guest nodes, by specifying **show atmf nodes all**
- only guest nodes, by specifying **show atmf nodes guest**

**Examples** To display AMF information for all nodes except guest nodes, use the command:

```
node1# show atmf nodes
```

Table 57-1: Sample output from **show atmf nodes**

```
node1#show atmf nodes guest

Node Information:

* = Local device

SC = Switch Configuration:
C = Chassis   S = Stackable   N = Standalone

Node          Device          ATMF          Parent          Node
Name          Type            Master SC          Domain          Depth
-----
* M1          x510-28GTX      Y             S              none            0
N3           x230-18GP       N             N              M1              1
N1           AR4050S         N             N              M1              1

Node map exchange is active
Current ATMF node count 3
```

To display AMF information for all nodes, including guest nodes, use the command:

```
node1# show atmf nodes all
```

**Table 58:** Sample output from **show atmf nodes all**. In this example, not all nodes support node map exchange, as shown by the message at the end

```
node1#show atmf nodes all

Node and Guest Information:

* = Local device

SC = Switch Configuration:
C = Chassis  S = Stackable  N = Standalone G = Guest

Node/Guest      Device          ATMF           Parent          Node
Name            Type            Master  SC   Domain          Depth
-----
* M1             x510-28GTX     Y         S    none            0
N3              x230-18GP     N         N    M1              1
N1              AR4050S       N         N    M1              1
N3-1.0.24       AT-TQ4600     N         G    N3              -

Node map exchange is inactive
Firmware on some nodes does not support node map exchange, eg AR4050S
Current ATMF node count 4 (guests 1)
```

To display AMF information for guest nodes only, use the command:

```
node1# show atmf nodes guest
```

**Table 57-1:** Sample output from **show atmf nodes guest**

```
node1#show atmf nodes guest

Guest Information:
Device      MAC
Name        Address      Parent          Port          IP/IPv6
Address
-----
aastra-...  0008.5d10.7635 Node-1          1.0.2         192.168.4.7
poe-1.0.1   0013.1a1e.4589 Node-1          1.0.1         192.168.4.6
ip-camera   0800.239e.f1fe Node-1          1.0.4         192.168.4.8

# show atmf provision nodes

**Overview** This command displays information about each provisioned node with details about date and time of creation, boot and configuration files available in the backup, and license files present in the provisioned backup. This includes nodes that have joined the network but are yet to run their first backup.

This command can only be run on AMF master and controller nodes.

**Syntax** `show atmf provision nodes`

**Mode** Privileged Exec

**Usage notes** This command will only work if provisioned nodes have already been set up. Otherwise, an error message is shown when the command is run.

**Example** To show the details of all the provisioned nodes in the backup use the command:

```
NodeName# show atmf provision nodes
```

Figure 57-31: Sample output from the **show atmf provision nodes** command

```
device1#show atmf provision nodes

ATMF Provisioned Node Information:

Backup Media .....: SD (Total 3827.0MB, Free 3481.1MB)

# show atmf recovery-file

- Overview** Use this command to display the recovery file information for an AMF node. AMF recovery files are created for nodes with special links. Special links include:
- virtual links,
  - area links terminating on an AMF master, and
  - area virtual links terminating on an AMF master.

**Syntax** `show atmf recovery-file`

**Mode** Privileged Exec

**Example** To display recovery file information for an AMF node, use the command:

```
node1# show atmf recovery-file
```

**Output** Figure 57-32: Example output from **show atmf recovery-file**

```
node1#show atmf recovery-file

ATMF Recovery File Info: Special Link Present
Location                               Date           Time

                  master_2           4 Mar 2017        Active
area_1_node_2     master_1           11 Mar 2017
                  master_2           4 Mar 2017        Revoked

Area-2 Certificates:
Node Name          Signer             Expires            Status
-----
area_2_node_1     master_1           18 Mar 2017        Active
area_2_node_2     master_1           18 Mar 2017        Rejected
```

Table 57-5: Parameters in the output from **show atmf secure-mode certificates**

| Parameter | Description   |
|-----------|---|
| Node Name | Name of AMF node the certificate was issued to.   |
| Signer    | Name of AMF master that issued the certificate.   |
| Expires   | Certificate expiry date.  |
| Status    | The status column will display <i>Active</i> before a member node is trusted, and can be accessed using AMF commands. Valid statuses are <i>Active</i> , <i>Revoked</i> , and <i>Rejected</i> . |

**Output** Figure 57-38: Example output from **show atmf secure-mode certificates detail area area-2 node area\_2\_node\_1**

```
Certificates Detail:
-----

- show atmf secure-mode sa

**Command changes** Version 5.4.7-0.3: command added

# show atmf secure-mode sa

**Overview** Use this command to display the security associations on the network. This is the list of links and neighbors that are trusted.

**Syntax** `show atmf secure-mode sa [detail] [link|neighbor|broadcast]`

| Parameter | Description  |
|-----------|--|
| detail    | Display detailed security association information. |
| link      | Display security associations for type links.      |
| neighbor  | Display security associations for type neighbors.  |
| broadcast | Display security associations for type broadcast.  |

**Mode** Privileged Exec

**Example** To display an overview of AMF secure mode security associations on a master or member node, use the command:

```
awplus# show atmf secure-mode sa
```

To display a detailed overview of AMF secure mode neighbor security associations on a master or member node, use the command:

```
awplus# show atmf secure-mode sa detail neighbor
```

**Output** Figure 57-39: Example output from **show atmf secure-mode sa**

```
ATMF Security Associations:
```

| Type                 | State         | ID       | Details    |
|----------------------|---------------|----------|------------|

# show atmf tech

**Overview** This command collects and displays all the AMF command output. The command can thus be used to display a complete picture of an AMF network.

**Syntax** show atmf tech

**Mode** Privileged Exec

**Example** To display output for all AMF commands, use the command:

```
NodeName# show atmf tech
```

**Table 58:** Sample output from the **show atmf tech** command.

```
node1#show atmf tech
ATMF Summary Information:

ATMF Status           : Enabled
Network Name          : ATMF_NET
Node Name              : node1

| Number of Up Uplinks on This Node | : 0     |
| DBE Checksum                      | : 84fc6 |
| Number of DBE Entries             | : 0     |
| ...                               |         |

**Table 59:** Parameter definitions from the **show atmf tech** command

| Parameter          | Definition   |
|--------------------|--|
| ATMF Status        | Shows status of AMF feature on the Node as Enabled/Disabled.   |
| Network Name       | The name of the AMF network to which this node belongs.  |
| Node Name          | The name assigned to the node within the AMF network.  |
| Role               | The role configured on the device within the AMF - either master or member.  |
| Current ATMF Nodes | A count of the AMF nodes in the AMF network.   |
| Node Address       | The identity of a node (in the format name.atmf) that enables its access it from a remote location.  |
| Node ID            | A unique identifier assigned to an AMF node.   |
| Node Depth         | The number of nodes in the path from this node to the core domain.   |
| Domain State       | A node's state within an AMF Domain - either controller or backup.   |
| Recovery State     | The AMF node recovery status. Indicates whether a node recovery is in progress on this device - either Auto, Manual, or None.  |
| Management VLAN    | The VLAN created for traffic between nodes of different domains (up/down links).<br>VLAN ID - In this example VLAN 4092 is configured as the Management VLAN.<br>Management Subnet - the Network prefix for the subnet.<br>Management IP Address - the IP address allocated for this traffic.<br>Management Mask - the Netmask used to create a subnet for this traffic 255.255.128.0 (= prefix /17) |

**Table 59:** Parameter definitions from the **show atmf tech** command (cont.)

| Parameter   | Definition  |
|-------------|---|
| Domain VLAN | The VLAN assigned for traffic between Nodes of same domain (crosslink).<br>VLAN ID - In this example VLAN 4091 is configured as the domain VLAN.<br>Domain Subnet - the Subnet address used for this traffic.<br>Domain IP Address - the IP address allocated for this traffic.<br>Domain Mask - the Netmask used to create a subnet for this traffic 255.255.128.0<br>(= prefix /17) |
| Device Type | Shows the Product Series Name.  |
| ATMF Master | Indicates the node's membership of the core domain (membership is indicated by Y)   |
| SC          | Shows switch configuration: <ul style="list-style-type: none"> <li>• C - Chassis (such as SBx8100 series)</li> <li>• S - Stackable (VCS)</li> <li>• N - Standalone</li> </ul>   |
| Parent      | A node that is connected to the present node's uplink, i.e. one layer higher in the hierarchy.  |
| Node Depth  | Shows the number of nodes in path from the current node to the Core domain.   |

**NOTE:** The **show atmf tech** command can produce very large output. For this reason only the most significant terms are defined in this table.

# show atmf virtual-links

**Overview** This command displays a summary of all virtual links (L2TP tunnels) currently in the running configuration.

**Syntax** `show atmf virtual-links [macaddr]`  
`show atmf virtual-links [id <1-4094>] [remote-id <1-4094>]`  
`show atmf virtual-links detail [id <1-4094>]`

| Parameter          | Description  |
|--------------------|--|
| macaddr            | Display the virtual AMF links' MAC addresses.  |
| id <1-4094>        | ID of the local virtual link.  |
| remote-id <1-4094> | ID of the remote virtual link  |
| detail             | Display information about a specific virtual link ID or range of virtual link IDs. Displays information such as: local and remote IP address, link type, packets received and transmitted. |

**Mode** Privileged Exec

**Example 1** To display AMF virtual links, use the command:

```
node_1# show atmf virtual-links
```

Table 57-1: Example output from **show atmf virtual-links**

```
ATMF Virtual-Link Information:
Local      Local      Remote      Tunnel      Tunnel
Port      ID   IP          ID   IP          Protect     State
-----
vlink1    1     172.16.24.2  2     1.0.0.2     -           Complete
vlink2    2     172.16.24.2* 10    172.16.24.3* ipsec       Complete
vlink3    3     (eth0)*      1     1.2.3.4     -           AcquireLocal

* = Dynamic Address.

Virtual Links Configured: 3
```

In the above example, a centrally located switch has the IP address space 192.0.2.x/24. It has two VLANs assigned the subnets 192.0.2.33 and 192.0.2.65 using the prefix /27. Each subnet connects to a virtual link. The first link has the IP address 192.168.1.1 and has a Local ID of 1. The second has the IP address 192.168.2.1 and has the Local ID of 2.

**Example 2** To display details about AMF virtual link with ID 1, use the command:

```
node_1# show atmf virtual-links detail id 1
```

Table 57-2: Example output from **show atmf virtual-links**

```

Virtual Link Detailed Information:

ID 1      Description      : None
ID 1      Local IP Address  : 192.168.5.1
ID 1      Remote ID        : 1
ID 1      Remote IP Address  : 192.168.5.20
ID 1      Link Type         : virtual-link
ID 1      Packets Received  : 236465
ID 1      Packets Transmitted : 192626
    
```

**Example 3** To display AMF virtual links' MAC address information, use the command:

```
node_1# show atmf virtual-links macaddr
```

Table 57-3: Example output from **show atmf virtual-links macaddr**

```

ATMF Link Remote Information:

ATMF Management Bridge Information:

Bridge: br-atmfmgmt

port no mac addr          is local?    ageing timer
  1    00:00:cd:27:c2:07    yes          0.00
  2    8e:c7:ae:81:7e:68    yes          0.00
  2    00:00:cd:28:bf:e7    no           0.01
    
```

Table 57-4: Parameters in the output from **show atmf virtual-links**

| Parameter      | Definition   |
|----------------|--|
| Local Port     | The tunnel name e.g. vlink1, vlink2, equivalent to an L2TP tunnel.   |
| Local ID       | The local ID of the virtual link. This matches the vlink<number>   |
| Tunnel Protect | Tunnel protection protocol.  |
| Tunnel State   | The operational state of the vlink (either Up or Down). This state is always displayed once a vlink has been created.                      |
| mac addr       | AMF virtual links terminate on an internal soft bridge. The "show atmf virtual-links macaddress" command displays MAC Address information. |
| is local?      | Indicates whether the MAC displayed is for a local or a remote device.   |
| ageing timer   | Indicates the current aging state for each MAC address.  |

- [show atmf group](#)

# show debugging atmf

**Overview** Use this command to see what debugging is turned on for AMF.  
For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show debugging atmf`

**Mode** Privileged Exec

**Example** To display the AMF debugging status, use the command:

```
node_1# show debugging atmf
```

Table 57-1: Sample output from the **show debugging atmf** command.

```
node_1# show debugging atmf
ATMF debugging status:
ATMF arealink debugging is on
ATMF link debugging is on
ATMF crosslink debugging is on
ATMF database debugging is on
ATMF neighbor debugging is on
ATMF packet debugging is on
ATMF error debugging is on
```

**Related commands** [debug atmf packet](#)

# show debugging atmf packet

**Overview** Use this command to see what debugging is turned on for AMF Packet debug. For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** show debugging atmf packet

**Mode** User Exec and Privileged Exec

**Example** To display the AMF packet debugging status, use the command:

```
node_1# show debug atmf packet
```

Table 57-2: Sample output from the **show debugging atmf packet** command.

```
ATMF packet debugging is on
=== ATMF Packet Debugging Parameters===
Node Name: x908
Port name: port1.1.1
Limit: 500 packets
Direction: TX
Info Level: Level 2
Packet Type Bitmap:
2. Crosslink Hello BPDU pkt with downlink domain info
3. Crosslink Hello BPDU pkt with uplink info
4. Down and up link Hello BPDU pkts
6. Stack hello unicast pkts
8. DBE request
9. DBE update
10. DBE bitmap update
```

**Related commands** debug atmf  
debug atmf packet

# show running-config atmf

**Overview** This command displays the running system information that is specific to AMF.

**Syntax** `show running-config atmf`

**Mode** User Exec and Global Configuration

**Example** To display the current configuration of AMF, use the following commands:

```
node_1# show running-config atmf
```

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Related commands** `show running-config`  
`no debug all`

# state

**Overview** This command sets the running state of an AMF container on a Virtual AMF Appliance (VAA).

An AMF container is an isolated instance of AlliedWare Plus with its own network interfaces, configuration, and file system. The features available inside an AMF container are a sub-set of the features available on the host VAA. These features enable the AMF container to function as a uniquely identifiable AMF master and allows for multiple tenants (up to 60) to run on a single VAA host. See the [AMF Feature Overview and Configuration Guide](#) for more information on running multiple tenants on a single VAA host.

**Syntax** `state {enable|disable}`

| Parameter | Description  |
|-----------|--|
| disable   | Stop the AMF container. The container's state changes to stopped.  |
| enable    | Start the AMF container. The container's state changes to running. |

**Default** By default, **state** is disabled.

**Mode** AMF Container Configuration

**Usage notes** The first time the **state enable** command is executed on a container it assigns the container to an area and configures it as an AMF master. This is achieved by automatically adding the following configuration to the AMF container:

```
atmf network-name <AMF network-name>
atmf master
atmf area <container area-name> <container area-id> local
atmf area <container area-name> password <container area-password>
atmf area <host area-name> <host area-id>

interface eth0
  atmf-arealink remote-area <host area-name> vlan 4094
```

For this reason the **state enable** command should be run after the container has been created with the [atmf container](#) command and an area-link configured with the [area-link](#) command.

Once the start-up configuration has been saved from within the AMF container, all further configuration changes need to be made manually.

**Example** To start the AMF container “vac-wlg-1” use the commands:

```
awplus# configure terminal
awplus(config)# atmf container vac-wlg-1
awplus(config-atmf-container)# state enable
```

To stop the AMF container “vac-wlg-1” use the commands:

```
awplus# configure terminal
awplus(config)# atmf container vac-wlg-1
awplus(config-atmf-container)# state disable
```

**Related commands** [atmf container](#)  
[show atmf container](#)

**Command changes** Version 5.4.7-0.1: command added

# switchport atmf-agentlink

**Overview** Use this command to configure a link between this device and an x600 Series switch, in order to integrate the x600 Series switch into your AMF network. The x600 Series switch is called an “AMF agent”, and the link between the x600 and this device is called an “agent link”.

The x600 Series switch must be running version 5.4.2-3.16 or later.

Use the **no** variant of this command to remove the agent link. If the x600 Series switch is still connected to the switch port, it will no longer be part of the AMF network.

**Syntax** `switchport atmf-agentlink`  
`no switchport atmf-agentlink`

**Default** By default, no agent links exist and x600 Series switches are not visible to AMF networks.

**Mode** Interface mode for a switch port. Note that the link between the x600 and the AMF network must be a single link, not an aggregated link.

**Usage notes** The x600 Series switch provides the following information to the AMF node that it is connected to:

- The MAC address
- The IPv4 address
- The IPv6 address
- The name/type of the device (Allied Telesis x600)
- The name of the current firmware
- The version of the current firmware
- The configuration name

AMF guestnode also makes most of this information available from x600 Series switches, but requires configuration with DHCP and/or LLDP. AMF agent is simpler; as soon the x600 is connected to an appropriately configured port of an AMF node, it is immediately integrated into the AMF network.

To see information about the x600 Series switch, use the **show atmf links guest detail** command.

**Example** To configure port1.0.1 as an agent link, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# switchport atmf-agentlink
```

**Related commands** [show atmf links guest](#)

# switchport atmf-arealink

**Overview** This command enables you to configure a port or aggregator to be an AMF area link. AMF area links are designed to operate between two nodes in different areas in an AMF network.

Use the **no** variant of this command to remove any AMF area link that may exist for the selected port or aggregated link.

This command is only available on AMF controllers and master nodes.

**Syntax** `switchport atmf-arealink remote-area <area-name> vlan <2-4094>`  
`no switchport atmf-arealink`

| Parameter   | Description  |
|-------------|--|
| <area-name> | The name of the remote area that the port is connecting to.  |
| <2-4094>    | The VLAN ID for the link. This VLAN cannot be used for any other purpose, and the same VLAN ID must be used at each end of the link. |

**Default** No arealinks are configured.

**Mode** Interface Configuration for a switchport, a static aggregator, or a dynamic channel group.

**Usage notes** Run this command on the port or aggregator at both ends of the link.

Each area must have the area-name configured, and the same area password must exist on both ends of the link.

Running this command will automatically place the port or static aggregator into trunk mode (i.e. switchport mode trunk) and will synchronize the area information stored on the two nodes.

You can configure multiple arealinks between two area nodes, but only one arealink at any time will be in use. All other arealinks will block information, to prevent network storms.

**NOTE:** See the [atmf-arealink](#) command to configure an AMF area link on an AR-series Eth interface.

**Example** To make switchport port1.0.2 an arealink to the 'Auckland' area on VLAN 6, use the commands:

```
controller-1# configure terminal
controller-1(config)# interface port1.0.2
controller-1(config-if)# switchport atmf-arealink remote-area
Auckland vlan 6
```

To remove switchport port1.0.1 as an AMF area link, use the commands:

```
controller-1# configure terminal
controller-1(config)# interface port1.0.1
controller-1(config-if)# no switchport atmf-arealink
```

**Related  
commands**

- [atmf area](#)
- [atmf area password](#)
- [atmf virtual-link](#)
- [show atmf links](#)

# switchport atmf-crosslink

**Overview** This command configures the selected port, statically aggregated link or dynamic channel group (LACP) to be an AMF crosslink. Running this command will automatically place the port or aggregator into trunk mode (i.e. **switchport mode trunk**).

The connection between two AMF masters must utilize a crosslink. Crosslinks are used to carry the AMF control information between master nodes. Multiple crosslinks can be configured between two master nodes, but only one crosslink can be active at any particular time. All other crosslinks between masters will be placed in the blocking state, in order to prevent broadcast storms.

Note that AlliedWare Plus CentreCOM Series switches are AMF Edge nodes and do not support virtual links or crosslinks. This is because each edge node can only have a single physical AMF link.

Use the **no** variant of this command to remove any crosslink that may exist for the selected port or aggregated link.

**Syntax** `switchport atmf-crosslink`  
`no switchport atmf-crosslink`

**Mode** Interface Configuration for a switchport, a static aggregator or a dynamic channel group.

**Usage notes** Crosslinks can be used anywhere within an AMF network. They have the effect of separating the AMF network into separate domains.

Where this command is used, it is also good practice to use the **switchport trunk native vlan** command with the parameter **none** selected. This is to prevent a network storm on a topology of ring connected devices.

**Example 1** To make switchport port1.0.1 an AMF crosslink, use the following commands:

```
Node_1# configure terminal
Node_1(config)# interface port1.0.1
Node_1(config-if)# switchport atmf-crosslink
```

**Example 2** This example is shown twice. Example 2A is the most basic command sequence. Example 2B is a good practice equivalent that avoids problems such as broadcast storms that can otherwise occur.

**Example 2A** To make static aggregator sa1 an AMF crosslink, use the following commands:

```
Node_1# configure terminal
Node_1(config)# interface sa1
Node_1(config-if)# switchport atmf-crosslink
```

**Example 2B** To make static aggregator sa1 an AMF crosslink, use the following commands for good practice:

```
Node_1# configure terminal
Node_1(config)# interface sa1
Node_1(config-if)# switchport atmf-crosslink
Node_1(config-if)# switchport trunk allowed vlan add 2
Node_1(config-if)# switchport trunk native vlan none
```

In this example VLAN 2 is assigned to the static aggregator, and the native VLAN (VLAN 1) is explicitly excluded from the aggregated ports and the crosslink assigned to it.

**NOTE:** *The AMF management and domain VLANs are automatically added to the aggregator and the crosslink.*

**Related commands** [show atmf links statistics](#)

# switchport atmf-guestlink

**Overview** Guest links are used to provide basic AMF functionality to non AMF capable devices. Guest links can be configured for either a selected switch port or a range of switch ports and use generic protocols to collect status and configuration information that the guest devices make available.

Use the **no** variant of this command to remove the guest node functionality from the selected port or ports.

**NOTE:** AMF guest nodes are not supported on ports using the OpenFlow protocol.

**Syntax** `switchport atmf-guestlink [class <guest-class>] [ip <A.B.C.D> | ipv6 <X:X::X:X>]`  
`no switchport atmf-guestlink`

| Parameter     | Description   |
|---------------|---|
| class         | Set a guest class   |
| <guest-class> | The name of the guest class.                                  |
| ip            | Specifies that the address following will have an IPv4 format |
| <A.B.C.D>     | The guest node's IP address in IPv4 format.                   |
| ipv6          | Specifies that the address following will have an IPv6 format |
| <X:X::X:X>    | The guest node's IP address in IPv6 format.                   |

**Default** No guest links are configured.

**Mode** Interface

**Example 1** To configure switchport port1.0.1 to be a guest link, that will connect to a guest node having a guest class of **camera** and an IPv4 address of **192.168.3.3**, use the following commands:

```
node1# configure terminal
node1(config)# int port1.0.1
node1(config-if)# switchport atmf-guestlink class camera ip
192.168.3.3
```

**Example 2** To configure switchport port1.0.1 to be a guest link, which will connect to a guest node having a guest class of **phone** and an IPv6 address of **2001:db8:21e:10d::5**, use the following commands:

```
node1# configure terminal
node1(config)# int port1.0.1
node1(config-if)# switchport atmf-guestlink class phone ipv6
2000:db8:21e:10d::5
```

**Example 3** To configure switchport port1.0.1 to be a guest link, using the default model type and learning method address, use the following commands:

```
node1# configure terminal
node1(config)# int port1.0.1
node1(config-if)# switchport atmf-guestlink
```

**Example 4** To configure switchports port1.0.1 to port1.0.3 to be guest links, for the guest class **camera**, use the following commands:

```
node1# configure terminal
node1(config)# int port1.0.1-port1.0.3
node1(config-if)# switchport atmf-guestlink class camera
```

**Example 5** To remove the guest-link functionality from switchport port1.0.1, use the following commands:

```
node1# configure terminal
node1(config)# int port1.0.1
node1(config-if)# no switchport atmf-guestlink
```

- show atmf guests

# switchport atmf-link

**Overview** This command enables you to configure a port or aggregator to be an up/down AMF link. Running this command will automatically place the port or aggregator into trunk mode. If the port was previously configured in access mode, the configured access VLAN will be removed.

Use the **no** variant of this command to remove any AMF link that may exist for the selected port or aggregated link.

**Syntax** `switchport atmf-link`  
`no switchport atmf-link`

**Mode** Interface Configuration for a switchport, a static aggregator or a dynamic channel group.

**Usage notes** Up/down links and virtual links interconnect domains in a vertical hierarchy, with the highest domain being the core domain. In effect, they form a tree of interconnected AMF domains. This tree must be loop-free. Therefore you must configure your up/down and virtual links so that no loops are formed.

Within each domain, cross-links between AMF nodes define those nodes as siblings within the same domain. You can form rings by combining cross-links with up/down links and/or virtual links, as long as each AMF domain links upwards to only a single parent domain. Each domain may link downwards to multiple child domains.

**NOTE:** See the [atmf-link](#) command to configure an AMF up/down link on an AR-series Eth interface.

**Example** To configure switchport port1.0.1 as an AMF up/down link, use the commands:

```
Node_1# configure terminal
Node_1(config)# interface port1.0.1
Node_1(config-if)# switchport atmf-link
```

To remove switchport port1.0.1 as an AMF up/down link, use the commands:

```
Node_1# configure terminal
Node_1(config)# interface port1.0.1
Node_1(config-if)# no switchport atmf-link
```

**Related commands** [atmf-link](#)  
[show atmf detail](#)  
[show atmf links](#)

# type atmf guest

**Overview** This command configures a trigger to activate when an AMF guest node joins or leaves.

**Syntax** `type atmf guest {join|leave}`

| Parameter | Description            |
|-----------|------------------------|
| join      | AMF guest node joins.  |
| leave     | AMF guest node leaves. |

**Mode** Trigger Configuration

**Example** To configure trigger 86 to activate when an AMF guest node leaves, use the following commands:

```
awplus(config)# trigger 86  
awplus(config-trigger)# type atmf guest leave
```

**Related commands** [show trigger](#)

**Command changes** Version 5.5.1-1.1: command added

# type atmf node

**Overview** This command configures a trigger to activate when an AMF node joins or leaves.

**Syntax** type atmf node {join|leave}

| Parameter | Description      |
|-----------|------------------|
| join      | AMF node joins.  |
| leave     | AMF node leaves. |

**Mode** Trigger Configuration

**Example 1** To configure trigger 5 to activate when an AMF node leaves, use the following commands. In this example the command is entered on node-1:

```
node1(config)# trigger 5
node1(config-trigger)# type atmf node leave
```

**Example 2** The following commands will configure trigger 5 to activate if an AMF node join event occurs on any node within the working set:

```
node1# atmf working-set group all
```

This command returns the following display:

```
=====
node1, node2, node3:
=====

Working set join
```

Note that the running the above command changes the prompt from the name of the local node, to the name of the AMF-Network followed, in square brackets, by the number of member nodes in the working set.

```
AMF-Net[3]# conf t
AMF-Net[3](config)# trigger 5
AMF-Net[3](config-trigger)# type atmf node leave
AMF-Net[3](config-trigger)# description "E-mail on AMF Exit"
AMF-Net[3](config-trigger)# active
```

Enter the name of the script to run at the trigger event.

```
AMF-Net[3](config-trigger)# script 1 email_me.scp
AMF-Net[3](config-trigger)# end
```

### Display the trigger configurations

```
AMF-Net[3]# show trigger
```

This command returns the following display:

```
=====
node1:
=====

TR# Type & Details      Description          Ac Te Tr Repeat      #Scr Days/Date
-----
001 Periodic (2 min)    Periodic Status Chk Y  N  Y Continuous    1  smtwtfS
005 ATMF node (leave)  E-mail on ATMF Exit Y  N  Y Continuous    1  smtwtfS
-----

=====
Node2, Node3,
=====

TR# Type & Details      Description          Ac Te Tr Repeat      #Scr Days/Date
-----
005 ATMF node (leave)  E-mail on ATMF Exit Y  N  Y Continuous    1  smtwtfS
-----
```

### Display the triggers configured on each of the nodes in the AMF Network.

```
AMF-Net[3]# show running-config trigger
```

This command returns the following display:

```
=====
Node1:
=====

trigger 1
  type periodic 2
  script 1 atmf.scp
trigger 5
  type atmf node leave
description "E-mail on ATMF Exit"
  script 1 email_me.scp
!

=====
Node2, Node3:
=====

trigger 5
  type atmf node leave
description "E-mail on ATMF Exit"
  script 1 email_me.scp
!
```

**Related commands** [show trigger](#)

# undebbug atmf

**Overview** This command is an alias for the **no** variant of the [debug atmf](#) command.

# username (atmf-guest)

**Overview** This command enables you to assign a **username** to a guest class. Guests may require a username and possibly also a password. The password must be between 1 and 32 characters and will allow spaces.

**Syntax** `username <name> password [8] <userpass>`  
`no username`

| Parameter                     | Description   |
|-------------------------------|---|
| <code>&lt;name&gt;</code>     | User name of the guest node.  |
| 8                             | The parameter <b>8</b> means that the password that follows is in hashed form, not plain text. Do not type this 8 when creating a password with this command; it is only used in configuration files. In configuration files, the device prints 8 in front of passwords, to indicate that it is displaying the password in its hashed form. |
| <code>&lt;userpass&gt;</code> | The password to be entered for the guest node.  |

**Default** No usernames are configured

**Mode** AMF Guest Configuration

**Example** To assign the user name 'reception' and the password of 'secret' to an AMF guest node that has the guest class of 'phone1' use the following commands:

```
node1# configure terminal
node1(config)# amf guest-class phone1
node1(config-atmf-guest)# username reception password secret
```

To remove a guest node username and password for the user guest class 'phone1', use the following commands:

```
node1# configure terminal
node1(config)# atmf guest-class phone1
node1(config-atmf-guest)# no username
```

# STOAT Commands

## Introduction

**Overview** This chapter provides an alphabetical reference of commands used to configure Device Discovery using STOAT (Standardized Topology Organizer and Transport).

Using LLDP and DHCP Snooping, STOAT can discover and gather information about devices in the local network. These devices may include IP cameras, IP phones, PCs, laptops, Wi-fi access points, printers, and so on.

Vista Manager EX merges the data from STOAT and existing discovery methods such as AMF, and AMF Plus Device Discovery, to provide a single, accurate and more complete view of the network.

For more information, see the [Device Discovery using STOAT Feature Overview and Configuration Guide](#).

# clear stoat collector session counters

**Overview** Use this command to clear the STOAT transport session counters.

**Syntax** clear stoat collector session counters [<1-4294967295>]

| Parameter      | Description |
|----------------|-------------|
| <1-4294967295> | Session ID  |

**Mode** Privileged Exec

**Example** To clear all STOAT transport session counters, use the command:

```
awplus# clear stoat collector session counters
```

To clear a specific STOAT transport session counter, use the command:

```
awplus# clear stoat collector session counters 234234234
```

**Related commands**

- [stoat collector trustpoint](#)
- [show stoat collector](#)
- [stoat collector expiry-period](#)
- [stoat collector key](#)

**Command changes** Version 5.5.3-1.1: command added

# description (stoat-dest)

**Overview** Use this command to add an informative description to a STOAT destination. Use the **no** variant of this command to remove a description from a STOAT destination.

**Syntax** `description <description>`  
`no description`

| Parameter                        | Description   |
|----------------------------------|---|
| <code>&lt;description&gt;</code> | A word or phrase that uniquely identifies this STOAT destination or its purpose. Valid characters are any printable character and spaces, up to a maximum of 40 characters. |

**Default** Not set.

**Mode** STOAT Destination Configuration

**Example** To add the description 'chc-collector-1' to a STOAT destination with IP address 192.0.2.6, use the commands:

```
awplus# configure terminal
awplus(config)# stoat destination 192.0.2.6
awplus(config-stoat-dest)# description chc-collector-1
```

To remove the description from a STOAT destination with IP address 192.0.2.6, use the commands:

```
awplus# configure terminal
awplus(config)# stoat destination 192.0.2.6
awplus(config-stoat-dest)# no description
```

**Related commands** [stoat destination](#)

**Command changes** Version 5.5.3-1.1: command added

# key (stoat-dest)

**Overview** Use this command to configure a key to use with a STOAT destination. The key allows the STOAT collector to authenticate this device as a valid source. The destination will not attempt to connect if no key is set.

A matching key must be configured on the STOAT collector device.

Use the **no** variant of this command to remove a key for a STOAT destination.

**Syntax** `key [8] <key-string>`  
`no key`

| Parameter    | Description  |
|--------------|--|
| 8            | Specifies that you are entering a password as a string that has already been encrypted instead of entering a plain text password. The running config displays the new password as an encrypted string even if password encryption is turned off. |
| <key-string> | Shared key string applied, a value in the range 8 to 80 characters.  |

**Default** Not set.

**Mode** STOAT Destination Configuration

**Example** To configure the key 'verysecret' for STOAT destination 192.0.2.6, use the commands:

```
awplus# configure terminal
awplus(config)# stoat destination 192.0.2.6
awplus(config-stoat-dest)# key verysecret
```

To remove the key for STOAT destination 192.0.2.6, use the commands:

```
awplus# configure terminal
awplus(config)# stoat destination 192.0.2.6
awplus(config-stoat-dest)# no key
```

**Related commands** [stoat collector key](#)  
[stoat destination](#)

**Command changes** Version 5.5.3-1.1: command added

# name-check (stoat-dest)

**Overview** Use this command to enable or disable certificate name checking for the server certificate received from the STOAT collector.

Use the **no** variant of this command to disable name checking for the server certificate received from the STOAT collector.

**Syntax** name-check  
no name-check

**Default** Disabled.

**Mode** STOAT Destination Configuration

**Usage notes** If enabled, the received server certificate must contain the address configured for this STOAT destination . This setting only takes effect if the STOAT destination has been configured with a trustpoint.

**Example** To enable name-check for STOAT destination 192.0.2.6, use the commands:

```
awplus# configure terminal
awplus(config)# stoat destination 192.0.2.6
awplus(config-stoat-destination)# name-check
```

To disable name-check for STOAT destination 192.0.2.6, use the commands:

```
awplus# configure terminal
awplus(config)# stoat destination 192.0.2.6
awplus(config-stoat-destination)# no name-check
```

**Related commands** [service stoat](#)

**Command changes** Version 5.5.3-1.1: command added

# service stoat

**Overview** Use this command to enable or disable Standardized Topology Organizer and Transport (STOAT) functionality on a device. Once enabled, the device will accept STOAT collector and STOAT source configuration.

Use the **no** variant of this command to disable STOAT functionality on a device.

**Syntax** `service stoat`  
`no service stoat`

**Default** Disabled.

**Mode** Global Configuration

**Example** To enable STOAT functionality on a device, use the commands:

```
awplus# configure terminal
awplus(config)# service stoat
```

To disable STOAT functionality on a device, use the commands:

```
awplus# configure terminal
awplus(config)# no service stoat
```

**Related commands** [stoat collector trustpoint](#)  
[stoat collector expiry-period](#)  
[stoat collector key](#)  
[show stoat collector](#)

**Command changes** Version 5.5.3-1.1: command added

# show stoat collector

**Overview** Use this command to see the operational status of the STOAT collector.

**Syntax** `show stoat collector [sessions|keys]`

| Parameter | Description                    |
|-----------|--------------------------------|
| sessions  | Active session information     |
| keys      | Authentication key information |

**Mode** Privileged Exec

**Example** To show the STOAT collector status information, use the command:

```
awplus# show stoat collector
```

To show the STOAT collector active session information, use the command:

```
awplus# show stoat collector sessions
```

To show the STOAT collector authentication key information, use the command:

```
awplus# show stoat collector keys
```

**Output** Figure 58-1: Example output from **show stoat collector**

```
awplus#show stoat collector
STOAT Collector Information:
-----
Status          : Enabled
Expiry-period   : 60 seconds

# show stoat destinations

**Overview** Use this command to see the operational status of the configured STOAT destinations.

**Syntax** `show stoat destinations [detail]`

| Parameter | Description               |
|-----------|---------------------------|
| detail    | Show detailed information |

**Mode** Privileged Exec

**Example** To show summary information about STOAT destinations, use the command:

```
awplus# show stoat destinations
```

To show detailed information about STOAT destinations, use the command:

```
awplus# show stoat destinations detail
```

**Output** Figure 58-4: Example output from **show stoat destinations**

```

**Related commands** [stoat destination](#)  
[shutdown \(stoat-dest\)](#)

**Command changes** Version 5.5.3-1.1: command added

# shutdown (stoat-dest)

**Overview** Use this command to disable a STOAT destination.  
Use the **no** variant of this command to enable a STOAT destination.

**Syntax** shutdown  
no shutdown

**Default** Enabled (no shutdown)

**Mode** STOAT Destination Configuration

**Example** To enable the STOAT destination 192.0.2.6, use the commands:

```
awplus# configure terminal
awplus(config)# stoat destination 192.0.2.6
awplus(config-stoat-dest)# no shutdown
```

**Related commands** [stoat destination](#)  
[show stoat destinations](#)

**Command changes** Version 5.5.3-1.1: command added

# stoat collector enable

**Overview** Use this command to start or stop the Standardized Topology Organizer and Transport (STOAT) collector functionality on a device.

Note: The device must be able to receive requests from STOAT sources before this command is used. To enable a device to receive requests from STOAT, use the **service stoat** command.

Use the **no** variant of this command to stop the STOAT collector functionality on a device.

**Syntax** `stoat collector enable`  
`no stoat collector enable`

**Default** Disabled.

**Mode** Global Configuration

**Usage notes** The STOAT feature is responsible for discovering devices and network topology, organizing that information into a standardized format, and transporting it to a central location for use. AMF uses STOAT data to allow non-AMF devices and their links to be displayed in the AMF topology map.

There are two types of STOAT device:

- **Collector** - receives and aggregates topology data
- **Source** - sends data to a collector. The data contains information that it knows about itself and has learned through discovery protocols

**Example** To start the STOAT collector, use the commands:

```
awplus# configure terminal
awplus(config)# stoat collector enable
```

To stop the STOAT collector, use the commands:

```
awplus# configure terminal
awplus(config)# no stoat collector enable
```

**Related commands** [stoat collector trustpoint](#)  
[show stoat collector](#)  
[stoat collector expiry-period](#)  
[stoat collector key](#)

**Command changes** Version 5.5.3-1.1: command added.

# stoat collector expiry-period

**Overview** Use this command to modify the session expiry-period for all of the STOAT collector's sessions.

Use the **no** variant of this command to revert to the default expiry-period of 60 seconds.

**Syntax** `stoat collector expiry-period <10-300>`  
`no stoat collector expiry-period`

| Parameter | Description                            |
|-----------|--|
| <10-300>  | Expiry-period in seconds (default: 60) |

**Default** 60 seconds.

**Mode** Global Configuration

**Example** To configure an expiry-period of 15 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# stoat collector expiry-period 15
```

To revert the expiry-period to its default of 60 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# no stoat collector expiry-period
```

**Related commands**

- [service stoat](#)

**Command changes** Version 5.5.3-1.1: command added

# stoat collector key

**Overview** Use this command to configure the authentication key used by the STOAT collector.

Use the **no** variant of this command to remove a STOAT authentication key.

**Syntax** `stoat collector key [8]{auth-key|generate} [description <description>]`  
`no stoat collector key [8]{auth-key|generate} [description <description>]`

| Parameter     | Description  |
|---------------|--|
| 8             | Specifies a key in encrypted format instead of plain text. |
| auth-key      | Authentication key   |
| generate      | Let STOAT generate a key                                   |
| description   | Add a useful description                                   |
| <description> | The useful description text                                |

**Default** Not set.

**Mode** Global Configuration

**Example** To configure a plain-text key 'secret-key' with no description, use the commands:

```
awplus# configure terminal
awplus(config)# stoat collector key secret-key
```

To configure a plain-text key 'secret-key' with a description, use the commands:

```
awplus# configure terminal
awplus(config)# stoat collector key secret-key description
'this is my secret key'
```

To **generate** a key with a description, use the commands:

```
awplus# configure terminal
awplus(config)# stoat collector key generate description 'my
generated key'
```

To configure an encrypted key with a description, use the commands:

```
awplus# configure terminal
awplus(config)# stoat collector key 8
CFWzNguaqyoPDqYoCBGzff07CfQZ0J-eJ00JslXON3E= description 'my
encrypted key'
```

To remove a configured encrypted key, use the commands:

```
awplus# configure terminal
awplus(config)# no stoat collector key 8
CFWzNguaqyoPDqYoCBGzff07CfQZ0J-eJ00JslXON3E=
```

**Output** Figure 58-6: Example output from **stoat collector key generate**

```
awplus(config)# stoat collector key generate
NttWCIS0KsyQ1-1_98qi4HcVdMRykeaE8IKfPe1Xv9o
```

changes**

Version 5.5.3-1.1: command added

# stoat collector trustpoint

**Overview** Use this command to add a crypto PKI trustpoint containing a server certificate and a key to the STOAT collector. This enables secure HTTPS API communication between the STOAT collector and STOAT source.

Use the **no** variant of this command to remove a configured PKI trustpoint from a STOAT collector.

**Syntax** `stoat collector trustpoint <trustpoint-name>`  
`no stoat collector trustpoint`

| Parameter                            | Description          |
|--------------------------------------|----------------------|
| <code>&lt;trustpoint-name&gt;</code> | PKI trustpoint name. |

**Mode** Global Configuration

**Example** To add an existing PKI trustpoint called 'chc' to the STOAT collector, use the commands:

```
awplus# configure terminal
awplus(config)# stoat collector trustpoint chc
```

To remove a configured PKI trustpoint from the STOAT collector, use the commands:

```
awplus# configure terminal
awplus(config)# no stoat collector trustpoint
```

**Related commands** [crypto pki authenticate](#)

**Command changes** Version 5.5.3-1.1: command added

# stoat destination

**Overview** Use this command to configure a remote STOAT collector destination.

Use the **no** variant of this command to remove a STOAT collector destination.

**Syntax**

```
stoat destination {<ip-address>|<host-name>|<ipv6-address>}  
[vrf <vrf-name>]  
  
no stoat destination {<ip-address>|<host-name>|<ipv6-address>}  
[vrf <vrf-name>]
```

| Parameter      | Description  |
|----------------|--|
| <ip-address>   | The IPv4 address, using the format A.B.C.D.  |
| <host-name>    | The host name specified in FQDN (Fully Qualified Domain Name). For example, manager.your.domain.com. |
| <ipv6-address> | The IPv6 address, using the format X:X::X:X.   |
| vrf            | Specify a VRF instance.  |
| <vrf-name>     | The name of the specific VRF instance.   |

**Default** Not set.

**Mode** Global Configuration

**Example** To configure a remote STOAT collector at IP address 10.0.0.1, use the commands:

```
awplus# configure terminal  
awplus(config)# stoat destination 10.0.0.1
```

To remove a remote STOAT collector at IP address 10.0.0.1, use the commands:

```
awplus# configure terminal  
awplus(config)# no stoat destination 10.0.0.1
```

To configure a remote STOAT collector at IP address 10.0.0.1 on VRF red, use the commands:

```
awplus# configure terminal  
awplus(config)# stoat destination 10.0.0.1 vrf red
```

To configure a remote STOAT collector at stoat.com, use the commands:

```
awplus# configure terminal  
awplus(config)# stoat destination stoat.com
```

To remove a remote STOAT collector at stoat.com, use the commands:

```
awplus# configure terminal  
awplus(config)# no stoat destination stoat.com
```

To configure a remote STOAT collector at 2001:db8::1, use the commands:

```
awplus# configure terminal  
awplus(config)# stoat destination 2001:db8::1
```

To remove a remote STOAT collector at 2001:db8::1, use the commands:

```
awplus# configure terminal  
awplus(config)# no stoat destination 2001:db8::1
```

**Related  
commands**

[stoat collector key](#)  
[show stoat collector](#)  
[stoat discovery](#)

**Command  
changes**

Version 5.5.3-1.1: command added

# stoat discovery

**Overview** Use this command to enable a device to import Standardized Topology Organizer and Transport (STOAT) discovery information learned by a given protocol. This command allows the device to act as a STOAT collector. STOAT collectors receive and aggregate topology data used in the AMF topology map.

Use the **no** variant of this command to disable the import of STOAT discovery information learned by a given protocol.

**Syntax** `stoat discovery {dhcp-snooping|lldp}`  
`no stoat discovery {dhcp-snooping|lldp}`

| Parameter     | Description   |
|---------------|---|
| dhcp-snooping | Import information learned by the DHCP Snooping protocol. |
| lldp          | Import information learned by the LLDP protocol.          |

**Default** Disabled.

**Mode** Global Configuration

**Example** To enable a device to import information learned by the DHCP Snooping protocol, use the commands:

```
awplus# configure terminal
awplus(config)# stoat discovery dhcp-snooping
```

To disable a device from importing information learned by the DHCP Snooping protocol, use the commands:

```
awplus# configure terminal
awplus(config)# no stoat discovery dhcp-snooping
```

**Related commands** [ip dhcp snooping](#)  
[lldp run](#)

**Command changes** Version 5.5.3-1.1: command added

# trustpoint (stoat-dest)

**Overview** Use this command to specify the trustpoint to use when authenticating the STOAT collector. If no trustpoint is specified, the STOAT collector will be implicitly trusted without authentication.

Use the **no** variant of this command to stop the use of trustpoints with a specified STOAT destination.

**Syntax** `trustpoint <trustpoint-name>`  
`no trustpoint`

| Parameter                            | Description             |
|--------------------------------------|-------------------------|
| <code>&lt;trustpoint-name&gt;</code> | Name of the trustpoint. |

**Default** Not set.

**Mode** STOAT Destination Configuration

**Example** To configure the STOAT destination 192.0.2.6 to use trustpoint 'chc', use the commands:

```
awplus# configure terminal
awplus(config)# stoat destination 192.0.2.6
awplus(config-stoat-dest)# trustpoint chc
```

To stop the use of trustpoints with STOAT destination 192.0.2.6 use the commands:

```
awplus# configure terminal
awplus(config)# stoat destination 192.0.2.6
awplus(config-stoat-dest)# no trustpoint
```

**Related commands** [stoat collector trustpoint](#)  
[stoat destination](#)  
[name-check \(stoat-dest\)](#)

**Command changes** Version 5.5.3-1.1: command added

# unique-id

**Overview** Use this command to generate a new unique ID for a device. This ID is used to uniquely identify a device in the STOAT topology.

Some circumstances may require you to generate a new unique ID, for example after recovering a device from an AMF provisioned backup.

**Syntax** `unique-id`

**Mode** Privileged Exec

**Example** To generate a new unique ID for a STOAT device, use the command:

```
awplus# unique-id
```

**Related commands** [service stoat](#)

**Command changes** Version 5.5.3-1.1: command added

# 59

# Dynamic Host Configuration Protocol (DHCP) Commands

## Introduction

**Overview** This chapter provides an alphabetical reference for commands used to configure DHCP.

# bootfile

**Overview** This command sets the boot filename for a DHCP server pool. This is the name of the boot file that the client should use in its bootstrap process. It may need to include a path.

The **no** variant of this command removes the boot filename from a DHCP server pool.

**Syntax** bootfile <filename>  
no bootfile

| Parameter  | Description         |
|------------|---------------------|
| <filename> | The boot file name. |

**Mode** DHCP Configuration

**Example** To configure the boot filename for a pool P2, use the command:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# bootfile boot/main_boot.bt
```

# clear ip dhcp binding

**Overview** This command clears either a specific lease binding or the lease bindings specified by the command or DHCP server. The command will only take effect on dynamically allocated bindings, not statically configured bindings.

**Syntax** `clear ip dhcp binding {ip <ip-address>|mac <mac-address>|all|pool <pool-name>|range <low-ip-address> <high-ip-address>}`

| Parameter   | Description  |
|---|--|
| <code>ip &lt;ip-address&gt;</code>                                | IPv4 address of the DHCP client, in dotted decimal notation in the format A.B.C.D.   |
| <code>mac &lt;mac-address&gt;</code>                              | MAC address of the DHCP client, in hexadecimal notation in the format HHHH.HHHH.HHHH.  |
| <code>all</code>  | All DHCP bindings.   |
| <code>pool &lt;pool-name&gt;</code>                               | Description used to identify DHCP server address pool. Valid characters are any printable character. If the name contains spaces then you must enclose these in "quotation marks". |
| <code>range &lt;low-ip-address&gt; &lt;high-ip-address&gt;</code> | IPv4 address range for DHCP clients, in dotted decimal notation. The first IP address is the low end of the range, the second IP address is the high end of the range.             |

**Mode** User Exec and Privileged Exec

**Usage** A specific binding may be deleted by **ip** address or **mac** address, or several bindings may be deleted at once using **all**, **pool** or **range**.

Note that if you specify to clear the **ip** or **mac** address of what is actually a static DHCP binding, an error message is displayed. If **all**, **pool** or **range** are specified and one or more static DHCP bindings exist within those addresses, any dynamic entries within those addresses are cleared but any static entries are not cleared.

**Examples** To clear the specific IP address binding 192.168.1.1, use the command:

```
awplus# clear ip dhcp binding ip 192.168.1.1
```

To clear all dynamic DHCP entries, use the command:

```
awplus# clear ip dhcp binding all
```

**Related commands** [show ip dhcp binding](#)

# default-router

**Overview** This command adds a default router to the DHCP address pool you are configuring. You can use this command multiple times to create a list of default routers on the client's subnet. This sets the router details using the pre-defined option 3. Note that if you add a user-defined option 3 using the **option** command, then you will override any settings created with this command.

The **no** variant of this command removes either the specified default router, or all default routers from the DHCP pool.

**Syntax** `default-router <ip-address>`  
`no default-router [<ip-address>]`

| Parameter                       | Description   |
|---------------------------------|---|
| <code>&lt;ip-address&gt;</code> | IPv4 address of the default router, in dotted decimal notation. |

**Mode** DHCP Configuration

**Examples** To add a router with an IP address 192.168.1.2 to the DHCP pool named P2, use the following commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# default-router 192.168.1.2
```

To remove a router with an IP address 192.168.1.2 to the DHCP pool named P2, use the following commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# no default-router 192.168.1.2
```

To remove all routers from the DHCP pool named P2, use the following commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# no default-router
```

# dns-server

**Overview** This command adds a Domain Name System (DNS) server to the DHCP address pool you are configuring. You can use this command multiple times to create a list of DNS name servers available to the client. This sets the DNS server details using the pre-defined option 6.

The **no** variant of this command removes either the specified DNS server, or all DNS servers from the DHCP pool.

**Syntax** `dns-server <ip-address>`  
`no dns-server [<ip-address>]`

| Parameter                       | Description   |
|---------------------------------|---|
| <code>&lt;ip-address&gt;</code> | IPv4 address of the DNS server, in dotted decimal notation. |

**Mode** DHCP Configuration

**Examples** To add the DNS server with the assigned IP address 192.168.1.1 to the DHCP pool named P1, use the following commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# dns-server 192.168.1.1
```

To remove the DNS server with the assigned IP address 192.168.1.1 from the DHCP pool named P1, use the following commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# no dns-server 192.168.1.1
```

To remove all DNS servers from the DHCP pool named P1, use the following commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# no dns-server
```

**Related commands** [default-router](#)  
[show ip dhcp pool](#)  
[subnet-mask](#)

# domain-name

**Overview** This command adds a domain name to the DHCP address pool you are configuring. Use this command to specify the domain name that a client should use when resolving host names using the Domain Name System. This sets the domain name details using the pre-defined option 15.

Note that if you add a user-defined option 15 using the [option](#) command, then you will override any settings created with this command.

The **no** variant of this command removes the domain name from the address pool.

**Syntax** `domain-name <domain-name>`  
`no domain-name`

| Parameter                        | Description  |
|----------------------------------|--|
| <code>&lt;domain-name&gt;</code> | The domain name you wish to assign the DHCP pool. Valid characters are any printable character. If the name contains spaces then you must enclose it in "quotation marks". |

**Mode** DHCP Configuration

**Examples** To add the domain name `Nerv_Office` to DHCP pool P2, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# domain-name Nerv_Office
```

To remove the domain name `Nerv_Office` from DHCP pool P2, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# no domain-name Nerv_Office
```

- [subnet-mask](#)

# host (DHCP)

**Overview** This command adds a static host address to the DHCP address pool you are configuring. The client with the matching MAC address is permanently assigned this IP address. No other clients can request it.

The **no** variant of this command removes the specified host address from the DHCP pool. Use the **no host all** command to remove all static host addresses from the DHCP pool.

**Syntax** `host <ip-address> <mac-address>`  
`no host <ip-address>`  
`no host all`

| Parameter                        | Description  |
|----------------------------------|--|
| <code>&lt;ip-address&gt;</code>  | IPv4 address of the DHCP client, in dotted decimal notation in the format A.B.C.D    |
| <code>&lt;mac-address&gt;</code> | MAC address of the DHCP client, in hexadecimal notation in the format HHHH.HHHH.HHHH |

**Mode** DHCP Configuration

**Usage** Note that a network/mask must be configured using a **network** command before issuing a **host** command. Also note that a host address must match a network to add a static host address.

**Examples** To add the host at 192.168.1.5 with the MAC address 000a.451d.6e34 to DHCP pool 1, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool 1
awplus(dhcp-config)# network 192.168.1.0/24
awplus(dhcp-config)# host 192.168.1.5 000a.451d.6e34
```

To remove the host at 192.168.1.5 with the MAC address 000a.451d.6e34 from DHCP pool 1, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool 1
awplus(dhcp-config)# no host 192.168.1.5 000a.451d.6e34
```

**Related  
Commands** [lease](#)  
[range](#)

[show ip dhcp pool](#)

# host client-id

**Overview** Use this command to add a static host address reservation to the DHCP address pool you are configuring for the DHCP client with the given client identifier.

Use the **no** variant of this command to remove the specified host address reservation from the DHCP pool. Use the **no host all** command to remove all static host addresses from the DHCP pool.

**Syntax** `host <ip-address> client-id <client-identifier>`  
`no host <ip-address>`

| Parameter                              | Description  |
|--|--|
| <code>&lt;ip-address&gt;</code>        | IPv4 address of the DHCP client, in dotted decimal notation in the format A.B.C.D  |
| <code>&lt;client-identifier&gt;</code> | An alphanumeric string to be used as a client identifier. This is from 1 to 63 characters in length. This string can also contain special characters '#', '-', '_' and "." |

**Default** No host static IP address reservations are defined for a pool.

**Mode** DHCP Configuration

**Usage notes** The client with the matching client-id is permanently assigned this IP address. No other clients can request it. If a subscriber identifier for a client identifier substitution is enabled for a remote pool, the DHCP server will expect to see the subscriber identifier sub-option being included in the relay agent information option on the relay client packet. And the subscriber-id is matched against the static host reservation with the matching client identifier.

A network/mask must be configured using the **network** command before issuing a host command. Also note that a host address must match a network to add a static host address.

**Example** To add a static host address for client-id 'office-pc-21' to a pool, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool Campus-1
awplus(dhcp-config)# host 192.168.2.5 client-id office-pc-21
```

**Output** Figure 59-1: Example output from **show ip dhcp binding**

```
awplus#show ip dhcp binding Campus-1

**Related commands** [network \(DHCP\)](#)

**Command changes** Version 5.5.2-0.1: command added

# ip address dhcp

**Overview** This command activates the DHCP client on the interface you are configuring. This allows the interface to use the DHCP client to obtain its IP configuration details from a DHCP server on its connected network.

The **client-id** and **hostname** parameters are identifiers that you may want to set in order to interoperate with your existing DHCP infrastructure. If neither option is needed, then the DHCP server uses the MAC address field of the request to identify the host.

The DHCP client supports the following IP configuration options:

- Option 1— the subnet mask for your device.
- Option 3— a list of default routers.
- Option 6 — a list of DNS servers. This list appends the DNS servers set on your device with the [ip name-server](#) command.
- Option 15—a domain name used to resolve host names. This option replaces the domain name set with the [ip domain-name](#) command. Your device ignores this domain name if it has a domain list set using the [ip domain-list](#) command.
- Option 51—lease expiration time.

The **no** variant of this command stops the interface from obtaining IP configuration details from a DHCP server.

**Syntax** `ip address dhcp [client-id <interface>] [hostname <hostname>]`  
`no ip address dhcp`

| Parameter  | Description  |
|--|--|
| <code>client-id</code><br><code>&lt;interface&gt;</code> | The name of the interface you are activating the DHCP client on. If you specify this, then the MAC address associated with the specified interface is sent to the DHCP server in the optional identifier field.<br>Default: no default |
| <code>hostname</code><br><code>&lt;hostname&gt;</code>   | The hostname for the DHCP client on this interface. Typically this name is provided by the ISP.<br>Default: no default   |

**Mode** Interface Configuration for VLAN interfaces.

**Examples** To set the interface `vlan2` to use DHCP to obtain an IP address, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip address dhcp
```

To stop the interface vlan2 from using DHCP to obtain its IP address, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip address dhcp
```

**Related commands**

- [ip address \(IP Addressing and Protocol\)](#)
- [show ip interface](#)
- [show running-config](#)

# ip dhcp bootp ignore

**Overview** This command configures the DHCP server to ignore any BOOTP requests it receives. The DHCP server accepts BOOTP requests by default.

The **no** variant of this command configures the DHCP server to accept BOOTP requests. This is the default setting.

**Syntax** `ip dhcp bootp ignore`  
`no ip dhcp bootp ignore`

**Mode** Global Configuration

**Examples** To configure the DHCP server to ignore BOOTP requests, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp bootp ignore
```

To configure the DHCP server to respond to BOOTP requests, use the commands:

```
awplus# configure terminal
awplus(config)# no ip dhcp bootp ignore
```

**Related commands** [show ip dhcp server summary](#)

# ip dhcp leasequery enable

**Overview** Use this command to enable the DHCP server to respond to DHCPLEASEQUERY packets. Enabling the DHCP leasequery feature allows a DHCP Relay Agent to obtain IP address information directly from the DHCP server using DHCPLEASEQUERY messages.

Use the **no** variant of this command to disable the support of DHCPLEASEQUERY packets.

For more information, see the [DHCP Feature Overview and Configuration Guide](#).

**Syntax** ip dhcp leasequery enable  
no ip dhcp leasequery enable

**Default** DHCP leasequery support is disabled by default.

**Mode** Global Configuration

**Examples** To enable DHCP leasequery support, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp leasequery enable
```

To disable DHCP leasequery support, use the commands:

```
awplus# configure terminal
awplus(config)# no ip dhcp leasequery enable
```

**Related commands** [show counter dhcp-server](#)  
[show ip dhcp server statistics](#)  
[show ip dhcp server summary](#)

# ip dhcp option

**Overview** This command creates a user-defined DHCP option. Options with the same number as one of the pre-defined options override the standard option definition. The pre-defined options use the option numbers 1, 3, 6, 15, and 51.

The **no** variant of this command removes either the specified user-defined option, or removes all user-defined options. This also automatically removes the user-defined options from the associated DHCP address pools.

**Syntax** `ip dhcp option <1-254> [name <option-name>] [<option-type>]`  
`no ip dhcp option [<1-254>|<option-name>]`

| Parameter     | Description  |       |                      |     |   |    |   |         |                                |      |   |
|---------------|--|-------|----------------------|-----|---|----|---|---------|--------------------------------|------|---|
| <1-254>       | The option number of the option. Options with the same number as one of the standard options overrides the standard option definition.   |       |                      |     |   |    |   |         |                                |      |   |
| <option-name> | Option name used to identify the option. You cannot use a number as the option name. Valid characters are any printable character. If the name contains spaces then you must enclose it in "quotation marks".<br>Default: no default   |       |                      |     |   |    |   |         |                                |      |   |
| <option-type> | The option value. You must specify a value that is appropriate to the option type: <table border="1"><tbody><tr><td>ascii</td><td>An ASCII text string</td></tr><tr><td>hex</td><td>A hexadecimal string. Valid characters are the numbers 0–9 and letters a–f. Embedded spaces are not valid. The string must be an even number of characters, from 2 and 256 characters long.</td></tr><tr><td>ip</td><td>An IPv4 address or mask that has the dotted decimal A.B.C.D notation. To create a list of IP addresses, you must add each IP address individually by using the option command multiple times.</td></tr><tr><td>integer</td><td>A number from 0 to 4294967295.</td></tr><tr><td>flag</td><td>A value that either sets (to 1) or unsets (to 0) a flag: <b>true</b>, <b>on</b>, or <b>enabled</b> will set the flag. <b>false</b>, <b>off</b> or <b>disabled</b> will unset the flag.</td></tr></tbody></table> | ascii | An ASCII text string | hex | A hexadecimal string. Valid characters are the numbers 0–9 and letters a–f. Embedded spaces are not valid. The string must be an even number of characters, from 2 and 256 characters long. | ip | An IPv4 address or mask that has the dotted decimal A.B.C.D notation. To create a list of IP addresses, you must add each IP address individually by using the option command multiple times. | integer | A number from 0 to 4294967295. | flag | A value that either sets (to 1) or unsets (to 0) a flag: <b>true</b> , <b>on</b> , or <b>enabled</b> will set the flag. <b>false</b> , <b>off</b> or <b>disabled</b> will unset the flag. |
| ascii         | An ASCII text string   |       |                      |     |   |    |   |         |                                |      |   |
| hex           | A hexadecimal string. Valid characters are the numbers 0–9 and letters a–f. Embedded spaces are not valid. The string must be an even number of characters, from 2 and 256 characters long.  |       |                      |     |   |    |   |         |                                |      |   |
| ip            | An IPv4 address or mask that has the dotted decimal A.B.C.D notation. To create a list of IP addresses, you must add each IP address individually by using the option command multiple times.  |       |                      |     |   |    |   |         |                                |      |   |
| integer       | A number from 0 to 4294967295.   |       |                      |     |   |    |   |         |                                |      |   |
| flag          | A value that either sets (to 1) or unsets (to 0) a flag: <b>true</b> , <b>on</b> , or <b>enabled</b> will set the flag. <b>false</b> , <b>off</b> or <b>disabled</b> will unset the flag.  |       |                      |     |   |    |   |         |                                |      |   |

**Mode** Global Configuration

**Examples** To define a user-defined ASCII string option as option 66, without a name, use the command:

```
awplus# configure terminal
awplus(config)# ip dhcp option 66 ascii
```

To define a user-defined hexadecimal string option as option 46, with the name `tcpip-node-type`, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp option 46 name tcpip-node-type hex
```

To define a user-defined IP address option as option 175, with the name `special-address`, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp option 175 name special-address ip
```

To remove the specific user-defined option with the option number 12, use the commands:

```
awplus# configure terminal
awplus(config)# no ip dhcp option 12
```

To remove the specific user-defined option with the option name `perform-router-discovery`, use the commands:

```
awplus# configure terminal
awplus(config)# no ip dhcp option perform-router-discovery
```

To remove all user-defined option definitions, use the commands:

```
awplus# configure terminal
awplus(config)# no ip dhcp option
```

**Related  
commands**

[default-router](#)

[dns-server](#)

[domain-name](#)

[show ip dhcp server summary](#)

[subnet-mask](#)

# ip dhcp pool

**Overview** This command will enter the configuration mode for the pool name specified. If the name specified is not associated with an existing pool, the device will create a new pool with this name, then enter the configuration mode for the new pool.

Once you have entered the DHCP configuration mode, all commands executed before the next **exit** command will apply to this pool.

You can create multiple DHCP pools on devices with multiple interfaces. This allows the device to act as a DHCP server on multiple interfaces to distribute different information to clients on the different networks.

The **no** variant of this command deletes the specific DHCP pool.

**Syntax** `ip dhcp pool <pool-name>`  
`no ip dhcp pool <pool-name>`

| Parameter                      | Description   |
|--------------------------------|---|
| <code>&lt;pool-name&gt;</code> | Description used to identify this DHCP pool. Valid characters are any printable character. If the name contains spaces then you must enclose it in "quotation marks". |

**Mode** Global Configuration

**Example** To create the DHCP pool named P2 and enter DHCP Configuration mode, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)#
```

To delete the DHCP pool named P2, use the commands:

```
awplus# configure terminal
awplus(config)# no ip dhcp pool P2
```

**Related commands** [service dhcp-server](#)

# ip dhcp-client default-route distance

**Overview** Use this command to specify an alternative Administrative Distance (AD) for the current default route (from DHCP) for an interface.

Use the **no** variant of this command to set the AD back to the default of 1.

**Syntax** `ip dhcp-client default-route distance [<1-255>]`  
`no ip dhcp-client default-route distance`

| Parameter | Description   |
|-----------|---|
| <1-255>   | Administrative Distance (AD) from the range 1 though 255. |

**Default** 1

**Mode** Interface Configuration for VLAN interfaces.

**Usage notes** DHCP client interfaces can automatically add a default route with an AD of 1 into the IP Routing Information Base (RIB).

Any pre-existing default route(s) via alternative interfaces (configured with a higher AD) will no longer be selected as the preferred forwarding path for traffic when the DHCP based default route is added to the IP routing table.

This can be problematic if the DHCP client is operating via an interface that is only intended to be used for back-up interface redundancy purposes, such as an interface with lower bandwidth or a particular role like the management interface.

Use this command to set the AD of the default route (via a specific DHCP client interface) to a non-default (higher cost) value, ensuring any pre-existing default route(s) via any other interface(s) continue to be selected as the preferred forwarding path for network traffic.

When the command is used, the static default route is deleted from the RIB, the distance value of the route is modified to the configured distance value, then it is reinstalled into the RIB.

**Examples** To configure vlan10 as a DHCP client and to set the AD for the default route added by DHCP to 150, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# ip address dhcp
awplus(config-if)# ip dhcp-client default-route distance 150
```

To set the AD for the default route back to the default value of 1, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# no ip dhcp-client default-route distance
```

[show ip route database](#)

**Command  
changes**

Version 5.4.7-0.2 Command added.

# ip dhcp-client request vendor-identifying-specific

**Overview** Use this command to add vendor-identifying vendor-specific information (option 125) requests to the DHCP discovery packets sent by an interface. This option, along with option 124, can be used to send vendor-specific information back to a DHCP client.

See RFC3925 for more information on Vendor-Identifying Vendor Options for DHCPv4.

Use the **no** variant of this command to remove the vendor-identifying-specific request from an interface.

**Syntax** `ip dhcp-client request vendor-identifying-specific`  
`no ip dhcp-client request vendor-identifying-specific`

**Default** The vendor-identifying-specific request is not configured by default.

**Mode** Interface Configuration for VLAN interfaces.

**Usage notes** The DHCP client must be activated on the interface, using the [ip address dhcp](#) command, so that DHCP discovery packets are sent.

**Example** To add the vendor-identifying-specific request on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip dhcp-client request
vendor-identifying-specific
```

To remove the vendor-identifying-specific request on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip dhcp-client request
vendor-identifying-specific
```

**Related commands** [ip address dhcp](#)  
[ip dhcp-client vendor-identifying-class](#)

**Command changes** Version 5.4.7-2.1: command added

# ip dhcp-client vendor-identifying-class

**Overview** Use this command to add a vendor-identifying vendor class (option 124) to the DHCP discovery packets sent by an interface. This option places the Allied Telesis Enterprise number (207) into the discovery packet. Option 124, along with option 125, can be used to send vendor-specific information back to a DHCP client.

See RFC3925 for more information on Vendor-Identifying Vendor Options for DHCPv4.

Use the **no** variant of this command to remove the vendor-identifying-class from an interface.

**Syntax** `ip dhcp-client vendor-identifying-class`  
`no ip dhcp-client vendor-identifying-class`

**Default** The vendor-identifying-class is not configured by default.

**Mode** Interface Configuration for VLAN interfaces.

**Usage notes** The DHCP client must be activated on the interface, using the [ip address dhcp](#) command, so that DHCP discovery packets are sent.

**Example** To remove the vendor-identifying-class on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip dhcp-client vendor-identifying-class
```

**Related commands** [ip address dhcp](#)  
[ip dhcp-client request vendor-identifying-specific](#)

**Command changes** Version 5.4.7-2.1: command added

# ip dhcp-relay agent-option

**Overview** This command enables the DHCP Relay Agent to insert the DHCP Relay Agent Information Option (Option 82) into the client-request packets that it relays to its DHCP server. This allows the DHCP Relay Agent to pass on information to the server about the network location of the client device. The DHCP Relay Agent strips the DHCP Relay Agent Option 82 field out of the DHCP server's response, so that the DHCP client never sees this field.

When the DHCP Relay Agent appends its DHCP Relay Agent Option 82 data into the packet, it first overwrites any pad options present; then if necessary, it increases the packet length to accommodate the DHCP Relay Agent Option 82 data.

The **no** variant of this command stops the DHCP Relay Agent from appending the Option 82 field onto DHCP requests before forwarding it to the server.

For DHCP Relay Agent and DHCP Relay Agent Option 82 introductory information, see the [DHCP Feature Overview and Configuration Guide](#).

**NOTE:** *The DHCP-relay service might alter the content of the DHCP Relay Agent Option 82 field, if the commands `ip dhcp-relay agent-option` and `ip dhcp-relay information policy` have been configured.*

**Syntax** `ip dhcp-relay agent-option`  
`no ip dhcp-relay agent-option`

**Default** DHCP Relay Agent Information Option (Option 82) insertion is disabled by default.

**Mode** Interface Configuration for VLAN interfaces.

**Usage notes** Use this command to alter the DHCP Relay Agent Option 82 setting when your device is the first hop for the DHCP client. To limit the maximum length of the packet, use the [ip dhcp-relay max-message-length](#) command.

This command cannot be enabled if DHCP snooping is enabled on your device ([service dhcp-snooping](#) command), and vice versa.

**Examples** To make the DHCP Relay Agent listening on vlan2 append the DHCP Relay Agent Option 82 field, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip dhcp-relay agent-option
```

To stop the DHCP Relay Agent from appending the DHCP Relay Agent Option 82 field on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip dhcp-relay agent-option
```

**Related commands** [ip dhcp-relay agent-option remote-id](#)  
[ip dhcp-relay information policy](#)  
[ip dhcp-relay max-message-length](#)  
[service dhcp-relay](#)

# ip dhcp-relay agent-option checking

**Overview** This command enables the DHCP Relay Agent to check DHCP Relay Agent Information Option (Option 82) information in response packets returned from DHCP servers. If the information does not match the information it has for its own client (downstream) interface then the DHCP Relay Agent drops the packet. Note that [ip dhcp-relay agent-option](#) must be configured.

The DHCP Relay Agent Option 82 field is included in relayed client DHCP packets if:

- DHCP Relay Agent Option 82 is enabled ([ip dhcp-relay agent-option](#)), and
- DHCP Relay Agent is enabled on the device ([service dhcp-relay](#))

For DHCP Relay Agent and DHCP Relay Agent Option 82 introductory information, see the [DHCP Feature Overview and Configuration Guide](#).

**Syntax** `ip dhcp-relay agent-option checking`  
`no ip dhcp-relay agent-option checking`

**Mode** Interface Configuration for VLAN interfaces.

**Examples** To make the DHCP Relay Agent listening on vlan2 check the DHCP Relay Agent Information Option (Option 82) field, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip dhcp-relay agent-option
awplus(config-if)# ip dhcp-relay agent-option checking
```

To stop the DHCP Relay Agent on vlan2 from checking the DHCP Relay Agent Information Option (Option 82) field, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip dhcp-relay agent-option checking
```

**Related commands** [ip dhcp-relay agent-option](#)  
[ip dhcp-relay agent-option remote-id](#)  
[ip dhcp-relay information policy](#)  
[service dhcp-relay](#)

# ip dhcp-relay agent-option remote-id

**Overview** Use this command to specify the Remote ID sub-option of the DHCP Relay Agent Option 82 field the DHCP Relay Agent inserts into clients' request packets. The Remote ID identifies the device that is inserting the DHCP Relay Agent Option 82 information. If a Remote ID is not specified, the Remote ID sub-option is set to the device's MAC address.

Use the **no** variant of this command to return the Remote ID for an interface.

For DHCP Relay Agent and DHCP Relay Agent Option 82 introductory information, see the [DHCP Feature Overview and Configuration Guide](#).

**Syntax**

```
ip dhcp-relay agent-option remote-id <remote-id>
no ip dhcp-relay agent-option remote-id
```

| Parameter   | Description  |
|-------------|--|
| <remote-id> | An alphanumeric (ASCII) string, 1 to 63 characters in length. Additional characters allowed are hyphen (-), underscore (_) and hash (#). Spaces are not allowed. |

**Default** The Remote ID is set to the device's MAC address by default.

**Mode** Interface Configuration for VLAN interfaces.

**Usage notes** The Remote ID sub-option is included in the DHCP Relay Agent Option 82 field of relayed client DHCP packets if:

- DHCP Relay Agent Option 82 is enabled ([ip dhcp-relay agent-option](#)), and
- DHCP Relay Agent is enabled on the device ([service dhcp-relay](#))

**Examples** To set the Remote ID to myid for client DHCP packets received on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip dhcp-relay agent-option remote-id myid
```

To remove the Remote ID specified for vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip dhcp-relay agent-option remote-id
```

**Related commands**

- [ip dhcp-relay agent-option](#)
- [ip dhcp-relay agent-option checking](#)
- [show ip dhcp-relay](#)

# ip dhcp-relay agent-option subscriber-id

**Overview** Use this command to set an ASCII string as a subscriber identifier for a port. Use the **no** variant of this command to unset the string as a subscriber identifier for a port.

**Syntax** `ip dhcp-relay agent-option subscriber-id <subscriber-id>`  
`no ip dhcp-relay agent-option subscriber-id`

| Parameter                          | Description   |
|------------------------------------|---|
| <code>&lt;subscriber-id&gt;</code> | An alphanumeric string to use as a client identifier. It is from 1 to 63 characters in length. This string may also contain special characters '#', '-', '_' and ".". |

**Default** No string is set.

**Mode** Interface Configuration

**Usage notes** The subscriber identifier is used by the relay agent to add a subscriber identifier sub-option to the relay-agent information option added by the relay-agent before forwarding the client packets coming from the switch port to the server. The agent option fields in responses sent from the servers to clients are stripped before forwarding such responses back to the client.

**Example** To set subscriber identifier 'office-1' to packets coming from the client directly connected to port1.0.1, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# ip dhcp-relay agent-option subscriber-id
office-1
```

**Output** Figure 59-2: Example output from **show interface**

```
awplus#show interface port1.0.1
Interface port1.0.1
  Scope: both
  Link is DOWN, administrative state is UP
  Thrash-limiting
    Status Not Detected, Action learn-disable, Timeout 1(s)
  Hardware is Ethernet, address is e01a.ea60.087f
  index 5010 metric 1 mru 1500
  configured duplex auto, configured speed auto, configured polarity auto
  <UP,BROADCAST,MULTICAST>
  SNMP link-status traps: Disabled
  DHCP subscriber-id substitution for client-id is not enabled
  DHCP subscriber-id is office-1
    input packets 0, bytes 0, dropped 0, multicast packets 0
    output packets 0, bytes 0, multicast packets 0, broadcast packets 0
    input average rate : 30 seconds 0 bps, 5 minutes 0 bps
    output average rate: 30 seconds 0 bps, 5 minutes 0 bps
  Time since last state change: 0 days 17:51:00
```

**Command changes** Version 5.5.2-0.1: command added

# ip dhcp-relay information policy

**Overview** This command sets the policy for how the DHCP relay deals with packets arriving from the client that contain DHCP Relay Agent Option 82 information.

If the command **ip dhcp-relay agent-option** has not been configured, then this command has no effect at all - no alteration is made to Option 82 information in packets arriving from the client side.

However, if the command **ip dhcp-relay agent-option** has been configured, this command modifies how the DHCP relay service deals with cases where the packet arriving from the client side already contains DHCP Relay Agent Option 82 information.

This command sets the action that the DHCP relay should take when a received DHCP client request contains DHCP Relay Agent Option 82 information.

By default, the DHCP Relay Agent replaces any existing DHCP Relay Agent Option 82 field with its own DHCP Relay Agent field. This is equivalent to the functionality of the **replace** parameter.

The **no** variant of this command returns the policy to the default behavior - i.e. replacing the existing DHCP Relay Agent Option 82 field.

For DHCP Relay Agent and DHCP Relay Agent Option 82 introductory information, see the [DHCP Feature Overview and Configuration Guide](#).

**NOTE:** The DHCP-relay service might alter the content of the DHCP Relay Agent Option 82 field, if the commands [ip dhcp-relay agent-option](#) and [ip dhcp-relay information policy](#) have been configured.

**Syntax**

```
ip dhcp-relay information policy {append|drop|keep|replace}
no ip dhcp-relay information policy
```

| Parameter | Description  |
|-----------|--|
| append    | The DHCP Relay Agent appends the DHCP Relay Agent Option 82 field of the packet with its own DHCP Relay Agent Option 82 details.                               |
| drop      | The DHCP Relay Agent discards the packet.  |
| keep      | The DHCP Relay Agent forwards the packet without altering the DHCP Relay Agent Option 82 field.  |
| replace   | The DHCP Relay Agent replaces the existing DHCP Relay Agent details in the DHCP Relay Agent Option 82 field with its own details before forwarding the packet. |

**Mode** Interface Configuration for VLAN interfaces.

**Examples** To make the DHCP Relay Agent listening on vlan2 drop any client requests that already contain DHCP Relay Agent Option 82 information, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip dhcp-relay information policy drop
```

To reset the DHCP relay information policy to the default policy for interface vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip dhcp-relay information policy
```

**Related commands**

- [ip dhcp-relay agent-option checking](#)
- [service dhcp-server](#)

# ip dhcp-relay maxhops

**Overview** This command sets the hop count threshold for discarding BOOTP messages. When the hops field in a BOOTP message exceeds the threshold, the DHCP Relay Agent discards the BOOTP message. The hop count threshold is set to 10 hops by default.

Use the **no** variant of this command to reset the hop count to the default.

For DHCP Relay Agent and DHCP Relay Agent Option 82 introductory information, see the [DHCP Feature Overview and Configuration Guide](#).

**Syntax** `ip dhcp-relay maxhops <1-255>`  
`no ip dhcp-relay maxhops`

| Parameter | Description                  |
|-----------|------------------------------|
| <1-255>   | The maximum hop count value. |

**Default** The default hop count threshold is 10 hops.

**Mode** Interface Configuration for VLAN interfaces.

**Example** To set the maximum number of hops to 5 for packets received on interface vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip dhcp-relay maxhops 5
```

**Related commands** [service dhcp-relay](#)

# ip dhcp-relay max-message-length

**Overview** This command applies when the device is acting as a DHCP Relay Agent and DHCP Relay Agent Option 82 insertion is enabled. It sets the maximum DHCP message length (in bytes) for the DHCP packet with its DHCP Relay Agent Option 82 data inserted. From this value it calculates the maximum packet size that it will accept at its input. Packets that arrive greater than this value will be dropped.

The **no** variant of this command sets the maximum message length to its default of 1400 bytes.

For DHCP Relay Agent and DHCP Relay Agent Option 82 introductory information, see the [DHCP Feature Overview and Configuration Guide](#).

**Syntax** `ip dhcp-relay max-message-length <548-1472>`  
`no ip dhcp-relay max-message-length`

| Parameter  | Description   |
|------------|---|
| <548-1472> | The maximum DHCP message length (this is the message header plus the inserted DHCP option fields in bytes). |

**Default** The default is 1400 bytes.

**Mode** Interface Configuration for VLAN interfaces.

**Usage notes** When a DHCP Relay Agent (that has DHCP Relay Agent Option 82 insertion enabled) receives a request packet from a DHCP client, it will append the DHCP Relay Agent Option 82 component data, and forward the packet to the DHCP server. The DHCP client will sometimes issue packets containing pad option fields that can be overwritten with Option 82 data.

Where there are insufficient pad option fields to contain all the DHCP Relay Agent Option 82 data, the DHCP Relay Agent will increase the packet size to accommodate the DHCP Relay Agent Option 82 data. If the new (increased) packet size exceeds that defined by the **maximum-message-length** parameter, then the DHCP Relay Agent will drop the packet.

**NOTE:** Before setting this command, you must first run the `ip dhcp-relay agent-option` command. This will allow the DHCP Relay Agent Option 82 fields to be appended.

**Example** To set the maximum DHCP message length to 1200 bytes for packets arriving in interface vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip dhcp-relay max-message-length 1200
```

To reset the maximum DHCP message length to the default of 1400 bytes for packets arriving in interface `vlan2`, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip dhcp-relay max-message-length
```

**Related commands** [service dhcp-relay](#)

# ip dhcp-relay server-address

**Overview** This command adds a DHCP server for the DHCP Relay Agent to forward client DHCP packets to on a particular interface. You can add up to five DHCP servers on each device interface that the DHCP Relay Agent is listening on.

The **no** variant of this command deletes the specified DHCP server from the list of servers available to the DHCP relay agent.

The **no ip dhcp-relay** command removes all DHCP relay settings from the interface.

For DHCP Relay Agent and DHCP Relay Agent Option 82 introductory information, see the [DHCP Feature Overview and Configuration Guide](#).

**Syntax**

```
ip dhcp-relay server-address {<ipv4-address>|<ipv6-address>
<server-interface>}

no ip dhcp-relay server-address {<ipv4-address>|<ipv6-address>
<server-interface>}

no ip dhcp-relay
```

| Parameter          | Description   |
|--------------------|---|
| <ipv4-address>     | Specify the IPv4 address of the DHCP server for the DHCP Relay Agent to forward client DHCP packets to, in dotted decimal notation. The IPv4 address uses the format A.B.C.D. |
| <ipv6-address>     | Specify the IPv6 address of the DHCPv6 server for the DHCPv6 Relay Agent to forward client DHCP packets to, in hexadecimal notation.  |
| <server-interface> | Specify the interface name of the DHCPv6 server. It is only required for a DHCPv6 server with an IPv6 address.  |

**Mode** Interface Configuration for VLAN interfaces.

**Usage notes** For a DHCP server with an IPv6 address you must specify the interface for the DHCP server. See examples below for configuration differences between IPv4 and IPv6 DHCP relay servers.

See also the [service dhcp-relay](#) command to enable the DHCP Relay Agent on your device. The [ip dhcp-relay server-address](#) command defines a relay destination on an interface on the device, needed by the DHCP Relay Agent to relay DHCP client packets to a DHCP server.

**Examples: DHCP for IPv4** To enable the DHCP Relay Agent to relay DHCP packets on interface vlan2 to the DHCP server with the IPv4 address 192.0.2.200, use the commands:

```
awplus# configure terminal
awplus(config)# service dhcp-relay
awplus(config)# interface vlan2
awplus(config-if)# ip dhcp-relay server-address 192.0.2.200
```

To remove the DHCP server with the IPv4 address 192.0.2.200 from the list of servers available to the DHCP Relay Agent on interface vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip dhcp-relay server-address 192.0.2.200
```

**Examples: DHCPv6** To enable the DHCP Relay Agent on your device to relay DHCP packets on interface vlan10 to the DHCP server with the IPv6 address 2001:0db8:010d::1 on interface vlan20, use the commands:

```
awplus# configure terminal
awplus(config)# service dhcp-relay
awplus(config)# interface vlan10
awplus(config-if)# ip dhcp-relay server-address
2001:0db8:010d::1 vlan20
```

To remove the DHCP server with the IPv6 address 2001:0db8:010d::1 on interface vlan20 from the list of servers available to the DHCP Relay Agent on interface vlan10, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# no ip dhcp-relay server-address
2001:0db8:010d::1 vlan20
```

**Example: disabling DHCP relay** To disable DHCP relay on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip dhcp-relay
```

**Related commands** [service dhcp-relay](#)

# ip dhcp-relay use-client-side-address

**Overview** Use this command to configure DHCP-Relay to use the client-side interface (that is the interface receiving the DHCP client packets) IP address as the source address of the relayed DHCP packets.

Use the **no** variant of this command to disable the use of the client-side interface IP address as the source IP address for relayed DHCP packets.

**Syntax** `ip dhcp-relay use-client-side-address`  
`no ip dhcp-relay use-client-side-address`

| Parameter                            | Description   |
|--------------------------------------|---|
| <code>use-client-side-address</code> | Use the client side interface IP address as the source IP address for relayed DHCP packets. |

**Default** By default, the server-side interface IP address is used as the source IP address of DHCP relayed packets.

**Mode** Global Configuration

**Usage notes** In most cases, there are filters placed between the DHCP relay and DHCP server which only allow DHCP packets from the client subnet to the server and back. This command allows you to configure the DHCP relay so that the relay will use the IP address of the interface **receiving** clients' DHCP requests to be used as the source IP address of the relayed DHCP packets.

**Example** To configure the client-side IP address as the source IP address of DHCP relayed packets, use the following commands:

```
awplus# configure terminal
awplus(config)# ip dhcp-relay use-client-side-address
```

**Output** Figure 59-3: Example output from **show ip dhcp-relay**

The second line of the display output shows the status of the client-side address being enabled as the source IP address.

```
awplus#sh ip dhcp-relay
DHCP Relay Service is enabled
Use of client side address as source address is enabled
...
```

**Related commands** [ip dhcp-relay server-address](#)

**Command changes** Version 5.4.9-0.7: command added

# ip dhcp use-subscriber-id

**Overview** Use this command in Global Configuration mode to configure the DHCP server to use the subscriber identifier substitution for the client identifier on all DHCP packets coming from all switch ports.

Use this command in Interface Configuration mode to configure a DHCP server to use the subscriber identifier substitution for the client identifier on all DHCP packets coming from a DHCP client directly connected to an interface.

Use the **no** variant of this command to disable the configuration.

**Syntax** `ip dhcp use-subscriber-id`  
`no ip dhcp use-subscriber-id`

**Default** Disabled

**Mode** Global Configuration  
Interface Configuration

**Usage notes** In Global Configuration mode, other DHCP packets coming from other interface types, for example Ethernet, are not affected by this command.

In Interface Configuration mode, the subscriber-id used in the substitution is derived from the port name of an interface. For example, for a DHCP packet coming in from a DHCP client directly attached to switchport port1.0.1, the subscriber-id is port1.0.1. This subscriber identifier for the client identifier substitution can only be applied to packets coming from switchport interfaces, consequently this command is only applicable to switchport interfaces.

**Example 1** In Global Configuration mode, to configure the subscriber-id client-id substitution for the DHCP packets coming from all switch port interfaces, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp use-subscriber-id
```

**Output** Figure 59-4: Example output from **show ip dhcp server summary**

```
awplus#show ip dhcp server summary

DHCP Server service is enabled
DHCP Server is running
BOOTP ignore is disabled
DHCP leasequery support is disabled
DHCP subscriber-id substitution for client-id is enabled
Pool list: pool_direct pool_relay Campus-1
```

**Example 2** In Interface Configuration mode, to configure subscriber identifier substitution for the client identifier on packets sent by a DHCP client directly attached to port port1.0.1, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# ip dhcp use-subscriber-id
```

**Output** Figure 59-5: Example output from **show interface**

```
awplus#show interface port1.0.1
Interface port1.0.1
  Scope: both
  Link is DOWN, administrative state is UP
  Thrash-limiting
    Status Not Detected, Action learn-disable, Timeout 1(s)
  Hardware is Ethernet, address is e01a.ea60.087f
  index 5010 metric 1 mru 1500
  configured duplex auto, configured speed auto, configured
  polarity auto

  SNMP link-status traps: Disabled
  DHCP subscriber-id substitution for client-id is enabled
  DHCP subscriber-id is office-1
    input packets 0, bytes 0, dropped 0, multicast packets 0
    output packets 0, bytes 0, multicast packets 0, broadcast
  packets 0
    input average rate : 30 seconds 0 bps, 5 minutes 0 bps
    output average rate: 30 seconds 0 bps, 5 minutes 0 bps
  Time since last state change: 0 days 17:51:00
```

**Related commands** [show ip dhcp server summary](#)  
[show interface](#)

**Command changes** Version 5.5.2-0.1: command added

# lease

**Overview** This command sets the expiration time for a leased address for the DHCP address pool you are configuring. The time set by the days, hours, minutes and seconds is cumulative. The minimum total lease time that can be configured is 20 seconds. The maximum total lease time that can be configured is 120 days.

Note that if you add a user-defined option 51 using the `option` command, then you will override any settings created with this command. Option 51 specifies a lease time of 1 day.

Use the **infinite** parameter to set the lease expiry time to infinite (leases never expire).

Use the **no** variant of this command to return the lease expiration time back to the default of one day.

**Syntax** `lease <days> <hours> <minutes> [<seconds>]`  
`lease infinite`  
`no lease`

| Parameter                    | Description  |
|------------------------------|--|
| <code>&lt;days&gt;</code>    | The number of days, from 0 to 120, that the lease expiry time is configured for.<br>Default: 1 |
| <code>&lt;hours&gt;</code>   | The number of hours, from 0 to 24, that the lease expiry time is configured for.<br>Default: 0 |
| <code>&lt;minutes&gt;</code> | The number of minutes, from 0 to 60, the lease expiry time is configured for.<br>Default: 0    |
| <code>&lt;seconds&gt;</code> | The number of seconds, from 0 to 60, the lease expiry time is configured for.                  |
| <code>infinite</code>        | The lease never expires.   |

**Default** The default lease time is 1 day.

**Mode** DHCP Configuration

**Examples** To set the lease expiration time for address pool P2 to 35 minutes, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# lease 0 0 35
```

To set the lease expiration time for the address pool `Nerv_Office` to 1 day, 5 hours, and 30 minutes, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool Nerv_Office
awplus(dhcp-config)# lease 1 5 30
```

To set the lease expiration time for the address pool `P3` to 20 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P3
awplus(dhcp-config)# lease 0 0 0 20
```

To set the lease expiration time for the pool to never expire, use the command:

```
awplus(dhcp-config)# lease infinite
```

To return the lease expiration time to the default of one day, use the command:

```
awplus(dhcp-config)# no lease
```

**Related  
commands**

[option](#)  
[service dhcp-server](#)  
[short-lease-threshold](#)

# network (DHCP)

**Overview** This command sets the network (subnet) that the DHCP address pool applies to. The **no** variant of this command removes the network (subnet) from the DHCP address pool.

**Syntax**

```
network  
{<ip-subnet-address/prefix-length>|<ip-subnet-address/mask>}  
no network
```

| Parameter                                      | Description  |
|--|--|
| <i>&lt;ip-subnet-address/prefix-length&gt;</i> | The IPv4 subnet address in dotted decimal notation followed by the prefix length in slash notation.        |
| <i>&lt;ip-subnet-address/mask&gt;</i>          | The IPv4 subnet address in dotted decimal notation followed by the subnet mask in dotted decimal notation. |

**Mode** DHCP Configuration

**Usage notes** This command will fail if it would make existing ranges invalid. For example, if they do not lie within the new network you are configuring. The **no** variant of this command will fail if ranges still exist in the pool. You must remove all ranges in the pool before issuing a **no network** command to remove a network from the pool.

**Examples** To configure a network for the address pool P2, where the subnet is 192.0.2.5 and the mask is 255.255.255.0, use the commands:

```
awplus# configure terminal  
awplus(config)# ip dhcp pool P2  
awplus(dhcp-config)# network 192.0.2.5/24
```

or you can use dotted decimal notation instead of slash notation for the subnet-mask:

```
awplus# configure terminal  
awplus(config)# ip dhcp pool P2  
awplus(dhcp-config)# network 192.0.2.5 255.255.255.0
```

**Related commands** [service dhcp-server](#)  
[subnet-mask](#)

## next-server

**Overview** This command sets the next server address for a DHCP server pool. It is the address of the next server that the client should use in its bootstrap process.

The **no** variant of this command removes the next server address from the DHCP address pool.

**Syntax** `next-server <ip-address>`  
`no next-server`

| Parameter                       | Description  |
|---------------------------------|--|
| <code>&lt;ip-address&gt;</code> | The server IP address, entered in dotted decimal notation. |

**Mode** DHCP Configuration

**Example** To set the next-server address for the address pool P2, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# next-server 192.0.2.2
```

# option

**Overview** This command adds a user-defined option to the DHCP address pool you are configuring. For the **hex**, **integer**, and **flag** option types, if the option already exists, the new option overwrites the existing option's value. Options with an **ip** type can hold a list of IP addresses or masks (i.e. entries that have the A.B.C.D address format), so if the option already exists in the pool, then the new IP address is added to the list of existing IP addresses.

Options with the same number as one of the pre-defined options override the standard option definition. The pre-defined options use the option numbers 1, 3, 6, 15, and 51.

The **no** variant of this command removes the specified user-defined option from the DHCP pool, or all user-defined options from the DHCP pool.

**Syntax** `option [<1-254>|<option-name>] <option-value>`  
`no option [<1-254>|<option-value>]`

| Parameter      | Description   |     |   |    |  |         |                                |      |  |
|----------------|---|-----|---|----|--|---------|--------------------------------|------|--|
| <1-254>        | The option number of the option. Options with the same number as one of the standard options overrides the standard option definition.  |     |   |    |  |         |                                |      |  |
| <option-name>  | Option name associated with the option.   |     |   |    |  |         |                                |      |  |
| <option-value> | The option value. You must specify a value that is appropriate to the option type: <table border="1" data-bbox="710 1261 1423 1751"> <tbody> <tr> <td>hex</td> <td>A hexadecimal string. Valid characters are the numbers 0–9 and letters a–f. Embedded spaces are not valid. The string must be an even number of characters, from 2 and 256 characters long.</td> </tr> <tr> <td>ip</td> <td>An IPv4 address or mask that has the dotted decimal A.B.C.D notation. To create a list of IP addresses, you must add each IP address individually using the option command multiple times.</td> </tr> <tr> <td>integer</td> <td>A number from 0 to 4294967295.</td> </tr> <tr> <td>flag</td> <td>A value of either true, on, or enabled to set the flag, or false, off or disabled to unset the flag.</td> </tr> </tbody> </table> | hex | A hexadecimal string. Valid characters are the numbers 0–9 and letters a–f. Embedded spaces are not valid. The string must be an even number of characters, from 2 and 256 characters long. | ip | An IPv4 address or mask that has the dotted decimal A.B.C.D notation. To create a list of IP addresses, you must add each IP address individually using the option command multiple times. | integer | A number from 0 to 4294967295. | flag | A value of either true, on, or enabled to set the flag, or false, off or disabled to unset the flag. |
| hex            | A hexadecimal string. Valid characters are the numbers 0–9 and letters a–f. Embedded spaces are not valid. The string must be an even number of characters, from 2 and 256 characters long.   |     |   |    |  |         |                                |      |  |
| ip             | An IPv4 address or mask that has the dotted decimal A.B.C.D notation. To create a list of IP addresses, you must add each IP address individually using the option command multiple times.  |     |   |    |  |         |                                |      |  |
| integer        | A number from 0 to 4294967295.  |     |   |    |  |         |                                |      |  |
| flag           | A value of either true, on, or enabled to set the flag, or false, off or disabled to unset the flag.  |     |   |    |  |         |                                |      |  |

**Mode** DHCP Configuration

**Examples** To add the ASCII-type option named `tftp-server-name` to the pool P2 and give the option the value `server1`, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# option tftp-server-name server1
```

To add the hex-type option named `tcpip-node-type` to the pool P2 and give the option the value `08af`, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# option tcpip-node-type 08af
```

To add multiple IP addresses for the ip-type option 175, use the command:

```
awplus(dhcp-config)# option 175 192.0.2.6
awplus(dhcp-config)# option 175 192.0.2.12
awplus(dhcp-config)# option 175 192.0.2.33
```

To add the option 179 to a pool, and give the option the value `123456`, use the command:

```
awplus(dhcp-config)# option 179 123456
```

To add a user-defined flag option with the name `perform-router-discovery`, use the command:

```
awplus(dhcp-config)# option perform-router-discovery yes
```

To clear all user-defined options from a DHCP address pool, use the command:

```
awplus(dhcp-config)# no option
```

To clear a user-defined option, named `tftp-server-name`, use the command:

```
awplus(dhcp-config)# no option tftp-server-name
```

[service dhcp-server](#)

[show ip dhcp pool](#)

# probe enable

**Overview** Use this command to enable lease probing for a DHCP pool. Probing is used by the DHCP server to check if an IP address it wants to lease to a client is already being used by another host.

The **no** variant of this command disables probing for a DHCP pool.

**Syntax** probe enable  
no probe enable

**Default** Probing is enabled by default.

**Mode** DHCP Pool Configuration

**Examples** To enable probing for pool P2, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# probe enable
```

To disable probing for pool P2, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# no probe enable
```

**Related commands**

- [probe packets](#)
- [probe timeout](#)
- [probe type](#)
- [show ip dhcp pool](#)

# probe packets

**Overview** Use this command to specify the number of packets sent for each lease probe. Lease probing is configured on a per-DHCP pool basis. When set to 0 probing is effectively disabled.

The **no** variant of this command sets the number of probe packets sent to the default of 5.

**Syntax** `probe packets <0-10>`  
`no probe packets`

| Parameter | Description                       |
|-----------|-----------------------------------|
| <0-10>    | The number of probe packets sent. |

**Default** The default is 5.

**Mode** DHCP Pool Configuration

**Examples** To set the number of probe packets to 2 for pool P2, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# probe packets 2
```

To set the number of probe packets to the default 5 for pool P2, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# no probe packets
```

**Related commands** [probe enable](#)  
[probe timeout](#)  
[probe type](#)  
[show ip dhcp pool](#)

# probe timeout

**Overview** Use this command to set the timeout value in milliseconds that the server waits for a response after each probe packet is sent. Lease probing is configured on a per-DHCP pool basis.

The **no** variant of this command sets the probe timeout value to the default setting, 200 milliseconds.

**Syntax** `probe timeout <50-5000>`  
`no probe timeout`

| Parameter                    | Description                       |
|------------------------------|-----------------------------------|
| <code>&lt;50-5000&gt;</code> | Timeout interval in milliseconds. |

**Default** The default timeout interval is 200 milliseconds.

**Mode** DHCP Pool Configuration

**Examples** To set the probe timeout value to 500 milliseconds for pool P2, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# probe timeout 500
```

To set the probe timeout value for pool P2 to the default, 200 milliseconds, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# no probe timeout
```

**Related commands** [probe enable](#)  
[probe packets](#)  
[probe type](#)  
[show ip dhcp pool](#)

# probe type

**Overview** Use this command to set the probe type for a DHCP pool. The probe type specifies how the DHCP server checks whether an IP address is being used by other hosts, referred to as lease probing. If **arp** is specified, the server sends an ARP request to determine if an address is in use. If **ping** is specified, the server will send an ICMP Echo Request (ping).

The **no** variant of this command sets the probe type to the default setting, ping.

**Syntax** `probe type {arp|ping}`  
`no probe type`

| Parameter | Description       |
|-----------|-------------------|
| arp       | Probe using ARP.  |
| ping      | Probe using ping. |

**Default** The default probe type is ping.

**Mode** DHCP Pool Configuration

**Examples** To set the probe type to `arp` for the pool `P2`, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# probe type arp
```

To set the probe type for the pool `P2` to the default, `ping`, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# no probe type
```

# range

**Overview** This command adds an address range to the DHCP address pool you are configuring. The DHCP server responds to client requests received from the pool's network. It assigns an IP addresses within the specified range. The IP address range must lie within the network. You can add multiple address ranges and individual IP addresses for a DHCP pool by using this command multiple times.

The **no** variant of this command removes an address range from the DHCP pool. Use the **no range all** command to remove all address ranges from the DHCP pool.

**Syntax** `range <ip-address> [<ip-address>]`  
`no range <ip-address> [<ip-address>]`  
`no range all`

| Parameter                       | Description  |
|---------------------------------|--|
| <code>&lt;ip-address&gt;</code> | IPv4 address range for DHCP clients, in dotted decimal notation. The first IP address is the low end of the range, the second IP address is the high end. Specify only one IP address to add an individual IP address to the address pool. |

**Mode** DHCP Configuration

**Examples** To add an address range of 192.0.2.5 to 192.0.2.16 to the pool `Nerv_Office`, use the command:

```
awplus# configure terminal
awplus(config)# ip dhcp pool Nerv_Office
awplus(dhcp-config)# range 192.0.2.5 192.0.2.16
```

To add the individual IP address 192.0.2.2 to a pool, use the command:

```
awplus(dhcp-config)# range 192.0.2.2
```

To remove all address ranges from a pool, use the command:

```
awplus(dhcp-config)# no range all
```

**Related commands**

- `ip dhcp pool`
- `service dhcp-server`
- `show ip dhcp pool`

# route

**Overview** This command allows the DHCP server to provide static routes to clients.

**Syntax** `route A.B.C.D/M A.B.C.D {both|opt249|rfc3442}`

| Parameter | Description                            |
|-----------|--|
| A.B.C.D/M | Subnet for the route                   |
| A.B.C.D   | Next hop for the route                 |
| both      | opt249 and rfc3442                     |
| opt249    | Classless static route option for DHCP |
| rfc3442   | Classless static route option for DHCP |

**Mode** DHCP Configuration

**Examples** To distribute static routes for route 0.0.0.0/0 whose next hop is 192.16.1.1 to clients using both opt249 and rfc3442, use the command:

```
awplus# configure terminal
awplus(config)# ip dhcp pool pubic
awplus(dhcp-config)# route 0.0.0.0/0 192.16.1.1 both
```

**Related commands** [ip dhcp pool](#)

# service dhcp-relay

**Overview** This command enables the DHCP Relay Agent on the device. However, on a given IP interface, no DHCP forwarding takes place until at least one DHCP server is specified to forward/relay all clients' DHCP packets to.

The **no** variant of this command disables the DHCP Relay Agent on the device for all interfaces.

**Syntax** `service dhcp-relay`  
`no service dhcp-relay`

**Mode** Global Configuration

**Usage notes** A maximum number of 400 DHCP Relay Agents (one per interface) can be configured on the device. Once this limit has been reached, any further attempts to configure DHCP Relay Agents will not be successful.

**Default** The DHCP-relay service is enabled by default.

**Examples** To enable the DHCP relay global function, use the commands:

```
awplus# configure terminal
awplus(config)# service dhcp-relay
```

To disable the DHCP relay global function, use the commands:

```
awplus# configure terminal
awplus(config)# no service dhcp-relay
```

# service dhcp-server

**Overview** This command enables the DHCP server on your device. The server then listens for DHCP requests on all IP interfaces. It will not run if there are no IP interfaces configured.

The **no** variant of this command disables the DHCP server.

**Syntax** `service dhcp-server`  
`no service dhcp-server`

**Mode** Global Configuration

**Example** To enable the DHCP server, use the commands:

```
awplus# configure terminal
awplus(config)# service dhcp-server
```

**Related commands** [ip dhcp pool](#)  
[show ip dhcp server summary](#)  
[subnet-mask](#)

# short-lease-threshold

**Overview** Use this command to configure a short lease threshold.

Use the **no** variant of this command to return the short lease threshold to the default of one minute.

**Syntax** `short-lease-threshold <hours> <minutes>`  
`no short-lease-threshold`

| Parameter                    | Description                          |
|------------------------------|--------------------------------------|
| <code>&lt;hours&gt;</code>   | The number of hours, from 0 to 24.   |
| <code>&lt;minutes&gt;</code> | The number of minutes, from 0 to 60. |

**Default** 1 minute.

**Mode** DHCP Configuration

**Usage notes** DHCP leases need to be backed up in NVS so that when the DHCP server reboots or goes through a power cycle it won't lose all the knowledge of these leases.

Some networks have a high number of mobile devices repeatedly requesting DHCP leases every few seconds before their existing lease expires. This can happen for example, when mobile devices move in and out of a Wi-Fi zone or when Wi-Fi signal strength changes. This means the same IP address can have multiple lease entries which can take up unnecessary backup file space.

The **short-lease-threshold** command allows you to configure the threshold for a short lease, from 1 minute to 24 hours. Any lease less than the threshold is deemed to be a short lease and will NOT be backed up to NVS.

This is useful if you have:

- limited backup file space, and
- you don't need to restore leases after a device reboot or power cycle

**Example** To set the short lease threshold for address pool P2 to 40 minutes, use the following commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# short-lease-threshold 0 40
```

To set the short lease threshold for address pool Nerv\_Office to 5 hours and 35 minutes, use the following commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool Nerv_Office
awplus(dhcp-config)# short-lease-threshold 5 35
```

To return the short lease threshold to the default of one minute, use the following commands:

```
awplus# configure terminal
awplus(config)# no short-lease-threshold
```

Version 5.4.8-2.1: command added

# show counter dhcp-client

**Overview** This command shows counters for the DHCP client on your device.  
For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show counter dhcp-client`

**Mode** User Exec and Privileged Exec

**Example** To display the message counters for the DHCP client on your device, use the command:

```
awplus# show counter dhcp-client
```

**Output** Figure 59-6: Example output from the **show counter dhcp-client** command

```
show counter dhcp-client
DHCPDISCOVER out      ..... 10
DHCPREQUEST out       ..... 34
DHCPCDECLINE out      ..... 4
DHCPRELEASE out       ..... 0
DHCPPOFFER in         ..... 22
DHCPACK in             ..... 18
DHCPNAK in            ..... 0
```

**Table 1:** Parameters in the output of the **show counter dhcp-client** command

| Parameter        | Description  |
|------------------|--|
| DHCPDISCOVER out | The number of DHCP Discover messages sent by the client.                     |
| DHCPREQUEST out  | The number of DHCP Request messages sent by the client.                      |
| DHCPCDECLINE out | The number of DHCP Decline messages sent by the client.                      |
| DHCPRELEASE out  | The number of DHCP Release messages sent by the client.                      |
| DHCPPOFFER in    | The number of DHCP Offer messages received by the client.                    |
| DHCPACK in       | The number of DHCP Acknowledgement messages received by the client.          |
| DHCPNAK in       | The number of DHCP Negative Acknowledgement messages received by the client. |

| Option Insert Failed     | The number of incoming DHCP Request messages dropped due to an error adding the DHCP Relay Agent information (option-82). This counter increments when: <ul style="list-style-type: none"> <li>the DHCP Relay Agent is set to drop packets with the DHCP Relay Agent Option 82 field already filled by another DHCP Relay Agent. This policy is set with the <code>ip dhcp-relay information policy</code> command.</li> <li>there is a packet error that stops the DHCP Relay Agent from being able to append the packet with its DHCP Relay Agent Information Option (Option 82) field.</li> </ul> |
| DHCPv6 Requests In       | The number of incoming DHCPv6 Request messages.  |
| DHCPv6 Replies In        | The number of incoming DHCPv6 Reply messages.  |
| DHCPv6 Relayed to Server | The number of DHCPv6 messages relayed to the server.   |
| DHCPv6 Relayed to Client | The number of DHCPv6 messages relayed to the client.   |

# show counter dhcp-server

**Overview** This command shows counters for the DHCP server on your device.  
For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show counter dhcp-server`

**Mode** User Exec and Privileged Exec

**Example** To display counters for the DHCP server on your device, use the command:

```
awplus# show counter dhcp-server
```

**Output** Figure 59-8: Example output from the **show counter dhcp-server** command

```
DHCP server counters
DHCPDISCOVER in      ..... 20
DHCYPREQUEST in     ..... 12
DHCPCDECLINE in     ..... 1
DHCPCRELEASE in     ..... 0
DHCPCINFORM in      ..... 0
DHCPCOFFER out      ..... 8
DHCPCACK out        ..... 4
DHCPCNAK out        ..... 0
BOOTREQUEST in      ..... 0
BOOTREPLY out       ..... 0
```

**Table 2:** Parameters in the output of the **show counter dhcp-server** command

| Parameter       | Description   |
|-----------------|---|
| DHCPDISCOVER in | The number of Discover messages received by the DHCP server.    |
| DHCYPREQUEST in | The number of Request messages received by the DHCP server.     |
| DHCPCDECLINE in | The number of Decline messages received by the DHCP server.     |
| DHCPCRELEASE in | The number of Release messages received by the DHCP server.     |
| DHCPCINFORM in  | The number of Inform messages received by the DHCP server.      |
| DHCPCOFFER out  | The number of Offer messages sent by the DHCP server.           |
| DHCPCACK out    | The number of Acknowledgement messages sent by the DHCP server. |

**Table 2:** Parameters in the output of the **show counter dhcp-server** command

| Parameter      | Description   |
|----------------|---|
| DHCPNAK out    | The number of Negative Acknowledgement messages sent by the DHCP server. The server sends these after receiving a request that it cannot fulfil because either there are no available IP addresses in the related address pool, or the request has come from a client that doesn't fit the network setting for an address pool. |
| BOOTREQUEST in | The number of bootp messages received by the DHCP server from bootp clients.  |
| BOOTREPLY out  | The number of bootp messages sent by the DHCP server to bootp clients.  |

# show dhcp lease

**Overview** This command shows details about the leases that the DHCP client has acquired from a DHCP server for interfaces on the device.

For information on filtering and saving command output, see “Controlling “show” Command Output” in the “Getting Started with AlliedWare\_Plus” Feature Overview and Configuration Guide.

**Syntax** `show dhcp lease [<interface>]`

| Parameter                      | Description                                       |
|--------------------------------|---|
| <code>&lt;interface&gt;</code> | Interface name to display DHCP lease details for. |

**Mode** User Exec and Privileged Exec

**Example** To show the current lease expiry times for all interfaces, use the command:

```
awplus# show dhcp lease
```

To show the current lease for vlan2, use the command:

```
awplus# show dhcp lease vlan2
```

**Output** Figure 59-9: Example output from the **show dhcp lease vlan1** command

```
Interface vlan1
-----
IP Address:                192.168.22.4
Expires:                   13 Mar 2022 20:10:19
Renew:                     13 Mar 2022 18:37:06
Rebind:                    13 Mar 2022 19:49:29
Server:

  domain-name               alliedtelesis.com
```

**Related commands** [ip address dhcp](#)

# show ip dhcp binding

**Overview** This command shows the lease bindings that the DHCP server has allocated clients.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip dhcp binding [<ip-address>|<address-pool>]`

| Parameter                         | Description  |
|-----------------------------------|--|
| <code>&lt;ip-address&gt;</code>   | IPv4 address of a leased IP address, in dotted decimal notation. This displays the lease information for the specified IP address. |
| <code>&lt;address-pool&gt;</code> | Name of an address pool. This displays the lease information for all clients within the address pool.                              |

**Mode** User Exec and Privileged Exec

**Examples** To display all leases for every client in all address pools, use the command:

```
awplus# show ip dhcp binding
```

To display the details for the leased IP address 172.16.2.16, use the command:

```
awplus# show ip dhcp binding 172.16.2.16
```

To display the leases from the address pool MyPool, use the command:

```
awplus# show ip dhcp binding MyPool
```

**Output** Figure 59-10: Example output from the **show ip dhcp binding** command

```
Pool 30_2_network Network 172.16.2.0/24

# show ip dhcp pool

**Overview** This command displays the configuration details and system usage of the DHCP address pools configured on the device.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip dhcp pool [<address-pool>]`

| Parameter      | Description  |
|----------------|--|
| <address-pool> | Name of a specific address pool. This displays the configuration of the specified address pool only. |

**Mode** User Exec and Privileged Exec

**Example** `awplus# show ip dhcp pool`

**Output** Figure 59-11: Example output from the **show ip dhcp pool** command

```
Pool p1 :
  network: 192.168.1.0/24
  address ranges:
    addr: 192.168.1.10 to 192.168.1.18
  static host addresses:
    addr: 192.168.1.12      MAC addr: 1111.2222.3333
  lease <days:hours:minutes:seconds> <1:0:0:0>
  subnet mask: 255.255.255.0 (pool's network mask)
  Probe:
    Status:      Enabled      [Enabled]
    Type:        ARP          [Ping]
    Packets:     2            [5]
    Timeout:    200 msec     [200]
  Dynamic addresses:
    Total:       8
    Leased:      2
    Utilization: 25.0 %
  Static host addresses:
    Total:       1
    Leased:      1
```

**Output** Figure 59-12: Example output from the **show ip dhcp pool** command with IP address 192.168.1.12 assigned to a VLAN interface on the device:

```
Pool p1 :
network: 192.168.1.0/24
address ranges:
  addr: 192.168.1.10 to 192.168.1.18
        (interface addr 192.168.1.12 excluded)
        (static host addr 192.168.1.12 excluded)
static host addresses:
  addr: 192.168.1.12      MAC addr: 1111.2222.3333
        (= interface addr, so excluded)
lease <days:hours:minutes:seconds> <1:0:0:0>
subnet mask: 255.255.255.0 (pool's network mask)
Probe:                               Default Values
  Status:      Enabled                 [Enabled]
  Type:        ARP                     [Ping]
  Packets:     2                       [5]

```

**Table 3:** Parameters in the output of the **show ip dhcp pool** command

| Parameter      | Description   |
|----------------|---|
| Pool           | Name of the pool.   |
| network        | Subnet and mask length of the pool.   |
| address ranges | Individual IP addresses and address ranges configured for the pool. The DHCP server can offer clients an IP address from within the specified ranges only.<br>Any of these addresses that match an interface address on the device, or a static host address configured in the pool, will be automatically excluded from the range, and a message to this effect will appear beneath the range entry. |

**Table 3:** Parameters in the output of the **show ip dhcp pool** command (cont.)

| Parameter                       | Description   |
|---------------------------------|---|
| static host addresses           | The static host addresses configured on the pool. Each IP address is permanently assigned to the client with the matching MAC address. Any of these addresses that match an interface address on the device will be automatically excluded, and a message to this effect will appear beneath the static host entry. |
| lease <days:hours:minutes>      | The lease duration for address allocated by this pool.  |
| domain                          | The domain name sent by the pool to clients. This is the domain name that the client should use when resolving host names using DNS.  |
| subnet mask                     | The subnet mask sent by the pool to clients.  |
| Probe - Status                  | Whether lease probing is enabled or disabled.   |
| Probe - Type                    | The lease probe type configured. Either ping or ARP.  |
| Probe - Packets                 | The number of packets sent for each lease probe in the range 0 to 10.   |
| Probe - Timeout                 | The timeout value in milliseconds to wait for a response after each probe packet is sent. In the range 50 to 5000.  |
| dns servers                     | The DNS server addresses sent to by the pool to clients.  |
| default-router(s)               | The default router addresses sent by the pool to clients.   |
| user-defined options            | The list of user-defined options sent by the pool to clients.   |
| Dynamic addresses- Total        | The total number of IP addresses that have been configured in the pool for dynamic allocation to DHCP clients.  |
| Dynamic addresses- Leased       | The number of IP addresses in the pool that have been dynamically allocated (leased) to DHCP clients.   |
| Dynamic addresses - Utilization | The percentage of IP addresses in the pool that are currently dynamically allocated to clients.   |
| Static host addresses- Total    | The number of static IP addresses configured in the pool for specific DHCP client hosts.  |
| Static host addresses - Leased  | The number of static IP addresses assigned to specific DHCP client hosts.   |

# show ip dhcp-relay

**Overview** This command shows the configuration of the DHCP Relay Agent on each interface.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip dhcp-relay [interface <interface-name>]`

| Parameter        | Description  |
|------------------|--|
| <interface-name> | Name of a specific interface. This displays the DHCP configuration for the specified interface only. |

**Mode** User Exec and Privileged Exec

**Example** To display the DHCP Relay Agent’s configuration on the interface vlan2, use the command:

```
awplus# show ip dhcp-relay interface vlan2
```

**Output** Figure 59-14: Example output from the **show ip dhcp-relay** command

```
DHCP Relay Service is enabled

vlan2 is up, line protocol is up
Maximum hop count is 10
Insertion of Relay Agent Option is disabled
Checking of Relay Agent Option is disabled
The Remote Id string for Relay Agent Option is 0000.cd28.074c
Relay information policy is to append new relay agent
information
List of servers : 192.168.1.200
```

# show ip dhcp server statistics

**Overview** This command shows statistics related to the DHCP server.

You can display the server counters using the [show counter dhcp-server](#) command as well as with this command.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** show ip dhcp server statistics

**Mode** User Exec and Privileged Exec

**Example** To display the server statistics, use the command:

```
awplus# show ip dhcp server statistics
```

**Output** Figure 59-15: Example output from the **show ip dhcp server statistics** command

```
DHCP server counters
DHCPDISCOVER in      ..... 20
DHCYPREQUEST in     ..... 12
DHCPCDECLINE in     ..... 1
DHCPCRELEASE in     ..... 0
DHCPCINFORM in      ..... 0
DHCPCOFFER out      ..... 8
DHCPCPACK out       ..... 4
DHCPCNAK out        ..... 0
BOOTREQUEST in      ..... 0
BOOTREPLY out       ..... 0
DHCPLEASEQUERY in   ..... 0
DHCPLEASEUNKNOWN out ..... 0
DHCPLEASEACTIVE out ..... 0
DHCPLEASEUNASSIGNED out ..... 0
```

| Parameter       | Description  |
|-----------------|--|
| DHCPDISCOVER in | The number of Discover messages received by the DHCP server. |
| DHCYPREQUEST in | The number of Request messages received by the DHCP server.  |
| DHCPCDECLINE in | The number of Decline messages received by the DHCP server.  |
| DHCPCRELEASE in | The number of Release messages received by the DHCP server.  |

| Parameter               | Description   |
|-------------------------|---|
| DHCPINFORM in           | The number of Inform messages received by the DHCP server.  |
| DHCPOFFER out           | The number of Offer messages sent by the DHCP server.   |
| DHCPACK out             | The number of Acknowledgement messages sent by the DHCP server.   |
| DHCPNAK out             | The number of Negative Acknowledgement messages sent by the DHCP server. The server sends these after receiving a request that it cannot fulfil because either there are no available IP addresses in the related address pool, or the request has come from a client that doesn't fit the network setting for an address pool. |
| BOOTREQUEST in          | The number of bootp messages received by the DHCP server from bootp clients.  |
| BOOTREPLY out           | The number of bootp messages sent by the DHCP server to bootp clients.  |
| DHCPLEASEQUERY in       | The number of Lease Query messages received by the DHCP server from DHCP Relay Agents.  |
| DHCPLEASEUNKNOWN out    | The number of Lease Unknown messages sent by the DHCP server to DHCP Relay Agents.  |
| DHCPLEASEACTIVE out     | The number of Lease Active messages sent by the DHCP server to DHCP Relay Agents.   |
| DHCPLEASEUNASSIGNED out | The number of Lease Unassigned messages sent by the DHCP server to DHCP Relay Agents.   |

**Related commands**

- [show counter dhcp-server](#)
- [service dhcp-server](#)
- [show ip dhcp binding](#)
- [show ip dhcp pool](#)

# show ip dhcp server summary

**Overview** This command shows the current configuration of the DHCP server. This includes:

- whether the DHCP server is enabled
- whether the DHCP server is configured to ignore BOOTP requests
- whether the DHCP server is configured to support DHCP lease queries
- the details of any user-defined options
- a list of the names of all DHCP address pools currently configured

This show command does not include any configuration details of the address pools. You can display these using the [show ip dhcp pool](#) command.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip dhcp server summary`

**Mode** User Exec and Privileged Exec

**Example** To display the current configuration of the DHCP server, use the command:

```
awplus# show ip dhcp server summary
```

**Output** Figure 59-16: Example output from the **show ip dhcp server summary** command

```
DHCP Server service is disabled
BOOTP ignore is disabled
DHCP leasequery support is disabled
Pool list: p2
```

**Related commands**

- [ip dhcp leasequery enable](#)
- [ip dhcp pool](#)
- [service dhcp-server](#)

# subnet-mask

**Overview** This command sets the subnet mask option for a DHCP address pool you are configuring. Use this command to specify the client's subnet mask as defined in RFC 950. This sets the subnet details using the pre-defined option 1. Note that if you create a user-defined option 1 using the [option](#) command, then you will override any settings created with this command. If you do not specify a subnet mask using this command, then the pool's network mask (specified using the [next-server](#) command) is applied.

The **no** variant of this command removes a subnet mask option from a DHCP pool. The pool reverts to using the pool's network mask.

**Syntax** `subnet-mask <mask>`  
`no subnet-mask`

| Parameter                 | Description   |
|---------------------------|---|
| <code>&lt;mask&gt;</code> | Valid IPv4 subnet mask, in dotted decimal notation. |

**Mode** DHCP Configuration

**Examples** To set the subnet mask option to 255.255.255.0 for DHCP pool P2, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# subnet-mask 255.255.255.0
```

To remove the subnet mask option from DHCP pool P2, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# no subnet-mask
```

**Related commands** [default-router](#)  
[dns-server](#)  
[domain-name](#)  
[show ip dhcp pool](#)

# use-subscriber-id

**Overview** Use this command to configure a DHCP server to use a subscriber identifier substitution for a client identifier on all DHCP packets for a given remote address pool.

Use the **no** variant of this command to remove the subscriber identifier substitution for a client identifier.

**Syntax** `use-subscriber-id`  
`no use-subscriber-id`

**Default** Disabled

**Mode** DHCP Configuration

**Usage notes** If the subscriber identifier for the client identifier substitution is enabled for a remote pool, then all relayed packets destined for the pool must contain the relay agent information option. This includes the subscriber identifier sub-option.

If not, then the relayed packet will be silently ignored as the situation is considered as an invalid operation.

**Example** To set the subscriber-id and client-id substitution for the DHCP pool 'Campus-1', use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool Campus-1
awplus(dhcp-config)# use-subscriber-id
```

**Output** Figure 59-17: Example output from **show ip dhcp pool Campus-1**

```
awplus#show ip dhcp pool Campus-1
Pool Campus-1 :
  subscriber-id substitution for client-id is enabled
  network: 192.168.2.0/24
  address ranges:
    addr: 192.168.2.50 to 192.168.2.100
  static host addresses:
    addr: 192.168.2.5      Client-id: office-pc-21
  lease <1:0:0:0>
  subnet mask: 255.255.255.0 (pool's network mask)
  dns servers: 192.168.2.2
  default-router(s): 192.168.2.2
  Probe:
    Status:      Enabled      [Enabled]
    Type:        Ping         [Ping]
    Packets:     5            [5]
    Timeout:     200 msec     [200]
  Dynamic addresses:
    Total:       51
    Leased:      0
    Utilization: 0.0 %
  Static host addresses:
    Total:       1
    Leased:      1
```

# 60

# DHCP for IPv6 (DHCPv6) Commands

## Introduction

**Overview** This chapter provides an alphabetical reference for commands used to configure DHCPv6. For more information, see the [DHCPv6 Feature Overview and Configuration Guide](#).

DHCPv6 is a network protocol used to configure IPv6 hosts with IPv6 addresses and IPv6 prefixes for an IPv6 network. DHCPv6 is used instead of SLAAC (Stateless Address Autoconfiguration) at sites where centralized management of IPv6 hosts is needed. IPv6 routers require automatic configuration of IPv6 addresses and IPv6 prefixes.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**NOTE:** The IPv6 addresses shown use the address space 2001:0db8::/32, defined in RFC 3849 for documentation purposes. These addresses should not be used for practical networks (other than for testing purposes) nor should they appear on any public network.

# clear counter ipv6 dhcp-client

**Overview** Use this command in Privileged Exec mode to clear DHCPv6 client counters.

**Syntax** `clear counter ipv6 dhcp-client`

**Mode** Privileged Exec

**Example** To clear DHCPv6 client counters, use the following command:

```
awplus# clear counter ipv6 dhcp-client
```

**Related commands** [show counter ipv6 dhcp-client](#)

# clear ipv6 dhcp client

**Overview** Use this command in Privileged Exec mode to restart a DHCPv6 client on an interface.

**Syntax** `clear ipv6 dhcp client <interface>`

| Parameter                      | Description   |
|--------------------------------|---|
| <code>&lt;interface&gt;</code> | Specify the interface name to restart a DHCPv6 client on. |

**Mode** Privileged Exec

**Example** To restart a DHCPv6 client on interface vlan1, use the following command:

```
awplus# clear ipv6 dhcp client vlan1
```

# ip dhcp-relay agent-option

**Overview** This command enables the DHCP Relay Agent to insert the DHCP Relay Agent Information Option (Option 82) into the client-request packets that it relays to its DHCP server. This allows the DHCP Relay Agent to pass on information to the server about the network location of the client device. The DHCP Relay Agent strips the DHCP Relay Agent Option 82 field out of the DHCP server's response, so that the DHCP client never sees this field.

When the DHCP Relay Agent appends its DHCP Relay Agent Option 82 data into the packet, it first overwrites any pad options present; then if necessary, it increases the packet length to accommodate the DHCP Relay Agent Option 82 data.

The **no** variant of this command stops the DHCP Relay Agent from appending the Option 82 field onto DHCP requests before forwarding it to the server.

For DHCP Relay Agent and DHCP Relay Agent Option 82 introductory information, see the [DHCP Feature Overview and Configuration Guide](#).

**NOTE:** *The DHCP-relay service might alter the content of the DHCP Relay Agent Option 82 field, if the commands `ip dhcp-relay agent-option` and `ip dhcp-relay information policy` have been configured.*

**Syntax**

```
ip dhcp-relay agent-option
no ip dhcp-relay agent-option
```

**Default** DHCP Relay Agent Information Option (Option 82) insertion is disabled by default.

**Mode** Interface Configuration for VLAN interfaces.

**Usage notes** Use this command to alter the DHCP Relay Agent Option 82 setting when your device is the first hop for the DHCP client. To limit the maximum length of the packet, use the [ip dhcp-relay max-message-length](#) command.

This command cannot be enabled if DHCP snooping is enabled on your device ([service dhcp-snooping](#) command), and vice versa.

**Examples** To make the DHCP Relay Agent listening on vlan2 append the DHCP Relay Agent Option 82 field, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip dhcp-relay agent-option
```

To stop the DHCP Relay Agent from appending the DHCP Relay Agent Option 82 field on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip dhcp-relay agent-option
```

**Related commands**

- ip dhcp-relay agent-option remote-id
- ip dhcp-relay information policy
- ip dhcp-relay max-message-length
- service dhcp-relay

# ip dhcp-relay agent-option subscriber-id-auto-mac

**Overview** This command causes the relay agent to insert the requesting clients' MAC address into a subscriber ID field in the relay header. A suitably-configured server can then use this subscriber ID option to assign the same IPv6 address to that requesting client every time it requires an address.

Use the no form of this command to disable this feature.

**Syntax** `ip dhcp-relay agent-option subscriber-id-auto-mac`  
`no ip dhcp-relay agent-option subscriber-id-auto-mac`

**Default** Disabled

**Usage notes** By default, DHCPv6 uses a DUID-LLT client identifier instead of a MAC address. This is generated by the operating system when DHCP first starts. If the OS is reinstalled the DUID-LLT can change, and any multiple operating systems on the machine will all have different DUIDs.

Configuring the subscriber-id-auto-mac option causes the relay agent to insert the requesting client's MAC address into a subscriber ID field in the relay header. A suitably-configured server can then use this subscriber ID to assign the same IPv6 address to that requesting client every time it connects.

The client must be in the same L2 network as the relay. If there are multiple relays between the client and the server, only the first relay will add a subscriber ID option.

**Example** To enable this feature on VLAN1, use the following commands:

```
awplus(config)#int vlan1
awplus(config-if)#ip dhcp-relay agent-option
subscriber-id-auto-mac
```

For an example of how to configure a relay agent and server, see the document "How to use DHCPv6 to assign specific IPv6 addresses to specific devices", available from [www.alliedtelesis.com](http://www.alliedtelesis.com).

# ip dhcp-relay agent-option checking

**Overview** This command enables the DHCP Relay Agent to check DHCP Relay Agent Information Option (Option 82) information in response packets returned from DHCP servers. If the information does not match the information it has for its own client (downstream) interface then the DHCP Relay Agent drops the packet. Note that [ip dhcp-relay agent-option](#) must be configured.

The DHCP Relay Agent Option 82 field is included in relayed client DHCP packets if:

- DHCP Relay Agent Option 82 is enabled ([ip dhcp-relay agent-option](#)), and
- DHCP Relay Agent is enabled on the device ([service dhcp-relay](#))

For DHCP Relay Agent and DHCP Relay Agent Option 82 introductory information, see the [DHCP Feature Overview and Configuration Guide](#).

**Syntax** `ip dhcp-relay agent-option checking`  
`no ip dhcp-relay agent-option checking`

**Mode** Interface Configuration for VLAN interfaces.

**Examples** To make the DHCP Relay Agent listening on vlan2 check the DHCP Relay Agent Information Option (Option 82) field, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip dhcp-relay agent-option
awplus(config-if)# ip dhcp-relay agent-option checking
```

To stop the DHCP Relay Agent on vlan2 from checking the DHCP Relay Agent Information Option (Option 82) field, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip dhcp-relay agent-option checking
```

**Related commands** [ip dhcp-relay agent-option](#)  
[ip dhcp-relay agent-option remote-id](#)  
[ip dhcp-relay information policy](#)  
[service dhcp-relay](#)

# ip dhcp-relay agent-option remote-id

**Overview** Use this command to specify the Remote ID sub-option of the DHCP Relay Agent Option 82 field the DHCP Relay Agent inserts into clients' request packets. The Remote ID identifies the device that is inserting the DHCP Relay Agent Option 82 information. If a Remote ID is not specified, the Remote ID sub-option is set to the device's MAC address.

Use the **no** variant of this command to return the Remote ID for an interface.

For DHCP Relay Agent and DHCP Relay Agent Option 82 introductory information, see the [DHCP Feature Overview and Configuration Guide](#).

**Syntax**

```
ip dhcp-relay agent-option remote-id <remote-id>
no ip dhcp-relay agent-option remote-id
```

| Parameter   | Description  |
|-------------|--|
| <remote-id> | An alphanumeric (ASCII) string, 1 to 63 characters in length. Additional characters allowed are hyphen (-), underscore (_) and hash (#). Spaces are not allowed. |

**Default** The Remote ID is set to the device's MAC address by default.

**Mode** Interface Configuration for VLAN interfaces.

**Usage notes** The Remote ID sub-option is included in the DHCP Relay Agent Option 82 field of relayed client DHCP packets if:

- DHCP Relay Agent Option 82 is enabled ([ip dhcp-relay agent-option](#)), and
- DHCP Relay Agent is enabled on the device ([service dhcp-relay](#))

**Examples** To set the Remote ID to myid for client DHCP packets received on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip dhcp-relay agent-option remote-id myid
```

To remove the Remote ID specified for vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip dhcp-relay agent-option remote-id
```

**Related commands**

- [ip dhcp-relay agent-option](#)
- [ip dhcp-relay agent-option checking](#)
- [show ip dhcp-relay](#)

# ip dhcp-relay information policy

**Overview** This command sets the policy for how the DHCP relay deals with packets arriving from the client that contain DHCP Relay Agent Option 82 information.

If the command **ip dhcp-relay agent-option** has not been configured, then this command has no effect at all - no alteration is made to Option 82 information in packets arriving from the client side.

However, if the command **ip dhcp-relay agent-option** has been configured, this command modifies how the DHCP relay service deals with cases where the packet arriving from the client side already contains DHCP Relay Agent Option 82 information.

This command sets the action that the DHCP relay should take when a received DHCP client request contains DHCP Relay Agent Option 82 information.

By default, the DHCP Relay Agent replaces any existing DHCP Relay Agent Option 82 field with its own DHCP Relay Agent field. This is equivalent to the functionality of the **replace** parameter.

The **no** variant of this command returns the policy to the default behavior - i.e. replacing the existing DHCP Relay Agent Option 82 field.

For DHCP Relay Agent and DHCP Relay Agent Option 82 introductory information, see the [DHCP Feature Overview and Configuration Guide](#).

**NOTE:** The DHCP-relay service might alter the content of the DHCP Relay Agent Option 82 field, if the commands [ip dhcp-relay agent-option](#) and [ip dhcp-relay information policy](#) have been configured.

**Syntax**

```
ip dhcp-relay information policy {append|drop|keep|replace}
no ip dhcp-relay information policy
```

| Parameter | Description  |
|-----------|--|
| append    | The DHCP Relay Agent appends the DHCP Relay Agent Option 82 field of the packet with its own DHCP Relay Agent Option 82 details.                               |
| drop      | The DHCP Relay Agent discards the packet.  |
| keep      | The DHCP Relay Agent forwards the packet without altering the DHCP Relay Agent Option 82 field.  |
| replace   | The DHCP Relay Agent replaces the existing DHCP Relay Agent details in the DHCP Relay Agent Option 82 field with its own details before forwarding the packet. |

**Mode** Interface Configuration for VLAN interfaces.

**Examples** To make the DHCP Relay Agent listening on vlan2 drop any client requests that already contain DHCP Relay Agent Option 82 information, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip dhcp-relay information policy drop
```

To reset the DHCP relay information policy to the default policy for interface vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip dhcp-relay information policy
```

**Related commands**

- [ip dhcp-relay agent-option](#)
- [ip dhcp-relay agent-option checking](#)
- [service dhcp-server](#)

# ip dhcp-relay maxhops

**Overview** This command sets the hop count threshold for discarding BOOTP messages. When the hops field in a BOOTP message exceeds the threshold, the DHCP Relay Agent discards the BOOTP message. The hop count threshold is set to 10 hops by default.

Use the **no** variant of this command to reset the hop count to the default.

For DHCP Relay Agent and DHCP Relay Agent Option 82 introductory information, see the [DHCP Feature Overview and Configuration Guide](#).

**Syntax** `ip dhcp-relay maxhops <1-255>`  
`no ip dhcp-relay maxhops`

| Parameter | Description                  |
|-----------|------------------------------|
| <1-255>   | The maximum hop count value. |

**Default** The default hop count threshold is 10 hops.

**Mode** Interface Configuration for VLAN interfaces.

**Example** To set the maximum number of hops to 5 for packets received on interface vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip dhcp-relay maxhops 5
```

**Related commands** [service dhcp-relay](#)

# ip dhcp-relay max-message-length

**Overview** This command applies when the device is acting as a DHCP Relay Agent and DHCP Relay Agent Option 82 insertion is enabled. It sets the maximum DHCP message length (in bytes) for the DHCP packet with its DHCP Relay Agent Option 82 data inserted. From this value it calculates the maximum packet size that it will accept at its input. Packets that arrive greater than this value will be dropped.

The **no** variant of this command sets the maximum message length to its default of 1400 bytes.

For DHCP Relay Agent and DHCP Relay Agent Option 82 introductory information, see the [DHCP Feature Overview and Configuration Guide](#).

**Syntax** `ip dhcp-relay max-message-length <548-1472>`  
`no ip dhcp-relay max-message-length`

| Parameter  | Description   |
|------------|---|
| <548-1472> | The maximum DHCP message length (this is the message header plus the inserted DHCP option fields in bytes). |

**Default** The default is 1400 bytes.

**Mode** Interface Configuration for VLAN interfaces.

**Usage notes** When a DHCP Relay Agent (that has DHCP Relay Agent Option 82 insertion enabled) receives a request packet from a DHCP client, it will append the DHCP Relay Agent Option 82 component data, and forward the packet to the DHCP server. The DHCP client will sometimes issue packets containing pad option fields that can be overwritten with Option 82 data.

Where there are insufficient pad option fields to contain all the DHCP Relay Agent Option 82 data, the DHCP Relay Agent will increase the packet size to accommodate the DHCP Relay Agent Option 82 data. If the new (increased) packet size exceeds that defined by the **maximum-message-length** parameter, then the DHCP Relay Agent will drop the packet.

**NOTE:** Before setting this command, you must first run the `ip dhcp-relay agent-option` command. This will allow the DHCP Relay Agent Option 82 fields to be appended.

**Example** To set the maximum DHCP message length to 1200 bytes for packets arriving in interface vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip dhcp-relay max-message-length 1200
```

To reset the maximum DHCP message length to the default of 1400 bytes for packets arriving in interface vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip dhcp-relay max-message-length
```

**Related commands** [service dhcp-relay](#)

# ip dhcp-relay server-address

**Overview** This command adds a DHCP server for the DHCP Relay Agent to forward client DHCP packets to on a particular interface. You can add up to five DHCP servers on each device interface that the DHCP Relay Agent is listening on.

The **no** variant of this command deletes the specified DHCP server from the list of servers available to the DHCP relay agent.

The **no ip dhcp-relay** command removes all DHCP relay settings from the interface.

For DHCP Relay Agent and DHCP Relay Agent Option 82 introductory information, see the [DHCP Feature Overview and Configuration Guide](#).

**Syntax**

```
ip dhcp-relay server-address {<ipv4-address>|<ipv6-address>
<server-interface>}

no ip dhcp-relay server-address {<ipv4-address>|<ipv6-address>
<server-interface>}

no ip dhcp-relay
```

| Parameter          | Description   |
|--------------------|---|
| <ipv4-address>     | Specify the IPv4 address of the DHCP server for the DHCP Relay Agent to forward client DHCP packets to, in dotted decimal notation. The IPv4 address uses the format A.B.C.D. |
| <ipv6-address>     | Specify the IPv6 address of the DHCPv6 server for the DHCPv6 Relay Agent to forward client DHCP packets to, in hexadecimal notation.  |
| <server-interface> | Specify the interface name of the DHCPv6 server. It is only required for a DHCPv6 server with an IPv6 address.  |

**Mode** Interface Configuration for VLAN interfaces.

**Usage notes** For a DHCP server with an IPv6 address you must specify the interface for the DHCP server. See examples below for configuration differences between IPv4 and IPv6 DHCP relay servers.

See also the [service dhcp-relay](#) command to enable the DHCP Relay Agent on your device. The [ip dhcp-relay server-address](#) command defines a relay destination on an interface on the device, needed by the DHCP Relay Agent to relay DHCP client packets to a DHCP server.

**Examples: DHCP for IPv4** To enable the DHCP Relay Agent to relay DHCP packets on interface vlan2 to the DHCP server with the IPv4 address 192.0.2.200, use the commands:

```
awplus# configure terminal
awplus(config)# service dhcp-relay
awplus(config)# interface vlan2
awplus(config-if)# ip dhcp-relay server-address 192.0.2.200
```

To remove the DHCP server with the IPv4 address 192.0.2.200 from the list of servers available to the DHCP Relay Agent on interface vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip dhcp-relay server-address 192.0.2.200
```

**Examples: DHCPv6** To enable the DHCP Relay Agent on your device to relay DHCP packets on interface vlan10 to the DHCP server with the IPv6 address 2001:0db8:010d::1 on interface vlan20, use the commands:

```
awplus# configure terminal
awplus(config)# service dhcp-relay
awplus(config)# interface vlan10
awplus(config-if)# ip dhcp-relay server-address
2001:0db8:010d::1 vlan20
```

To remove the DHCP server with the IPv6 address 2001:0db8:010d::1 on interface vlan20 from the list of servers available to the DHCP Relay Agent on interface vlan10, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# no ip dhcp-relay server-address
2001:0db8:010d::1 vlan20
```

**Example: disabling DHCP relay** To disable DHCP relay on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip dhcp-relay
```

**Related commands** [service dhcp-relay](#)

# ipv6 address dhcp

**Overview** Use this command to activate the DHCPv6 client on the interface that you are configuring. This allows the interface to use the DHCPv6 client to obtain its IPv6 configuration details from a DHCPv6 server on its connected network.

The command also enables IPv6 on the interface, which creates an EUI-64 link-local address as well as enabling RA processing and SLAAC.

Use the **no** variant of this command to stop the interface from obtaining IPv6 configuration details from a DHCPv6 server.

The DHCPv6 client supports the following IP configuration options:

- Option 1—the subnet mask for your device.
- Option 3—a list of default routers.
- Option 6— list of DNS servers.
- Option 15—a domain name used to resolve host names.
- Option 51—lease expiration time.

**Syntax** `ipv6 address dhcp [default-route-to-server]`  
`no ipv6 address dhcp`

| Parameter                            | Description   |
|--------------------------------------|---|
| <code>default-route-to-server</code> | Allow the automatic configuration of a default route to the DHCPv6 server. This option is not enabled by default when you enable the DHCP client on an interface. |

**Mode** Interface Configuration for VLAN interfaces.

**Usage notes** Use the **default-route-to-server** option to allow the automatic configuration of a default route to the DHCPv6 server. Note that this option is not enabled by default when you enable the DHCP client on an interface.

**Examples** To set the interface `vlan2` to use DHCPv6 to obtain an IPv6 address, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 address dhcp
```

To stop the interface vlan2 from using DHCPv6 to obtain its IPv6 address, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 address dhcp
```

**Related  
commands**

```
clear ipv6 dhcp client
ipv6 address
show ipv6 dhcp interface
show running-config
```

# service dhcp-relay

**Overview** This command enables the DHCP Relay Agent on the device. However, on a given IP interface, no DHCP forwarding takes place until at least one DHCP server is specified to forward/relay all clients' DHCP packets to.

The **no** variant of this command disables the DHCP Relay Agent on the device for all interfaces.

**Syntax** `service dhcp-relay`  
`no service dhcp-relay`

**Mode** Global Configuration

**Usage notes** A maximum number of 400 DHCP Relay Agents (one per interface) can be configured on the device. Once this limit has been reached, any further attempts to configure DHCP Relay Agents will not be successful.

**Default** The DHCP-relay service is enabled by default.

**Examples** To enable the DHCP relay global function, use the commands:

```
awplus# configure terminal
awplus(config)# service dhcp-relay
```

To disable the DHCP relay global function, use the commands:

```
awplus# configure terminal
awplus(config)# no service dhcp-relay
```

# show counter dhcp-relay

**Overview** This command shows counters for the DHCP Relay Agent on your device.  
For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show counter dhcp-relay`

**Mode** User Exec and Privileged Exec

**Examples** To display counters for the DHCP Relay Agent on your device, use the following command:

```
awplus# show counter dhcp-relay
```

**Output** Figure 60-1: Example output from the **show counter dhcp-relay** command

```
awplus#show counter dhcp-relay

DHCP relay counters
Requests In           ..... 4
Replies In           ..... 4
Relayed To Server    ..... 4
Relayed To Client    ..... 4
Out To Server Failed ..... 0
Out To Client Failed ..... 0
Invalid hlen         ..... 0
Bogus giaddr         ..... 0
Corrupt Agent Option ..... 0
Missing Agent Option ..... 0
Bad Circuit ID       ..... 0
Missing Circuit ID    ..... 0
Bad Remote ID        ..... 0
Missing Remote ID    ..... 0
Option Insert Failed ..... 0
DHCPv6 Requests In  ..... 0
DHCPv6 Replies In    ..... 0
DHCPv6 Relayed to Server ..... 0
DHCPv6 Relayed to Client ..... 0
```

| Parameter         | Description  |
|-------------------|--|
| Requests In       | The number of DHCP Request messages received from clients. |
| Replies In        | The number of DHCP Reply messages received from servers.   |
| Relayed To Server | The number of DHCP Request messages relayed to servers.    |
| Relayed To Client | The number of DHCP Reply messages relayed to clients.      |

| Parameter            | Description  |
|----------------------|--|
| Out To Server Failed | The number of failures when attempting to send request messages to servers. This is an internal debugging counter.   |
| Out To Client Failed | The number of failures when attempting to send reply messages to clients. This is an internal debugging counter.   |
| Invalid hlen         | The number of incoming messages dropped due to an invalid hlen field.  |
| Bogus giaddr         | The number of incoming DHCP Reply messages dropped due to the bogus giaddr field.  |
| Corrupt Agent Option | The number of incoming DHCP Reply messages dropped due to a corrupt relay agent information option field. Note that Agent Option counters only increment on errors occurring if the <code>ip dhcp-relay agent-option</code> command is configured for an interface. Messages generating the errors are only dropped if the <code>ip dhcp-relay agent-option checking</code> command is configured on the interface as well as the <code>ip dhcp-relay agent-option</code> command. |
| Missing Agent Option | The number of incoming DHCP Reply messages dropped due to a missing relay agent information option field. Note that Agent Option counters only increment on errors occurring if the <code>ip dhcp-relay agent-option</code> command is configured for an interface. Messages generating the errors are only dropped if the <code>ip dhcp-relay agent-option checking</code> command is configured on the interface as well as the <code>ip dhcp-relay agent-option</code> command. |
| Bad Circuit ID       | The number of incoming DHCP Reply messages dropped due to a bad circuit ID. Note that Agent Option counters only increment on errors occurring if the <code>ip dhcp-relay agent-option</code> command is configured for an interface. Messages generating the errors are only dropped if the <code>ip dhcp-relay agent-option checking</code> command is configured on the interface as well as the <code>ip dhcp-relay agent-option</code> command.                               |
| Missing Circuit ID   | The number of incoming DHCP Reply messages dropped due to a missing circuit ID. Note that Agent Option counters only increment on errors occurring if the <code>ip dhcp-relay agent-option</code> command is configured for an interface. Messages generating the errors are only dropped if the <code>ip dhcp-relay agent-option checking</code> command is configured on the interface as well as the <code>ip dhcp-relay agent-option</code> command.                           |

| Parameter                | Description  |
|--------------------------|--|
| Bad Remote ID            | The number of incoming DHCP Reply messages dropped due to a bad remote ID.<br>Note that Agent Option counters only increment on errors occurring if the <code>ip dhcp-relay agent-option</code> command is configured for an interface. Messages generating the errors are only dropped if the <code>ip dhcp-relay agent-option checking</code> command is configured on the interface as well as the <code>ip dhcp-relay agent-option</code> command  |
| Missing Remote ID        | The number of incoming DHCP Reply messages dropped due to a missing remote ID.<br>Note that Agent Option counters only increment on errors occurring if the <code>ip dhcp-relay agent-option</code> command is configured for an interface. Messages generating the errors are only dropped if the <code>ip dhcp-relay agent-option checking</code> command is configured on the interface as well as the <code>ip dhcp-relay agent-option</code> command  |
| Option Insert Failed     | The number of incoming DHCP Request messages dropped due to an error adding the DHCP Relay Agent information (option-82). This counter increments when: <ul style="list-style-type: none"> <li>the DHCP Relay Agent is set to drop packets with the DHCP Relay Agent Option 82 field already filled by another DHCP Relay Agent. This policy is set with the <code>ip dhcp-relay information policy</code> command.</li> <li>there is a packet error that stops the DHCP Relay Agent from being able to append the packet with its DHCP Relay Agent Information Option (Option 82) field.</li> </ul> |
| DHCPv6 Requests In       | The number of incoming DHCPv6 Request messages.  |
| DHCPv6 Replies In        | The number of incoming DHCPv6 Reply messages.  |
| DHCPv6 Relayed to Server | The number of DHCPv6 messages relayed to the server.   |
| DHCPv6 Relayed to Client | The number of DHCPv6 messages relayed to the client.   |

# show counter ipv6 dhcp-client

**Overview** Use this command in User Exec or Privilege Exec mode to show DHCPv6 client counter information.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show counter ipv6 dhcp-client`

**Mode** User Exec and Privileged Exec

**Example** To display the DHCPv6 client counter information, use the command:

```
awplus# show counter ipv6 dhcp-client
```

**Output** Figure 60-2: Example output from the **show counter ipv6 dhcp-client** command

```
awplus#show counter ipv6 dhcp-client
SOLICIT out          ..... 20
ADVERTISE in         ..... 12
REQUEST out          ..... 1
CONFIRM out          ..... 0
RENEW out            ..... 0
REBIND out           ..... 0
REPLY in             ..... 0
RELEASE out          ..... 0
DECLINE out          ..... 0
INFORMATION-REQUEST out ..... 0
```

**Table 1:** Parameters in the output of the **show counter ipv6 dhcp-client** command

| Parameter    | Description   |
|--------------|---|
| SOLICIT out  | Displays the count of SOLICIT messages sent by the DHCPv6 client.       |
| ADVERTISE in | Displays the count of ADVERTISE messages received by the DHCPv6 client. |
| REQUEST out  | Displays the count of REQUEST messages sent by the DHCPv6 client.       |
| CONFIRM out  | Displays the count of CONFIRM messages sent by the DHCPv6 client.       |
| RENEW out    | Displays the count of RENEW messages sent by the DHCPv6 client.         |

**Table 1:** Parameters in the output of the **show counter ipv6 dhcp-client** command (cont.)

| Parameter               | Description   |
|-------------------------|---|
| REBIND out              | Displays the count of REBIND messages sent by the DHCPv6 client.              |
| REPLY in                | Displays the count of REPLY messages received by the DHCPv6 client.           |
| RELEASE out             | Displays the count of RELEASE messages sent by the DHCPv6 client.             |
| DECLINE out             | Displays the count of DECLINE messages sent by the DHCPv6 client.             |
| INFORMATION-REQUEST out | Displays the count of INFORMATION-REQUEST messages sent by the DHCPv6 client. |

# show ip dhcp-relay

**Overview** This command shows the configuration of the DHCP Relay Agent on each interface.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip dhcp-relay [interface <interface-name>]`

| Parameter        | Description  |
|------------------|--|
| <interface-name> | Name of a specific interface. This displays the DHCP configuration for the specified interface only. |

**Mode** User Exec and Privileged Exec

**Example** To display the DHCP Relay Agent’s configuration on the interface vlan2, use the command:

```
awplus# show ip dhcp-relay interface vlan2
```

**Output** Figure 60-3: Example output from the **show ip dhcp-relay** command

```
DHCP Relay Service is enabled

vlan2 is up, line protocol is up
Maximum hop count is 10
Insertion of Relay Agent Option is disabled
Checking of Relay Agent Option is disabled
The Remote Id string for Relay Agent Option is 0000.cd28.074c
Relay information policy is to append new relay agent
information
List of servers : 192.168.1.200
```

# show ipv6 dhcp

**Overview** Use this command in User Exec or Privileged Exec mode to show the DHCPv6 unique identifier (DUID) configured on your device.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ipv6 dhcp`

**Mode** User Exec and Privileged Exec

**Usage notes** The DUID is based on the link-layer address for both DHCPv6 client and DHCPv6 server identifiers. The device uses the MAC address from the lowest interface number for the DUID.

The DUID is used by a DHCPv6 client to obtain an IPv6 address from a DHCPv6 server. A DHCPv6 server compares the DUID with its database of DUIDs and sends configuration data for an IPv6 address plus the preferred and valid lease time values to a DHCPv6 client.

**Example** To display the DUID configured on your device, use the command:

```
awplus# show ipv6 dhcp
```

**Output** Figure 60-4: Example output from the **show ipv6 dhcp** command

```
awplus#show ipv6 dhcp
DHCPv6 Server DUID: 0001000117ab6876001577f7ba23
```

**Related commands** [ipv6 address dhcp](#)

# show ipv6 dhcp interface

**Overview** Use this command in User Exec or Privileged Exec mode to display DHCPv6 information for a specified interface, or all interfaces when entered without the interface parameter.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ipv6 dhcp interface [<interface-name>]`

| Parameter        | Description  |
|------------------|--|
| <interface-name> | Optional. Specify the name of the interface to show DHCPv6 information about. Omit this optional parameter to display DHCPv6 information for all interfaces DHCPv6 is configured on. |

**Mode** User Exec and Privileged Exec

**Example** To display DHCPv6 information for all interfaces DHCPv6 is configured on, use the command:

```
awplus# show ipv6 dhcp interface
```

**Output** Figure 60-5: Example output from the **show ipv6 dhcp interface** command

```
awplus# show ipv6 dhcp interface
vlan1 is in client mode
Address 1001::3c0:1
    preferred lifetime 9000, valid lifetime 5000
    starts at 20 Jan 2021 09:21:35

**Table 2:** Parameters in the output of the **show counter dhcp-client** command

| Parameter                     | Description   |
|-------------------------------|---|
| <interface> is in client mode | Displays that the specified interface is in client mode.    |
| Address                       | Displays the address of the DHCPv6 server on the interface. |
| Preference                    | Displays the preference value for the DHCPv6 server.        |

# 61

# NTP Commands

## Introduction

**Overview** This chapter provides an alphabetical reference for commands used to configure the Network Time Protocol (NTP). For more information, see the [NTP Feature Overview and Configuration Guide](#).

The device can act as an NTP client to receive time from one or more NTP servers, and as an NTP server.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare\\_Plus” Feature Overview and Configuration Guide](#).

- Command List**
- [“ntp authentication-key”](#) on page 3168
  - [“ntp broadcastdelay”](#) on page 3170
  - [“ntp master”](#) on page 3171
  - [“ntp peer”](#) on page 3172
  - [“ntp rate-limit”](#) on page 3174
  - [“ntp restrict”](#) on page 3175
  - [“ntp server”](#) on page 3177
  - [“ntp source”](#) on page 3179
  - [“show ntp associations”](#) on page 3181
  - [“show ntp counters”](#) on page 3183
  - [“show ntp counters associations”](#) on page 3184
  - [“show ntp status”](#) on page 3185

# ntp authentication-key

**Overview** This command defines each of the authentication keys. Each key has a key number, a type (MD5 or SHA1), and a value.

The **no** variant of this disables the authentication key.

**Syntax** `ntp authentication-key <keynumber> md5 <key-string> [trusted]`  
`ntp authentication-key <keynumber> sha1 <key-string> [trusted]`

When in secure mode, MD5 is not available and the syntax in config files will be:

```
ntp authentication-key <keynumber> sha1-encrypted  
<encrypted-key-string> [trusted]  
no ntp authentication-key <keynumber>
```

| Parameter              | Description   |
|------------------------|---|
| <keynumber>            | <1-4294967295> An identification number for the key.  |
| md5                    | Define an MD5 key.  |
| sha1                   | Define an SHA1 key.   |
| <key-string>           | The authentication key. For SHA1, this is a 20 hexadecimal character string. For MD5, this is a string of up to 31 ASCII characters.  |
| sha1-encrypted         | This parameter indicates in running config that the key is in its encrypted form instead of in plaintext. If secure mode is enabled and you enter a SHA1 key, the running config will display this sha1-encrypted parameter instead of sha1, and will display the key in encrypted form. Do not enter a key using the sha1-encrypted parameter. Instead, enter sha1 and the unencrypted key string. |
| <encrypted-key-string> | The encrypted authentication key.   |
| trusted                | Add this key to the list of authentication keys that this server trusts.  |

**Mode** Global Configuration

**Examples** To define an MD5 authentication key number 134343 and a key value 'mystring', use the commands:

```
awplus# configure terminal  
awplus(config)# ntp authentication-key 134343 md5 mystring
```

To disable the authentication key number 134343 with the key value 'mystring', use the commands:

```
awplus# configure terminal
```

```
awplus(config)# no ntp authentication-key 134343
```

**Command  
changes**

Version 5.4.9-2.1 sha1-encrypted parameter added.

# ntp broadcastdelay

**Overview** Use this command to set the estimated round-trip delay for broadcast packets. Use the **no** variant of this command to reset the round-trip delay for broadcast packets to the default offset of 0 microseconds.

**Syntax** `ntp broadcastdelay <delay>`  
`no ntp broadcastdelay`

| Parameter                  | Description  |
|----------------------------|--|
| <code>&lt;delay&gt;</code> | <code>&lt;1-999999&gt;</code> The broadcast delay in microseconds. |

**Default** 0 microsecond offset, which can only be applied with the **no** variant of this command.

**Mode** Global Configuration

**Examples** To set the estimated round-trip delay to 23464 microseconds for broadcast packets, use these commands:

```
awplus# configure terminal
awplus(config)# ntp broadcastdelay 23464
```

To reset the estimated round-trip delay for broadcast packets to the default setting (0 microseconds), use these commands:

```
awplus# configure terminal
awplus(config)# no ntp broadcastdelay
```

# ntp master

**Overview** Use this command to make the device to be an authoritative NTP server, even if the system is not synchronized to an outside time source.

Use the **no** variant of this command to stop the device being the designated NTP server.

**Syntax** `ntp master [<stratum>]`  
`no ntp master`

| Parameter                    | Description   |
|------------------------------|---|
| <code>&lt;stratum&gt;</code> | <code>&lt;1-15&gt;</code> The stratum number defines the configured level that is set for this master within the NTP hierarchy. The default stratum number is 12. |

**Mode** Global Configuration

**Usage notes** The stratum levels define the distance from the reference clock and exist to prevent cycles in the hierarchy. Stratum 1 is used to indicate time servers, which are more accurate than Stratum 2 servers. For more information on the Network Time Protocol go to: [www.ntp.org](http://www.ntp.org)

**Examples** To stop the device from being the designated NTP server, use the commands:

```
awplus# configure terminal  
awplus(config)# no ntp master
```

To make the device the designated NTP server with stratum number 2, use the commands:

```
awplus# configure terminal  
awplus(config)# ntp master 2
```

# ntp peer

**Overview** Use this command to configure an NTP peer association. An NTP association is a peer association if this system is willing to either synchronize to the other system, or allow the other system to synchronize to it.

Use the **no** variant of this command to remove the configured NTP peer association.

**Syntax** `ntp peer {<peeraddress>|<peername>} [prefer] [key <key>]  
[version <version>]  
no ntp peer {<peeraddress>|<peername>}`

| Parameter                            | Description   |
|--------------------------------------|---|
| <code>&lt;peeraddress&gt;</code>     | Specify the IP address of the peer, entered in the form A.B.C.D for an IPv4 address, or in the form X:X::X:X for an IPv6 address. |
| <code>&lt;peername&gt;</code>        | Specify the peer hostname. The peer hostname can resolve to an IPv4 and an IPv6 address.  |
| <code>prefer</code>                  | Prefer this peer when possible.   |
| <code>key &lt;key&gt;</code>         | <1-4294967295><br>Configure the peer authentication key.  |
| <code>version &lt;version&gt;</code> | <1-4><br>Configure for this NTP version.  |

**Mode** Global Configuration

**Examples** To set an NTP peer association for this peer with an IPv4 address of 192.0.2.23, use the commands:

```
awplus# configure terminal  
awplus(config)# ntp peer 192.0.2.23
```

To remove an NTP peer association for this peer with an IPv4 address of 192.0.2.23, use the commands:

```
awplus# configure terminal  
awplus(config)# no ntp peer 192.0.2.23
```

To set an NTP peer association for this peer with an IPv6 address of 2001:0db8:010d::1, use the commands:

```
awplus# configure terminal  
awplus(config)# ntp peer 2001:0db8:010d::1
```

To remove an NTP peer association for this peer with an IPv6 address of 2001:0db8:010d::1, use the following commands:

```
awplus# configure terminal
awplus(config)# no ntp peer 2001:0db8:010d::1
```

To set the preferred peer to be IPv4 192.0.2.23 and the version to 4, with the authentication key '1234', use the commands:

```
awplus# configure terminal
awplus(config)# ntp peer 192.0.2.23 prefer version 4 key 1234
```

**Related  
commands**   [ntp server](#)  
                  [ntp source](#)

# ntp rate-limit

**Overview** Use this command to enable NTP server response rate-limiting. Limiting NTP server responses can reduce network traffic when occurrences such as misconfigured or broken NTP clients poll the NTP server too frequently. Excessive polling can lead to network overload.

Use the **no** variant of this command to remove the rate-limit configuration.

**Syntax** `ntp rate-limit {interval<1-4096>|burst <1-255>|leak <2-16>}`  
`no ntp rate-limit`

| Parameter | Description  |
|-----------|--|
| interval  | The minimum interval between responses configured in seconds. The default interval is 8 seconds.   |
| burst     | The maximum number of responses that can be sent in a burst, temporarily exceeding the limit specified by the interval option. The default burst is 8 responses.   |
| leak      | The rate at which responses are randomly allowed even if the limits specified by the interval and burst options are exceeded. The default leak is 4, i.e. on average, every fourth request has a response. |

**Mode** Global Configuration

**Default** Interval - 8 seconds.

Burst - 8 responses.

Leak - 4.

**Example** To configure an NTP rate-limiting interval of 30 seconds, use the following commands:

```
awplus# configure terminal  
awplus(config)# ntp rate-limit interval 30
```

**Related commands** [ntp restrict](#)

**Command changes** Version 5.4.8-1.1: command added

# ntp restrict

**Overview** Use this command to configure a restriction (allow or deny) on NTP packets or NTP functionality for a specific host/network or all hosts of a given IP family.

This means you can control host access to NTP service and NTP server status queries.

Use the **no** variant of this command to remove a restriction from one or more hosts.

**Syntax**

```
ntp restrict
{default-v4|default-v6|<host-address>|<host-subnet>}
{allow|deny}

ntp restrict
{default-v4|default-v6|<host-address>|<host-subnet>} query
{allow|deny}

ntp restrict
{default-v4|default-v6|<host-address>|<host-subnet>} serve
{allow|deny}

no ntp restrict
{default-v4|default-v6|<host-address>|<host-subnet>}
```

| Parameter      | Description  |
|----------------|--|
| default-v4     | Apply this restriction to all IPv4 hosts.  |
| default-v6     | Apply this restriction to all IPv6 hosts.  |
| <host-address> | Apply this restriction to the specified IPv4 or IPv6 host.<br>Enter an IPv4 address in the format A.B.C.D.<br>Enter an IPv6 address in the format X::X:X.            |
| <host-subnet>  | Apply this restriction to the specified IPv4 subnet or IPv6 prefix.<br>Enter an IPv4 subnet in the format A.B.C.D/M.<br>Enter an IPv6 prefix in the format X::X:X/X. |
| query          | Control NTP server status queries to matching hosts.   |
| serve          | Control NTP time service to matching hosts.  |
| allow          | Allow the configured restriction.  |
| deny           | Deny the configured restriction.   |

**Default** By default, time service is allowed to all hosts, and NTP server status querying is denied to all hosts.

**Mode** Global Configuration

**Example** To prevent all IPv4 hosts from accessing a device for NTP service, use the commands:

```
awplus# configure terminal
awplus(config)# ntp restrict default-v4 deny
```

To prevent the host 192.168.1.1 from accessing a device for NTP service, use the commands:

```
awplus# configure terminal
awplus(config)# ntp restrict 198.168.1.1 deny
```

To allow all hosts in the 10.10.10.0/24 subnet to access a device for NTP server status, use the commands:

```
awplus# configure terminal
awplus(config)# ntp restrict 10.10.10.0/24 query allow
```

**Related commands** [ntp rate-limit](#)

**Command changes** Version 5.4.8-1.1: command added

# ntp server

**Overview** Use this command to configure an NTP server. This means that this system will synchronize to the other system, and not vice versa. You can configure an NTP server association by hostname or IP address.

Use the **no** variant of this command to remove the configured NTP server.

**Syntax** `ntp server {<serveraddress>|<servername>} [prefer] [key <key>]  
[version <version>]`  
`no ntp server {<serveraddress>|<servername>}`

| Parameter         | Description   |
|-------------------|---|
| <serveraddress>   | Specify the IP address of the peer, entered in the form A.B.C.D for an IPv4 address, or in the form X:X::X.X for an IPv6 address. |
| <servername>      | Specify the server hostname. The server hostname can resolve to an IPv4 and an IPv6 address.                                      |
| prefer            | Prefer this server when possible.   |
| key <key>         | Configure the server authentication key from the range 1 to 4294967295.   |
| version <version> | Configure for this NTP version from the range 1 to 4.   |

**Mode** Global Configuration

**Examples** To obtain the time by synchronizing with the server at 192.0.1.23, use the commands:

```
awplus# configure terminal  
awplus(config)# ntp server 192.0.1.23
```

To obtain the time by synchronizing with the server at 192.0.1.23, and specify that this is the best server to use, use the commands:

```
awplus# configure terminal  
awplus(config)# ntp server 192.0.1.23 prefer
```

To obtain the time by synchronizing with the server at 2001:0db8:010e::2, use the commands:

```
awplus# configure terminal  
awplus(config)# ntp server 2001:0db8:010e::2
```

To obtain the time by synchronizing with the server at 2001:0db8:010e::2, and specify that this is the best server to use, use the commands:

```
awplus# configure terminal  
awplus(config)# ntp server 2001:0db8:010e::2 prefer
```

To stop using the time server at 2001:0db8:010e::2, use the commands:

```
awplus# configure terminal
```

```
awplus(config)# no ntp server 2001:0db8:010e::2
```

**Related  
commands** [ntp peer](#)  
[ntp source](#)

# ntp source

**Overview** Use this command to configure an IPv4 or an IPv6 address for the NTP source interface. This command defines the socket used for NTP messages, and only applies to NTP client behavior.

Note that you cannot use this command when using AMF (Allied Telesis Management Framework).

Use the **no** variant of this command to remove the configured IPv4 or IPv6 address from the NTP source interface.

**Syntax** `ntp source <source-address>`  
`no ntp source`

| Parameter                           | Description   |
|-------------------------------------|---|
| <code>&lt;source-address&gt;</code> | Specify the IP address of the NTP source interface, entered in the form A.B.C.D for an IPv4 address, or in the form X:X::X.X for an IPv6 address. |

**Default** An IP address is selected based on the most appropriate egress interface used to reach the NTP peer if a configured NTP client source IP address is unavailable or invalid.

**Mode** Global Configuration

**Usage notes** Adding an IPv4 or an IPv6 address allows you to select which source interface NTP uses for peering. The IPv4 or IPv6 address configured using this command is matched to the interface.

When selecting a source IP address to use for NTP messages to the peer, if the configured NTP client source IP address is unavailable then default behavior will apply, and an alternative source IP address is automatically selected. This IP address is based on the most appropriate egress interface used to reach the NTP peer. The configured NTP client source IP may be unavailable if the interface is down, or an invalid IP address is configured that does not reside on the device.

Note that this command only applies to NTP client behavior. The egress interface that the NTP messages use to reach the NTP server is determined by the `ntp peer` and `ntp server` commands.

**Examples** To configure the NTP source interface with the IPv4 address 192.0.2.23, enter the commands:

```
awplus# configure terminal
awplus(config)# ntp source 192.0.2.23
```

To configure the NTP source interface with the IPv6 address 2001:0db8:010e::2, enter the commands:

```
awplus# configure terminal
awplus(config)# ntp source 2001:0db8:010e::2
```

To remove a configured address for the NTP source interface, use the following commands:

```
awplus# configure terminal
awplus(config)# no ntp source
```

**Related commands**

- [ntp peer](#)
- [ntp server](#)

# show ntp associations

**Overview** Use this command to display the status of NTP associations.

**Syntax** show ntp associations

**Mode** User Exec and Privileged Exec

**Example** See the sample output of the **show ntp associations** command displaying the status of NTP associations.

Table 61-1: Example output from **show ntp associations**

```
awplus#show ntp associations
remote          refid          st t when poll reach  delay  offset disp
-----
*server1.example.com
                192.0.2.2      4 u  47  64  377  0.177  0.021  0.001
+192.168.1.10   10.32.16.80   5 u  46  64  377  0.241 -0.045  0.000
* system peer, # backup, + candidate, - outlier, x false ticker
```

Table 61-2: Parameters in the output from **show ntp associations**

| Parameter      | Description  |
|----------------|--|
| * system peer  | The peer that NTP uses to calculate variables like the offset and root dispersion of this AlliedWare Plus device. NTP passes these variables to the clients using this AlliedWare Plus device.   |
| # backup       | Peers that are usable, but are not among the first six peers sorted by synchronization distance. These peers may not be used.  |
| + candidate    | Peers that the NTP algorithm has determined can be used, along with the system peer, to discipline the clock (i.e. to set the time on the AlliedWare Plus device).   |
| - outlier      | Peers that are not used because their time is significantly different from the other peers.  |
| x false ticker | Peers that are not used because they are not consider trustworthy.   |
| space          | Peers that are not used because they are, for example, unreachable.  |
| remote         | The peer IP address  |
| refid          | The IP address of the reference clock, or an abbreviation indicating the type of clock (e.g. GPS indicates that the server uses GPS for the reference clock). INIT indicates that the reference clock is initializing, so it is not operational. |

Table 61-2: Parameters in the output from **show ntp associations** (cont.)

| Parameter | Description  |
|-----------|--|
| st        | The stratum, which is the number of hops between the server and the accurate time source such as an atomic clock.  |
| t         | Type, one of:<br>u: unicast or manycast client<br>b: broadcast or multicast client<br>l: local reference clock<br>s: symmetric peer<br>A: manycast server<br>B: broadcast server<br>M: multicast server  |
| when      | When last polled (seconds ago, h hours ago, or d days ago).  |
| poll      | Time between NTP requests from the device to the server.   |
| reach     | An indication of whether or not the NTP server is responding to requests. 0 indicates there has never been a successful poll; 1 indicates that the last poll was successful; 3 indicates that the last two polls were successful; 377 indicates that the last 8 polls were successful. |
| delay     | The round trip communication delay to the remote peer or server, in milliseconds.  |
| offset    | The mean offset (phase) in the times reported between this local host and the remote peer or server (root mean square, milliseconds).  |
| disp      | The amount of clock error (in milliseconds) of the server due to clock resolution, network congestion, etc.  |

# show ntp counters

**Overview** This command displays packet counters for NTP.

**Syntax** show ntp counters

**Mode** Privileged Exec

**Example** To display counters for NTP use the command:

```
awplus# show ntp counters
```

Figure 61-1: Example output from **show ntp counters**

```
awplus#show ntp counters
Server Received          4
Server Dropped          0
Client Sent             90
Client Received         76
Client Valid Received   76
```

Table 61-3: Parameters in the output from **show ntp counters**

| Parameter             | Description  |
|-----------------------|--|
| Server Received       | Number of NTP packets received from NTP clients.             |
| Server Dropped        | Number of NTP packets received from NTP clients but dropped. |
| Client Sent           | Number of NTP packets sent to servers.                       |
| Client Received       | Number of NTP packets received from servers                  |
| Client Valid Received | Number of valid NTP packets received from servers.           |

# show ntp counters associations

**Overview** Use this command to display NTP packet counters for individual servers and peers.

**Syntax** show ntp counters associations

**Mode** Privileged Exec

**Examples** To display packet counters for each NTP server and peer that is associated with a device, use the command:

```
awplus# show ntp counters associations
```

**Output** Figure 61-2: Example output from **show ntp counters associations**

```
awplus#show ntp counters associations
Peer 2001::1
  sent:          -
  received:      -
Peer 10.37.219.100
  sent:          7
  received:      7
```

Table 61-4: Parameters in the output from **show ntp counters associations**

| Parameter | Description  |
|-----------|--|
| Peer      | An NTP peer or server that the device is associated with.          |
| sent      | The number of NTP packets that this device sent to the peer.       |
| received  | The number of NTP packets that this device received from the peer. |

**Related commands** [ntp restrict](#)

# show ntp status

**Overview** Use this command to display the status of the Network Time Protocol (NTP).

**Syntax** show ntp status

**Mode** User Exec and Privileged Exec

**Example** To see information about NTP status, use the command:

```
awplus# show ntp status
```

For information about the output displayed by this command, see [ntp.org](http://ntp.org).

Figure 61-3: Example output from **show ntp status**

```
awplus#show ntp status
Reference ID   : COA8010A (192.168.1.10)
Stratum       : 4

# Precision Time Protocol (PTP) and Transparent Clock Commands

## Introduction

**Overview** This chapter provides an alphabetical reference of commands used to configure Precision Time Protocol (PTP) and Transparent Clock.

For more information, see the [Precision Time Protocol \(PTP\) and Transparent Clock Feature Overview and Configuration Guide](#).

- Command List**
- [“clock-port”](#) on page 3187
  - [“ptp-clk”](#) on page 3188
  - [“ptp global”](#) on page 3190
  - [“show ptp data transparent”](#) on page 3191
  - [“show ptp port”](#) on page 3192

# clock-port

**Overview** Use this command to associate the port with the clock and enable the required PTP functionality for IEEE 1588v2 standard packets entering and leaving this port. For the transparent clock, this specifically means modification of the Correction Factor to reflect the residence time in the bridge.

Use the **no** variant of this command to remove the port from the clock and disable modification of the Correction Factor.

**Syntax** `clock-port`  
`no clock-port`

**Default** Ports are unassociated and disabled with the clock by default.

**Mode** Interface Configuration

**Example** To configure the clock-port on port1.0.1, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# clock-port
```

To remove port1.0.1 from the clock and disable modification of the Correction Factor, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# no clock-port
```

**Related commands** [ptp global](#)  
[ptp-clk](#)  
[show ptp data transparent](#)  
[show ptp port](#)

**Command changes** Version 5.5.3-1.1: added to x530L, x950, SBx908 GEN2 Series  
Version 5.4.8-0.2: added to x230, x550 Series  
Version 5.4.7-0.1: command added

# ptp-clk

**Overview** Use this command to configure the PTP clock instance on the switch. All values must be specified.

Use the **no** variant of this command to disable the clock and disable timing support on any other ports that were set as clock-ports.

**Syntax** `ptp-clk {ordinary|boundary|transparent} transport-type {udp {v4|v6}|ethernet} delay-mechanism {e2e|p2p} step-type {onestep|twostep}`  
`no ptp-clk`

| Parameter   | Description  |
|-------------|--|
| ordinary    | An ordinary clock, able to act as Master, Backup member, or Grand Master.  |
| boundary    | A clock able to manage downstream fan-out for an upstream Master.  |
| transparent | A device that acts as a bridge between a Master and a Backup member and participates in the timing protocol by adding the bridge residence time to the correction factor in the packets.   |
| udp v4      | Timing protocol forwarded in IPv4 UDP packets.   |
| udp v6      | Timing protocol forwarded in IPv6 UDP packets.   |
| ethernet    | Timing protocol forwarded in Ethernet frames.  |
| e2e         | Specifies that the clock supports end to end messaging sequences between the Master and the Backup member and that the Correction Factor is updated based on the Bridge residence time. A Delay_Request sequence is required to determine the link delay.  |
| p2p         | Specifies that the clock supports end to end messaging sequences between the Master and the Backup member as well as peer to peer messaging sequences to determine the link delay between this device and its peers.<br>The Correction Factor is updated based on the Bridge residence time plus the peer to peer link delay - so there is no need for a delay_request message sequence. |
| onestep     | Specifies that the clock supports modification of the correction factor as the message is transiting the switch.   |
| twostep     | Specifies that the clock requires that a follow-up message be sent that is used to carry the correction factor for the previous 1588v2 message (sync, delay_request or pdelay_req).  |

**Default** This command is disabled by default.

**Mode** Global Configuration

**Usage notes** The clock is not active until the PTP timing service is enabled via the command `ptp global`. If the clock has not been configured, you cannot make a port a clock port.

**Example** To configure a PTP instance on the switch, use the following commands:

```
awplus# configure terminal
awplus(config)# ptp-clk transparent transport-type ethernet
delay-mechanism e2e step-type onestep
```

**Related commands** `ptp global`  
`show ptp data transparent`  
`show ptp port`

**Command changes** Version 5.5.3-1.1: added to x530L, x950, SBx908 GEN2 Series  
Version 5.4.8-0.2: added to x230, x550 Series  
Version 5.4.7-0.1: command added

# ptp global

**Overview** Use this command to enable 1588v2 based timing support on the device.  
Use the **no** variant of this command to disable the timing support.

**Syntax** `ptp global`  
`no ptp global`

**Default** Disabled

**Mode** Global Configuration

**Example** To enable 1588v2 timing support on the switch, use the commands:

```
awplus# configure terminal  
awplus(config)# ptp global
```

To disable 1588v2 timing support on the switch, use the commands:

```
awplus# configure terminal  
awplus(config)# no ptp global
```

**Related commands** [clock-port](#)  
[ptp-clk](#)  
[show ptp data transparent](#)  
[show ptp port](#)

**Command changes** Version 5.5.3-1.1: added to x530L, x950, SBx908 GEN2 Series  
Version 5.4.8-0.2: added to x230, x550 Series  
Version 5.4.7-0.1: command added

# show ptp data transparent

**Overview** Use this command to display configuration information for the PTP transparent clock.

**Syntax** `show ptp data transparent`

**Mode** Privileged Exec

**Example** To display configuration for PTP transparent clock, use the following command:

```
awplus# show ptp data transparent
```

**Output** Figure 62-1: Example output from **show ptp data transparent**

```
IE300-1#show ptp data transparent

Version 5.4.7-0.1: command added

# show ptp port

**Overview** Use this command to display the configuration and status information of the individual ports that have been associated with the clock.

**Syntax** show ptp port

**Mode** Privileged Exec

**Example** To display configuration and status information of the individual ports associated with the clock, use the command:

```
awplus# show ptp port
```

**Output** Figure 62-2: Example output from **show ptp port**

```
IE300-1#show ptp port

# SNMP Commands

## Introduction

**Overview** This chapter provides an alphabetical reference for commands used to configure SNMP. For more information, see:

- the [Support for Allied Telesis Enterprise\\_MIBs in AlliedWare Plus](#), for information about which MIB objects are supported.
- the [SNMP Feature Overview and Configuration\\_Guide](#).

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

# alias (interface)

**Overview** Use this command to set an alias name for a port, as returned by the SNMP ifMIB in OID 1.3.6.1.2.1.31.1.1.1.18.

Use the **no** variant of this command to remove an alias name from a port.

**Syntax** `alias <ifAlias>`  
`no alias`

| Parameter                    | Description  |
|------------------------------|--|
| <code>&lt;ifAlias&gt;</code> | 64 character name for an interface in a network management system. All printable characters are valid. |

**Default** Not set.

**Mode** Interface Configuration

**Usage notes** The interface alias can also be set via SNMP.

Third-party management systems often use standard MIBs to access device information. Network managers can specify an alias interface name to provide a non-volatile way to access the interface.

**Example** To configure the alias interface name 'uplink\_a' for port1.0.1, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# alias uplink_a
```

To remove an alias interface name from port1.0.1, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# no alias
```

**Command changes** Version 5.4.8-2.1: command added

# clear mac address-table notification mac-change

**Overview** Use this command to clear the MAC address table change history and counters. This command clears the change history and resets the counters to zero.

**Syntax** `clear mac address-table notification mac-change`

**Mode** User Exec

**Example** To clear the MAC address table change history and counters, use the command:

```
awplus# clear mac address-table notification mac-change
```

**Related commands** [mac address-table notification mac-change interval](#)  
[mac address-table notification mac-change history-size](#)  
[show mac address-table notification mac-change](#)  
[snmp trap mac-change](#)

**Command changes** Version 5.5.1-2.1: command added

# debug snmp

**Overview** This command enables SNMP debugging.

The **no** variant of this command disables SNMP debugging.

**Syntax**

```
debug snmp  
[all|detail|error-string|process|receive|send|xdump]  
  
no debug snmp  
[all|detail|error-string|process|receive|send|xdump]
```

| Parameter    | Description   |
|--------------|---|
| all          | Enable or disable the display of all SNMP debugging information.                          |
| detail       | Enable or disable the display of detailed SNMP debugging information.                     |
| error-string | Enable or disable the display of debugging information for SNMP error strings.            |
| process      | Enable or disable the display of debugging information for processed SNMP packets.        |
| receive      | Enable or disable the display of debugging information for received SNMP packets.         |
| send         | Enable or disable the display of debugging information for sent SNMP packets.             |
| xdump        | Enable or disable the display of hexadecimal dump debugging information for SNMP packets. |

**Mode** Privileged Exec and Global Configuration

**Example** To start SNMP debugging, use the command:

```
awplus# debug snmp
```

To start SNMP debugging, showing detailed SNMP debugging information, use the command:

```
awplus# debug snmp detail
```

To start SNMP debugging, showing all SNMP debugging information, use the command:

```
awplus# debug snmp all
```

**Related commands**

- [show debugging snmp](#)
- [terminal monitor](#)
- [undebug snmp](#)

# mac address-table notification mac-change

**Overview** Use this command to enable the mac-change history table. You also need to use the command `snmp trap mac-change` to set up the trap and `snmp-server enable trap` to enable the trap for transmission.

Use the **no** variant of this command to disable the mac-change history table.

**Syntax** `mac address-table notification mac-change`  
`no mac address-table notification mac-change`

**Default** Disabled

**Mode** Global Configuration

**Usage notes** To set up the mac-change trap use the command:

- `snmp trap mac-change`

To enable transmission of the mac-change trap, specify the parameter **mac-change**, use the command:

- `snmp-server enable trap`

**Example** To enable the mac-change history table, use the commands:

```
awplus# configure terminal
awplus(config)# mac address-table notification mac-change
```

**Related commands** `clear mac address-table notification mac-change`  
`mac address-table notification mac-change history-size`  
`mac address-table notification mac-change interval`  
`mac address-table notification mac-threshold`  
`show mac address-table notification mac-change`  
`snmp-server enable trap`  
`snmp trap mac-change`

**Command changes** Version 5.5.1-2.1: command added

# mac address-table notification mac-change history-size

**Overview** Use this command to set the MAC address table history size to an upper limit on the number of entries that the SNMP table may contain.

Use the **no** variant of this command to set the history size back to the default (1).

**Syntax** `mac address-table notification mac-change history-size <0-500>`  
`no mac address-table notification mac-change history-size`

| Parameter                  | Description   |
|----------------------------|---|
| <code>&lt;0-500&gt;</code> | Set the upper limit on the number of entries that the SNMP MAC address table may contain. |

**Default** Table size is set at 1 entry.

**Mode** Global Configuration

**Usage notes** If the mac-change history table is not enabled, then the history size is stored for when it is enabled.

To enable the mac-change history table, use the command:

- `mac address-table notification mac-change`

**Example** To configure the size of the MAC change history table to 40, use the commands:

```
awplus# configure terminal
awplus(config)# mac address-table notification mac-change
history-size 40
```

**Related commands**

- `clear mac address-table notification mac-change`
- `mac address-table notification mac-change`
- `mac address-table notification mac-change interval`
- `mac address-table notification mac-threshold`
- `show mac address-table notification mac-change`
- `snmp trap mac-change`

**Command changes** Version 5.5.1-2.1: command added

# mac address-table notification mac-change interval

**Overview** Use this command to set the maximum time that a MAC change SNMP notification is delayed in the MAC address table.

Use the **no** variant of this command to set the interval back to the default (1).

**Syntax** `mac address-table notification mac-change interval  
<0-2147483647>`  
`no mac address-table notification mac-change interval`

| Parameter                         | Description                  |
|-----------------------------------|------------------------------|
| <code>&lt;0-2147483647&gt;</code> | Set the interval in seconds. |

**Default** Interval is set at 1 second.

**Mode** Global Configuration

**Usage notes** If the mac-change history table is not enabled, then the interval is stored for when it is enabled.

To enable the mac-change history table, use the command:

- [mac address-table notification mac-change](#)

**Example** To configure an interval of 5 seconds for the time between two MAC change SNMP notifications being sent, use the commands:

```
awplus# configure terminal
awplus(config)# mac address-table notification mac-change
interval 5
```

**Related commands** [clear mac address-table notification mac-change](#)  
[mac address-table notification mac-change](#)  
[mac address-table notification mac-change history-size](#)  
[mac address-table notification mac-threshold](#)  
[show mac address-table notification mac-change](#)  
[snmp trap mac-change](#)

**Command changes** Version 5.5.1-2.1: command added

# mac address-table notification mac-threshold

**Overview** Use this command to change the default interval and threshold values for storing and sending Layer 2 forwarding database (FDB) utilization information. These settings are stored in the running configuration.

Use the **no** variant of this command to set the threshold configuration back to the default.

**Syntax** `mac address-table notification mac-threshold {interval <120-214783647>|limit <0-100>}`  
`no mac address-table notification mac-threshold`

| Parameter       | Description   |
|-----------------|---|
| interval        | Change the default interval value. The interval value controls the interval between utilization checks. |
| <120-214783647> | Set the interval in seconds.  |
| limit           | Change the limit value. When this limit is reached, an SNMP trap is sent.                               |
| <0-100>         | Set the limit as a percentage.  |

**Default** Interval default is 120 seconds and the limit default is 50 percent.

**Mode** Global Configuration

**Usage notes** To enable transmission of the mac-threshold trap, specify the parameter **mac-threshold**, use the command:

- [snmp-server enable trap](#)

**Example** To configure the MAC threshold notifications to be sent if the L2 FDB table utilization is more than or equal to 70%, use the commands:

```
awplus# configure terminal
awplus(config)# mac address-table notification mac-threshold
limit 70
```

To set the MAC threshold notifications interval and limit back to default values, use the commands:

```
awplus# configure terminal
awplus(config)# no mac address-table notification mac-threshold
```

**Related commands** [show running-config](#)  
[snmp-server enable trap](#)

**Command changes** Version 5.5.1-2.1: command added

# show counter snmp-server

**Overview** This command displays counters for SNMP messages received by the SNMP agent.

**Syntax** show counter snmp-server

**Mode** User Exec and Privileged Exec

**Example** To display the counters for the SNMP agent, use the command:

```
awplus# show counter snmp-server
```

**Output** Figure 63-1: Example output from the **show counter snmp-server** command

```

**Table 1:** Parameters in the output of the **show counter snmp-server** command

| Parameter           | Meaning   |
|---------------------|---|
| inPkts              | The total number of SNMP messages received by the SNMP agent.   |
| inBadVersions       | The number of messages received by the SNMP agent for an unsupported SNMP version. It drops these messages. The SNMP agent on your device supports versions 1, 2C, and 3.   |
| inBadCommunityNames | The number of messages received by the SNMP agent with an unrecognized SNMP community name. It drops these messages.  |
| inBadCommunityUses  | The number of messages received by the SNMP agent where the requested SNMP operation is not permitted from SNMP managers using the SNMP community named in the message.   |
| inASNParseErrs      | The number of ASN.1 or BER errors that the SNMP agent has encountered when decoding received SNMP Messages.   |
| inTooBig            | The number of SNMP PDUs received by the SNMP agent where the value of the error-status field is 'tooBig'. This is sent by an SNMP manager to indicate that an exception occurred when processing a request from the agent.  |
| inNoSuchNames       | The number of SNMP PDUs received by the SNMP agent where the value of the error-status field is 'noSuchName'. This is sent by an SNMP manager to indicate that an exception occurred when processing a request from the agent.  |
| inBadValues         | The number of SNMP PDUs received by the SNMP agent where the value of the error-status field is 'badValue'. This is sent by an SNMP manager to indicate that an exception occurred when processing a request from the agent.  |
| inReadOnly          | The number of valid SNMP PDUs received by the SNMP agent where the value of the error-status field is 'readOnly'. The SNMP manager should not generate a PDU which contains the value 'readOnly' in the error-status field. This indicates that there is an incorrect implementation of the SNMP. |
| inGenErrs           | The number of SNMP PDUs received by the SNMP agent where the value of the error-status field is 'genErr'.   |

**Table 1:** Parameters in the output of the **show counter snmp-server** command

| Parameter      | Meaning  |
|----------------|--|
| inTotalReqVars | The number of MIB objects that the SNMP agent has successfully retrieved after receiving valid SNMP Get-Request and Get-Next PDUs.   |
| inTotalSetVars | The number of MIB objects that the SNMP agent has successfully altered after receiving valid SNMP Set-Request PDUs.  |
| inGetRequests  | The number of SNMP Get-Request PDUs that the SNMP agent has accepted and processed.  |
| inGetNexts     | The number of SNMP Get-Next PDUs that the SNMP agent has accepted and processed.   |
| inSetRequests  | The number of SNMP Set-Request PDUs that the SNMP agent has accepted and processed.  |
| inGetResponses | The number of SNMP Get-Response PDUs that the SNMP agent has accepted and processed.   |
| inTraps        | The number of SNMP Trap PDUs that the SNMP agent has accepted and processed.   |
| outPkts        | The number of SNMP Messages that the SNMP agent has sent.  |
| outTooBig      | The number of SNMP PDUs that the SNMP agent has generated with the value 'tooBig' in the error-status field. This is sent to the SNMP manager to indicate that an exception occurred when processing a request from the manager.     |
| outNoSuchNames | The number of SNMP PDUs that the SNMP agent has generated with the value 'noSuchName' in the error-status field. This is sent to the SNMP manager to indicate that an exception occurred when processing a request from the manager. |
| outBadValues   | The number of SNMP PDUs that the SNMP agent has generated with the value 'badValue' in the error-status field. This is sent to the SNMP manager to indicate that an exception occurred when processing a request from the manager.   |
| outGenErrs     | The number of SNMP PDUs that the SNMP agent has generated with the value 'genErr' in the error-status field. This is sent to the SNMP manager to indicate that an exception occurred when processing a request from the manager.     |
| outGetRequests | The number of SNMP Get-Request PDUs that the SNMP agent has generated.   |

**Table 1:** Parameters in the output of the **show counter snmp-server** command

| Parameter                 | Meaning   |
|---------------------------|---|
| outGetNexts               | The number of SNMP Get-Next PDUs that the SNMP agent has generated.   |
| outSetRequests            | The number of SNMP Set-Request PDUs that the SNMP agent has generated.  |
| outGetResponses           | The number of SNMP Get-Response PDUs that the SNMP agent has generated.   |
| outTraps                  | The number of SNMP Trap PDUs that the SNMP agent has generated.   |
| UnsupportedSecurityLevels | The number of received packets that the SNMP agent has dropped because they requested a securityLevel unknown or not available to the SNMP agent. |
| NotInTimeWindows          | The number of received packets that the SNMP agent has dropped because they appeared outside of the authoritative SNMP agent's window.            |
| UnknownUserNames          | The number of received packets that the SNMP agent has dropped because they referenced an unknown user.   |
| UnknownEngineIDs          | The number of received packets that the SNMP agent has dropped because they referenced an unknown snmpEngineID.                                   |
| WrongDigest               | The number of received packets that the SNMP agent has dropped because they didn't contain the expected digest value.                             |
| DecryptionErrors          | The number of received packets that the SNMP agent has dropped because they could not be decrypted.   |
| UnknownSecModels          | The number of messages received that contain a security model that is not supported by the server. Valid for SNMPv3 messages only.                |
| InvalidMsgs               | The number of messages received where the security model is supported but the authentication fails. Valid for SNMPv3 messages only.               |
| UnknownPDUHandlers        | The number of times the SNMP handler has failed to process a PDU. This is a system debugging counter.   |

**Related commands** [show snmp-server](#)

# show debugging snmp

**Overview** This command displays whether SNMP debugging is enabled or disabled.

**Syntax** `show debugging snmp`

**Mode** User Exec and Privileged Exec

**Example** To display the status of SNMP debugging, use the command:

```
awplus# show debugging snmp
```

**Output** Figure 63-2: Example output from the **show debugging snmp** command

```
Sntp (SMUX) debugging status:

# show mac address-table notification mac-change

**Overview** Use this command to show the MAC change configuration. It includes the MAC change history.

**Syntax** show mac address-table notification mac-change

**Mode** User Exec

**Example** To show the MAC change configuration and history, use the command:

```
awplus# show mac address-table notification mac-change
```

**Output** Figure 63-3: Example output from **show mac address-table notification mac-change**

```
awplus#show mac address-table notification mac-change
MAC Change Feature: Enabled
MAC Change Notification Traps: Enabled
Wait time for MAC Change Notification Traps: 1 seconds
Number of MAC Address Add events: 1
Number of MAC Address Remove events: 0
Number of MAC Change Notification Traps sent: 1
Maximum Number of entries configured in History Table: 1
Number of entries currently in History Table: 1
History Table contents
-----
History Index 1, Timestamp(uptime) 0 days 00:39:25 (236500)
MAC Change message:
  Operation: Added   Vlan: 2       MAC Addr: 000d.b950.0c26
  Dot1dBasePort: 2
```

Table 63-1: Parameters in the output from **show mac address-table notification mac-change**

| Parameter                                   | Description  |
|---|--|
| MAC Change Feature                          | Displays if the feature is enabled or not. If this is disabled, then no more MAC change events will be generated, no events are added to the history, and no traps are logged.                           |
| MAC Change Notification Traps               | Displays if MAC change traps are sent when MAC change events are generated. This only affects traps, (MAC change history is not affected).   |
| Wait time for MAC Change Notification Traps | The maximum time a MAC change event waits before a MAC change trap is sent. This is also the maximum time a MAC change event waits before being added to the MAC change history. The time is in seconds. |

Table 63-1: Parameters in the output from **show mac address-table notification mac-change** (cont.)

| Parameter   | Description  |
|---|--|
| Number of MAC Address Add events                      | The number of MAC-added events processed by the feature.       |
| Number of MAC Address Remove events                   | The number of MAC-removed events processed by the feature.     |
| Number of MAC Change Notification Traps sent          | The number of MAC notification traps sent by the feature.      |
| Maximum Number of entries configured in History Table | The maximum number of entries present in the MAC change table. |

```

**Related commands** [show snmp-server](#)  
[snmp-server view](#)

# snmp trap link-status

**Overview** Use this command to enable SNMP to send link status notifications (traps) for the interfaces when an interface goes up (linkUp) or down (linkDown).

Use the **no** variant of this command to disable the sending of link status notifications.

**Syntax** `snmp trap link-status [enterprise]`  
`no snmp trap link-status`

| Parameter  | Description  |
|------------|--|
| enterprise | Send an Allied Telesis enterprise type of link trap. |

**Default** Disabled

**Mode** Interface Configuration

**Usage notes** The link status notifications can be enabled for the following interface types:

- switch port (e.g. port1.0.1)
- VLAN (e.g. vlan2)
- static and dynamic link aggregation (e.g. sa2, po2)

To specify where notifications are sent, use the [snmp-server host](#) command. To configure the device globally to send other notifications, use the [snmp-server enable trap](#) command.

**Examples** To enable SNMP to send link status notifications for port1.0.1 to port1.0.3 use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1-port1.0.3
awplus(config-if)# snmp trap link-status
```

To disable the sending of link status notifications for port1.0.1, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# no snmp trap link-status
```

**Related commands** [show interface](#)  
[snmp trap link-status suppress](#)  
[snmp-server enable trap](#)  
[snmp-server host](#)

# snmp trap link-status suppress

**Overview** Use this command to enable the suppression of link status notifications (traps) for the interfaces beyond the specified threshold, in the specified interval.

Use the **no** variant of this command to disable the suppression of link status notifications for the ports.

**Syntax** `snmp trap link-status suppress {time {<1-60>|default}|threshold {<1-20>|default}}`

`no snmp trap link-status suppress`

| Parameter | Description   |
|-----------|---|
| time      | Set the suppression timer for link status notifications.  |
| <1-60>    | The suppress time in seconds.   |
| default   | The default suppress time in seconds (60).  |
| threshold | Set the suppression threshold for link status notifications. This is the number of link status notifications after which to suppress further notifications within the suppression timer interval. |
| <1-20>    | The number of link status notifications.  |
| default   | The default number of link status notifications (20).   |

**Default** By default, if link status notifications are enabled (they are enabled by default), the suppression of link status notifications is enabled: notifications that exceed the notification threshold (default 20) within the notification timer interval (default 60 seconds) are not sent.

**Mode** Interface Configuration

**Usage notes** An unstable network can generate many link status notifications. When notification suppression is enabled, a suppression timer is started when the first link status notification of a particular type (linkUp or linkDown) is sent for an interface.

If the threshold number of notifications of this type is sent before the timer reaches the suppress time, any further notifications of this type generated for the interface during the interval are not sent. At the end of the interval, the sending of link status notifications resumes, until the threshold is reached in the next interval.

**Examples** To suppress link status notifications for port1.0.1 to port1.0.3 after 10 notifications in 40 seconds, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1-port1.0.3
awplus(config-if)# snmp trap link-status suppress time 40
threshold 10
```

To stop suppressing link status notifications for port1.0.1, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# no snmp trap link-status suppress
```

**Related commands**

- [show interface](#)
- [snmp trap link-status](#)

# snmp trap mac-change

**Overview** Use this command to enable the MAC notification feature to apply mac-change notifications via the mac-change trap. This command configures the trap so that you are notified when MAC addresses are added or removed from the forwarding database (FDB). This is applied to interfaces via a specified port or a range of ports.

Use the **no** variant of this command to disable the MAC notification feature.

**Syntax** `snmp trap mac-change {[add] [remove]}`  
`no snmp trap mac-change [add] [remove]`

| Parameter | Description   |
|-----------|---|
| add       | Enable SNMP mac-change traps when a MAC address is added.   |
| remove    | Enable SNMP mac-change traps when a MAC address is removed. |

**Default** Disabled

**Mode** Interface Configuration

**Usage notes** To enable transmission of the mac-change trap, specify the parameter **mac-change**, use the command:

- [snmp-server enable trap](#)

To enable the mac-change history table, use the command:

- [mac address-table notification mac-change](#)

**Example** To get mac-change notifications whenever a MAC address associated with port1.0.1 is added or removed from the FDB table, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# snmp trap mac-change add remove
```

**Related commands** [clear mac address-table notification mac-change](#)  
[mac address-table notification mac-change](#)  
[show interface](#)  
[snmp-server enable trap](#)

**Command changes** Version 5.5.1-2.1: command added

# snmp-server

**Overview** Use this command to enable the SNMP agent (server) on the device. The SNMP agent receives and processes SNMP packets sent to the device, and generates notifications (traps) that have been enabled by the [snmp-server enable trap](#) command.

Use the **no** variant of this command to disable the SNMP agent on the device. When SNMP is disabled, SNMP packets received by the device are discarded, and no notifications are generated. This does not remove any existing SNMP configuration.

**Syntax** `snmp-server [ip|ipv6]`  
`no snmp-server [ip|ipv6]`

| Parameter | Description                                |
|-----------|--|
| ip        | Enable or disable the SNMP agent for IPv4. |
| ipv6      | Enable or disable the SNMP agent for IPv6. |

**Default** By default, the SNMP agent is enabled for both IPv4 and IPv6. If neither the **ip** parameter nor the **ipv6** parameter is specified for this command, then SNMP is enabled or disabled for both IPv4 and IPv6.

**Mode** Global Configuration

**Examples** To enable SNMP on the device for both IPv4 and IPv6, use the commands:

```
awplus# configure terminal  
awplus(config)# snmp-server
```

To enable the SNMP agent for IPv4 on the device, use the commands:

```
awplus# configure terminal  
awplus(config)# snmp-server ip
```

To disable the SNMP agent for both IPv4 and IPv6 on the device, use the commands:

```
awplus# configure terminal  
awplus(config)# no snmp-server
```

To disable the SNMP agent for IPv4, use the commands:

```
awplus(config)# no snmp-server ipv4
```

**Related commands**

# snmp-server community

**Overview** This command creates an SNMP community, optionally setting the access mode for the community. The default access mode is read-only. If view is not specified, the community allows access to all the MIB objects. The SNMP communities are only valid for SNMPv1 and v2c and provide very limited security. Communities should not be used when operating SNMPv3.

The **no** variant of this command removes an SNMP community. The specified community must already exist on the device.

**Syntax** `snmp-server community <community-name> {view <view-name>|ro|rw|<access-list>}`  
`no snmp-server community <community-name>`

| Parameter        | Description  |
|------------------|--|
| <community-name> | Community name. The community name is a case sensitive string of up to 20 characters.              |
| view             | Configure SNMP view. If view is not specified, the community allows access to all the MIB objects. |
| <view-name>      | View name. The view name is a string up to 20 characters long and is case sensitive.               |
| ro               | Read-only community.   |
| rw               | Read-write community.  |
| <access-list>    | <1-99> Access list number.   |

**Mode** Global Configuration

**Example** Use the following commands to create an SNMP community called 'public' with read-only access to all MIB variables from any management station:

```
awplus# configure terminal  
awplus(config)# snmp-server community public ro
```

Use the following commands to remove an SNMP community called 'public'

```
awplus# configure terminal  
awplus(config)# no snmp-server community public
```

**Related commands** [show snmp-server](#)  
[show snmp-server community](#)  
[snmp-server view](#)

# snmp-server contact

**Overview** This command sets the contact information for the system. The contact name is:

- displayed in the output of the [show system](#) command
- stored in the MIB object sysContact

The **no** variant of this command removes the contact information from the system.

**Syntax** `snmp-server contact <contact-info>`  
`no snmp-server contact`

| Parameter                         | Description   |
|-----------------------------------|---|
| <code>&lt;contact-info&gt;</code> | The contact information for the system, from 0 to 255 characters long. Valid characters are any printable character and spaces. |

**Mode** Global Configuration

**Example** To set the system contact information to “support@alliedtelesis.co.nz”, use the command:

```
awplus# configure terminal
awplus(config)# snmp-server contact
support@alliedtelesis.co.nz
```

**Related commands** [show system](#)  
[snmp-server location](#)  
[snmp-server group](#)

# snmp-server enable trap

**Overview** Use this command to enable the transmission of the specified notifications (traps) on your device.

Note that the Environmental Monitoring traps defined in the AT-ENVMONv2-MIB are enabled by default.

Use the **no** variant of this command to disable the transmission of the specified notifications.

**Syntax** `snmp-server enable trap <trap-list>`  
`no snmp-server enable trap <trap-list>`

Depending on your device model, you can enable some or all of the traps in the following table:

| Parameter     | Description  |
|---------------|--|
| atmf          | AMF traps.   |
| atmfguestnode | AMF guest node traps.  |
| atmflink      | AMF link traps.  |
| atmfnode      | AMF node traps.  |
| atmfrr        | AMF reboot-rolling traps.  |
| auth          | Authentication failure.  |
| bgp           | BGP traps.   |
| chassis       | Chassis traps.   |
| cwmap         | Access Point traps with the AWC wireless manager.  |
| dhcpsnooping  | DHCP snooping and ARP security traps. These notifications must also be set using the <b>ip dhcp snooping violation</b> command, and/or the arp security violation <b>arp security violation</b> command. |
| epsr          | EPSR traps.  |
| g8032         | G.8032 ERP traps.  |
| lldp          | Link Layer Discovery Protocol (LLDP) traps. These notifications must also be enabled using the <b>lldp notifications</b> command, and/or the <b>lldp med-notifications</b> command.                      |
| loopprot      | Loop Protection traps.   |
| mac-change    | MAC address changed.   |
| mac-move      | MAC address moved between interface.   |
| mac-threshold | MAC address table reaches a threshold limit.   |
| mstp          | MSTP traps.  |

| Parameter    | Description                                       |
|--------------|---|
| nsm          | NSM traps.  |
| ospf         | OSPF traps.                                       |
| pim          | PIM traps.  |
| power-inline | Power-inline traps (Power Ethernet MIB RFC 3621). |
| qsp          | QoS Storm Protection.                             |
| rmon         | RMON traps.                                       |
| thrash-limit | MAC address Thrash Limiting traps.                |
| vcs          | VCS traps.  |
| vrrp         | Virtual Router Redundancy (VRRP) traps.           |
| ufo          | Upstream Forwarding Only (UFO) traps.             |

**Default** Disabled

**Mode** Global Configuration

**Usage notes** This command cannot be used to enable link status notifications globally. To enable link status notifications for particular interfaces, use the [snmp trap link-status](#) command.

To specify where notifications are sent, use the [snmp-server host](#) command.

Note that you can enable (or disable) multiple traps with a single command, by specifying a space-separated list of traps.

**Examples** To enable the device to send a notification if an AMF node changes its status, use the following commands:

```
awplus# configure terminal
awplus(config)# snmp-server enable trap atmfnode
```

To enable the device to send PoE related traps, use the following commands:

```
awplus# configure terminal
awplus(config)# snmp-server enable trap power-inline
```

To disable PoE traps being sent out by the device, use the following commands:

```
awplus# configure terminal
awplus(config)# no snmp-server enable trap power-inline
```

To enable the device to send MAC address Thrash Limiting traps, use the following commands:

```
awplus# configure terminal
awplus(config)# snmp-server enable trap thrash-limit
```

To disable the device from sending MAC address Thrash Limiting traps, use the following commands:

```
awplus# configure terminal
awplus(config)# no snmp-server enable trap thrash-limit
```

To enable the device to send OSPF and VRRP-related traps, use the following commands:

```
awplus# configure terminal
awplus(config)# snmp-server enable trap ospf vrrp
```

To disable OSPF traps being sent out by the device, use the following commands:

```
awplus# configure terminal
awplus(config)# no snmp-server enable trap ospf
```

[trap \(g8032-switch\)](#)  
[private-vlan ufo trap](#)

**Command changes**

Version 5.4.7-2.1: **ufo** parameter added  
Version 5.5.1-1.1: **atmfguestnode** and **cwmap** parameters added  
Version 5.5.1-2.1: **mac-change**, **mac-move**, and **mac-threshold** parameters added

# snmp-server engineID local

**Overview** Use this command to configure the SNMPv3 engine ID. The SNMPv3 engine ID is used to uniquely identify the SNMPv3 agent on a device when communicating with SNMP management clients. Once an SNMPv3 engine ID is assigned, this engine ID is permanently associated with the device until you change it.

Use the **no** variant of this command to set the user defined SNMPv3 engine ID to a system generated pseudo-random value by resetting the SNMPv3 engine. The **no snmp-server engineID local** command has the same effect as the **snmp-server engineID local default** command.

Note that the [snmp-server engineID local reset](#) command is used to force the system to generate a new engine ID when the current engine ID is also system generated.

**Syntax** `snmp-server engineID local {<engine-id>|default}`  
`no snmp-server engineID local`

| Parameter                      | Description  |
|--------------------------------|--|
| <code>&lt;engine-id&gt;</code> | Specify SNMPv3 Engine ID value, a string of up to 27 characters.   |
| <code>default</code>           | Set SNMPv3 engine ID to a system generated value by resetting the SNMPv3 engine, provided the current engine ID is user defined. If the current engine ID is system generated, use the <a href="#">snmp-server engineID local reset</a> command to force the system to generate a new engine ID. |

**Mode** Global Configuration

**Usage notes** All devices must have a unique engine ID which is permanently set unless it is configured by the user.

**Example** To set the SNMPv3 engine ID to 800000cf030000cd123456, use the following commands:

```
awplus# configure terminal
awplus(config)# snmp-server engineID local
800000cf030000cd123456
```

To set a user defined SNMPv3 engine ID back to a system generated value, use the following commands:

```
awplus# configure terminal
awplus(config)# no snmp-server engineID local
```

**Output** The following example shows the engine ID values after configuration:

```
awplus(config)#snmp-server engineid local asdgdh231234d
awplus(config)#exit
awplus#show snmp-server

SNMP Server ..... Enabled
IP Protocol ..... IPv4
SNMPv3 Engine ID (configured name) ... asdgdh231234d
SNMPv3 Engine ID (actual) ..... 0x80001f888029af52e149198483

awplus(config)#no snmp-server engineid local
awplus(config)#exit
awplus#show snmp-server

SNMP Server ..... Enabled
IP Protocol ..... IPv4
SNMPv3 Engine ID (configured name) ... Not set
SNMPv3 Engine ID (actual) ..... 0x80001f888029af52e149198483
```

**Related commands**

- [show snmp-server](#)
- [snmp-server engineID local reset](#)
- [snmp-server group](#)

# snmp-server engineID local reset

**Overview** Use this command to force the device to generate a new pseudo-random SNMPv3 engine ID by resetting the SNMPv3 engine. If the current engine ID is user defined, use the [snmp-server engineID local](#) command to set SNMPv3 engine ID to a system generated value.

**Syntax** `snmp-server engineID local reset`

**Mode** Global Configuration

**Example** To force the SNMPv3 engine ID to be reset to a system generated value, use the commands:

```
awplus# configure terminal
awplus(config)# snmp-server engineID local reset
```

**Related commands** [snmp-server engineID local](#)  
[show snmp-server](#)

# snmp-server group

**Overview** This command is used with SNMP version 3 only, and adds an SNMP group, optionally setting the security level and view access modes for the group. The security and access views defined for the group represent the minimum required of its users in order to gain access.

The **no** variant of this command deletes an SNMP group, and is used with SNMPv3 only. The group with the specified authentication/encryption parameters must already exist.

**Syntax** `snmp-server group <groupname> {auth|noauth|priv} [read <readname>|write <writename>|notify <notifyname>]`  
`no snmp-server group <groupname>`

| Parameter    | Description   |
|--------------|---|
| <groupname>  | Group name. The group name is a string up to 20 characters long and is case sensitive.      |
| auth         | Authentication.   |
| noauth       | No authentication and no encryption.  |
| priv         | Authentication and encryption.  |
| read         | Configure read view.  |
| <readname>   | Read view name.   |
| write        | Configure write view.   |
| <writename>  | Write view name. The view name is a string up to 20 characters long and is case sensitive.  |
| notify       | Configure notify view.  |
| <notifyname> | Notify view name. The view name is a string up to 20 characters long and is case sensitive. |

**Mode** Global Configuration

**Examples** To add SNMP group, for ordinary users, use the following commands:

```
awplus# configure terminal
awplus(config)# snmp-server group usergroup noauth read
useraccess write useraccess
```

To delete the SNMP group called 'usergroup', use the following commands:

```
awplus# configure terminal
awplus(config)# no snmp-server group usergroup
```

**Related  
commands**

- snmp-server
- show snmp-server
- show snmp-server group
- show snmp-server user

# snmp-server host

**Overview** This command specifies an SNMP trap host destination to which Trap or Inform messages generated by the device are sent.

For SNMP version 1 and 2c you must specify the community name parameter. For SNMP version 3, specify the authentication/encryption parameters and the user name. If the version is not specified, the default is SNMP version 1. Inform messages can be sent instead of traps for SNMP version 2c and 3.

Use the **no** variant of this command to remove an SNMP trap host. The trap host must already exist.

The trap host is uniquely identified by:

- host IP address (IPv4 or IPv6),
- inform or trap messages,
- community name (SNMPv1 or SNMP v2c) or the authentication/encryption parameters and user name (SNMP v3).

**Syntax**

```
snmp-server host {<ipv4-address>|<ipv6-address>} [traps]
[version 1] <community-name>

snmp-server host {<ipv4-address>|<ipv6-address>}
[informs|traps] version 2c <community-name>

snmp-server host {<ipv4-address>|<ipv6-address>}
[informs|traps] version 3 {auth|noauth|priv} <user-name>

no snmp-server host {<ipv4-address>|<ipv6-address>} [traps]
[version 1] <community-name>

no snmp-server host {<ipv4-address>|<ipv6-address>}
[informs|traps] version 2c <community-name>

no snmp-server host {<ipv4-address>|<ipv6-address>}
[informs|traps] version 3 {auth|noauth|priv} <user-name>
```

| Parameter      | Description  |
|----------------|--|
| <ipv4-address> | IPv4 trap host address in the format A.B.C.D, for example, 192.0.2.2.          |
| <ipv6-address> | IPv6 trap host address in the format x::x::x for example, 2001:db8::8a2e:7334. |
| informs        | Send Inform messages to this host.   |
| traps          | Send Trap messages to this host (default).                                     |
| version        | SNMP version to use for notification messages. Default: version 1.             |
| 1              | Use SNMPv1(default).   |
| 2c             | Use SNMPv2c.   |
| 3              | Use SNMPv3.  |

| Parameter        | Description                           |
|------------------|---------------------------------------|
| auth             | Authentication.                       |
| noauth           | No authentication.                    |
| priv             | Encryption.                           |
| <community-name> | The SNMPv1 or SNMPv2c community name. |
| <user-name>      | SNMPv3 user name.                     |

**Mode** Global Configuration

**Examples** To configure the device to send generated traps to the IPv4 host destination 192.0.2.5 with the SNMPv2c community name 'public', use the following commands:

```
awplus# configure terminal
awplus(config)# snmp-server host 192.0.2.5 version 2c public
```

To configure the device to send generated traps to the IPv6 host destination 2001:db8::8a2e:7334 with the SNMPv2c community name 'private', use the following commands:

```
awplus# configure terminal
awplus(config)# snmp-server host 2001:db8::8a2e:7334 version 2c
private
```

To remove a configured trap host of 192.0.2.5 with the SNMPv2c community name 'public', use the following commands:

```
awplus# configure terminal
awplus(config)# no snmp-server host 192.0.2.5 version 2c public
```

**Related commands** [snmp trap link-status](#)  
[snmp-server enable trap](#)  
[snmp-server view](#)

**Command changes** Version 5.5.2-1.1: **vrf** parameter added for products that support VRF

# snmp-server legacy-ifadminstatus

**Overview** Use this command to set the ifAdminStatus to reflect the operational state of the interface, rather than the administrative state.

The **no** variant of this command sets the ifAdminStatus to reflect the administrative state of the interface.

**Syntax** `snmp-server legacy-ifadminstatus`  
`no snmp-server legacy-ifadminstatus`

**Default** Legacy ifAdminStatus is turned off by default, so by default the SNMP ifAdminStatus reflects the administrative state of the interface.

**Mode** Global Configuration

**Usage notes** Note that if you enable Legacy ifAdminStatus, the ifAdminStatus will report a link's status as Down when the link has been blocked by a process such as loop protection.

**Example** To turn on Legacy ifAdminStatus, use the commands:

```
awplus# configure terminal
awplus(config)# snmp-server legacy-ifadminstatus
```

**Related commands** [show interface](#)

# snmp-server location

**Overview** This command sets the location of the system. The location is:

- displayed in the output of the [show system](#) command
- stored in the MIB object sysLocation

The **no** variant of this command removes the configured location from the system.

**Syntax** `snmp-server location <location-name>`  
`no snmp-server location`

| Parameter                          | Description   |
|------------------------------------|---|
| <code>&lt;location-name&gt;</code> | The location of the system, from 0 to 255 characters long. Valid characters are any printable character and spaces. |

**Mode** Global Configuration

**Example** To set the location to “server room 523”, use the following commands:

```
awplus# configure terminal
awplus(config)# snmp-server location server room 523
```

**Related commands** [show snmp-server](#)  
[show system](#)  
[snmp-server contact](#)

# snmp-server source-interface

**Overview** Use this command to specify the originating interface for SNMP traps or informs. An interface specified by this command must already have an IP address assigned to it.

Use the **no** variant of this command to reset the interface to its default value (the originating egress interface).

**Syntax** `snmp-server source-interface {traps|informs} <interface-name>`  
`no snmp-server source-interface {traps|informs}`

| Parameter        | Description  |
|------------------|--|
| traps            | SNMP traps.  |
| informs          | SNMP informs.  |
| <interface-name> | Interface name (must already have an IP address assigned). |

**Default** The originating egress interface of the traps and informs messages

**Mode** Global Configuration

**Usage notes** When an SNMP server sends an SNMP trap or inform message, the message carries the notification IP address of its originating interface. Use this command to assign this interface.

**Example** The following commands set vlan2 to be the interface whose IP address is used as the originating address in SNMP informs packets.

```
awplus# configure terminal
awplus(config)# snmp-server source-interface informs vlan2
```

The following commands reset the originating source interface for SNMP trap messages to be the default interface (the originating egress interface):

```
awplus# configure terminal
awplus(config)# no snmp-server source-interface traps
```

**Validation Commands** [show running-config](#)

# snmp-server startup-trap-delay

**Overview** Use this command to set the time in seconds after following completion of the device startup sequence before the device sends any SNMP traps (or SNMP notifications).

Use the no variant of this command to restore the default startup delay of 30 seconds.

**Syntax** `snmp-server startup-trap-delay <delay-time>`  
`no snmp-server startup-trap-delay`

| Parameter                       | Description   |
|---------------------------------|---|
| <code>&lt;delay-time&gt;</code> | Specify an SNMP trap delay time in seconds in the range of 30 to 600 seconds. |

**Default** The SNMP server trap delay time is 30 seconds. The no variant restores the default.

**Mode** Global Configuration

**Example** To delay the device sending SNMP traps until 60 seconds after device startup, use the following commands:

```
awplus# configure terminal
awplus(config)# snmp-server startup-trap-delay 60
```

To restore the sending of SNMP traps to the default of 30 seconds after device startup, use the following commands:

```
awplus# configure terminal
awplus(config)# no snmp-server startup-trap-delay
```

**Validation Commands** `show snmp-server`

# snmp-server user

**Overview** Use this command to create or move users as members of specified groups. This command is used with SNMPv3 only.

The **no** variant of this command removes an SNMPv3 user. The specified user must already exist.

**Syntax** `snmp-server user <username> <groupname> [encrypted] [auth {md5|sha|sha-256} <auth-password>] [priv {des|aes} <privacy-password>]`  
`no snmp-server user <username>`

| Parameter          | Description  |
|--------------------|--|
| <username>         | User name. The user name is a string up to 20 characters long and is case sensitive.                   |
| <groupname>        | Group name. The group name is a string up to 20 characters long and is case sensitive.                 |
| encrypted          | Use the encrypted parameter when you want to enter encrypted passwords.                                |
| auth               | Authentication protocol.   |
| md5                | MD5 Message Digest Algorithms.   |
| sha                | SHA Secure Hash Algorithm.   |
| sha-256            | SHA-256 Secure Hash Algorithm. Note: SHA-256 authentication is required in crypto secure-mode.         |
| <auth-password>    | Authentication password. The password is a string of 8 to 20 characters long and is case sensitive.    |
| priv               | Privacy protocol.  |
| des                | DES: Data Encryption Standard. DES is not available if you enable <a href="#">crypto secure-mode</a> . |
| aes                | AES: Advanced Encryption Standards.  |
| <privacy-password> | Privacy password. The password is a string of 8 to 20 characters long and is case sensitive.           |

**Mode** Global Configuration

**Usage notes** Additionally this command provides the option of selecting an authentication protocol and (where appropriate) an associated password. Similarly, options are offered for selecting a privacy protocol and password.

- Note that each SNMP user must be configured on both the manager and agent entities. Where passwords are used, these passwords must be the same for both entities.

- Use the **encrypted** parameter when you want to enter already encrypted passwords in encrypted form as displayed in the running and startup configs stored on the device. For example, you may need to move a user from one group to another group and keep the same passwords for the user instead of removing the user to apply new passwords.
- User passwords are entered using plaintext without the **encrypted** parameter and are encrypted according to the authentication and privacy protocols selected.
- User passwords are viewed as encrypted passwords in running and startup configs shown from **show running-config** and **show startup-config** commands respectively. Copy and paste encrypted passwords from running-configs or startup-configs to avoid entry errors.

**Examples** To add SNMP user authuser as a member of group 'usergroup', with authentication protocol MD5, authentication password 'Authpass', privacy protocol AES and privacy password 'Privpass' use the following commands:

```
awplus# configure terminal
awplus(config)# snmp-server user authuser usergroup auth md5
Authpass priv aes Privpass
```

Validate the user is assigned to the group using the **show snmp-server user** command:

| Name     | Group name | Auth | Privacy |
|----------|------------|------|---------|
| authuser | usergroup  | md5  | aes     |

To enter existing SNMP user 'authuser' with existing passwords as a member of group 'newusergroup' with authentication protocol MD5 with the encrypted authentication password 0x1c74b9c22118291b0ce0cd883f8dab6b74, and privacy protocol AES with the encrypted privacy password 0x0e0133db5453ebd03822b004eeacb6608f, use the following commands:

```
awplus# configure terminal
awplus(config)# snmp-server user authuser newusergroup
encrypted auth md5 0x1c74b9c22118291b0ce0cd883f8dab6b74 priv
aes 0x0e0133db5453ebd03822b004eeacb6608f
```

**NOTE:** Copy and paste the encrypted passwords from the **running-config** or the **startup-config** displayed, using the **show running-config** and **show startup-config** commands respectively, into the command line to avoid key stroke errors issuing this command.

Validate the user has been moved from the first group using the **show snmp-server user** command:

```
awplus#show snmp-server user
Name          Group name      Auth           Privacy
-----
authuser      newusergroup    md5            aes
```

To delete SNMP user 'authuser', use the following commands:

```
awplus# configure terminal
awplus(config)# no snmp-server user authuser
```

**Related commands**

- [show snmp-server user](#)
- [snmp-server view](#)

# snmp-server view

**Overview** Use this command to create an SNMP view that specifies a sub-tree of the MIB. Further sub-trees can then be added by specifying a new OID to an existing view. Views can be used in SNMP communities or groups to control the remote manager's access.

**NOTE:** The object identifier must be specified in a sequence of integers separated by decimal points.

The **no** variant of this command removes the specified view on the device. The view must already exist.

**Syntax** `snmp-server view <view-name> <mib-name> {included|excluded}`  
`no snmp-server view <view-name>`

| Parameter   | Description   |
|-------------|---|
| <view-name> | SNMP server view name.<br>The view name is a string up to 20 characters long and is case sensitive. |
| <mib-name>  | Object identifier of the MIB.   |
| included    | Include this OID in the view.   |
| excluded    | Exclude this OID in the view.   |

**Mode** Global Configuration

**Examples** The following command creates a view called "loc" that includes the system location MIB sub-tree.

```
awplus(config)# snmp-server view loc 1.3.6.1.2.1.1.6.0 included
```

To remove the view "loc" use the following command

```
awplus(config)# no snmp-server view loc
```

# undebbug snmp

**Overview** This command applies the functionality of the no `debug snmp` command.

# 64

# LLDP Commands

## Introduction

**Overview** LLDP and LLDP-MED can be configured using the commands in this chapter, or by using SNMP with the LLDP-MIB and LLDP-EXT-DOT1-MIB (see the [Support for Allied Telesis Enterprise MIBs in AlliedWare Plus](#)).

The Voice VLAN feature can be configured using commands in the [VLAN Commands](#) chapter.

For more information about LLDP, see the [LLDP Feature Overview and Configuration Guide](#).

LLDP can transmit a lot of data about the network. Typically, the network information gathered using LLDP is transferred to a Network Management System by SNMP. For security reasons, we recommend using SNMPv3 for this purpose (see the [SNMP Feature Overview and Configuration Guide](#)).

LLDP operates over physical ports only. For example, it can be configured on switch ports that belong to static or dynamic channel groups, but not on the channel groups themselves.

# clear lldp statistics

**Overview** This command clears all LLDP statistics (packet and event counters) associated with specified ports. If no port list is supplied, LLDP statistics for all ports are cleared.

**Syntax** `clear lldp statistics [interface <port-list>]`

| Parameter   | Description   |
|-------------|---|
| <port-list> | The ports for which the statistics are to be cleared. |

**Mode** Privileged Exec

**Examples** To clear the LLDP statistics on port1.0.1 and port1.0.4 use the command:

```
awplus# clear lldp statistics interface port1.0.1,port1.0.4
```

To clear all LLDP statistics for all ports, use the command:

```
awplus# clear lldp statistics
```

**Related commands** [show lldp statistics](#)

[show lldp statistics interface](#)

**Command changes** Version 5.5.3-1.1: Command added to AR1050V

Version 5.4.8-2.1: Command added to AR2050V, AR3050S, AR4050S

# clear lldp table

**Overview** This command clears the table of LLDP information received from neighbors through specified ports. If no port list is supplied, neighbor information is cleared for all ports.

**Syntax** `clear lldp table [interface <port-list>]`

| Parameter   | Description  |
|-------------|--|
| <port-list> | The ports for which the neighbor information table is to be cleared. |

**Mode** Privileged Exec

**Examples** To clear the table of neighbor information received on port1.0.1 and port1.0.4, use the command:

```
awplus#clear lldp table interface port1.0.1,port1.0.4
```

To clear the entire table of neighbor information received through all ports, use the command:

```
awplus# clear lldp table
```

**Related commands** [show lldp neighbors](#)

**Command changes** Version 5.5.3-1.1: Command added to AR1050V

# debug lldp

**Overview** This command enables specific LLDP debug for specified ports. When LLDP debugging is enabled, diagnostic messages are entered into the system log. If no port list is supplied, the specified debugging is enabled for all ports.

The **no** variant of this command disables specific LLDP debug for specified ports. If no port list is supplied, the specified debugging is disabled for all ports.

**Syntax** debug lldp {[rx][rxpkt][tx][txpkt]} [interface [<port-list>]]  
debug lldp operation  
no debug lldp {[rx][rxpkt][tx][txpkt]} [interface [<port-list>]]  
no debug lldp operation  
no debug lldp all

| Parameter   | Description                                      |
|-------------|--|
| rx          | LLDP receive debug.                              |
| rxpkt       | Raw LLDPDUs received in hex format.              |
| tx          | LLDP transmit debug.                             |
| txpkt       | Raw Tx LLDPDUs transmitted in hex format.        |
| <port-list> | The ports for which debug is to be configured.   |
| operation   | Debug for LLDP internal operation on the switch. |
| all         | Disables all LLDP debugging for all ports.       |

**Default** By default no debug is enabled for any ports.

**Mode** Privileged Exec

**Examples** To enable debugging of LLDP receive on port1.0.1 and port1.0.4, use the command:

```
awplus# debug lldp rx interface port1.0.1,port1.0.4
```

To enable debugging of LLDP transmit with packet dump on all ports, use the command:

```
awplus# debug lldp tx txpkt
```

To disable debugging of LLDP receive on port1.0.1 and port1.0.4, use the command:

```
awplus# no debug lldp rx interface port1.0.1,port1.0.4
```

To turn off all LLDP debugging on all ports, use the command:

```
awplus# no debug lldp all
```

**Related commands** show debugging lldp  
show running-config lldp  
terminal monitor

**Command changes** Version 5.5.3-1.1: Command added to AR1050V

# lldp faststart-count

**Overview** Use this command to configure the fast start count for LLDP-MED. The fast start count determines the number of fast start advertisements a port sends when initiating LLDP-MED advertisements. This occurs, for example, when a new LLDP-MED capable device is detected.

The **no** variant of this command resets the LLDP-MED fast start count to the default (3).

**Syntax** `lldp faststart-count <1-10>`  
`no lldp faststart-count`

| Parameter | Description                                      |
|-----------|--|
| <1-10>    | The number of fast start advertisements to send. |

**Default** The default fast start count is 3.

**Mode** Global Configuration

**Examples** To set the fast start count to 5, use the command:

```
awplus# configure terminal  
awplus(config)# lldp faststart-count 5
```

To reset the fast start count to the default setting (3), use the command:

```
awplus# configure terminal  
awplus(config)# no lldp faststart-count
```

**Related commands** [show lldp](#)

**Command changes** Version 5.5.3-1.1: Command added to AR1050V

# Ildp holdtime-multiplier

**Overview** This command sets the holdtime multiplier value. This value is multiplied by the transmit interval to determine the advertised Time To Live (TTL) value advertised to neighbors.

The **no** variant of this command sets the multiplier back to its default.

**Syntax** `lldp holdtime-multiplier <2-10>`  
`no lldp holdtime-multiplier`

| Parameter | Description            |
|-----------|------------------------|
| <2-10>    | The multiplier factor. |

**Default** The default holdtime multiplier value is 4.

**Mode** Global Configuration

**Usage** The Time-To-Live (TTL) specifies how long the advertised information remains valid for neighbors. If the TTL expires before receiving an update, the neighbor removes the information from its database.

**Examples** To set the holdtime multiplier to 2, use the commands:

```
awplus# configure terminal  
awplus(config)# lldp holdtime-multiplier 2
```

To set the holdtime multiplier back to its default, use the commands:

```
awplus# configure terminal  
awplus(config)# no lldp holdtime-multiplier 2
```

**Related commands** [show lldp](#)

**Command changes** Version 5.5.3-1.1: Command added to AR1050V

# Ildp management-address

**Overview** This command sets the IPv4 address to be advertised to neighbors (in the Management Address TLV) via the specified ports. This address will override the default address for these ports.

The **no** variant of this command clears the user-configured management IP address advertised to neighbors via the specified ports. The advertised address reverts to the default.

**Syntax** `lldp management-address <ipaddr>`  
`no lldp management-address`

| Parameter                   | Description  |
|-----------------------------|--|
| <code>&lt;ipaddr&gt;</code> | The IPv4 address to be advertised to neighbors, in dotted decimal format. This must be one of the IP addresses already configured on the device. |

**Default** The local loopback interface primary IPv4 address if set, else the primary IPv4 interface address of the lowest numbered VLAN the port belongs to, else the MAC address of the device's baseboard if no VLAN IP addresses are configured for the port.

**Mode** Interface Configuration

**Usage notes** To see the management address that will be advertised, use the [show lldp interface](#) command or [show lldp local-info](#) command.

**Examples** To set the management address advertised by port1.0.1 and port1.0.2, to be 192.168.1.6, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1,port1.0.2
awplus(config-if)# lldp management-address 192.168.1.6
```

To clear the user-configured management address advertised by port1.0.1 and port1.0.2, and revert to using the default address, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1,port1.0.2

# lldp med-notifications

**Overview** Use this command to enable LLDP to send LLDP-MED Topology Change Detected SNMP notifications relating to the specified ports. The switch sends an SNMP event notification when a new LLDP-MED compliant IP Telephony device is connected to or disconnected from a port on the switch.

Use the **no** variant of this command to disable the sending of LLDP-MED Topology Change Detected notifications relating to the specified ports.

**Syntax** `lldp med-notifications`  
`no lldp med-notifications`

**Default** The sending of LLDP-MED notifications is disabled by default.

**Mode** Interface Configuration

**Examples** To enable the sending of LLDP-MED Topology Change Detected notifications relating to ports port1.0.1 and port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1,port1.0.2
awplus(config-if)# lldp med-notifications
```

To disable the sending of LLDP-MED notifications relating to port1.0.1 and port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1,port1.0.2
awplus(config-if)# no lldp med-notifications
```

**Related commands** [lldp notification-interval](#)

[show lldp interface](#)

**Command changes** Version 5.5.3-1.1: Command added to AR1050V  
Version 5.4.8-2.1: Command added to AR2050V, AR3050S, AR4050S

# lldp med-tlv-select

**Overview** Use this command to enable LLDP-MED Organizationally Specific TLVs for transmission in LLDP advertisements via the specified ports. The LLDP-MED Capabilities TLV must be enabled before any of the other LLDP-MED Organizationally Specific TLVs are enabled.

Use the **no** variant of this command to disable the specified LLDP-MED Organizationally Specific TLVs for transmission in LLDP advertisements via these ports. In order to disable the LLDP-MED Capabilities TLV, you must also disable the rest of these TLVs. Disabling all these TLVs disables LLDP-MED advertisements.

**Syntax**

```
lldp med-tlv-select [capabilities] [network-policy] [location]
[power-management-ext] [inventory-management]

lldp med-tlv-select all

no lldp med-tlv-select [capabilities] [network-policy]
[location] [power-management-ext] [inventory-management]

no lldp med-tlv-select all
```

| Parameter            | Description   |
|----------------------|---|
| capabilities         | LLDP-MED Capabilities TLV. When this is enabled, the MAC/PHY Configuration/Status TLV from IEEE 802.3 Organizationally Specific TLVs is also automatically included in LLDP-MED advertisements, whether or not it has been explicitly enabled by the <code>lldp tlv-select</code> command.  |
| network-policy       | Network Policy TLV. This TLV is transmitted if Voice VLAN parameters have been configured using the commands: <ul style="list-style-type: none"><li><code>switchport voice dscp</code></li><li><code>switchport voice vlan</code></li><li><code>switchport voice vlan priority</code></li></ul>   |
| location             | Location Identification TLV. This TLV is transmitted if location information has been configured using the commands: <ul style="list-style-type: none"><li><code>location elin-location-id</code></li><li><code>location civic-location identifier</code></li><li><code>location civic-location configuration</code></li><li><code>location coord-location identifier</code></li><li><code>location coord-location configuration</code></li><li><code>location elin-location</code></li></ul> |
| power-management-ext | Extended Power-via-MDI TLV. This TLV is transmitted if the port is PoE capable, and PoE is enabled ( <code>power-inline enable</code> command).   |

| Parameter            | Description   |
|----------------------|---|
| inventory-management | Inventory Management TLV Set, including the following TLVs: <ul style="list-style-type: none"> <li>• Hardware Revision</li> <li>• Firmware Revision</li> <li>• Software Revision</li> <li>• Serial Number</li> <li>• Manufacturer Name</li> <li>• Model Name</li> <li>• Asset ID</li> </ul> |
| all                  | All LLDP-MED Organizationally Specific TLVs.  |

**Default** By default, LLDP-MED Capabilities, Network Policy, Location Identification, and Extended Power-via-MDI TLVs are enabled. Therefore, if LLDP is enabled using the `lldp run` command, by default LLDP-MED advertisements are transmitted on ports that detect LLDP-MED neighbors connected to them.

**Mode** Interface Configuration

**Usage notes** LLDP-MED TLVs are only sent in advertisements via a port if there is an LLDP-MED-capable device connected to it. To see whether there are LLDP-MED capable devices connected to the ports, use the `show lldp neighbors` command.

**Examples** To enable inclusion of the Inventory TLV Set in advertisements transmitted via port1.0.1 and port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1,port1.0.2
awplus(config-if)# lldp med-tlv-select inventory-management
```

To exclude the Inventory TLV Set in advertisements transmitted via port1.0.1 and port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1,port1.0.2
awplus(config-if)# no lldp med-tlv-select inventory-management
```

To disable LLDP-MED advertisements transmitted via port1.0.1 and port1.0.2, disable all these TLVs using the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1,port1.0.2
awplus(config-if)# no lldp med-tlv-select all
```

# lldp non-strict-med-tlv-order-check

**Overview** Use this command to enable non-strict order checking for LLDP-MED advertisements it receives. That is, use this command to enable LLDP to receive and store TLVs from LLDP-MED advertisements even if they do not use standard TLV order.

Use the **no** variant of this command to disable non-strict order checking for LLDP-MED advertisements, that is, to set strict TLV order checking, so that LLDP discards any LLDP-MED TLVs that occur before the LLDP-MED Capabilities TLV in an advertisement.

**Syntax** `lldp non-strict-med-tlv-order-check`  
`no lldp non-strict-med-tlv-order-check`

**Default** By default TLV non-strict order checking for LLDP-MED advertisements is disabled. That is, strict order checking is applied to LLDP-MED advertisements, according to ANSI/TIA-1057, and LLDP-MED TLVs in non-standard order are discarded.

**Mode** Global Configuration

**Usage notes** The ANSI/TIA-1057 specifies standard order for TLVs in LLDP-MED advertisements, and specifies that if LLDP receives LLDP advertisements with non-standard LLDP-MED TLV order, the TLVs in non-standard order should be discarded. This implementation of LLDP-MED follows the standard: it transmits TLVs in the standard order, and by default discards LLDP-MED TLVs that occur before the LLDP-MED Capabilities TLV in an advertisement. However, some implementations of LLDP transmit LLDP-MED advertisements with non-standard TLV order. To receive and store the data from these non-standard advertisements, enable non-strict order checking for LLDP-MED advertisements using this command.

**Examples** To enable strict TLV order checking, use the commands:

```
awplus# configure terminal
awplus(config)# lldp tlv-order-check
```

To disable strict TLV order checking, use the commands:

```
awplus# configure terminal
awplus(config)# no lldp tlv-order-check
```

# lldp notification-interval

**Overview** This command sets the notification interval. This is the minimum interval between LLDP SNMP notifications (traps) of each kind (LLDP Remote Tables Change Notification and LLDP-MED Topology Change Notification).

The **no** variant of this command sets the notification interval back to its default.

**Syntax** `lldp notification-interval <5-3600>`  
`no lldp notification-interval`

| Parameter | Description              |
|-----------|--------------------------|
| <5-3600>  | The interval in seconds. |

**Default** The default notification interval is 5 seconds.

**Mode** Global Configuration

**Examples** To set the notification interval to 20 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# lldp notification-interval 20
```

To set the notification interval back to its default, use the commands:

```
awplus# configure terminal
awplus(config)# no lldp notification-interval
```

**Related commands** [lldp notifications](#)  
[show lldp](#)

# Ildp notifications

**Overview** This command enables the sending of LLDP SNMP notifications (traps) relating to specified ports.

The **no** variant of this command disables the sending of LLDP SNMP notifications for specified ports.

**Syntax** `lldp notifications`  
`no lldp notifications`

**Default** The sending of LLDP SNMP notifications is disabled by default.

**Mode** Interface Configuration

**Examples** To enable sending of LLDP SNMP notifications for ports 1.0.1 and 1.0.6, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1,port1.0.6
awplus(config-if)# lldp notifications
```

To disable sending of LLDP SNMP notifications for ports 1.0.1 and 1.0.6, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1,port1.0.6
awplus(config-if)# no lldp notifications
```

# lldp port-number-type

**Overview** This command sets the type of port identifier used to enumerate, that is to count, the LLDP MIB local port entries. The LLDP MIB (IEEE Standard 802.1AB-2005, Section 12, LLDP MIB Definitions.) requires the port number value to count LLDP local port entries.

This command also enables you to optionally set an interface index to enumerate the LLDP MIB local port entries, if required by your management system.

The **no** variant of this command resets the type of port identifier back to the default setting (number).

**Syntax** `lldp port-number-type [number|ifindex]`  
`no lldp port-number-type`

| Parameter | Description   |
|-----------|---|
| number    | Set the type of port identifier to a port number to enumerate the LLDP MIB local port entries.      |
| ifindex   | Set the type of port identifier to an interface index to enumerate the LLDP MIB local port entries. |

**Default** The default port identifier type is number. The no variant of this command sets the port identifier type to the default.

**Mode** Global Configuration

**Examples** To set the type of port identifier used to enumerate LLDP MIB local port entries to port numbers, use the commands:

```
awplus# configure terminal
awplus(config)# lldp port-number-type number
```

To set the type of port identifier used to enumerate LLDP MIB local port entries to interface indexes, use the commands:

```
awplus# configure terminal
awplus(config)# lldp port-number-type ifindex
```

To reset the type of port identifier used to enumerate LLDP MIB local port entries the default (port numbers), use the commands:

```
awplus# configure terminal
awplus(config)# no lldp port-number-type
```

# Ildp reinit

**Overview** This command sets the value of the reinitialization delay. This is the minimum time after disabling LLDP on a port before it can reinitialize.

The **no** variant of this command sets the reinitialization delay back to its default setting.

**Syntax** `lldp reinit <1-10>`  
`no lldp reinit`

| Parameter | Description           |
|-----------|-----------------------|
| <1-10>    | The delay in seconds. |

**Default** The default reinitialization delay is 2 seconds.

**Mode** Global Configuration

**Examples** To set the reinitialization delay to 3 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# lldp reinit 3
```

To set the reinitialization delay back to its default, use the commands:

```
awplus# configure terminal
awplus(config)# no lldp reinit
```

# lldp run

**Overview** This command enables the operation of LLDP on the device.  
The **no** variant of this command disables the operation of LLDP on the device. The LLDP configuration remains unchanged.

**Syntax** `lldp run`  
`no lldp run`

**Default** LLDP is disabled by default.

**Mode** Global Configuration

**Examples** To enable LLDP operation, use the commands:

```
awplus# configure terminal  
awplus(config)# lldp run
```

To disable LLDP operation, use the commands:

```
awplus# configure terminal  
awplus(config)# no lldp run
```

**Command changes** Version 5.5.3-1.1: Command added to AR1050V

# lldp timer

**Overview** This command sets the value of the transmit interval. This is the interval between regular transmissions of LLDP advertisements.

The **no** variant of this command sets the transmit interval back to its default.

**Syntax** `lldp timer <5-32768>`  
`no lldp timer`

| Parameter                    | Description  |
|------------------------------|--|
| <code>&lt;5-32768&gt;</code> | The transmit interval in seconds. The transmit interval must be at least four times the transmission delay timer ( <a href="#">lldp tx-delay</a> command). |

**Default** The default transmit interval is 30 seconds.

**Mode** Global Configuration

**Examples** To set the transmit interval to 90 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# lldp timer 90
```

To set the transmit interval back to its default, use the commands:

```
awplus# configure terminal
awplus(config)# no lldp timer
```

**Related commands** [lldp tx-delay](#)  
[show lldp](#)

**Command changes** Version 5.5.3-1.1: Command added to AR1050V

# lldp tlv-select

**Overview** This command enables one or more optional TLVs, or all TLVs, for transmission in LLDP advertisements via the specified ports. The TLVs can be specified in any order; they are placed in LLDP frames in a fixed order (as described in IEEE 802.1AB). The mandatory TLVs (Chassis ID, Port ID, Time To Live, End of LLDPDU) are always included in LLDP advertisements.

In LLDP-MED advertisements the MAC/PHY Configuration/Status TLV will be always be included regardless of whether it is selected by this command.

The **no** variant of this command disables the specified optional TLVs, or all optional TLVs, for transmission in LLDP advertisements via the specified ports.

**Syntax**

```
lldp tlv-select {[<tlv>]...}
lldp tlv-select all
no lldp tlv-select {[<tlv>]...}
no lldp tlv-select all
```

| Parameter | Description  |
|-----------|--|
| <tlv>     | The TLV to transmit in LLDP advertisements. One of these keywords: <ul style="list-style-type: none"> <li>port-description (specified by the <a href="#">description (interface)</a> command)</li> <li>system-name (specified by the <a href="#">hostname</a> command)</li> <li>system-description</li> <li>system-capabilities</li> <li>management-address</li> <li>port-vlan</li> <li>port-and-protocol-vlans</li> <li>vlan-names</li> <li>protocol-ids</li> <li>mac-phy-config</li> <li>power-management (Power Via MDI TLV)</li> <li>link-aggregation</li> <li>max-frame-size</li> </ul> |
| all       | All TLVs.  |

**Default** By default, no optional TLVs are included in LLDP advertisements. The MAC/PHY Configuration/Status TLV (**mac-phy-config**) is included in LLDP-MED advertisements whether or not it is selected by this command.

**Mode** Interface Configuration

**Examples** To include the management-address and system-name TLVs in advertisements transmitted via port1.0.1 and port1.0.4, use the commands:

```
awplus#configure terminal
awplus(config)# interface port1.0.1,port1.0.4
awplus(config-if)# lldp tlv-select management-address
system-name
```

To include all optional TLVs in advertisements transmitted via port1.0.1 and port1.0.4, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1,port1.0.4
awplus(config-if)# lldp tlv-select all
```

To exclude the management-address and system-name TLVs from advertisements transmitted via port1.0.1 and port1.0.4, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1,port1.0.4
awplus(config-if)# no lldp tlv-select management-address
system-name
```

To exclude all optional TLVs from advertisements transmitted via port1.0.1 and port1.0.4, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1,port1.0.4
awplus(config-if)# no lldp tlv-select all
```

# lldp transmit receive

**Overview** This command enables transmission and/or reception of LLDP advertisements to or from neighbors through the specified ports.

The **no** variant of this command disables transmission and/or reception of LLDP advertisements through specified ports.

**Syntax** `lldp {[transmit] [receive]}`  
`no lldp {[transmit] [receive]}`

| Parameter | Description   |
|-----------|---|
| transmit  | Enable or disable transmission of LLDP advertisements via this port or ports. |
| receive   | Enable or disable reception of LLDP advertisements via this port or ports.    |

**Default** LLDP advertisement transmission and reception are enabled on all ports by default.

**Mode** Interface Configuration

**Examples** To enable transmission of LLDP advertisements on port1.0.1 and port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1,port1.0.2
awplus(config-if)# lldp transmit
```

To enable LLDP advertisement transmission and reception on port1.0.1 and port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1,port1.0.2
awplus(config-if)# lldp transmit receive
```

To disable LLDP advertisement transmission and reception on port1.0.1 and port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1,port1.0.2
awplus(config-if)# no lldp transmit receive
```

# lldp tx-delay

**Overview** This command sets the value of the transmission delay timer. This is the minimum time interval between transmitting LLDP advertisements due to a change in LLDP local information.

The **no** variant of this command sets the transmission delay timer back to its default setting.

**Syntax** `lldp tx-delay <1-8192>`  
`no lldp tx-delay`

| Parameter                   | Description  |
|-----------------------------|--|
| <code>&lt;1-8192&gt;</code> | The transmission delay in seconds. The transmission delay cannot be greater than a quarter of the transmit interval ( <a href="#">lldp timer</a> command). |

**Default** The default transmission delay timer is 2 seconds.

**Mode** Global Configuration

**Examples** To set the transmission delay timer to 12 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# lldp tx-delay 12
```

To set the transmission delay timer back to its default, use the commands:

```
awplus# configure terminal
awplus(config)# no lldp tx-delay
```

| Parameter                  | Description  |
|----------------------------|--|
| <country>                  | Upper-case two-letter country code, as specified in ISO 3166.                      |
| <state>                    | State (Civic Address (CA) Type 1): national subdivisions (state, canton, region).  |
| <county>                   | County (CA Type 2): County, parish, gun (JP), district (IN).                       |
| <city>                     | City (CA Type 3): city, township, shi (JP).  |
| <division>                 | City division (CA Type 4): City division, borough, city district, ward, chou (JP). |
| <neighborhood>             | Neighborhood (CA Type 5): neighborhood, block.                                     |
| <street-group>             | Street group (CA Type 6): group of streets below the neighborhood level.           |
| <leading-street-direction> | Leading street direction (CA Type 16).   |
| <trailing-street-suffix>   | Trailing street suffix (CA Type 17).   |
| <street-suffix>            | Street suffix (CA Type 18): street suffix or type.                                 |
| <house-number>             | House number (CA Type 19).   |
| <house-number-suffix>      | House number suffix (CA Type 20).  |
| <landmark>                 | Landmark or vanity address (CA Type 21).   |
| <additional-information>   | Additional location information (CA Type 22).                                      |
| <name>                     | Name (CA Type 23): residence and office occupant.                                  |
| <postal-code>              | Postal/zip code (CA Type 24).  |
| <building>                 | Building (CA Type 25): structure.  |
| <unit>                     | Unit (CA Type 26): apartment, suite.   |
| <floor>                    | Floor (CA Type 27).  |
| <room>                     | Room (CA Type 28).   |
| <place-type>               | Type of place (CA Type 29).  |
| <postal-community-name>    | Postal community name (CA Type 30).  |
| <post-office-box>          | Post office box (P.O. Box) (CA Type 31).   |
| <additional-code>          | Additional code (CA Type 32).  |
| <seat>                     | Seat (CA Type 33): seat (desk, cubicle, workstation).                              |
| <primary-road-name>        | Primary road name (CA Type 34).  |
| <road-section>             | Road section (CA Type 35).   |

| Parameter                                      | Description                             |
|--|---|
| <code>&lt;branch-road-name&gt;</code>          | Branch road name (CA Type 36).          |
| <code>&lt;sub-branch-road-name&gt;</code>      | Sub-branch road name (CA Type 37).      |
| <code>&lt;street-name-pre-modifier&gt;</code>  | Street name pre-modifier (CA Type 38).  |
| <code>&lt;street-name-post-modifier&gt;</code> | Street name post-modifier (CA Type 39). |

**Default** By default no civic address location information is configured.

**Mode** Civic Address Location Configuration

**Usage notes** The **country** parameter must be configured before any other parameters can be configured; this creates the location. The country parameter cannot be deleted. One or more of the other parameters must be configured before the location can be assigned to a port. The country parameter must be entered as an upper-case two-letter country code, as specified in ISO 3166. All other parameters are entered as alpha-numeric strings. Do not configure all the civic address parameters (this would generate TLVs that are too long). Configure a subset of these parameters—enough to consistently and precisely identify the location of the device. If the location is to be used for Emergency Call Service (ECS), the particular ECS application may have guidelines for configuring the civic address location. For more information about civic address format, see the [LLDP Feature Overview and Configuration Guide](#).

To specify the civic address location, use the [location civic-location identifier](#) command. To delete the civic address location, use the **no** variant of the **location civic-location identifier** command. To assign the civic address location to particular ports, so that it can be advertised in TLVs from those ports, use the command [location civic-location-id](#) command.

**Examples** To configure civic address location 1 with location "27 Nazareth Avenue, Christchurch, New Zealand" in civic-address format, use the commands:

```
awplus# configure terminal
awplus(config)# location civic-location identifier 1
awplus(config-civic)# country NZ
awplus(config-civic)# city Christchurch
awplus(config-civic)# primary-road-name Nazareth
awplus(config-civic)# street-suffix Avenue
awplus(config-civic)# house-number 27
```

**Related commands**

**Command changes** Version 5.5.3-1.1: Command added to AR1050V

# location civic-location identifier

**Overview** Use this command to enter the Civic Address Location Configuration mode to configure the specified location.

Use the **no** variant of this command to delete a civic address location. This also removes the location from any ports it has been assigned to.

**Syntax** `location civic-location identifier <civic-loc-id>`  
`no location civic-location identifier <civic-loc-id>`

| Parameter                         | Description   |
|-----------------------------------|---|
| <code>&lt;civic-loc-id&gt;</code> | A unique civic address location ID, in the range 1 to 4095. |

**Default** By default there are no civic address locations.

**Mode** Global Configuration

**Usage notes** To configure the location information for this civic address location identifier, use the [location civic-location configuration](#) command. To associate this civic location identifier with particular ports, use the [location elin-location-id](#) command.

Up to 400 locations can be configured on the switch for each type of location information, up to a total of 1200 locations.

**Examples** To enter Civic Address Location Configuration mode for the civic address location with ID 1, use the commands:

```
awplus# configure terminal
awplus(config)# location civic-location identifier 1
awplus(config-civic)#
```

To delete the civic address location with ID 1, use the commands:

```
awplus# configure terminal
awplus(config)# no location civic-location identifier 1
```

**Related commands** [location civic-location-id](#)  
[location civic-location configuration](#)  
[show location](#)  
[show running-config lldp](#)

**Command changes** Version 5.5.3-1.1: Command added to AR1050V

# location civic-location-id

**Overview** Use this command to assign a civic address location identifier to the ports. The civic address location must already exist. This replaces any previous assignment of civic address location for the ports. Up to one location of each type can be assigned to a port.

Use the **no** variant of this command to remove a location identifier from the ports.

**Syntax** `location civic-location-id <civic-loc-id>`  
`no location civic-location-id [<civic-loc-id>]`

| Parameter                         | Description  |
|-----------------------------------|--|
| <code>&lt;civic-loc-id&gt;</code> | Civic address location ID, in the range 1 to 4095. |

**Default** By default no civic address location is assigned to ports.

**Mode** Interface Configuration

**Usage notes** The civic address location associated with a port can be transmitted in Location Identification TLVs via the port.

Before using this command, create the location using the following commands:

- [location civic-location identifier](#) command
- [location civic-location configuration](#) command

If a civic-address location is deleted using the **no** variant of the [location civic-location identifier](#) command, it is automatically removed from all ports.

**Examples** To assign the civic address location 1 to port1.0.1, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# location civic-location-id 1
```

To remove a civic address location from port1.0.1, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# no location civic-location-id
```

**Command changes** Version 5.5.3-1.1: Command added to AR1050V  
Version 5.4.8-2.1: Command added to AR2050V, AR3050S, AR4050S

# location coord-location configuration

**Overview** Use this command to configure a coordinate-based location. All parameters must be configured before assigning this location identifier to a port.

**Syntax**

```
latitude <latitude>  
lat-resolution <lat-resolution>  
longitude <longitude>  
long-resolution <long-resolution>  
altitude <altitude> {meters|floor}  
alt-resolution <alt-resolution>  
datum {wgs84|nad83-navd|nad83-mllw}
```

| Parameter         | Description   |
|-------------------|---|
| <lat-resolution>  | Latitude resolution, as a number of valid bits, in the range 0 to 34.   |
| <latitude>        | Latitude value in degrees in the range -90.0 to 90.0  |
| <long-resolution> | Longitude resolution, as a number of valid bits, in the range 0 to 34.  |
| <longitude>       | Longitude value in degrees, in the range -180.0 to 180.0.   |
| <alt-resolution>  | Altitude resolution, as a number of valid bits, in the range 0 to 30. A resolution of 0 can be used to indicate an unknown value. |
| <altitude>        | Altitude value, in meters or floors.  |
| meters            | The altitude value is in meters.  |
| floors            | The altitude value is in floors.  |
| datum             | The geodetic system (or datum) that the specified coordinate values are based on.   |
| wgs84             | World Geodetic System 1984.   |
| nad83-navd        | North American Datum 1983 - North American Vertical Datum.  |
| nad83-mllw        | North American Datum 1983 - Mean Lower Low Water vertical datum.  |

**Default** By default no coordinate location information is configured.

**Mode** Coordinate Configuration

**Usage** Latitude and longitude values are always stored internally, and advertised in the Location Identification TLV, as 34-bit fixed-point binary numbers, with a 25-bit fractional part, irrespective of the number of digits entered by the user. Likewise

altitude is stored as a 30-bit fixed point binary number, with an 8-bit fractional part. Because the user-entered decimal values are stored as fixed point binary numbers, they cannot always be represented exactly—the stored binary number is converted to a decimal number for display in the output of the [show location](#) command. For example, a user-entered latitude value of “2.77” degrees is displayed as “2.7699999809265136718750000”.

The **lat-resolution**, **long-resolution**, and **alt-resolution** parameters allow the user to specify the resolution of each coordinate element as the number of valid bits in the internally-stored binary representation of the value. These resolution values can be used by emergency services to define a search area.

To specify the coordinate identifier, use the [location coord-location identifier](#) command. To remove coordinate information, delete the coordinate location by using the **no** variant of that command. To associate the coordinate location with particular ports, so that it can be advertised in TLVs from those ports, use the [location elin-location-id](#) command.

**Example** To configure the location for the White House in Washington DC, which has the coordinates based on the WGS84 datum of 38.89868 degrees North (with 22 bit resolution), 77.03723 degrees West (with 22 bit resolution), and 15 meters height (with 9 bit resolution), use the commands:

```
awplus# configure terminal
awplus(config)# location coord-location identifier 1
awplus(config-coord)# la-resolution 22
awplus(config-coord)# latitude 38.89868
awplus(config-coord)# lo-resolution 22
awplus(config-coord)# longitude -77.03723
awplus(config-coord)# alt-resolution 9
awplus(config-coord)# altitude 15 meters
awplus(config-coord)# datum wgs84
```

# location coord-location identifier

**Overview** Use this command to enter Coordinate Location Configuration mode for this coordinate location.

Use the **no** variant of this command to delete a coordinate location. This also removes the location from any ports it has been assigned to.

**Syntax** `location coord-location identifier <coord-loc-id>`  
`no location coord-location identifier <coord-loc-id>`

| Parameter                         | Description  |
|-----------------------------------|--|
| <code>&lt;coord-loc-id&gt;</code> | A unique coordinate location identifier, in the range 1 to 4095. |

**Default** By default there are no coordinate locations.

**Mode** Global Configuration

**Usage** Up to 400 locations can be configured on the switch for each type of location information, up to a total of 1200 locations.

To configure this coordinate location, use the [location coord-location configuration](#) command. To associate this coordinate location with particular ports, so that it can be advertised in TLVs from those ports, use the [location coord-location-id](#) command.

**Examples** To enter Coordinate Location Configuration mode to configure the coordinate location with ID 1, use the commands:

```
awplus# configure terminal
awplus(config)# location coord-location identifier 1
awplus(config-coord)#
```

To delete coordinate location 1, use the commands:

```
awplus# configure terminal
awplus(config)# no location coord-location identifier 1
```

**Command changes** Version 5.5.3-1.1: Command added to AR1050V

# location coord-location-id

**Overview** Use this command to assign a coordinate location to the ports. The coordinate location must already exist. This replaces any previous assignment of coordinate location for the ports. Up to one location of each type can be assigned to a port.

Use the **no** variant of this command to remove a location from the ports.

**Syntax** `location coord-location-id <coord-loc-id>`  
`no location coord-location-id [<coord-loc-id>]`

| Parameter                         | Description                                     |
|-----------------------------------|---|
| <code>&lt;coord-loc-id&gt;</code> | Coordinate location ID, in the range 1 to 4095. |

**Default** By default no coordinate location is assigned to ports.

**Mode** Interface Configuration

**Usage notes** The coordinate location associated with a port can be transmitted in Location Identification TLVs via the port.

Before using this command, configure the location using the following commands:

- [location coord-location identifier](#) command
- [location coord-location configuration](#) command

If a coordinate location is deleted using the **no** variant of the [location coord-location identifier](#) command, it is automatically removed from all ports.

**Examples** To assign coordinate location 1 to port1.0.1, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# location coord-location-id 1
```

To remove a coordinate location from port1.0.1, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# no location coord-location-id
```

# location elin-location

**Overview** Use this command to create or modify an ELIN location.

Use the **no** variant of this command to delete an ELIN location, and remove it from any ports it has been assigned to.

**Syntax** `location elin-location <elin> identifier <elin-loc-id>`  
`no location elin-location identifier <elin-loc-id>`

| Parameter                        | Description  |
|----------------------------------|--|
| <code>&lt;elin&gt;</code>        | Emergency Location Identification Number (ELIN) for Emergency Call Service (ECS), in the range 10 to 25 digits long. In North America, ELINs are typically 10 digits long. |
| <code>&lt;elin-loc-id&gt;</code> | A unique ELIN location identifier, in the range 1 to 4095.   |

**Default** By default there are no ELIN location identifiers.

**Mode** Global Configuration

**Usage** Up to 400 locations can be configured on the switch for each type of location information, up to a total of 1200 locations.

To assign this ELIN location to particular ports, so that it can be advertised in TLVs from those ports, use the [location elin-location-id](#) command.

**Examples** To create a new ELIN location with ID 1, and configure it with ELIN "1234567890", use the commands:

```
awplus# configure terminal
awplus(config)# location elin-location 1234567890 identifier 1
```

To delete existing ELIN location with ID 1, use the commands:

```
awplus# configure terminal
awplus(config)# no location elin-location identifier 1
```

**Related commands** [location elin-location-id](#)

**Command changes** Version 5.5.3-1.1: Command added to AR1050V

# location elin-location-id

**Overview** Use this command to assign an ELIN location to the ports. The ELIN location must already exist. This replaces any previous assignment of ELIN location for the ports. Up to one location of each type can be assigned to a port.

Use the **no** variant of this command to remove a location identifier from the ports.

**Syntax** `location elin-location-id <elin-loc-id>`  
`no location elin-location-id [<elin-loc-id>]`

| Parameter                        | Description                                       |
|----------------------------------|---|
| <code>&lt;elin-loc-id&gt;</code> | ELIN location identifier, in the range 1 to 4095. |

**Default** By default no ELIN location is assigned to ports.

**Mode** Interface Configuration

**Usage notes** An ELIN location associated with a port can be transmitted in Location Identification TLVs via the port.

Before using this command, configure the location using the [location elin-location](#) command.

If an ELIN location is deleted using the **no** variant of one of the [location elin-location](#) command, it is automatically removed from all ports.

**Examples** To assign ELIN location 1 to port1.0.1, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# location elin-location-id 1
```

To remove ELIN location 1 from port1.0.1, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# no location elin-location-id 1
```

# show debugging lldp

**Overview** This command displays LLDP debug settings for specified ports. If no port list is supplied, LLDP debug settings for all ports are displayed.

**Syntax** `show debugging lldp [interface <port-list>]`

| Parameter   | Description  |
|-------------|--|
| <port-list> | The ports for which the LLDP debug settings are shown. |

**Mode** User Exec and Privileged Exec

**Examples** To display LLDP debug settings for all ports, use the command:

```
awplus# show debugging lldp
```

To display LLDP debug settings for port1.0.1 to port1.0.4, use the command:

```
awplus# show debugging lldp interface port1.0.1-port1.0.4
```

**Output** Figure 64-1: Example output from the **show debugging lldp** command

```
LLDP Debug settings:
Debugging for LLDP internal operation is on
Port      Rx      RxPkt   Tx      TxPkt
-----
1.0.1     Yes    Yes     No      No
1.0.2     Yes    No      No      No
1.0.3     No     No      No      No
1.0.4     Yes    Yes     Yes     No
```

**Table 1:** Parameters in the output of the **show debugging lldp** command

| Parameter | Description  |
|-----------|--|
| Port      | Port name.   |
| Rx        | Whether debugging of LLDP receive is enabled on the port.              |
| RxPkt     | Whether debugging of LLDP receive packet dump is enabled on the port.  |
| Rx        | Whether debugging of LLDP transmit is enabled on the port.             |
| RxPkt     | Whether debugging of LLDP transmit packet dump is enabled on the port. |

**Related commands** [debug lldp](#)

**Command changes** Version 5.5.3-1.1: Command added to AR1050V

# show lldp

**Overview** This command displays LLDP status and global configuration settings.

**Syntax** show lldp

**Mode** User Exec and Privileged Exec

**Example** To display LLDP status and global configuration settings, use the command:

```
awplus# show lldp
```

## Output

**Table 2:** Example output from the **show lldp** command

```
awplus# show lldp

LLDP Global Configuration:                               [Default Values]
LLDP Status ..... Enabled                               [Disabled]
Notification Interval ..... 5 secs                     [5]
Tx Timer Interval ..... 30 secs                        [30]
Hold-time Multiplier ..... 4                           [4]
(Computed TTL value ..... 120 secs)
Reinitialization Delay .... 2 secs                     [2]
Tx Delay ..... 2 secs                                  [2]

Port Number Type..... Ifindex                          [Port-Number]
Fast Start Count ..... 5                               [3]

LLDP Global Status:
Total Neighbor Count ..... 47
Neighbors table last updated 0 hrs 0 mins 43 secs ago
```

**Table 3:** Parameters in the output of the **show lldp** command

| Parameter              | Description   |
|------------------------|---|
| LLDP Status            | Whether LLDP is enabled. Default is disabled.   |
| Notification Interval  | Minimum interval between LLDP notifications.  |
| Tx Timer Interval      | Transmit interval between regular transmissions of LLDP advertisements.   |
| Hold-time Multiplier   | The holdtime multiplier. The transmit interval is multiplied by the holdtime multiplier to give the Time To Live (TTL) value that is advertised to neighbors. |
| Reinitialization Delay | The reinitialization delay. This is the minimum time after disabling LLDP transmit on a port before it can reinitialize again.                                |

**Table 3:** Parameters in the output of the **show lldp** command (cont.)

| Parameter                    | Description  |
|------------------------------|--|
| Tx Delay                     | The transmission delay. This is the minimum time interval between transmitting advertisements due to a change in LLDP local information. |
| Port Number Type             | The type of port identifier used to enumerate LLDP MIB local port entries, as set by the lldp port-number-type command.                  |
| Fast Start Count             | The number of times fast start advertisements are sent for LLDP-MED.   |
| Total Neighbor Count         | Number of LLDP neighbors discovered on all ports.  |
| Neighbors table last updated | The time since the LLDP neighbor table was last updated.   |

**Related commands** [show lldp interface](#)  
[show running-config lldp](#)

**Command changes** Version 5.5.3-1.1: Command added to AR1050V

# show lldp interface

**Overview** This command displays LLDP configuration settings for specified ports. If no port list is specified, LLDP configuration for all ports is displayed.

**Syntax** `show lldp interface [<port-list>]`

| Parameter   | Description  |
|-------------|--|
| <port-list> | The ports for which the LLDP configuration settings are to be shown. |

**Mode** User Exec and Privileged Exec

**Examples** To display LLDP configuration settings for port1.0.1 to port1.0.4, use the command:

```
awplus# show lldp interface port1.0.1-port1.0.4
```

To display LLDP configuration settings for all ports, use the command:

```
awplus# show lldp interface
```

**Output** Figure 64-2: Example output from the **show lldp interface** command

```
awplus# show lldp interface port1.0.1-1.0.4
LLDP Port Status and Configuration:

**Related commands** [show lldp](#)  
[show running-config lldp](#)

**Command changes** Version 5.5.3-1.1: Command added to AR1050V

# show lldp local-info

**Overview** This command displays local LLDP information that can be transmitted through specified ports. If no port list is entered, local LLDP information for all ports is displayed.

**Syntax** `show lldp local-info [base] [dot1] [dot3] [med] [interface <port-list>]`

| Parameter   | Description   |
|-------------|---|
| base        | Information for base TLVs.                                |
| dot1        | Information for 802.1 TLVs.                               |
| dot3        | Information for 802.3 TLVs.                               |
| med         | Information for LLDP-MED TLVs.                            |
| <port-list> | The ports for which the local information is to be shown. |

**Mode** User Exec and Privileged Exec

**Usage notes** Whether and which local information is transmitted in advertisements via a port depends on:

- whether the port is set to transmit LLDP advertisements ([lldp transmit receive](#) command)
- which TLVs it is configured to send ([lldp tlv-select](#) command, [lldp med-tnv-select](#) command)

**Examples** To display local information transmitted via port1.0.1, use the command:

```
awplus# show lldp local-info interface port1.0.1
```

To display local information transmitted via all ports, use the command:

```
awplus# show lldp local-info
```

**Output** Figure 64-3: Example output from **show lldp local-info**

```

Table 64-1: Parameters in the output of **show lldp local-info**

| Parameter                        | Description   |
|----------------------------------|---|
| Chassis ID Type                  | Type of the Chassis ID.   |
| Chassis ID                       | Chassis ID that uniquely identifies the local device.   |
| Port ID Type                     | Type of the Port ID.  |
| Port ID                          | Port ID of the local port through which advertisements are sent.  |
| TTL                              | Number of seconds that the information advertised by the local port remains valid.  |
| Port Description                 | Port description of the local port, as specified by the <a href="#">description (interface)</a> command.                    |
| System Name                      | System name, as specified by the <a href="#">hostname</a> command.  |
| System Description               | System description.   |
| System Capabilities (Supported)  | Capabilities that the local port supports.  |
| System Capabilities (Enabled)    | Enabled capabilities on the local port.   |
| Management Addresses             | Management address associated with the local port. To change this, use the <a href="#">lldp management-address</a> command. |
| Port VLAN ID (PVID)              | VLAN identifier associated with untagged or priority tagged frames received via the local port.                             |
| Port & Protocol VLAN (Supported) | Whether Port & Protocol VLANs (PPV) is supported on the local port.   |
| Port & Protocol VLAN (Enabled)   | Whether the port is in one or more Port & Protocol VLANs.   |
| Port & Protocol VLAN (VIDs)      | List of identifiers for Port & Protocol VLANs that the port is in.  |
| VLAN Names                       | List of VLAN names for VLANs that the local port is assigned to.  |
| Protocol IDs                     | List of protocols that are accessible through the local port.   |
| MAC/PHY Auto-negotiation         | Auto-negotiation support and current status of the 802.3 LAN on the local port.   |

Table 64-1: Parameters in the output of **show lldp local-info** (cont.)

| Parameter                    | Description   |
|------------------------------|---|
| Power Via MDI (PoE)          | PoE-capability and current status on the local port.  |
| Port Class                   | Whether the device is a PSE (Power Sourcing Entity) or a PD (Powered Device).                                   |
| Pair Control Ability         | Whether power pair selection can be controlled.   |
| Power Pairs                  | Which power pairs are selected for power ("Signal Pairs" or "Spare Pairs") if pair selection can be controlled. |
| Power Class                  | The power class of the PD device on the port (class 0, 1, 2, 3 or 4).   |
| Link Aggregation             | Whether the link is capable of being aggregated and it is currently in an aggregation.                          |
| Aggregated Port-ID           | Aggregated port identifier.   |
| Maximum Frame Size           | The maximum frame size capability of the implemented MAC and PHY.   |
| LLDP-MED Device Type         | LLDP-MED device type.   |
| LLDP-MED Capabilities        | Capabilities LLDP-MED capabilities supported on the local port.   |
| Network Policy               | List of network policies configured on the local port.  |
| VLAN ID                      | VLAN identifier for the port for the specified application type.  |
| Tagged Flag                  | Whether the VLAN ID is to be used as tagged or untagged.  |
| Layer-2 Priority:            | Layer 2 User Priority (in the range 0 to 7).  |
| DSCP Value                   | Diffserv codepoint (in the range 0 to 63).  |
| Location Identification      | Location configured on the local port.  |
| Extended Power Via MDI (PoE) | PoE-capability and current status of the PoE parameters for Extended Power-Via-MDI TLV on the local port.       |
| Power Source                 | The power source the switch currently uses; either primary power or backup power.                               |
| Power Priority               | The power priority configured on the port; either critical, high or low.  |

Table 64-1: Parameters in the output of **show lldp local-info** (cont.)

| Parameter            | Description  |
|----------------------|--|
| Power Value          | The total power the switch can source over a maximum length cable to a PD device on the port. The value shows the power value in Watts from the PD side. |
| Inventory Management | Inventory information for the device.  |

**Command changes** Version 5.5.3-1.1: Command added to AR1050V

# show lldp statistics

**Overview** This command displays the global LLDP statistics (packet and event counters).

**Syntax** show lldp statistics

**Mode** User Exec and Privileged Exec

**Example** To display global LLDP statistics information, use the command:

```
awplus# show lldp statistics
```

## Output

**Table 67:** Example output from the **show lldp statistics** command

```
awplus# show lldp statistics

Global LLDP Packet and Event counters:

Frames:   Out ..... 345
          In ..... 423
          In Errored ..... 0
          In Dropped ..... 0
TLVs:    Unrecognized ..... 0
          Discarded ..... 0
Neighbors: New Entries ..... 20
           Deleted Entries ..... 20
           Dropped Entries ..... 0
           Entry Age-outs ..... 20
```

**Table 68:** Parameters in the output of the **show lldp statistics** command

| Parameter             | Description  |
|-----------------------|--|
| Frames Out            | Number of LLDPDU frames transmitted.   |
| Frames In             | Number of LLDPDU frames received.  |
| Frames In Errored     | Number of invalid LLDPDU frames received.  |
| Frames In Dropped     | Number of LLDPDU frames received and discarded for any reason.   |
| TLVs Unrecognized     | Number of LLDP TLVs received that are not recognized but the TLV type is in the range of reserved TLV types. |
| TLVs Discarded        | Number of LLDP TLVs discarded for any reason.  |
| Neighbors New Entries | Number of times the information advertised by neighbors has been inserted into the neighbor table.           |

**Table 68:** Parameters in the output of the **show lldp statistics** command (cont.)

| Parameter                        | Description  |
|----------------------------------|--|
| Neighbors Deleted Entries        | Number of times the information advertised by neighbors has been removed from the neighbor table.  |
| Neighbors Dropped Entries        | Number of times the information advertised by neighbors could not be entered into the neighbor table because of insufficient resources.            |
| Neighbors Entry Age-outs Entries | Number of times the information advertised by neighbors has been removed from the neighbor table because the information TTL interval has expired. |

awplus# show lldp statistics interface port1.0.1,port1.0.4
```

## Output

**Table 69:** Example output from the **show lldp statistics interface** command

```
awplus# show lldp statistics interface port1.0.1,port1.0.4

LLDP Packet and Event Counters:

port1.0.1
  Frames:  Out ..... 27
           In ..... 22
           In Errored ..... 0
           In Dropped ..... 0
  TLVs:    Unrecognized ..... 0
           Discarded ..... 0
  Neighbors: New Entries ..... 3
            Deleted Entries ..... 0
            Dropped Entries ..... 0
            Entry Age-outs ..... 0

port1.0.4
  Frames:  Out ..... 15
           In ..... 18
           In Errored ..... 0
           In Dropped ..... 0
  TLVs:    Unrecognized ..... 0
           Discarded ..... 0
  Neighbors: New Entries ..... 1
            Deleted Entries ..... 0
            Dropped Entries ..... 0
            Entry Age-outs ..... 0
```

**Table 70:** Parameters in the output of the **show lldp statistics interface** command

| Parameter                        | Description  |
|----------------------------------|--|
| Frames Out                       | Number of LLDPDU frames transmitted.   |
| Frames In                        | Number of LLDPDU frames received.  |
| Frames In Errored                | Number of invalid LLDPDU frames received.  |
| Frames In Dropped                | Number of LLDPDU frames received and discarded for any reason.   |
| TLVs Unrecognized                | Number of LLDP TLVs received that are not recognized but the TLV type is in the range of reserved TLV types.                                       |
| TLVs Discarded                   | Number of LLDP TLVs discarded for any reason.  |
| Neighbors New Entries            | Number of times the information advertised by neighbors has been inserted into the neighbor table.   |
| Neighbors Deleted Entries        | Number of times the information advertised by neighbors has been removed from the neighbor table.  |
| Neighbors Dropped Entries        | Number of times the information advertised by neighbors could not be entered into the neighbor table because of insufficient resources.            |
| Neighbors Entry Age-outs Entries | Number of times the information advertised by neighbors has been removed from the neighbor table because the information TTL interval has expired. |

[show lldp statistics](#)

**Command changes** Version 5.5.3-1.1: Command added to AR1050V

# show location

**Overview** Use this command to display selected location information configured on the switch.

**Syntax**

```
show location {civic-location|coord-location|elin-location}
show location {civic-location|coord-location|elin-location}
identifier {<civic-loc-id>|<coord-loc-id>|<elin-loc-id>}
show location {civic-location|coord-location|elin-location}
interface <port-list>
```

| Parameter      | Description  |
|----------------|--|
| civic-location | Display civic location information.                              |
| coord-location | Display coordinate location information.                         |
| elin-location  | Display ELIN (Emergency Location Identifier Number) information. |
| <civic-loc-id> | Civic address location identifier, in the range 1 to 4095.       |
| <coord-loc-id> | Coordinate location identifier, in the range 1 to 4095.          |
| <elin-loc-id>  | ELIN location identifier, in the range 1 to 4095.                |
| <port-list>    | Ports to display information about.                              |

**Mode** User Exec and Privileged Exec

**Examples** To display a civic address location configured on port 1.0.1, use the command:

```
awplus# show location civic-location interface port1.0.1
```

**Table 71:** Example output from the **show location** command

```
awplus# show location civic-location interface port1.0.1
Port      ID      Element Type      Element Value
-----
1.0.1    1      Country           NZ
          City           Christchurch
          Street-suffix   Avenue
          House-number    27
          Primary-road-name Nazareth
```

To display coordinate location information configured on the identifier 1, use the command:

```
awplus# show location coord-location identifier 1
```

**Table 72:** Example output from the **show location** command

```
awplus# show location coord-location identifier 1
  ID Element Type           Element Value
-----
  1  Latitude Resolution    15 bits
    Latitude                38.8986481130123138427734375 degrees
    Longitude Resolution    15 bits
    Longitude                130.2323232293128967285156250 degrees
    Altitude Resolution     10 bits
    Altitude                 2.50000000 meters
    Map Datum                WGS 84
```

The coordinate location information displayed may differ from the information entered because it is stored in binary format. For more information, see the [location coord-location configuration](#) command.

To display all ELIN location information configured on the switch, use the command:

```
awplus# show location elin-location
```

**Table 73:** Example output from the **show location elin-location** command

```
awplus# show location elin-location
  ID  ELIN
-----
  1   1234567890
  2   5432154321
```

# Mail (SMTP) Commands

## Introduction

**Overview** This chapter provides an alphabetical reference for commands used to configure mail. The mail feature uses Simple Mail Transfer Protocol (SMTP) to transfer mail from an internal email client operating within the AlliedWare Plus device. This feature is typically used to email event notifications to an external email server from the AlliedWare Plus device.

For information on using the mail feature, see the [Mail \(SMTP\) Feature Overview and Configuration Guide](#).

- Command List**
- “[debug mail](#)” on page 3308
  - “[delete mail](#)” on page 3309
  - “[mail](#)” on page 3310
  - “[mail from](#)” on page 3312

  - “[mail smtpserver authentication](#)” on page 3314
  - “[mail smtpserver port](#)” on page 3316
  - “[mail smtpserver tls](#)” on page 3318
  - “[show counter mail](#)” on page 3319
  - “[show mail](#)” on page 3320
  - “[undebbug mail](#)” on page 3321

# debug mail

**Overview** This command turns on debugging for sending emails.  
The **no** variant of this command turns off debugging for sending emails.

**Syntax** debug mail  
no debug mail

**Mode** Privileged Exec

**Examples** To turn on debugging for sending emails, use the command:

```
awplus# debug mail
```

To turn off debugging for sending emails, use the command:

```
awplus# no debug mail
```

**Related commands**

- [delete mail](#)
- [mail](#)
- [mail from](#)
- [mail smtpserver](#)
- [show counter mail](#)
- [show mail](#)
- [undebug mail](#)

# delete mail

**Overview** This command deletes mail from the queue.

You need the *mail-id* from the **show mail** command output to delete specific emails, or use the **all** parameter to clear all messages in the queue completely.

**Syntax** `delete mail [mail-id <mail-id>|all]`

| Parameter | Description   |
|-----------|---|
| mail-id   | Deletes a single mail from the mail queue.  |
|           | <mail-id> A unique mail ID number. Use the <a href="#">show mail</a> command to display this for an item of mail. |
| all       | Delete all the mail in the queue.   |

**Mode** Privileged Exec

**Examples** To delete the unique mail item "20060912142356.1234" from the queue, use the command:

```
awplus# delete mail 20060912142356.1234
```

To delete all mail from the queue, use the command:

```
awplus# delete mail all
```

**Related commands**

- [debug mail](#)
- [mail](#)
- [mail from](#)
- [mail smtpserver](#)
- [show mail](#)

# mail

**Overview** This command sends an email using the SMTP protocol. If you specify a file the text inside the file is sent in the message body.

If you do not specify the **to**, **file**, or **subject** parameters, the CLI prompts you for the missing information.

Before you can send mail using this command, you must specify the sending email address using the [mail from](#) command and a mail server using the [mail smtpserver](#) command.

**Syntax** mail [to <to>] [subject <subject>] [file <filename>]

| Parameter | Description   |
|-----------|---|
| to        | The email recipient.<br><br><to> Email address.   |
| subject   | Description of the subject of this email. Use quote marks when the subject text contains spaces.<br><br><subject> String. |
| file      | File to insert as text into the message body.<br><br><filename> String.   |

**Mode** Privileged Exec

**Usage notes** When you use the **mail** command you can use parameter substitutions in the subject field. The following table lists the parameters that can be substituted and their descriptions:

| Parameter            | Description  |
|----------------------|--|
| <%N>                 | When this parameter is specified, the %N is replaced by the host name of your device.                                  |
| <%S>                 | When this parameter is specified, the %S is replaced by the serial number of your device.                              |
| <%D><br><%L><br><%T> | When any of these parameters is specified, they are replaced by the current date and time (local time) on your device. |
| <%U>                 | When this parameter is specified, the %U is replaced by the current date and time (UTC time) on your device.           |

**NOTE:** If no local time is configured, it will use UTC.

**Examples** To send an email to "admin@example.com" with the subject "test email" and with the message body inserted from the file "test.conf", use the command:

```
awplus# mail to admin@example.com subject "test email" filename  
test.conf
```

To send an email using parameter substitutions for the host name, serial number and date, use the commands:

```
awplus# mail to admin@example.com subject "Sending email from  
Hostname:%N Serial Number:%S Date:%T"
```

**Related  
commands**

[debug mail](#)

[delete mail](#)

[mail smtpserver port](#)

[show counter mail](#)

[show mail](#)

# mail from

**Overview** This command sets an email address as the sender. You must specify a sending email address with this command before you can send email.

Use the **no** variant of this command to remove the “mail from” address.

**Syntax** mail from <from>  
no mail from

| Parameter | Description  |
|-----------|--|
| <from>    | The email address that the mail is sent from (also known as the hostname). |

**Mode** Global Configuration

**Example** To set up your email address as the sender “kaji@nerv.com”, use the command:

```
awplus(config)# mail from kaji@nerv.com
```

**Related commands**

- debug mail
- delete mail
- mail
- mail smtpserver
- show counter mail
- show mail
- undebug mail

# mail smtpserver

**Overview** This command specifies the IP address or domain name of the SMTP server that your device sends email to. You must specify a mail server with this command before you can send email.

Use the **no** variant of this command to remove the configured mail server.

**Syntax** mail smtpserver {<ip-address>|<name>}  
no mail smtpserver

| Parameter    | Description   |
|--------------|---|
| <ip-address> | Internet Protocol (IP) address for the mail server.                   |
| <name>       | Domain name (FQDN) for the mail server (also known as the host name). |

**Mode** Global Configuration

**Usage notes** If you specify the server by specifying its domain name, you must also ensure that the DNS client on your device is enabled. It is enabled by default but if it has been disabled, you can re-enable it by using the [ip domain-lookup](#) command.

**Examples** To specify a mail server at "192.168.0.1", use the command:

```
awplus(config)# mail smtpserver 192.168.0.1
```

To specify a mail server that has a host name of "smtp.example.com", use the command:

```
awplus(config)# mail smtpserver smtp.example.com
```

To remove the configured mail server, use the command:

```
awplus(config)# no mail smtpserver
```

**Related commands**

- [debug mail](#)
- [delete mail](#)
- [mail](#)
- [mail from](#)
- [show counter mail](#)
- [show mail](#)

# mail smtpserver authentication

**Overview** Use this command to configure SMTP mail server authentication.

Use the **no** variant of this command to remove the configured SMTP mail server authentication.

**Syntax** `mail smtpserver authentication {crammd5|login|plain} username <username> password [8] <password>`  
`no mail smtpserver authentication`

| Parameter  | Description  |
|------------|--|
| crammd5    | This is a Challenge Request Authentication Mechanism based on the HMAC-MD5 mechanism and is the most secure option.  |
| login      | A BASE64 encryption method   |
| plain      | A BASE64 encryption method   |
| <username> | Registered user name   |
| 8          | The registered user password is presented in an already encrypted format. This is how the running configuration stores the plain text password and is not for general use. |
| <password> | Registered user password   |

**Default** No authentication option is set by default.

**Mode** Global Configuration

**Usage notes** You cannot change the IP address or Domain Name of the SMTP server if authentication is configured. If you attempt to change it when authentication is configured, the following error message is displayed:

```
% Error: authentication configuration still exists
```

**Examples** To configure the SMTP mail server authentication to crammd5, use the commands:

```
awplus# configure terminal
awplus(config)# mail smtpserver authentication crammd5 username
admin password unguessablePassword
```

To remove SMTP mail server authentication, use the commands:

```
awplus# configure terminal
awplus(config)# no mail smtpserver authentication
```

**Output** Figure 65-1: Example output from **show mail**:

```
awplus#show mail
Mail Settings
-----
State                : Alive
SMTP Server          : 1.2.3.4
Host Name            : admin@example.com
Authentication       : crammd5
Username             : admin
Debug                : Disabled

awplus#show running-config
!
mail smtpserver authentication plain username admin password 8
aF0a9pkjbmXGfl6TlSk/GakeIK5tMYN6LqMYT8Ia2qw=
!
```

**Command  
changes**

Version 5.4.8-1.1: command added

# mail smtpserver port

**Overview** Use this command to configure the SMTP mail client/server communication port. Use the **no** variant of this command to remove the configured port and set it back to the default port.

**Syntax** mail smtpserver port <port>  
no mail smtpserver port

| Parameter | Description                           |
|-----------|---------------------------------------|
| <port>    | Port number from the range 1 to 65535 |

**Default** The default port value is 25 if TLS is not enabled for the SMTP server, 587 if TLS is enabled with STARTTLS, and 465 if TLS is enabled with SMTPS.

**Mode** Global Configuration

**Examples** To configure the mail server communication over port 587, use the commands:

```
awplus# configure terminal
awplus(config)# mail smtpserver port 587
```

To revert to the default SMTP mail server communication port, use the commands:

```
awplus# configure terminal
awplus(config)# no mail smtpserver port
```

**Output** Figure 65-2: Example output from **show mail**:

```
awplus#show mail
Mail Settings
-----
State                : Alive
SMTP Server          : 10.24.165.4
Host Name             : admin@example.com
Authentication       : plain
Username             : admin
Port                 : 587
Use TLS              : STARTTLS
Debug                : Disabled

awplus#show running-config
!
mail smtpserver port 587
!
```

**Related commands** [debug mail](#)  
[delete mail](#)

mail  
mail from  
mail smtpserver  
mail smtpserver tls  
show counter mail  
show mail

**Command changes** Version 5.4.8-1.1: command added

# mail smtpserver tls

**Overview** Use this command to configure the device to send emails over a TLS connection to the SMTP server instead of sending in clear-text. If the SMTP server does not support receiving emails over a TLS connection, sending emails from the device will fail.

Use the **no** variant of this command to configure the device to send emails over an unencrypted TCP connection (clear text).

**Syntax** mail smtpserver tls [starttls|smtps]  
no mail smtpserver tls

| Parameter | Description   |
|-----------|---|
| starttls  | The connection starts as clear-text SMTP first and then the client establishes a TLS connection using the STARTTLS extension. |
| smtps     | Use a TLS connection from the start.  |

**Default** By default, TLS is disabled and the device sends emails in clear-text.

**Mode** Global Configuration

**Examples** To send emails to the SMTP server over a TLS connection that will be established by the STARTTLS method, use the commands:

```
awplus# configure terminal  
awplus(config)# mail smtpserver tls starttls
```

To send emails to the SMTP server over a TLS connection from the beginning, use the commands:

```
awplus# configure terminal  
awplus(config)# mail smtpserver tls smtps
```

To send emails to the SMTP server in clear text, use the commands:

```
awplus# configure terminal  
awplus(config)# no mail smtpserver tls
```

**Related commands** mail

show mail

mail smtpserver

mail smtpserver port

mail smtpserver authentication

**Command changes** Version 5.5.3-0.1: command added

# show counter mail

**Overview** This command displays the mail counters.

**Syntax** `show counter mail`

**Mode** User Exec and Privileged Exec

**Example** To show the emails in the queue use the command:

```
awplus# show counter mail
```

**Output** Figure 65-3: Example output from the **show counter mail** command

```
Mail Client (SMTP) counters
Mails Sent           ..... 2
Mails Sent Fails     ..... 1
```

**Table 1:** Parameters in the output of the **show counter mail** command

| Parameter        | Description   |
|------------------|---|
| Mails Sent       | The number of emails sent successfully since the last device restart.         |
| Mails Sent Fails | The number of emails the device failed to send since the last device restart. |

# RMON Commands

## Introduction

**Overview** This chapter provides an alphabetical reference for commands used to configure Remote Monitoring (RMON).

For an introduction to RMON and an RMON configuration example, see the [RMON Feature Overview and Configuration Guide](#).

RMON is disabled by default in AlliedWare Plus™. No RMON alarms or events are configured.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

- Command List**
- [“rmon alarm”](#) on page 3323
  - [“rmon collection history”](#) on page 3326
  - [“rmon collection stats”](#) on page 3327
  - [“rmon event”](#) on page 3328
  - [“show rmon alarm”](#) on page 3329
  - [“show rmon event”](#) on page 3330
  - [“show rmon history”](#) on page 3332
  - [“show rmon statistics”](#) on page 3334

# rmon alarm

**Overview** Use this command to configure an RMON alarm to monitor the value of an SNMP object, and to trigger specified events when the monitored object crosses specified thresholds.

To specify the action taken when the alarm is triggered, use the event index of an event defined by the [rmon event](#) command.

Use the **no** variant of this command to remove the alarm configuration.

**NOTE:** You can only configure alarms for switch port interfaces, not for VLANs.

**Syntax** **User-defined alarm:**

```
rmon alarm <alarm-index> <oid.index> interval <1-2147483647>
{delta|absolute} rising-threshold <1-2147483647> event
<rising-event-index> falling-threshold <1-2147483647> event
<falling-event-index> [alarmstartup {1|2|3}] [owner <owner>]
```

**Eventwatch alarm, do not use (used by Vista Manager EX only):**

```
rmon alarm <alarm-index> <oid.index> interval <1-4294967295>
{delta|absolute} rising-threshold <1-2147483647> event
eventwatch falling-threshold <1-2147483647> event eventwatch
[owner <owner>]
```

```
no rmon alarm <alarm-index>
```

| Parameter                  | Description   |
|----------------------------|---|
| <alarm-index>              | Alarm entry index value from the range 1 to 65535 seconds.  |
| <oid.index>                | The variable SNMP MIB Object Identifier (OID) name to be monitored, for either etherStats or etherHistory entries. The entries can be either of the following formats:<br>- etherStatsEntry.<field>.<stats-index> or etherHistoryEntry.<field>.<history-index>, or<br>- etherStatsFieldName.<stats-index> or etherHistoryFieldName.<history-index>. To define the <stats-index>, use the <a href="#">rmon collection stats</a> command. To define the <history-index>, use the <a href="#">rmon collection history</a> command. |
| interval<br><1-2147483647> | Polling interval in seconds from the range 1 to 2147483647.   |
| delta                      | The RMON MIB alarmSampleType: the change in the monitored MIB object value between the beginning and end of the polling interval.   |
| absolute                   | The RMON MIB alarmSampleType: the value of the monitored MIB object.  |

| Parameter                           | Description  |
|-------------------------------------|--|
| rising-threshold<br><1-2147483647>  | Rising threshold value of the alarm entry in seconds from the range 1 to 2147483647.   |
| <rising-event-index>                | From the range 1 to 65535 seconds. The event to be triggered when the monitored object value reaches the rising threshold value. This is the event index of an event specified by the <code>rmon event</code> command.                       |
| eventwatch                          | The alarm triggers an eventwatch event. This mechanism is used by Vista Manager EX, the Allied Telesis network management and monitoring tool. Do not use this parameter; use the <code>&lt;rising-event-index&gt;</code> parameter instead. |
| falling-threshold<br><1-2147483647> | Falling threshold value of the alarm entry in seconds from the range 1 to 2147483647.  |
| <falling-event-index>               | From the range 1 to 65535 seconds. The event to be triggered when the monitored object value reaches the falling threshold value. This is an event index of an event specified by the <code>rmon event</code> command.                       |
| eventwatch                          | The alarm triggers an eventwatch event. This mechanism is used by Vista Manager EX, the Allied Telesis network management and monitoring tool. Do not use this parameter; use the <code>&lt;rising-event-index&gt;</code> parameter instead. |
| alarmstartup {1 2 3}                | Whether RMON can trigger a falling alarm (1), a rising alarm (2) or either (3) when you first start monitoring. See the Usage section for more information. The default is setting 3 (either).   |
| owner <owner>                       | Arbitrary owner name to identify the alarm entry.  |

**Default** By default, there are no alarms.

**Mode** Global Configuration

**Usage notes** RMON alarms have a rising and falling threshold. Once the alarm monitoring is operating, you cannot have a falling alarm unless there has been a rising alarm and vice versa.

However, when you start RMON alarm monitoring, an alarm must be generated without the other type of alarm having first been triggered. The **alarmstartup** parameter allows this. It is used to say whether RMON can generate a rising alarm (1), a falling alarm (2) or either alarm (3) as the first alarm.

Note that you specify the SNMP MIB Object Identifier (OID) as a dotted decimal value, using one of the following forms:

- etherStatsEntry.<field>.<stats-index> or  
etherHistoryEntry.<field>.<history-index>.  
For example, etherHistoryEntry.8.8

- or, etherStatsFieldName.<stats-index> or etherHistoryFieldName.<history-index>. For example, etherHistoryMulticastPkts.8

If you enter the first form (etherHistoryEntry.8.8), the device will save it as the second form (etherHistoryMulticastPkts.8) in the running-config.

**Example** To configure an alarm to:

- monitor the change per minute in the etherStatsPkt value for interface 22 (defined by stats-index 22 in the [rmon collection stats](#) command)
- and trigger event 2 (defined by the [rmon event](#) command) when the change reaches the rising threshold 400
- and trigger event 3 when it reaches the falling threshold 200
- and identify this alarm as belonging to the user with username Maria

use the following commands:

```
awplus# configure terminal
awplus(config)# rmon alarm 229 etherStatsEntry.22.5 interval 60
delta rising-threshold 400 event 2 falling-threshold 200 event
3 alarmstartup 3 owner maria
```

To configure an alarm that:

- every 10 seconds, checks the number of multicast packets
- in the latest history control table entry controlled by history-index 8
- to see if the number of packets has increased to 15 or dropped to 5
- and if it has, triggers event 10

use either of the following commands:

```
awplus(config)# rmon alarm 56 etherHistoryMulticastPkts.8
interval 10 absolute rising-threshold 15 event 10
falling-threshold 5 event 10

awplus(config)# rmon alarm 56 etherHistoryEntry.8.8 interval 10
absolute rising-threshold 15 event 10 falling-threshold 5 event
10
```

**Related commands** [rmon collection history](#)  
[rmon collection stats](#)  
[rmon event](#)

# rmon collection history

**Overview** Use this command to create a history statistics control group to store a specified number of snapshots (buckets) of the standard RMON statistics for the switch port, and to collect these statistics at specified intervals. If there is sufficient memory available, then the device will allocate memory for storing the set of buckets that comprise this history control.

Use the **no** variant of this command to remove the specified history control configuration.

**NOTE:** A history can only be collected for switch port interfaces, not for VLANs.

**Syntax** `rmon collection history <history-index> [buckets <1-65535>]  
[interval <1-3600>] [owner <owner>]  
no rmon collection history <history-index>`

| Parameter         | Description  |
|-------------------|--|
| <history-index>   | A unique RMON history control entry index value from the range 1 to 65535.                           |
| buckets <1-65535> | Number of requested buckets to store snapshots from the range 1 to 65535. The default is 50 buckets. |
| interval <1-3600> | Polling interval in seconds. Default 1800 second polling interval from the range 1 to 3600.          |
| owner <owner>     | Owner name to identify the entry.  |

**Default** The default interval is 1800 seconds and the default number of buckets is 50.

**Mode** Interface Configuration

**Example** To create a history statistics control group with ID 200 to store 500 snapshots with an interval of 600 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# rmon collection history 200 buckets 500
interval 600 owner herbert
```

To disable the history statistics control group, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no rmon collection history 200
```

**Related commands**

- [rmon alarm](#)
- [rmon collection stats](#)
- [rmon event](#)

# rmon collection stats

**Overview** Use this command to enable the collection of RMON statistics on a switch port, and assign an index number by which to access these collected statistics.

Use the **no** variant of this command to stop collecting RMON statistics on this switch port.

**NOTE:** *Statistics can only be collected for switch port interfaces, not for VLANs.*

**Syntax** `rmon collection stats <collection-index> [owner <owner>]`  
`no rmon collection stats <collection-index>`

| Parameter                             | Description  |
|---------------------------------------|--|
| <code>&lt;collection-index&gt;</code> | Give this collection of statistics an index number to uniquely identify it. This is the index to use to access the statistics collected for this switch port. Use a number in the range of 1 to 65535. |
| <code>owner &lt;owner&gt;</code>      | An arbitrary owner name to identify this statistics collection entry.  |

**Default** RMON statistics are not enabled by default.

**Mode** Interface Configuration

**Example** To enable the collection of RMON statistics with a statistics index of 200, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# rmon collection stats 200 owner myrtle
```

To stop collecting RMON statistics, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no rmon collection stats 200
```

**Related commands** [rmon alarm](#)  
[rmon collection history](#)  
[rmon event](#)

# rmon event

**Overview** Use this command to create an event definition for a log or a trap or both. Then you can use this event index in the [rmon alarm](#) command to indicate whether to send an SNMP trap or log message (or both) when an alarm is triggered.

Use the **no** variant of this command to remove the event definition.

**Syntax**

```
rmon event <event-index> [description <description>|owner <owner>| trap <trap>]
```

```
rmon event <event-index> [log [description <description>|owner <owner>|trap <trap>] ]
```

```
rmon event <event-index> [log trap [description <description>|owner <owner>] ]
```

```
no rmon event <event-index>
```

| Parameter                | Description                               |
|--------------------------|---|
| <event-index>            | <1-65535> Unique event entry index value. |
| log                      | Log event type.                           |
| trap                     | Trap event type.                          |
| log trap                 | Log and trap event type.                  |
| description<description> | Event entry description.                  |
| owner <owner>            | Owner name to identify the entry.         |

**Default** No event is configured by default.

**Mode** Global Configuration

**Example** To create an event definition with an index of 299 for a log, use this command:

```
awplus# configure terminal
awplus(config)# rmon event 299 log description cond3 owner
alfred
```

To remove the event definition, use the command:

```
awplus# configure terminal
awplus(config)# no rmon event 299
```

**Related commands** [rmon alarm](#)

# show rmon alarm

**Overview** Use this command to display the alarms and threshold configured for the RMON probe.

**Syntax** `show rmon alarm`

**Mode** User Exec and Privileged Exec

**Example** To display the alarms and threshold, use this command:

```
awplus# show rmon alarm
```

**Related commands** [rmon alarm](#)

# show rmon event

**Overview** Use this command to display the events configured for the RMON probe.

**Syntax** show rmon event

**Mode** User Exec and Privileged Exec

**Output** Figure 66-1: Example output from the **show rmon event** command

```
awplus#sh rmon event
event Index = 787
  Description TRAP
  Event type log & trap
  Event community name gopher
  Last Time Sent = 0
  Owner RMON_SNMP

event Index = 990
  Description TRAP
  Event type trap
  Event community name teabo
  Last Time Sent = 0
  Owner RMON_SNMP
```

# banner login (SSH)

**Overview** This command configures a login banner on the SSH server. This displays a message on the remote terminal of the SSH client before the login prompt. SSH client version 1 does not support this banner.

To add a banner, first enter the command **banner login**, and hit [Enter]. Write your message. You can use any character and spaces. Use Ctrl+D at the end of your message to save the text and re-enter the normal command line mode.

The banner message is preserved if the device restarts.

The **no** variant of this command deletes the login banner from the device.

**Syntax** banner login  
no banner login

**Default** No banner is defined by default.

**Mode** Global Configuration

**Examples** To set a login banner message, use the commands:

```
awplus# configure terminal  
awplus(config)# banner login
```

The screen will prompt you to enter the message:

Type CNTL/D to finish.

... banner message comes here ...

Enter the message. Use Ctrl+D to finish, like this:

```
^D  
awplus(config)#
```

To remove the login banner message, use the commands:

```
awplus# configure terminal  
awplus(config)# no banner login
```

**Related commands** [show banner login](#)

# clear ssh

**Overview** This command deletes Secure Shell sessions currently active on the device. This includes both incoming and outgoing sessions. The deleted sessions are closed. You can only delete an SSH session if you are a system manager or the user who initiated the session. If **all** is specified then all active SSH sessions are deleted.

**Syntax** `clear ssh {<1-65535>|all}`

| Parameters | Description  |
|------------|--|
| <1-65535>  | Specify a session ID in the range 1 to 65535 to delete a specific session. |
| all        | Delete all SSH sessions.   |

**Mode** Privileged Exec

**Examples** To stop the current SSH session 123, use the command:

```
awplus# clear ssh 123
```

To stop all SSH sessions active on the device, use the command:

```
awplus# clear ssh all
```

**Related commands** [service ssh](#)  
[ssh](#)

# crypto key destroy hostkey

**Overview** This command deletes the existing public and private keys of the SSH server.

**Syntax** `crypto key destroy hostkey {dsa|ecdsa|ed25519|rsa|rsa1}`

| Parameters | Description  |
|------------|--|
| dsa        | Deletes the existing DSA public and private keys.  |
| ecdsa      | Deletes the existing ECDSA public and private keys.  |
| ed25519    | Deletes the existing Ed25519 public and private keys.  |
| rsa        | Deletes the existing RSA public and private keys that were configured for SSH version 2 connections.   |
| rsa1       | Deletes the existing RSA public and private keys that were configured for SSH version 1 connections. From AlliedWare Plus version 5.5.1-1.1 onwards, SSH version 1 is not supported. |

**Mode** Global Configuration

**Example** To destroy the RSA host key used for SSH version 2 connections, use the commands:

```
awplus# configure terminal
awplus(config)# crypto key destroy hostkey rsa
```

**Related commands** [crypto key generate hostkey](#)  
[service ssh](#)

**Command changes** Version 5.5.2-2.1: **ed25519** parameter added

# crypto key destroy userkey

**Overview** This command destroys the existing public and private keys of an SSH user configured on the device.

**Syntax** `crypto key destroy userkey <username>`  
{dsa|ecdsa|ed25519|rsa|rsa1}

| Parameters | Description  |
|------------|--|
| <username> | Name of the user whose userkey you are destroying. The username must begin with a letter. Valid characters are all numbers, letters, and the underscore, hyphen and full stop symbols. |
| dsa        | Deletes the existing DSA userkey.  |
| ecdsa      | Deletes the existing ECDSA userkey.  |
| ed25519    | Deletes the existing Ed25519 userkey.  |
| rsa        | Deletes the existing RSA userkey that was configured for SSH version 2 connections.  |
| rsa1       | Deletes the existing RSA userkey that was configured for SSH version 1 connections. From AlliedWare Plus version 5.5.1-1.1 onwards, SSH version 1 is not supported.                    |

**Mode** Global Configuration

**Example** To destroy the RSA user key for the SSH user `remoteuser`, use the commands:

```
awplus# configure terminal
awplus(config)# crypto key destroy userkey remoteuser rsa
```

**Related commands**

- [crypto key generate hostkey](#)
- [crypto key generate userkey](#)
- [show ssh](#)
- [show crypto key hostkey](#)

**Command changes** Version 5.5.2-2.1: **ed25519** parameter added

# crypto key generate hostkey

**Overview** This command generates public and private keys for the SSH server.

When you enable the SSH server, if no host keys exist, the server automatically generates SSHv2 host key pairs using Ed25519 with a keysize of 256, ECDSA with a curve length of 384, and RSA with a 2048-bit key (unless in secure mode, when it only generates the ECDSA key).

If you need a key with different parameters than this, you can use this command to generate that key before you enable the SSH server. If a host key exists with the same cryptography algorithm, this command replaces the old host key with the new key.

This command is not saved in the device configuration. However, the device saves the keys generated by this command in the non-volatile memory.

**Syntax**

```
crypto key generate hostkey rsa [<1024-16384>]
crypto key generate hostkey ecdsa [<256|384|521>]
crypto key generate hostkey ed25519
```

| Parameters    | Description                                       |
|---------------|---|
| rsa           | Creates an RSA hostkey.                           |
| ecdsa         | Creates an ECDSA hostkey.                         |
| ed25519       | Creates an Ed25519 hostkey with a keysize of 256. |
| <1024-16384>  | The length in bits of the generated key.          |
| <256 384 521> | The ECDSA key size in bits.                       |

**Default** The default key length for RSA is 2048 bits.

The default key size for ECDSA is 384 bits.

**Mode** Global Configuration

**Examples** To generate an RSA host key that is 4096 bits in length, use the commands:

```
awplus# configure terminal
awplus(config)# crypto key generate hostkey rsa 4096
```

To generate an ECDSA host key with an elliptic curve size of 521 bits, use the commands:

```
awplus# configure terminal
awplus(config)# crypto key generate hostkey ecdsa 521
```

To generate an Ed25519 host key with a keysize of 256, use the commands:

```
awplus# configure terminal
awplus(config)# crypto key generate hostkey ed25519
```

**Related commands** `crypto key destroy hostkey`  
`service ssh`  
`show crypto key hostkey`

**Command changes** Version 5.5.2-2.1: **ed25519** parameter added  
Version 5.5.2-0.1: changes to key length and key size ranges and defaults  
Version 5.5.1-1.1: support removed for the ssh-rsa algorithm in OpenSSH and for SSH protocol v1

# crypto key generate userkey

**Overview** This command generates public and private keys for an SSH user using an RSA, ECDSA, or ED25519 cryptography algorithm. To use public key authentication, copy the public key of the user onto the remote SSH server.

This command is not saved in the device configuration. However, the device saves the keys generated by this command in the non-volatile memory.

**Syntax** `crypto key generate userkey <username> rsa [<1024-16384>]`  
`crypto key generate userkey <username> ecdsa [<256|384|521>]`  
`crypto key generate userkey <username> ed25519`

| Parameters    | Description  |
|---------------|--|
| <username>    | Name of the user that the user key is generated for. The username must begin with a letter. Valid characters are all numbers, letters, and the underscore, hyphen and full stop symbols. |
| rsa           | Creates an RSA userkey.  |
| ecdsa         | Creates an ECDSA userkey.  |
| ed25519       | Creates an Ed25519 userkey with a keysize of 256.  |
| <1024-16384>  | The length in bits of the generated key. The default is 2048 bits.   |
| <256 384 521> | The ECDSA key size in bits. The default is 384.  |

**Default** The default key length for RSA is 2048 bits.  
The default key size for ECDSA is 384 bits.

**Mode** Global Configuration

**Examples** To generate a 4096-bit RSA user key for SSH version 2 connections for the user 'bob', use the commands:

```
awplus# configure terminal
awplus(config)# crypto key generate userkey bob rsa 4096
```

To generate an ECDSA user key of key size 521 for the user 'lapo', use the commands:

```
awplus# configure terminal
awplus(config)# crypto key generate userkey lapo ecdsa 521
```

To generate an Ed25519 user key of key size 256 for the user 'lapo', use the commands:

```
awplus# configure terminal
awplus(config)# crypto key generate userkey lapo ed25519
```

**Related commands** `crypto key pubkey-chain userkey`  
`show crypto key userkey`

**Command changes** Version 5.5.2-2.1: **ed25519** parameter added  
Version 5.5.2-0.1: changes to key length and key size ranges and defaults  
Version 5.5.1-1.1: support removed for the ssh-rsa algorithm in OpenSSH and for SSH protocol v1

# crypto key pubkey-chain knownhosts

**Overview** This command adds a public key of the specified SSH server to the known host database on your device. The SSH client on your device uses this public key to verify the remote SSH server.

The key is retrieved from the server. Before adding a key to this database, check that the key sent to you is correct.

If the server's key changes, or if your SSH client does not have the public key of the remote SSH server, then your SSH client will inform you that the public key of the server is unknown or altered.

The **no** variant of this command deletes the public key of the specified SSH server from the known host database on your device.

**Syntax** `crypto key pubkey-chain knownhosts [ip|ipv6] <hostname> [ecdsa|rsa]`  
`no crypto key pubkey-chain knownhosts <1-65535>`

| Parameter                     | Description  |
|-------------------------------|--|
| <code>ip</code>               | Keyword used prior to specifying an IPv4 address   |
| <code>ipv6</code>             | Keyword used prior to specifying an IPv6 address   |
| <code>&lt;hostname&gt;</code> | IPv4/IPv6 address or hostname of a remote server in the format <code>a.b.c.d</code> for an IPv4 address, or in the format <code>x:x::x:x</code> for an IPv6 address. |
| <code>ecdsa</code>            | Specify the ECDSA public key of the server to be added to the known host database.   |
| <code>rsa</code>              | Specify the RSA public key of the server to be added to the known host database.   |
| <code>&lt;1-65535&gt;</code>  | Specify a key identifier when removing a key using the <b>no</b> parameter.  |

**Default** If no cryptography algorithm is specified, then **rsa** is used as the default cryptography algorithm.

**Mode** Privilege Exec

**Usage notes** This command adds a public key of the specified SSH server to the known host database on the device. The key is retrieved from the server. The remote SSH server is verified by using this public key. The user is requested to check the key is correct before adding it to the database.

If the remote server's host key is changed, or if the device does not have the public key of the remote server, then SSH clients will inform the user that the public key of the server is altered or unknown.

**Examples** To add the RSA host key of the remote SSH host IPv4 address 192.0.2.11 to the known host database, use the command:

```
awplus# crypto key pubkey-chain knownhosts 192.0.2.11
```

To delete the second entry in the known host database, use the command:

```
awplus# no crypto key pubkey-chain knownhosts 2
```

**Validation Commands** `show crypto key pubkey-chain knownhosts`

# crypto key pubkey-chain userkey

**Overview** This command adds a public key for an SSH user on the SSH server. This allows the SSH server to support public key authentication for the SSH user. When configured, the SSH user can access the SSH server without providing a password from the remote host.

The **no** variant of this command removes a public key for the specified SSH user that has been added to the public key chain. When a SSH user's public key is removed, the SSH user can no longer login using public key authentication.

**Syntax** `crypto key pubkey-chain userkey <username> [<filename>]`  
`no crypto key pubkey-chain userkey <username> <1-65535>`

| Parameters | Description   |
|------------|---|
| <username> | Name of the user that the SSH server associates the key with. The username must begin with a letter. Valid characters are all numbers, letters, and the underscore, hyphen and full stop symbols. Default: no default |
| <filename> | Filename of a key saved in flash. Valid characters are any printable character. You can add a key as a hexadecimal string directly into the terminal if you do not specify a filename.                                |
| <1-65535>  | The key ID number of the user's key. Specify the key ID to delete a key.  |

**Mode** Global Configuration

**Usage notes** You should import the public key file from the client node. The device can read the data from a file on the flash or user terminal.

Or you can add a key as text into the terminal. To add a key as text into the terminal, first enter the command **crypto key pubkey-chain userkey <username>**, and hit [Enter]. Enter the key as text. Note that the key you enter as text must be a valid SSH RSA key, not random ASCII text. Use [Ctrl]+D after entering it to save the text and re-enter the normal command line mode.

Note you can generate a valid SSH RSA key on the device first using the **crypto key generate host rsa** command. View the SSH RSA key generated on the device using the **show crypto hostkey rsa** command. Copy and paste the displayed SSH RSA key after entering the **crypto key pubkey-chain userkey <username>** command. Use [Ctrl]+D after entering it to save it.

**Examples** To generate a valid SSH RSA key on the device and add the key, use the following commands:

```
awplus# configure terminal
awplus(config)# crypto key generate host rsa
awplus(config)# exit

awplus# show crypto key hostkey
rsaAAAAB3NzaC1yc2EAAAABIwAAAIEAr1s7SokW5aW2fcOw1TStpb9J20bWluhnUC768EoWhyPW6FZ2t5360O5M29EpKBmGq1kQaz5V0mU9IQe66+5YyD4UxOKSDtTI+7jtjDcoGWHb2u4sFwRpXwJZcgYrXW16+6NvNbk+h+c/pqGDijj4SvfZZfeITzvvyZW4/I4pbN8=

awplus# configure terminal
awplus(config)# crypto key pubkey-chain userkey joeType CNTRL/D
to
finish:AAAAB3NzaC1yc2EAAAABIwAAAIEAr1s7SokW5aW2fcOw1TStpb9J20bWluhnUC768EoWhyPW6FZ2t5360O5M29EpKBmGq1kQaz5V0mU9IQe66+5YyD4UxOKSDtTI+7jtjDcoGWHb2u4sFwRpXwJZcgYrXW16+6NvNbk+h+c/pqGDijj4SvfZZfeITzvvyZW4/I4pbN8=control-D

awplus(config)#
```

To add a public key for the user `graydon` from the file `key.pub`, use the commands:

```
awplus# configure terminal
awplus(config)# crypto key pubkey-chain userkey graydon key.pub
```

To add a public key for the user `tamara` from the terminal, use the commands:

```
awplus# configure terminal
awplus(config)# crypto key pubkey-chain userkey tamara
```

and enter the key. Use Ctrl+D to finish.

To remove the first key entry from the public key chain of the user `john`, use the commands:

```
awplus# configure terminal
awplus(config)# no crypto key pubkey-chain userkey john 1
```

**Related commands** [show crypto key pubkey-chain userkey](#)

# debug ssh client

**Overview** This command enables the SSH client debugging facility. When enabled, any SSH, SCP and SFTP client sessions send diagnostic messages to the login terminal.

The **no** variant of this command disables the SSH client debugging facility. This stops the SSH client from generating diagnostic debugging message.

**Syntax** `debug ssh client [brief|full]`  
`no debug ssh client`

| Parameter | Description               |
|-----------|---------------------------|
| brief     | Enables brief debug mode. |
| full      | Enables full debug mode.  |

**Default** SSH client debugging is disabled by default.

**Mode** Privileged Exec and Global Configuration

**Examples** To start SSH client debugging, use the command:

```
awplus# debug ssh client
```

To start SSH client debugging with extended output, use the command:

```
awplus# debug ssh client full
```

To disable SSH client debugging, use the command:

```
awplus# no debug ssh client
```

**Related commands** [debug ssh server](#)  
[show ssh client](#)  
[undebug ssh client](#)

**Command changes** Version 5.5.3-1.1: added to AR1050V

# debug ssh server

**Overview** This command enables the SSH server debugging facility. When enabled, the SSH server sends diagnostic messages to the system log. To display the debugging messages on the terminal, use the **terminal monitor** command.

The **no** variant of this command disables the SSH server debugging facility. This stops the SSH server from generating diagnostic debugging messages.

**Syntax** `debug ssh server [brief|full]`  
`no debug ssh server`

| Parameter | Description               |
|-----------|---------------------------|
| brief     | Enables brief debug mode. |
| full      | Enables full debug mode.  |

**Default** SSH server debugging is disabled by default.

**Mode** Privileged Exec and Global Configuration

**Examples** To start SSH server debugging, use the command:

```
awplus# debug ssh server
```

To start SSH server debugging with extended output, use the command:

```
awplus# debug ssh server full
```

To disable SSH server debugging, use the command:

```
awplus# no debug ssh server
```

**Related commands** [debug ssh client](#)  
[show ssh server](#)  
[undebug ssh server](#)

# service ssh

**Overview** Use this command to enable the Secure Shell server on the device. Once enabled, connections coming from SSH clients are accepted.

When you enable the SSH server, if no host keys exist, the server automatically generates SSHv2 host key pairs using ECDSA with a curve length of 384, and RSA with a 1024-bit key (unless in secure mode, when it only generates the ECDSA key).

If you need a key with different parameters than this, you can use the [crypto key generate hostkey](#) command to generate that key before you enable the SSH server.

Use the **no** variant of this command to disable the Secure Shell server. When the Secure Shell server is disabled, connections from SSH, SCP, and SFTP clients are not accepted. This command does not affect existing SSH sessions. To terminate existing sessions, use the [clear ssh](#) command.

**Syntax** `service ssh [ip|ipv6]`  
`no service ssh [ip|ipv6]`

**Default** The Secure Shell server is disabled by default. Both IPv4 and IPv6 Secure Shell server are enabled when you issue **service ssh** without specifying the optional **ip** or **ipv6** parameters.

The server supports SSH version 2 only (not SSH version 1).

**Mode** Global Configuration

**Examples** To enable both the IPv4 and the IPv6 Secure Shell server, use the commands:

```
awplus# configure terminal
awplus(config)# service ssh
```

To enable the IPv4 Secure Shell server only, use the commands:

```
awplus# configure terminal
awplus(config)# service ssh ip
```

To enable the IPv6 Secure Shell server only, use the commands:

```
awplus# configure terminal
awplus(config)# service ssh ipv6
```

To disable both the IPv4 and the IPv6 Secure Shell server, use the commands:

```
awplus# configure terminal
awplus(config)# no service ssh
```

To disable the IPv4 Secure Shell server only, use the commands:

```
awplus# configure terminal
awplus(config)# no service ssh ip
```

To disable the IPv6 Secure Shell server only, use the commands:

```
awplus# configure terminal  
awplus(config)# no service ssh ipv6
```

Version 5.5.1-1.1: support removed for the ssh-rsa algorithm in OpenSSH and for SSH protocol v1

# show banner login

**Overview** This command displays the banner message configured on the device. The banner message is displayed to the remote user before user authentication starts.

**Syntax** `show banner login`

**Mode** User Exec, Privileged Exec, Global Configuration, Interface Configuration, Line Configuration

**Example** To display the current login banner message, use the command:

```
awplus# show banner login
```

**Related commands** [banner login \(SSH\)](#)

# show crypto key hostkey

**Overview** This command displays the public keys generated on the device for the SSH server.

When you enable the SSH server, if no host keys exist, the server automatically generates SSHv2 host key pairs using ECDSA with a curve length of 384, and RSA with a 1024-bit key (unless in secure mode, when it only generates the ECDSA key).

The private key remains on the device secretly. The public key is copied to SSH clients to identify the server. This command displays the public key.

**Syntax** `show crypto key hostkey [dsa|ecdsa|rsa|rsa1]`

| Parameter | Description  |
|-----------|--|
| dsa       | Displays the DSA algorithm public key.   |
| ecdsa     | Displays the ECDSA algorithm public key.   |
| rsa       | Displays the RSA algorithm public key for SSH version 2 connections.   |
| rsa1      | Displays the RSA algorithm public key for SSH version 1 connections. From AlliedWare Plus 5.5.1-1.1 onwards, SSH version 1 is not supported. |

**Mode** User Exec, Privileged Exec and Global Configuration

**Examples** To show the public keys generated on the device for SSH server, use the command:

```
awplus# show crypto key hostkey
```

To display the RSA public key of the SSH server, use the command:

```
awplus# show crypto key hostkey rsa
```

**Output** Figure 67-1: Example output from the **show crypto key hostkey** command

```
Type Bits Fingerprint
-----
rsa 1024 SHA256:T/sVz5OoA1HHXcov9dXzGGQg8avRUYh1psxNSUcSOvs
ecdsa 384 SHA256:qVn/KpN5X5ct5CJakxE40mPWmPvW2vIbBjF4SA2bZkM
```

**Table 1:** Parameters in output of the **show crypto key hostkey** command

| Parameter   | Description                         |
|-------------|-------------------------------------|
| Type        | Algorithm used to generate the key. |
| Bits        | Length in bits of the key.          |
| Fingerprint | Checksum value for the public key.  |

**Related commands** [crypto key destroy hostkey](#)  
[crypto key generate hostkey](#)

# show crypto key pubkey-chain knownhosts

**Overview** This command displays the list of public keys maintained in the known host database on the device.

**Syntax** show crypto key pubkey-chain knownhosts [*<1-65535>*]

| Parameter              | Description   |
|------------------------|---|
| <i>&lt;1-65535&gt;</i> | Key identifier for a specific key. Displays the public key of the entry if specified. |

**Default** Display all keys.

**Mode** User Exec, Privileged Exec and Global Configuration

**Examples** To display public keys of known SSH servers, use the command:

```
awplus# show crypto key pubkey-chain knownhosts
```

To display the key data of the first entry in the known host data, use the command:

```
awplus# show crypto key pubkey-chain knownhosts 1
```

**Output** Figure 67-2: Example output from the **show crypto key public-chain knownhosts** command

| No | Hostname                                 | Type | Fingerprint                                     |
|----|--|------|---|
| 1  | 172.16.23.1                              | rsa  | c8:33:b1:fe:6f:d3:8c:81:4e:f7:2a:aa:a5:be:df:18 |

# show crypto key pubkey-chain userkey

**Overview** This command displays the public keys registered with the SSH server for SSH users. These keys allow remote users to access the device using public key authentication. By using public key authentication, users can access the SSH server without providing password.

**Syntax** `show crypto key pubkey-chain userkey <username> [<1-65535>]`

| Parameter  | Description  |
|------------|--|
| <username> | User name of the remote SSH user whose keys you wish to display. The username must begin with a letter. Valid characters are all numbers, letters, and the underscore, hyphen and full stop symbols. |
| <1-65535>  | Key identifier for a specific key.   |

**Default** Display all keys.

**Mode** User Exec, Privileged Exec and Global Configuration

**Example** To display the public keys for the user `manager` that are registered with the SSH server, use the command:

```
awplus# show crypto key pubkey-chain userkey manager
```

**Output** Figure 67-3: Example output from the **show crypto key public-chain userkey** command

| No | Type | Bits | Fingerprint                                     |
|----|------|------|---|
| 1  | dsa  | 1024 | 2b:cc:df:a8:f8:2e:8f:a4:a5:4f:32:ea:67:29:78:fd |
| 2  | rsa  | 2048 | 6a:ba:22:84:c1:26:42:57:2c:d7:85:c8:06:32:49:0e |

**Table 3:** Parameters in the output of the **show crypto key userkey** command

| Parameter   | Description                             |
|-------------|---|
| No          | Number ID of the key.                   |
| Type        | The algorithm used to generate the key. |
| Bits        | Length in bits of the key.              |
| Fingerprint | Checksum value for the key.             |

**Related commands** [crypto key pubkey-chain userkey](#)

# show crypto key userkey

**Overview** This command displays the public keys created on this device for the specified SSH user.

**Syntax** `show crypto key userkey <username> [dsa|rsa|rsa1]`

| Parameter  | Description   |
|------------|---|
| <username> | User name of the local SSH user whose keys you wish to display. The username must begin with a letter. Valid characters are all numbers, letters, and the underscore, hyphen and full stop symbols. |
| dsa        | Displays the DSA public key.  |
| rsa        | Displays the RSA public key used for SSH version 2 connections.   |
| rsa1       | Displays the RSA key used for SSH version 1 connections.  |

**Mode** User Exec, Privileged Exec and Global Configuration

**Examples** To show the public key generated for the user, use the command:

```
awplus# show crypto key userkey manager
```

To store the RSA public key generated for the user manager to the file "user.pub", use the command:

```
awplus# show crypto key userkey manager rsa > manager-rsa.pub
```

**Output** Figure 67-4: Example output from the **show crypto key userkey** command

| Type | Bits | Fingerprint                                     |

# show ssh

**Overview** This command displays the active SSH sessions on the device, both incoming and outgoing.

**Syntax** `show ssh`

**Mode** User Exec, Privileged Exec and Global Configuration

**Example** To display the current SSH sessions on the device, use the command:

```
awplus# show ssh
```

**Output** Figure 67-6: Example output from the **show ssh** command

```
Secure Shell Sessions:
ID  Type  Mode   Peer Host      Username      State      Filename
-----
414 ssh   server 172.16.23.1   root         open
456 ssh   client 172.16.23.10 manager      user-auth
459 scp   client 172.16.23.12 root         download   example.awd
463 ssh   client 5ffe:33fe:5632:ffbb:bc35:ddee:0101:ac51
                                manager      user-auth
```

**Table 6:** Parameters in the output of the **show ssh** command

| Parameter | Description  |
|-----------|--|
| ID        | Unique identifier for each SSH session.  |
| Type      | Session type; either SSH, SCP, or SFTP.  |
| Mode      | Whether the device is acting as an SSH client (client) or SSH server (server) for the specified session. |
| Peer Host | The hostname or IP address of the remote server or client.   |
| Username  | Login user name of the server.   |

**Table 6:** Parameters in the output of the **show ssh** command (cont.)

| Parameter | Description   |   |
|-----------|---|---|
| State     | The current state of the SSH session. One of:                         |   |
|           | connecting  | The device is looking for a remote server.      |
|           | connected   | The device is connected to the remote server.   |
|           | accepted  | The device has accepted a new session.          |
|           | host-auth   | host-to-host authentication is in progress.     |
|           | user-auth   | User authentication is in progress.             |
|           | authenticated   | User authentication is complete.                |
|           | open  | The session is in progress.                     |
|           | download  | The user is downloading a file from the device. |
|           | upload  | The user is uploading a file from the device.   |
|           | closing   | The user is terminating the session.            |
|           | closed  | The session is closed.                          |
| Filename  | Local filename of the file that the user is downloading or uploading. |   |

**Related commands** [clear ssh](#)

# show ssh client

**Overview** This command displays the current configuration of the Secure Shell client.

**Syntax** `show ssh client`

**Mode** User Exec, Privileged Exec and Global Configuration

**Example** To display the current configuration for SSH clients on the login shell, use the command:

```
awplus# show ssh client
```

**Output** Figure 67-7: Example output from the **show ssh client** command

```
Secure Shell Client Configuration
-----
Port                : 22
Version             : 2,1
Connect Timeout     : 30 seconds
Session Timeout     : 0 (off)
Debug               : NONE
```

**Table 7:** Parameters in the output of the **show ssh client** command

| Parameter       | Description   |
|-----------------|---|
| Port            | SSH server TCP port where the SSH client connects to. The default is port 22.   |
| Version         | SSH server version, either "2" or "2,1". From AlliedWare Plus 5.5.1-1.1 onwards, SSH version 1 is not supported.  |
| Connect Timeout | Time in seconds that the SSH client waits for an SSH session to establish. If the value is 0, the connection is terminated when it reaches the TCP timeout. |
| Debug           | Whether debugging is active on the client.  |

**Related commands** [show ssh server](#)

**Command changes** Version 5.5.3-1.1: added to AR1050V

# show ssh server

**Overview** This command displays the current configuration of the Secure Shell server.

Note that changes to the SSH configuration affects only new SSH sessions coming from remote hosts, and does not affect existing sessions.

**Syntax** `show ssh server`

**Mode** User Exec, Privileged Exec, and Global Configuration

**Example** To display the current configuration of the Secure Shell server, use the command:

```
awplus# show ssh server
```

**Output** Figure 67-8: Example output from the **show ssh server** command

```
Secure Shell Server Configuration
-----
SSH Server                : Enabled

                           ecdh-sha2-nistp256,ecdh-sha2-nistp384,
                           ecdh-sha2-nistp521,
                           diffie-hellman-group-exchange-sha256,
                           diffie-hellman-group-exchange-sha1,
                           diffie-hellman-group14-sha1
```

**Table 8:** Parameters in the output of the **show ssh server** command

| Parameter  | Description  |
|------------|--|
| SSH Server | Whether the Secure Shell server is enabled or disabled.  |
| Port       | TCP port where the Secure Shell server listens for connections. The default is port 22.                          |
| Version    | SSH server version; either '2' or '2,1'. From AlliedWare Plus 5.5.1-1.1 onwards, SSH version 1 is not supported. |
| Services   | List of the available Secure Shell services; one or more of SHELL, SCP or SFTP.                                  |

**Table 8:** Parameters in the output of the **show ssh server** command (cont.)

| Parameter           | Description  |
|---------------------|--|
| User Authentication | List of available authentication methods.  |
| Login Timeout       | Time (in seconds) that the SSH server will wait the SSH session to establish. If the value is 0, the client login will be terminated when TCP timeout reaches.                       |
| Idle Timeout        | Time (in seconds) that the SSH server will wait to receive data from the SSH client. The server disconnects if this timer limit is reached. If set at 0, the idle timer remains off. |
| Maximum Startups    | The maximum number of concurrent connections that are waiting authentication. The default is 10.   |
| Debug               | Whether debugging is active on the server.   |
| Ciphers             | List of ciphers permitted.   |
| KEX                 | List of available Key Exchange algorithms.   |

**Related commands** [show ssh](#)  
[show ssh client](#)

# show ssh server allow-users

**Overview** This command displays the user entries in the allow list of the SSH server.

**Syntax** `show ssh server allow-users`

**Mode** User Exec, Privileged Exec and Global Configuration

**Example** To display the user entries in the allow list of the SSH server, use the command:

```
awplus# show ssh server allow-users
```

**Output** Figure 67-9: Example output from the **show ssh server allow-users** command

| Username | Remote Hostname (pattern) |
|----------|---------------------------|
| awplus   | 192.168.*                 |
| john     |                           |
| manager  | *.alliedtelesis.com       |

**Table 9:** Parameters in the output of the **show ssh server allow-users** command

| Parameter                 | Description   |
|---------------------------|---|
| Username                  | User name that is allowed to access the SSH server.   |
| Remote Hostname (pattern) | IP address or hostname pattern of the remote client. The user is allowed requests from a host that matches this pattern. If no hostname is specified, the user is allowed from all hosts. |

**Related commands** [ssh server allow-users](#)  
[ssh server deny-users](#)

# show ssh server deny-users

**Overview** This command displays the user entries in the deny list of the SSH server. The user in the deny list is rejected to access the SSH server. If a user is not included in the access list of the SSH server, the user is also rejected.

**Syntax** `show ssh server deny-users`

**Mode** User Exec, Privileged Exec and Global Configuration

**Example** To display the user entries in the deny list of the SSH server, use the command:

```
awplus# show ssh server deny-users
```

**Output** Figure 67-10: Example output from the **show ssh server deny-users** command

| Username | Remote Hostname (pattern) |
|----------|---------------------------|
| john     | *.b-company.com           |
| manager  | 192.168.2.*               |

**Table 10:** Parameters in the output of the **show ssh server deny-user** command

| Parameter                 | Description   |
|---------------------------|---|
| Username                  | The user that this rule applies to.   |
| Remote Hostname (pattern) | IP address or hostname pattern of the remote client. The user is denied requests from a host that matches this pattern. If no hostname is specified, the user is denied from all hosts. |

**Related commands** [ssh server allow-users](#)  
[ssh server deny-users](#)

# ssh

**Overview** Use this command to initiate a Secure Shell connection to a remote SSH server.

If the server requests a password to login, you need to type in the correct password at the "Password:" prompt.

An SSH client identifies the remote SSH server by its public key registered on the client device. If the server identification is changed, server verification fails. If the public key of the server has been changed, the public key of the server must be explicitly added to the known host database.

**NOTE:** A hostname specified with SSH cannot begin with a hyphen (-) character.

**Syntax** `ssh [ip|ipv6] [user <username>|port <1-65535>|version 2]  
<remote-device> [<command>]`

**Syntax in secure mode** `ssh [cipher  
{aes128-cbc|aes256-cbc|aes128-ctr|aes192-ctr|aes256-ctr}]  
[hmac {hmac-sha2-256}]  
[public-key {ecdsa-sha2-nistp256|ecdsa-sha2-nistp384}]  
[key-exchange {ecdh-sha2-nistp256|ecdh-sha2-nistp384}]  
[ip|ipv6] [user <username>|port <1-65535>|version 2]  
<remote-device> [<command>]`

| Parameter                 | Description   |
|---------------------------|---|
| <code>cipher</code>       | The supported cipher name.<br>Select either: aes128-cbc or aes256-cbc.  |
| <code>hmac</code>         | The supported hmac name: hmac-sha2-256  |
| <code>public-key</code>   | The supported public-key name.<br>Select either:<br>ecdsa-sha2-nistp256 or ecdsa-sha2-nistp384  |
| <code>key-exchange</code> | The supported key-exchange name.<br>Select either:<br>ecdsa-sha2-nistp256 or ecdsa-sha2-nistp384  |
| <code>ip</code>           | Specify IPv4 SSH.   |
| <code>ipv6</code>         | Specify IPv6 SSH.   |
| <code>user</code>         | Login user. If user is specified, the username is used for login to the remote SSH server when user authentication is required. Otherwise the current user name is used.<br><br><username> User name to login on the remote server.                 |
| <code>port</code>         | SSH server port. If port is specified, the SSH client connects to the remote SSH server with the specified TCP port. Otherwise, the client port configured by "ssh client" command or the default TCP port (22) is used.<br><br><1-65535> TCP port. |

| Parameter       | Description  |
|-----------------|--|
| version         | SSH client version. From 5.5.1-1.1 onwards, SSH only supports version 2.   |
| <remote-device> | IPv4/IPv6 address or hostname of a remote server. The address is in the format A.B.C.D for an IPv4 address, or in the format X:X::X:X for an IPv6 address. Note that a hostname specified with SSH cannot begin with a hyphen (-) character. |
| <command>       | A command to execute on the remote server. If a command is specified, the command is executed on the remote SSH server and the session is disconnected when the remote command finishes.   |

**Mode** User Exec and Privileged Exec

**Usage notes** This command contains some additional security parameters (cipher, hmac, public-key, and key exchange). To access these parameters you must enable Secure Mode on the device by using the command: **crypto secure-mode**.

```
awplus(config)# crypto secure-mode
```

**Examples** To login to the remote SSH server at 192.0.2.5, use the command:

```
awplus# ssh ip 192.0.2.5
```

To login to the remote SSH server at 192.0.2.5 as user 'manager', use the command:

```
awplus# ssh ip user manager 192.0.2.5
```

To login to the remote SSH server at 192.0.2.5 that is listening on TCP port 2000, use the command:

```
awplus# ssh port 2000 192.0.2.5
```

To login to the remote SSH server 'example\_host' using an IPv6 session, use the command:

```
awplus# ssh ipv6 example_host
```

To run the **cmd** command on the remote SSH server at 192.0.2.5, use the command:

```
awplus# ssh ip 192.0.2.5 cmd
```

**Command changes**

- Version 5.5.3-1.1: added to AR1050V
- Version 5.5.1-1.1: support removed for SSH protocol v1
- Version 5.4.8-2.1: secure mode syntax added for x950, SBx908 GEN2.

Version 5.4.8-1.2: secure mode syntax added for x220, x930, x550, XS900MX.

Version 5.4.6-2.1: VRF-lite support added for AR-Series devices.

# ssh client

**Overview** This command modifies the default configuration parameters of the Secure Shell (SSH) client. The configuration is used for any SSH client on the device to connect to remote SSH servers. Any parameters specified on SSH client explicitly override the default configuration parameters.

The change affects the current user shell only. When the user exits the login session, the configuration does not persist. This command does not affect existing SSH sessions.

The **no** variant of this command resets configuration parameters of the Secure Shell (SSH) client changed by the `ssh client` command, and restores the defaults.

This command does not affect the existing SSH sessions.

**Syntax**

```
ssh client {port <1-65535>|version 2|session-timeout <0-3600>|connect-timeout <1-600>}  
no ssh client {port|version|session-timeout|connect-timeout}
```

| Parameter       | Description   |
|-----------------|---|
| port            | The default TCP port of the remote SSH server. If an SSH client specifies an explicit port of the server, it overrides the default TCP port.<br>Default: 22   |
|                 | <1-65535> TCP port number.  |
| version         | The SSH version used by the client for SSH sessions.<br>From 5.5.1-1.1 onwards, the SSH client supports only version 2  |
| session-timeout | The global session timeout for SSH sessions. If the session timer lapses since the last time an SSH client received data from the remote server, the session is terminated. If the value is 0, then the client does not terminate the session. Instead, the connection is terminated when it reaches the TCP timeout.<br>Default: 0 (session timer remains off) |
|                 | <0-3600> Timeout in seconds.  |
| connect-timeout | The maximum time period that an SSH session can take to become established. The SSH client terminates the SSH session if this timeout expires and the session is still not established.<br>Default: 30  |
|                 | <1-600> Timeout in seconds.   |

**Mode** Privileged Exec

**Examples** To configure the default TCP port for SSH clients to 2200, and the session timer to 10 minutes, use the command:

```
awplus# ssh client port 2200 session-timeout 600
```

To configure the connect timeout of SSH client to 10 seconds, use the command:

```
awplus# ssh client connect-timeout 10
```

To restore the connect timeout to its default, use the command:

```
awplus# no ssh client connect-timeout
```

**Related commands** [show ssh client](#)  
[ssh](#)

**Command changes** Version 5.5.3-1.1: added to AR1050V  
Version 5.5.2-1.1: **vrf** parameter added for products that support VRF  
Version 5.5.1-1.1: support removed for the ssh-rsa algorithm in OpenSSH and for SSH protocol v1

# ssh client allow-legacy-ssh-rsa

**Overview** Use this command to enable support for the legacy ssh-rsa algorithm on the SSH client. Support for this algorithm was removed in version 5.5.1-1.1 due to security concerns. Support for it is still disabled by default and you should only enable it if you cannot avoid using ssh-rsa. It cannot be enabled when the device is in Secure Mode.

Use the **no** variant of this command to disable support for the legacy ssh-rsa algorithm on the SSH client.

**Syntax** `ssh client allow-legacy-ssh-rsa`  
`no ssh client allow-legacy-ssh-rsa`

**Default** Disabled

**Mode** Global Configuration

**Example** To enable SSH client support for the legacy ssh-rsa algorithm, use the commands:

```
awplus# configure terminal
awplus(config)# ssh client allow-legacy-ssh-rsa
```

**Related commands** [show ssh client](#)  
[ssh client](#)  
[ssh server allow-legacy-ssh-rsa](#)

**Command changes** Version 5.5.3-1.1: added to AR1050V  
Version 5.5.3-0.1: command added

# ssh server

**Overview** Use this command to modify the configuration of the SSH server. Changing these parameters affects new SSH sessions connecting to the device.

Use the **no** variant of this command to restore the configuration of a specified parameter to its default. The change affects the SSH server immediately if the server is running. Otherwise, the configuration is used when the server starts.

To enable the SSH server, use the [service ssh](#) command.

**Syntax**

```
ssh server <1-65535>  
ssh server {[session-timeout <0-3600>] [login-timeout <1-600>]  
[max-startups <1-128>]}  
no ssh server {[session-timeout] [login-timeout]  
[max-startups]}
```

| Parameter       | Description  |
|-----------------|--|
| <1-65535>       | The TCP port number that the server listens to for incoming SSH sessions.<br>Default: 22   |
| session-timeout | The maximum time period that the server waits before deciding that a session is inactive and should be terminated. The server considers the session inactive when it has not received any data from the client, and when the client does not respond to keep alive messages.<br>Default: 0 (session timer remains off).<br>Enter a timeout between 0-3600 seconds. |
| login-timeout   | The maximum time period the server waits before disconnecting an unauthenticated client.<br>Default: 60<br>Enter a timeout between 1- 600 seconds.   |
| max-startups    | The maximum number of concurrent unauthenticated connections the server accepts. When the number of SSH connections awaiting authentication reaches the limit, the server drops any additional connections until authentication succeeds or the login timer expires for a connection.<br>Default: 10<br>Enter a number of sessions in the range of 1-128.          |

**Mode** Global Configuration

**Examples** To set the session timer of the SSH server to 10 minutes (600 seconds), use the commands:

```
awplus# configure terminal  
awplus(config)# ssh server session-timeout 600
```

To set the login timeout of the SSH server to 30 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server login-timeout 30
```

To limit the number of SSH client connections waiting for authentication from the SSH server to 3, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server max-startups 3
```

To return the limit on the number of waiting connections to the default of 10, use the commands:

```
awplus# configure terminal
awplus(config)# no ssh server max-startups
```

To support the SSH server with TCP port 2200, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server 2200
```

**Related commands** [show ssh server](#)  
[ssh client](#)

**Command changes** Version 5.5.1-1.1: support removed for the ssh-rsa algorithm in OpenSSH and for SSH protocol v1

# ssh server allow-legacy-ssh-rsa

**Overview** Use this command to enable support for the legacy ssh-rsa algorithm on the SSH server. Support for this algorithm was removed in version 5.5.1-1.1 due to security concerns. Support for it is still disabled by default and you should only enable it if you cannot avoid using ssh-rsa. It cannot be enabled when the device is in Secure Mode.

Use the **no** variant of this command to disable support for the legacy ssh-rsa algorithm on the SSH server.

**Syntax** `ssh server allow-legacy-ssh-rsa`  
`no ssh server allow-legacy-ssh-rsa`

**Default** Disabled

**Mode** Global Configuration

**Example** To enable SSH server support for the legacy ssh-rsa algorithm, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server allow-legacy-ssh-rsa
```

**Related commands** [show ssh server](#)  
[ssh server](#)  
[ssh client allow-legacy-ssh-rsa](#)

**Command changes** Version 5.5.3-0.1: command added

# ssh server allow-users

**Overview** This command adds a username pattern to the allow list of the SSH server. If the user of an incoming SSH session matches the pattern, the session is accepted.

When there are no registered users in the server's database of allowed users, the SSH server does not accept SSH sessions even when enabled.

SSH server also maintains the deny list. The server checks the user in the deny list first. If a user is listed in the deny list, then the user access is denied even if the user is listed in the allow list.

The **no** variant of this command deletes a username pattern from the allow list of the SSH server. To delete an entry from the allow list, the username and hostname pattern should match exactly with the existing entry.

**Syntax** `ssh server allow-users <username-pattern> [<hostname-pattern>]`  
`no ssh server allow-users <username-pattern>`  
 `[<hostname-pattern>]`

| Parameter                             | Description  |
|---------------------------------------|--|
| <code>&lt;username-pattern&gt;</code> | The username pattern that users can match to. An asterisk acts as a wildcard character that matches any string of characters.  |
| <code>&lt;hostname-pattern&gt;</code> | The host name pattern that hosts can match to. If specified, the server allows the user to connect only from hosts matching the pattern. An asterisk acts as a wildcard character that matches any string of characters. |

**Mode** Global Configuration

**Examples** To allow the user `john` to create an SSH session from any host, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server allow-users john
```

To allow the user `john` to create an SSH session from a range of IP address (from 192.168.1.1 to 192.168.1.255), use the commands:

```
awplus# configure terminal
awplus(config)# ssh server allow-users john 192.168.1.*
```

To allow the user `john` to create a SSH session from `a-company.com` domain, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server allow-users john *.a-company.com
```

To delete the existing user entry `john 192.168.1.*` in the allow list, use the commands:

```
awplus# configure terminal
```

```
awplus(config)# no ssh server allow-users john 192.168.1.*
```

**Related commands**

- [show running-config ssh](#)
- [show ssh server allow-users](#)
- [ssh server deny-users](#)

# ssh server authentication

**Overview** This command enables RSA public-key or password user authentication for SSH Server. Apply the **password** keyword with the **ssh server authentication** command to enable password authentication for users. Apply the **publickey** keyword with the **ssh server authentication** command to enable RSA public-key authentication for users.

Use the **no** variant of this command to disable RSA public-key or password user authentication for SSH Server. Apply the **password** keyword with the **no ssh authentication** command to disable password authentication for users. Apply the required **publickey** keyword with the **no ssh authentication** command to disable RSA public-key authentication for users.

**Syntax** `ssh server authentication {password|publickey}`  
`no ssh server authentication {password|publickey}`

| Parameter              | Description   |
|------------------------|---|
| <code>password</code>  | Specifies user password authentication for SSH server.  |
| <code>publickey</code> | Specifies user publickey authentication for SSH server. |

**Default** Both RSA public-key authentication and password authentication are enabled by default.

**Mode** Global Configuration

**Usage** For password authentication to authenticate a user, password authentication for a user must be registered in the local user database or on an external RADIUS server, before using the **ssh server authentication password** command.

For RSA public-key authentication to authenticate a user, a public key must be added for the user, before using the **ssh server authentication publickey** command.

**Examples** To enable `password` authentication for users connecting through SSH, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server authentication password
```

To enable `publickey` authentication for users connecting through SSH, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server authentication publickey
```

To disable `password` authentication for users connecting through SSH, use the commands:

```
awplus# configure terminal
awplus(config)# no ssh server authentication password
```

To disable `publickey` authentication for users connecting through SSH, use the commands:

```
awplus# configure terminal
awplus(config)# no ssh server authentication publickey
```

**Related  
commands**

`crypto key pubkey-chain userkey`

`service ssh`

`show ssh server`

# ssh server deny-users

**Overview** This command adds a username pattern to the deny list of the SSH server. If the user of an incoming SSH session matches the pattern, the session is rejected.

SSH server also maintains the allow list. The server checks the user in the deny list first. If a user is listed in the deny list, then the user access is denied even if the user is listed in the allow list.

If a hostname pattern is specified, the user is denied from the hosts matching the pattern.

The **no** variant of this command deletes a username pattern from the deny list of the SSH server. To delete an entry from the deny list, the username and hostname pattern should match exactly with the existing entry.

**Syntax** `ssh server deny-users <username-pattern> [<hostname-pattern>]`  
`no ssh server deny-users <username-pattern>`  
`[<hostname-pattern>]`

| Parameter                             | Description   |
|---------------------------------------|---|
| <code>&lt;username-pattern&gt;</code> | The username pattern that users can match to. The username must begin with a letter. Valid characters are all numbers, letters, and the underscore, hyphen, full stop and asterisk symbols. An asterisk acts as a wildcard character that matches any string of characters. |
| <code>&lt;hostname-pattern&gt;</code> | The host name pattern that hosts can match to. If specified, the server denies the user only when they connect from hosts matching the pattern. An asterisk acts as a wildcard character that matches any string of characters.   |

**Mode** Global Configuration

**Examples** To deny the user john to access SSH login from any host, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server deny-users john
```

To deny the user john to access SSH login from a range of IP address (from 192.168.2.1 to 192.168.2.255), use the commands:

```
awplus# configure terminal
awplus(config)# ssh server deny-users john 192.168.2.*
```

To deny the user john to access SSH login from b-company.com domain, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server deny-users john*.b-company.com
```

To delete the existing user entry `john 192.168.2.*` in the deny list, use the commands:

```
awplus# configure terminal
```

```
awplus(config)# no ssh server deny-users john 192.168.2.*
```

commands**

[show running-config ssh](#)

[show ssh server deny-users](#)

[ssh server allow-users](#)

# ssh server disallow-cbc-ciphers

**Overview** Use this command to disallow CBC mode ciphers on SSH servers. You can only use this command when your device is in Secure Mode (see the [crypto secure-mode](#) command).

Use the **no** variant of this command to allow CBC mode ciphers.

**Syntax** `ssh server disallow-cbc-ciphers`  
`no ssh server disallow-cbc-ciphers`

**Default** CBC mode ciphers are allowed by default.

**Mode** Global Configuration

**Example** To disallow CBC mode ciphers for SSH server in Secure Mode, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server disallow-cbc-ciphers
```

**Related commands** [crypto secure-mode](#)  
[service ssh](#)  
[ssh server](#)

**Command changes** Version 5.5.1-2.1: command added

# ssh server max-auth-tries

**Overview** Use this command to specify the maximum number of SSH authentication attempts that the device will allow.

Use the **no** variant of this command to return the maximum number of attempts to its default value of 6.

**Syntax** `ssh server max-auth-tries <1-32>`  
`no ssh server max-auth-tries`

| Parameter | Description  |
|-----------|--|
| <1-32>    | Maximum number of SSH authentication attempts the device will allow. |

**Default** 6 attempts

**Mode** Global Configuration

**Usage** By default, users must wait one second after a failed login attempt before trying again. You can increase this gap by using the command [aaa login fail-delay](#).

**Example** To set the maximum number of SSH authentication attempts to 3, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server max-auth-tries 3
```

**Related commands** [show ssh server](#)

# ssh server resolve-host

**Overview** This command enables resolving an IP address from a host name using a DNS server for client host authentication.

The **no** variant of this command disables this feature.

**Syntax** `ssh server resolve-hosts`  
`no ssh server resolve-hosts`

**Default** This feature is disabled by default.

**Mode** Global Configuration

**Usage notes** Your device has a DNS Client that is enabled automatically when you add a DNS server to your device. Use the [ip name-server](#) command to add a DNS server to the list of servers that the device queries.

**Example** To resolve a host name using a DNS server, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server resolve-hosts
```

**Related commands** [ip name-server](#)  
[show ssh server](#)  
[ssh server allow-users](#)  
[ssh server deny-users](#)

# ssh server scp

**Overview** This command enables the Secure Copy (SCP) service on the SSH server. Once enabled, the server accepts SCP requests from remote clients.

You must enable the SSH server as well as this service before the device accepts SCP connections. The SCP service is enabled by default as soon as the SSH server is enabled.

The **no** variant of this command disables the SCP service on the SSH server. Once disabled, SCP requests from remote clients are rejected.

**Syntax** `ssh server scp`  
`no ssh server scp`

**Mode** Global Configuration

**Examples** To enable the SCP service, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server scp
```

To disable the SCP service, use the commands:

```
awplus# configure terminal
awplus(config)# no ssh server scp
```

**Related commands** [show running-config ssh](#)  
[show ssh server](#)

# ssh server secure-algs

**Overview** Use this command to force the SSH server to only use ciphers, key exchange algorithms and Message Authentication Code (MAC) algorithms that are currently considered best-practice.

This command is the same as using all of the commands [ssh server secure-ciphers](#), [ssh server secure-hostkey](#), [ssh server secure-mac](#), and [ssh server secure-kex](#). However, it does not include the optional **exclude-nist-curves** parameter of [ssh server secure-kex](#).

Use the **no** variant of this command to stop forcing the SSH server to use this restricted set of algorithms.

**Syntax** `ssh server secure-algs`  
`no ssh server secure-algs`

**Default** Disabled.

**Mode** Global Configuration

**Usage notes** To see the list of algorithms, use the [show ssh server](#) command.

This command is not available in Secure Mode because Secure Mode already forces the device to use only FIPS-approved algorithms.

**Example** To force the SSH server to use best-practice algorithms, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server secure-algs
```

**Related commands** [show ssh server](#)  
[ssh server](#)  
[ssh server secure-ciphers](#)  
[ssh server secure-hostkey](#)  
[ssh server secure-kex](#)  
[ssh server secure-mac](#)

**Command changes** Version 5.5.1-1.1: command added

# ssh server secure-ciphers

**Overview** Use this command to force the SSH server to only negotiate ciphers regarded as current best-practice.

Use the **no** variant of this command to stop forcing the SSH server to use this restricted set of ciphers.

**Syntax** `ssh server secure-ciphers`  
`no ssh server secure-ciphers`

**Default** Not set

**Mode** Global Configuration

**Usage notes** To see the list of ciphers, use the [show ssh server](#) command.

This command is not available in Secure Mode because Secure Mode already forces the device to use only FIPS-approved algorithms.

**Example** To configure the SSH server to use best-practice ciphers, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server secure-ciphers
```

**Related commands** [show ssh server](#)  
[ssh server](#)  
[ssh server secure-algs](#)  
[ssh server secure-hostkey](#)  
[ssh server secure-kex](#)  
[ssh server secure-mac](#)

**Command changes** Version 5.5.0-1.1: command added

# ssh server secure-hostkey

**Overview** Use this command to force the SSH server to only use hostkey algorithms that are currently considered best-practice. This excludes NIST curve-based hostkey algorithms.

Use the **no** variant of this command to stop forcing the SSH server to use this restricted set of hostkey algorithms.

**Syntax** `ssh server secure-hostkey`  
`no ssh server secure-hostkey`

**Default** Disabled

**Mode** Global Configuration

**Usage notes** Using this command may reduce compatibility with older SSH clients.

To see the list of hostkey algorithms, use the [show ssh server](#) command.

This command is not available in Secure Mode because Secure Mode already forces the device to use only FIPS-approved algorithms.

**Example** To force the SSH server to use best-practice hostkey algorithms, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server secure-hostkey
```

**Related commands** [show ssh server](#)  
[ssh server](#)  
[ssh server secure-algs](#)  
[ssh server secure-ciphers](#)  
[ssh server secure-kex](#)  
[ssh server secure-mac](#)

**Command changes** Version 5.5.2-2.1: command added

# ssh server secure-kex

**Overview** Use this command to force the SSH server to only use key exchange algorithms that are currently considered best-practice.

For example, using this command stops the device from using the diffie-hellman-group-exchange-sha1 key exchange algorithm.

Use the **no** variant of this command to stop forcing the SSH server to use this restricted set of key-exchange algorithms.

**Syntax** `ssh server secure-kex [exclude-nist-curves]`  
`no ssh server secure-kex`

| Parameter                        | Description  |
|----------------------------------|--|
| <code>exclude-nist-curves</code> | Also exclude all NIST key exchange algorithms. Using this parameter may reduce compatibility with older SSH clients. |

**Default** Disabled.

**Mode** Global Configuration

**Usage notes** To see the list of key exchange algorithms, use the [show ssh server](#) command. This command is not available in Secure Mode because Secure Mode already forces the device to use only FIPS-approved algorithms.

**Example** To force the SSH server to use best-practice key-exchange algorithms, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server secure-kex
```

**Related commands** [show ssh server](#)  
[ssh server](#)  
[ssh server secure-algs](#)  
[ssh server secure-ciphers](#)  
[ssh server secure-hostkey](#)  
[ssh server secure-mac](#)

**Command changes** Version 5.5.2-2.1: **exclude-nist-curves** parameter added  
Version 5.5.0-2.3: command added

# ssh server secure-mac

**Overview** Use this command to force the SSH server to only use Message Authentication Code (MAC) algorithms that are currently considered best-practice.

Use the **no** variant of this command to stop forcing the SSH server to use this restricted set of MAC algorithms.

**Syntax** `ssh server secure-mac`  
`no ssh server secure-mac`

**Default** Disabled.

**Mode** Global Configuration

**Usage notes** To see the list of MAC algorithms, use the `show ssh server` command.  
This command is not available in Secure Mode because Secure Mode already forces the device to use only FIPS-approved algorithms.

**Example** To force the SSH server to use best-practice MAC algorithms, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server secure-mac
```

**Related commands** `show ssh server`  
`ssh server`  
`ssh server secure-algs`  
`ssh server secure-ciphers`  
`ssh server secure-hostkey`  
`ssh server secure-kex`

**Command changes** Version 5.5.1-1.1: command added

# ssh server sftp

**Overview** This command enables the Secure FTP (SFTP) service on the SSH server. Once enabled, the server accepts SFTP requests from remote clients.

You must enable the SSH server as well as this service before the device accepts SFTP connections. The SFTP service is enabled by default as soon as the SSH server is enabled. If the SSH server is disabled, SFTP service is unavailable.

The **no** variant of this command disables SFTP service on the SSH server. Once disabled, SFTP requests from remote clients are rejected.

**Syntax** `ssh server sftp`  
`no ssh server sftp`

**Mode** Global Configuration

**Examples** To enable the SFTP service, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server sftp
```

To disable the SFTP service, use the commands:

```
awplus# configure terminal
awplus(config)# no ssh server sftp
```

**Related commands** [show running-config ssh](#)  
[show ssh server](#)

# ssh server tcpforwarding

**Overview** Use this command to enable TCP port forwarding on the SSH server. It is disabled by default, to enhance security.

Use the **no** variant of this command to disable TCP port forwarding again.

**Syntax** `ssh server tcpforwarding`  
`no ssh server tcpforwarding`

**Default** Disabled

**Mode** Global Configuration

**Example** To enable TCP port forwarding, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server tcpforwarding
```

To disable it again, use the commands:

```
awplus# configure terminal
awplus(config)# no ssh server tcpforwarding
```

**Related commands** [show ssh server](#)

**Command changes** Version 5.5.2-1.1: command added

# undebug ssh client

**Overview** This command applies the functionality of the **no debug ssh client** command.

**Command changes** Version 5.5.3-1.1: added to AR1050V

# undebug ssh server

**Overview** This command applies the functionality of the **no debug ssh server** command.

# 68

# Trigger Commands

## Introduction

**Overview** This chapter provides an alphabetical reference for commands used to configure Triggers. For more information, see the [Triggers Feature Overview and Configuration Guide](#).

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

- Command List**
- [“active \(trigger\)”](#) on page 3400
  - [“day”](#) on page 3401
  - [“debug trigger”](#) on page 3403
  - [“description \(trigger\)”](#) on page 3404
  - [“repeat”](#) on page 3405
  - [“script”](#) on page 3406
  - [“show debugging trigger”](#) on page 3408

- [“type ping-poll”](#) on page 3434
- [“type pse-port”](#) on page 3435
- [“type reboot”](#) on page 3436
- [“type time”](#) on page 3437
- [“type usb”](#) on page 3438
- [“undebg trigger”](#) on page 3439

# active (trigger)

**Overview** This command enables a trigger. This allows the trigger to activate when its trigger conditions are met.

The **no** variant of this command disables a trigger. While in this state the trigger cannot activate when its trigger conditions are met.

**Syntax** active  
no active

**Default** Active, which means that triggers are enabled by default

**Mode** Trigger Configuration

**Usage notes** Configure a trigger first before you use this command to activate it.

For information about configuring a trigger, see the [Triggers\\_Feature Overview and Configuration Guide](#).

**Examples** To enable trigger 172, so that it can activate when its trigger conditions are met, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 172
awplus(config-trigger)# active
```

To disable trigger 182, preventing it from activating when its trigger conditions are met, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 182
awplus(config-trigger)# no active
```

**Related commands** [show trigger](#)  
[trigger](#)  
[trigger activate](#)

# day

**Overview** This command specifies the days or date that the trigger can activate on. You can specify one of:

- A specific date
- A specific day of the week
- A list of days of the week
- A day of any month of any year
- A day of a specific month in any year
- Every day

By default, the trigger can activate on any day.

**Syntax** day every-day  
 day <1-31>  
 day <1-31> <month>  
 day <1-31> <month> <year>  
 day <weekday>

| Parameter | Description   |
|-----------|---|
| every-day | Sets the trigger so that it can activate on any day.  |
| <1-31>    | Day of the month the trigger is permitted to activate on.   |
| <month>   | Sets the month that the trigger is permitted to activate on. Valid keywords are: <b>january, february, march, april, may, june, july, august, september, october, november, and december.</b>                               |
| <year>    | Sets the year that the trigger is permitted to activate in, between 2000 and 2035.  |
| <weekday> | Sets the days of the week that the trigger can activate on. You can specify one or more week days in a space separated list. Valid keywords are: <b>monday, tuesday, wednesday, thursday, friday, saturday, and sunday.</b> |

**Default** **every-day**, so by default, the trigger can activate on any day.

**Mode** Trigger Configuration

**Usage notes** For example trigger configurations that use the **day** command, see “Restrict Internet Access” and “Turn off Power to Port LEDs” in the [Triggers Feature Overview and Configuration Guide](#).

**Examples** To permit trigger 55 to activate on the 1 June 2019, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 55
awplus(config-trigger)# day 1 jun 2019
```

To permit trigger 12 to activate on Mondays, Wednesdays and Fridays, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 12
awplus(config-trigger)# day monday wednesday friday
```

To permit trigger 17 to activate on the 5th day of any month, in any year, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 17
awplus(config-trigger)# day 5
```

To permit trigger 6 to activate on the 20th day of September, in any year, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 6
awplus(config-trigger)# day 20 september
```

To permit trigger 14 to activate on the 1st day of each month, in any year, at 11.00am, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 14
awplus(config-trigger)# day 1
awplus(config-trigger)# type time 11:00
```

**Related commands** [show trigger](#)  
[type time](#)  
[trigger](#)

**Command changes** Version 5.4.8-2.1: day of the month functionality added

# debug trigger

**Overview** This command enables trigger debugging. This generates detailed messages about how your device is processing the trigger commands and activating the triggers.

The **no** variant of this command disables trigger debugging.

**Syntax** `debug trigger`  
`no debug trigger`

**Mode** Privilege Exec

**Examples** To start trigger debugging, use the command:

```
awplus# debug trigger
```

To stop trigger debugging, use the command:

```
awplus# no trigger
```

**Related commands** [show debugging trigger](#)  
[show trigger](#)  
[test](#)  
[trigger](#)  
[undebug trigger](#)

# description (trigger)

**Overview** This command adds an optional description to help you identify the trigger. This description is displayed in show command outputs and log messages.

The **no** variant of this command removes a trigger's description. The show command outputs and log messages stop displaying a description for this trigger.

**Syntax** `description <description>`  
`no description`

| Parameter                        | Description   |
|----------------------------------|---|
| <code>&lt;description&gt;</code> | A word or phrase that uniquely identifies this trigger or its purpose. Valid characters are any printable character and spaces, up to a maximum of 40 characters. |

**Mode** Trigger Configuration

**Examples** To give trigger 240 the description `daily status report`, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 240
awplus(config-trigger)# description daily status report
```

To remove the description from trigger 36, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 36
awplus(config-trigger)# no description
```

**Related commands** [show trigger](#)  
[test](#)  
[trigger](#)

# repeat

**Overview** This command specifies the number of times that a trigger is permitted to activate. This allows you to specify whether you want the trigger to activate:

- only the first time that the trigger conditions are met
- a limited number of times that the trigger conditions are met
- an unlimited number of times

Once the trigger has reached the limit set with this command, the trigger remains in your configuration but cannot be activated. Use the **repeat** command again to reset the trigger so that it is activated when its trigger conditions are met.

By default, triggers can activate an unlimited number of times. To reset a trigger to this default, specify either **yes** or **forever**.

**Syntax** `repeat { forever | no | once | yes | <1-4294967294> }`

| Parameter                         | Description  |
|-----------------------------------|--|
| <code>yes   forever</code>        | The trigger repeats indefinitely, or until disabled. |
| <code>no   once</code>            | The trigger activates only once.                     |
| <code>&lt;1-4292967294&gt;</code> | The trigger repeats the specified number of times.   |

**Mode** Trigger Configuration

**Examples** To allow trigger 21 to activate only once, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 21
awplus(config-trigger)# repeat no
```

To allow trigger 22 to activate an unlimited number of times whenever its trigger conditions are met, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 22
awplus(config-trigger)# repeat forever
```

To allow trigger 23 to activate only the first 10 times the conditions are met, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 23
awplus(config-trigger)# repeat 10
```

**Related commands** [show trigger](#)  
[trigger](#)

# script

**Overview** This command specifies one or more scripts that are to be run when the trigger activates. You can add up to five scripts to a single trigger.

The sequence in which the trigger runs the scripts is specified by the number you set before the name of the script file. One script is executed completely before the next script begins.

Scripts may be either ASH shell scripts, indicated by a **.sh** filename extension suffix, or AlliedWare Plus scripts, indicated by a **.scp** filename extension suffix. AlliedWare Plus scripts only need to be readable. You can't use ASH scripts when the device is in Secure Mode.

The **no** variant of this command removes one or more scripts from the trigger's script list. The scripts are identified by either their name, or by specifying their position in the script list. The **all** parameter removes all scripts from the trigger.

**Syntax**

```
script <1-5> {<filename>}
no script {<1-5>|<filename>|all}
```

| Parameter  | Description  |
|------------|--|
| <1-5>      | The position of the script in execution sequence. The trigger runs the lowest numbered script first. |
| <filename> | The path to the script file.   |

**Mode** Trigger Configuration

**Examples** To configure trigger 71 to run the script flash:/cpu\_trig.sh in position 3 when the trigger activates, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 71
awplus(config-trigger)# script 3 flash:/cpu_trig.sh
```

To configure trigger 99 to run the scripts flash:reconfig.scp, flash:cpu\_trig.sh and flash:email.scp in positions 2, 3 and 5 when the trigger activates, use the following commands:

```
awplus# configure terminal
awplus(config)# trigger 99
awplus(config-trigger)# script 2 flash:/reconfig.scp 3
flash:/cpu_trig.sh 5 flash:/email.scp
```

To remove the scripts 1, 3 and 4 from trigger 71's script list, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 71
awplus(config-trigger)# no script 1 3 4
```

To remove the script flash:/cpu\_trig.sh from trigger 71's script list, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 71
awplus(config-trigger)# no script flash:/cpu_trig.sh
```

To remove all the scripts from trigger 71's script list, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 71
awplus(config-trigger)# no script all
```

**Related commands** [show trigger](#)  
[trigger](#)

# show debugging trigger

**Overview** This command displays the current status for trigger utility debugging. Use this command to show when trigger debugging has been turned on or off from the [debug trigger](#) command.

**Syntax** `show debugging trigger`

**Mode** User Exec and Privileged Exec

**Example** To display the current configuration of trigger debugging, use the command:

```
awplus# show debugging trigger
```

**Output** Figure 68-1: Example output from the **show debugging trigger** command

```
awplus#debug trigger
awplus#show debugging trigger
Trigger debugging status:
  Trigger debugging is on

awplus#no debug trigger
awplus#show debugging trigger
Trigger debugging status:
  Trigger debugging is off
```

**Related commands** [debug trigger](#)

# show running-config trigger

**Overview** This command displays the current running configuration of the trigger utility.

**Syntax** `show running-config trigger`

**Mode** Privileged Exec

**Example** To display the current configuration of the trigger utility, use the command:

```
awplus# show running-config trigger
```

**Output** Figure 68-2: Example output from the **show running-config trigger** command

```
trigger 1
  type card in

type usb in
trigger 2

type usb out
!
```

**Related commands** [show trigger](#)

# show trigger

**Overview** This command displays configuration and diagnostic information about the triggers configured on the device. Specify the **show trigger** command without any options to display a summary of the configuration of all triggers.

**Syntax** `show trigger [<1-250>|counter|full]`

| Parameter | Description   |
|-----------|---|
| <1-250>   | Displays detailed information about a specific trigger, identified by its trigger ID. |
| counter   | Displays statistical information about all triggers.                                  |
| full      | Displays detailed information about all triggers.                                     |

**Mode** Privileged Exec

**Example** To get summary information about all triggers, use the following command:

```
awplus# show trigger
```

Table 68-1: Example output from **show trigger**

```
awplus#show trigger
TR# Type & Details      Name                Ac Te Repeat      #Scr Days/Date
-----
001 CPU (80% any)      Busy CPU            Y  N  5              1  smtwtfS
005 Periodic (30 min)  Regular status check Y  N  Continuous     1  -mtwtf-
007 Memory (85% up)   High mem usage      Y  N  8              1  smtwtfS
011 Time (00:01)      Weekend access      Y  N  Continuous     1  -----s
013 Reboot            Y  N  Continuous     2  smtwtfS
019 Ping-poll (5 up)  Connection to svr1  Y  N  Continuous     1  smtwtfS
-----
```

Table 68-2: Parameters in the output of **show trigger**

| Parameter      | Description  |
|----------------|--|
| TR#            | Trigger identifier (ID).   |
| Type & Details | The trigger type, followed by the trigger details in brackets.                                     |
| Name           | Descriptive name of the trigger configured with the <a href="#">description (trigger)</a> command. |
| Ac             | Whether the trigger is active (Y), or inactive (N).  |
| Te             | Whether the trigger is in test mode (Y) or not (N).  |

Table 68-2: Parameters in the output of **show trigger** (cont.)

| Parameter | Description   |
|-----------|---|
| Repeat    | Whether the trigger repeats continuously, and if not, the configured repeat count for the trigger. To see the number of times a trigger has activated, use the <b>show trigger</b> <1-250> command.                 |
| #Scr      | Number of scripts associated with the trigger.  |
| Days/Date | Days or date when the trigger may be activated. For the days options, the days are shown as a seven character string representing Sunday to Saturday. A hyphen indicates days when the trigger cannot be activated. |

To display detailed information about trigger 3, use the command:

```
awplus# show trigger 3
```

Figure 68-3: Example output from **show trigger** for a specific trigger

```
awplus#show trigger 1

**Table 69:** Parameters in the output of **show trigger full** and **show trigger** for a specific trigger

| Parameter        | Description   |
|------------------|---|
| Trigger          | The ID of the trigger.                                  |
| Name             | Descriptive name of the trigger.                        |
| Type and details | The trigger type and its activation conditions.         |
| Days             | The days on which the trigger is permitted to activate. |

**Table 69:** Parameters in the output of **show trigger full** and **show trigger** for a specific trigger (cont.)

| Parameter             | Description   |
|-----------------------|---|
| Date                  | The date on which the trigger is permitted to activate. Only displayed if configured, in which case it replaces "Days".   |
| Active                | Whether or not the trigger is permitted to activate.  |
| Test                  | Whether or not the trigger is operating in diagnostic mode.   |
| Trap                  | Whether or not the trigger is enabled to send SNMP traps.   |
| Repeat                | Whether the trigger repeats an unlimited number of times (Continuous) or for a set number of times. When the trigger can repeat only a set number of times, then the number of times the trigger has been activated is displayed in brackets. |
| Modified              | The date and time of the last time that the trigger was modified.   |
| Number of activations | Number of times the trigger has been activated since the last restart of the device.  |
| Last activation       | The date and time of the last time that the trigger was activated.  |
| Number of scripts     | How many scripts are associated with the trigger, followed by the names of the script files in the order in which they run.   |

To display counter information about all triggers use the command:

```
awplus# show trigger counter
```

**Figure 68-4:** Example output from **show trigger counter**

```
awplus# show trigger counter
Trigger Module Counters
-----

**Related  
commands** [active \(trigger\)](#)  
[debug trigger](#)  
[script](#)  
[trigger](#)  
[trigger activate](#)

# test

**Overview** This command puts the trigger into a diagnostic mode. In this mode the trigger may activate but when it does it will not run any of the trigger's scripts. A log message will be generated to indicate when the trigger has been activated.

The **no** variant of this command takes the trigger out of diagnostic mode, restoring normal operation. When the trigger activates, the scripts associated with the trigger will be run, as normal.

**Syntax** test  
no test

**Mode** Trigger Configuration

**Usage notes** Configure a trigger first before you use this command to diagnose it. For information about configuring a trigger, see the [Triggers\\_Feature Overview and Configuration Guide](#).

**Examples** To put trigger 5 into diagnostic mode, where no scripts will be run when the trigger activates, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 5
awplus(config-trigger)# test
```

To take trigger 205 out of diagnostic mode, restoring normal operation, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 205
awplus(config-trigger)# no test
```

**Related commands** [show trigger](#)  
[trigger](#)

# time (trigger)

**Overview** This command specifies the time of day when the trigger is permitted to activate. The **after** parameter specifies the start of a time period that extends to midnight during which trigger may activate. By default the value of this parameter is 00:00:00 (am); that is, the trigger may activate at any time. The **before** parameter specifies the end of a time period beginning at midnight during which the trigger may activate. By default the value of this parameter is 23:59:59; that is, the trigger may activate at any time. If the value specified for **before** is later than the value specified for **after**, a time period from “after” to “before” is defined, during which the trigger may activate. This command is not applicable to time triggers ( **type time** ).

The following figure illustrates how the **before** and **after** parameters operate.

**Syntax** `time {[after <hh:mm:ss>] [before <hh:mm:ss>]}`

| Parameter                           | Description   |
|-------------------------------------|---|
| <code>after&lt;hh:mm:ss&gt;</code>  | The earliest time of day when the trigger may be activated. |
| <code>before&lt;hh:mm:ss&gt;</code> | The latest time of day when the trigger may be activated.   |

**Mode** Trigger Configuration

**Usage notes** For example trigger configurations that use the **time (trigger)** command, see “Restrict Internet Access” and “Turn off Power to Port LEDs” in the [Triggers Feature Overview and Configuration Guide](#).

**Examples** To allow trigger 63 to activate between midnight and 10:30am, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 63
awplus(config-trigger)# time before 10:30:00
```

To allow trigger 64 to activate between 3:45pm and midnight, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 64
awplus(config-trigger)# time after 15:45:00
```

To allow trigger 65 to activate between 10:30am and 8:15pm, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 65
awplus(config-trigger)# time after 10:30:00 before 20:15:00
```

**Related commands** [show trigger](#)  
[trigger](#)

# trap

**Overview** This command enables the specified trigger to send SNMP traps.

Use the **no** variant of this command to disable the sending of SNMP traps from the specified trigger.

**Syntax** trap  
no trap

**Default** SNMP traps are enabled by default for all defined triggers.

**Mode** Trigger Configuration

**Usage notes** You must configure SNMP before using traps with triggers. For more information, see:

- [Support for Allied Telesis Enterprise\\_MIBs\\_in\\_AlliedWare Plus](#), for information about which MIB objects are supported.
- the [SNMP Feature Overview and Configuration\\_Guide](#).
- the [SNMP Commands](#) chapter.

Since SNMP traps are enabled by default for all defined triggers, a common usage will be for the **no** variant of this command to disable SNMP traps from a specified trap if the trap is only periodic. Refer in particular to AT-TRIGGER-MIB in the [Support for Allied Telesis Enterprise\\_MIBs\\_in AlliedWare Plus](#) for further information about the relevant SNMP MIB.

**Examples** To enable SNMP traps to be sent from trigger 5, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 5
awplus(config-trigger)# trap
```

To disable SNMP traps being sent from trigger 205, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 205
awplus(config-trigger)# no trap
```

**Related commands** [trigger](#)  
[show trigger](#)

# trigger

**Overview** This command is used to access the Trigger Configuration mode for the specified trigger. Once Trigger Configuration mode has been entered the trigger type information can be configured and the trigger scripts and other operational parameters can be specified. At a minimum the trigger type information must be specified before the trigger can become active.

The **no** variant of this command removes a specified trigger and all configuration associated with it.

**Syntax** trigger <1-250>  
no trigger <1-250>

| Parameter | Description   |
|-----------|---------------|
| <1-250>   | A trigger ID. |

**Mode** Global Configuration

**Examples** To enter trigger configuration mode for trigger 12, use the commands:

```
awplus# configure terminal  
awplus(config)# trigger 12
```

To completely remove all configuration associated with trigger 12, use the commands:

```
awplus# configure terminal  
awplus(config)# no trigger 12
```

**Related commands** [show trigger](#)  
[trigger activate](#)

# trigger activate

**Overview** This command is used to manually activate a specified trigger from the Privileged Exec mode, which has been configured with the **trigger** command from the Global Configuration mode.

**Syntax** `trigger activate <1-250>`

| Parameter | Description   |
|-----------|---------------|
| <1-250>   | A trigger ID. |

**Mode** Privileged Exec

**Usage notes** This command manually activates a trigger without the normal trigger conditions being met.

The trigger is activated even if it has been configured as inactive by using the command **no active**. The scripts associated with the trigger will be executed even if the trigger is in the diagnostic test mode.

Triggers activated manually do not have their repeat counts decremented or their 'last triggered' time updated, and do not result in updates to the '[type] triggers today' counters.

**Example** To manually activate trigger 12 use the command:

```
awplus# trigger activate 12
```

**Related commands**

- [active \(trigger\)](#)
- [show trigger](#)
- [trigger](#)

# type atmf guest

**Overview** This command configures a trigger to activate when an AMF guest node joins or leaves.

**Syntax** `type atmf guest {join|leave}`

| Parameter | Description            |
|-----------|------------------------|
| join      | AMF guest node joins.  |
| leave     | AMF guest node leaves. |

**Mode** Trigger Configuration

**Example** To configure trigger 86 to activate when an AMF guest node leaves, use the following commands:

```
awplus(config)# trigger 86  
awplus(config-trigger)# type atmf guest leave
```

**Related commands** [show trigger](#)

**Command changes** Version 5.5.1-1.1: command added

# type atmf node

**Overview** This command configures a trigger to activate when an AMF node joins or leaves.

**Syntax** type atmf node {join|leave}

| Parameter | Description      |
|-----------|------------------|
| join      | AMF node joins.  |
| leave     | AMF node leaves. |

**Mode** Trigger Configuration

**Example 1** To configure trigger 5 to activate when an AMF node leaves, use the following commands. In this example the command is entered on node-1:

```
node1(config)# trigger 5
node1(config-trigger)# type atmf node leave
```

**Example 2** The following commands will configure trigger 5 to activate if an AMF node join event occurs on any node within the working set:

```
node1# atmf working-set group all
```

This command returns the following display:

```
=====
node1, node2, node3:
=====

Working set join
```

Note that the running the above command changes the prompt from the name of the local node, to the name of the AMF-Network followed, in square brackets, by the number of member nodes in the working set.

```
AMF-Net[3]# conf t
AMF-Net[3](config)# trigger 5
AMF-Net[3](config-trigger)# type atmf node leave
AMF-Net[3](config-trigger)# description "E-mail on AMF Exit"
AMF-Net[3](config-trigger)# active
```

Enter the name of the script to run at the trigger event.

```
AMF-Net[3](config-trigger)# script 1 email_me.scp
AMF-Net[3](config-trigger)# end
```

### Display the trigger configurations

```
AMF-Net[3]# show trigger
```

This command returns the following display:

```
=====
node1:
=====

TR# Type & Details      Description          Ac Te Tr Repeat      #Scr Days/Date
-----
001 Periodic (2 min)   Periodic Status Chk Y  N  Y Continuous    1  smtwtfS
005 ATMF node (leave)  E-mail on ATMF Exit Y  N  Y Continuous    1  smtwtfS
-----

=====
Node2, Node3,
=====

TR# Type & Details      Description          Ac Te Tr Repeat      #Scr Days/Date
-----
005 ATMF node (leave)  E-mail on ATMF Exit Y  N  Y Continuous    1  smtwtfS
-----
```

### Display the triggers configured on each of the nodes in the AMF Network.

```
AMF-Net[3]# show running-config trigger
```

This command returns the following display:

```
=====
Node1:
=====

trigger 1
  type periodic 2
  script 1 atmf.scp
trigger 5
  type atmf node leave
description "E-mail on ATMF Exit"
  script 1 email_me.scp
!

=====
Node2, Node3:
=====

trigger 5
  type atmf node leave
description "E-mail on ATMF Exit"
  script 1 email_me.scp
!
```

**Related commands** [show trigger](#)

# type cpu

**Overview** This command configures a trigger to activate based on CPU usage level. Selecting the **up** option causes the trigger to activate when the CPU usage exceeds the specified usage level. Selecting the **down** option causes the trigger to activate when CPU usage drops below the specified usage level. Selecting **any** causes the trigger to activate in both situations. The default is **any**.

**Syntax** `type cpu <1-100> [up|down|any]`

| Parameter | Description  |
|-----------|--|
| <1-100>   | The percentage of CPU usage at which to trigger.                       |
| up        | Activate when CPU usage exceeds the specified level.                   |
| down      | Activate when CPU usage drops below the specified level                |
| any       | Activate when CPU usage passes the specified level in either direction |

**Mode** Trigger Configuration

**Usage notes** For an example trigger configuration that uses the **type cpu** command, see “Capture Unusual CPU and RAM Activity” in the [Triggers Feature Overview and Configuration Guide](#).

**Examples** To configure trigger 28 to be a CPU trigger that activates when CPU usage exceeds 80% use the following commands:

```
awplus# configure terminal
awplus(config)# trigger 28
awplus(config-trigger)# type cpu 80 up
```

To configure trigger 5 to be a CPU trigger that activates when CPU usage either rises above or drops below 65%, use the following commands:

```
awplus# configure terminal
awplus(config)# trigger 5
awplus(config-trigger)# type cpu 65

or

awplus# configure terminal
awplus(config)# trigger 5
awplus(config-trigger)# type cpu 65 any
```

**Related commands** [show trigger](#)  
[trigger](#)

# type env-sensor

**Overview** Use this command to create a trigger that will run a script when the device's environment sensors detect an event. Environment sensors are shown in the output of the command [show system environment](#), and include things like device temperature, power settings and voltage.

Depending on the device and sensor, you can create a trigger to run when:

- the sensor's state changes, for example when a loss of power is detected for a power supply, or when power is restored, or both.
- the sensor's reading crosses a high or low threshold, for example when the device temperature becomes too high, or returns to normal, or both.

**Syntax when a sensor changes state**

```
type env-sensor resource <resource-id> sensor <sensor-id> state {true|false|any}
```

| Parameter              | Description   |
|------------------------|---|
| resource <resource-id> | The 'Resource ID' for the device, as shown in output of the command <a href="#">show system environment</a> .                           |
| sensor <sensor-id>     | The 'ID' for the sensor, as shown in output of the command <a href="#">show system environment</a> .                                    |
| state true             | The trigger will activate if this sensor reading changes to 'Yes' or 'Open' in the output of <a href="#">show system environment</a> .  |
| state false            | The trigger will activate if this sensor reading changes to 'No' or 'Closed' in the output of <a href="#">show system environment</a> . |
| state any              | The trigger will activate if this sensor reading changes to any of 'Yes', 'Open', 'No', or 'Closed'.                                    |

**Syntax when a sensor crosses a threshold**

```
type env-sensor resource <resource-id> sensor <sensor-id> {low-limit|high-limit} {exceeded|cleared|any}
```

| Parameter              | Description  |
|------------------------|--|
| resource <resource-id> | The 'Resource ID' for the device, as shown in output of the command <a href="#">show system environment</a> .  |
| sensor <sensor-id>     | The 'ID' for the sensor, as shown in output of the command <a href="#">show system environment</a> .   |
| low-limit              | The trigger will activate when the sensor reading falls below the 'Low Limit' alarm threshold shown in <a href="#">show system environment</a> , or returns to an acceptable value after being too low, or both. The alarm threshold values are pre-defined within the device and cannot be changed. |

| Parameter  | Description   |
|------------|---|
| high-limit | The trigger will activate when the sensor reading rises above the 'High Limit' alarm threshold shown in <a href="#">show system environment</a> , or returns to an acceptable value after being too high, or both. The alarm threshold values are pre-defined within the device and cannot be changed.  |
| exceeded   | If you chose low-limit, the trigger will trigger if the sensor's reading falls below the low limit.<br>If you chose high-limit, the trigger will trigger if the sensor's reading goes above the high limit.   |
| cleared    | If you chose low-limit, the trigger will trigger if the sensor's reading rises to above the low limit again.<br>If you chose high-limit, the trigger will trigger if the sensor's reading falls below the high limit again.<br>Some temperature sensors include a hysteresis value and will not clear until the temperature has changed significantly. For example, if a sensor has a high alarm threshold of 75 degrees Celsius, the hysteresis value may mean that the alarm clears when the temperature falls to 63 degrees Celsius. |
| any        | The trigger will trigger if the low or high limit is either exceeded or cleared.  |

**Mode** Trigger Configuration

**Example** To configure trigger 1, which will activate when the internal temperature becomes too high or drops to a low-enough value after being too high, use the following commands. In this example, the monitored temperature has a resource ID of 4 and a sensor ID of 6:

```
awplus# configure terminal
awplus(config)# trigger 1
awplus(config-trigger)# type env-sensor resource 4 sensor 6
high-limit any
```

**Related commands** [show system environment](#)  
[show trigger](#)  
[trigger](#)

**Command changes** Version 5.5.2-1.1: command added

# type interface

**Overview** This command configures a trigger to activate based on the link status of an interface. The trigger can be activated when the interface becomes operational by using the **up** option, or when the interface closes by using the **down** option. The trigger can also be configured to activate when either one of these events occurs by using the **any** option.

**Syntax** `type interface <interface> {up|down|any}`

| Parameter   | Description   |
|-------------|---|
| <interface> | Interface name.                                       |
| up          | Activate when interface becomes operational.          |
| down        | Activate when the interface closes.                   |
| any         | Activate when any interface link status event occurs. |

**Mode** Trigger Configuration

**Example** To configure trigger 19 to be an interface trigger that activates when port1.0.1 becomes operational, use the following commands:

```
awplus# configure terminal
awplus(config)# trigger 19
awplus(config-trigger)# type interface port1.0.1 up
```

**Related commands** [show trigger](#)  
[trigger](#)

# type linkmon-probe

**Overview** Use this command to create a trigger that will run a script when a Link Health Monitoring probe reports that a link becomes “good”, “bad”, or “unreachable”.

**Syntax** `type linkmon-probe <probename> <profilename>  
{good|bad|unreachable|any}`

| Parameter     | Description  |
|---------------|--|
| <probename>   | The name of the Link Health Monitoring probe that will be used for executing the trigger.  |
| <profilename> | The name of the Link Health Monitoring performance profile that will be used for determine if the Link Health Monitoring probe is good, bad, or unreachable. |
| good          | If the Link Health Monitoring probe becomes 'good' according to the Link Health Monitoring performance profile then the trigger will be executed.            |
| bad           | If the Link Health Monitoring probe goes 'bad' according to the Link Health Monitoring performance profile then the trigger will be executed.                |
| unreachable   | If the Link Health Monitoring probe becomes 'unreachable' according to the Link Health Monitoring performance profile then the trigger will be executed.     |
| any           | If the Link Health Monitoring probe changes state according to the Link Health Monitoring performance profile then the trigger will be executed.             |

**Mode** Trigger Configuration

**Example** When the Link Health Monitoring probes sent to the “test-probe” destination no longer meet the performance profile “test-profile” the link will be deemed “bad”. To create a trigger that will run a script when a Link Health Monitoring probe is deemed “bad”, use the following commands:

```
awplus(config)# trigger 1
awplus(config-trigger)# script 1 link-bad.scp
awplus(config-trigger)# type linkmon-probe test-probe
test-profile bad
```

To create a trigger that will run a script when the link is deemed “good” again, use the following commands:

```
awplus(config)# trigger 2
awplus(config-trigger)# script 1 link-good.scp
awplus(config-trigger)# type linkmon-probe test-probe
test-profile good
```

**Related commands** [trigger](#)

**Command changes** Version 5.4.8-1.1: command added

# type log

**Overview** Use this command to configure a trigger to activate based on the content of log messages matching a string or regular expression.

**Syntax** `type log <log-message-string>`

| Parameter                               | Description  |
|---|--|
| <code>&lt;log-message-string&gt;</code> | A string or a regular expression (PCRE) to match a log message or part of a log message. |

**Default** There is no type or log message string set by default.

**Mode** Trigger Configuration

**Usage notes** Log type triggers fully support regular expressions using PCRE (Perl-Compatible Regular Expression) syntax.

Only log messages of severity level notice or higher can activate a trigger.

Note that any command executed by the script will generate a log message with level notice, and will include '[SCRIPT]' before the command string. Therefore, if something in the script matches the configured log message trigger string, it will retrigger indefinitely.

**Example** To configure trigger 6 to activate when a log message of level notice or higher indicates that any port has 'failed', use the commands:

```
awplus# configure terminal
awplus(config)# trigger 6
awplus(config-trigger)# type log port.+ failed
```

**Related commands** [show trigger](#)  
[trigger](#)

**Command changes** Version 5.4.7-2.1: command added

## type main-pse

**Overview** Use this command to monitor the total Power over Ethernet (PoE) power usage on the switch. This trigger activates if the amount of power being drawn exceeds the switch's PoE budget, or if it falls back within the budget again.

Note that the switch will take corrective action when the budget is exceeded. This means the amount of power will drop soon after the fault occurs.

**Syntax** `type main-pse {up|down|any}`

| Parameter | Description   |
|-----------|---|
| up        | Activate when the total power being drawn exceeds the PoE budget for the switch   |
| down      | Activate when the total power drawn falls back within the PoE budget for the switch                                       |
| any       | Activate both when the total power drawn exceeds the PoE budget for the switch and when it falls back within budget again |

**Mode** Trigger Configuration

**Example** To configure trigger 1, which will activate if the switch's power usage exceeds the PoE budget, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 1
awplus(config-trigger)# type main-pse up
```

**Related commands** [script](#)  
[show trigger](#)  
[type pse-port](#)

**Command changes** Version 5.5.3-1.1: command added

# type memory

**Overview** This command configures a trigger to activate based on RAM usage level. Selecting the **up** option causes the trigger to activate when memory usage exceeds the specified level. Selecting the **down** option causes the trigger to activate when memory usage drops below the specified level. Selecting **any** causes the trigger to activate in both situations. The default is **any**.

**Syntax** `type memory <1-100> [up|down|any]`

| Parameter | Description  |
|-----------|--|
| <1-100>   | The percentage of memory usage at which to trigger.                        |
| up        | Activate when memory usage exceeds the specified level.                    |
| down      | Activate when memory usage drops below the specified level.                |
| any       | Activate when memory usage passes the specified level in either direction. |

**Mode** Trigger Configuration

**Examples** To configure trigger 12 to be a memory trigger that activates when memory usage exceeds 50% use the following commands:

```
awplus# configure terminal
awplus(config)# trigger 12
awplus(config-trigger)# type memory 50 up
```

To configure trigger 40 to be a memory trigger that activates when memory usage either rises above or drops below 65%, use the following commands:

```
awplus# configure terminal
awplus(config)# trigger 40
awplus(config-trigger)# type memory 65
```

or

```
awplus# configure terminal
awplus(config)# trigger 40
awplus(config-trigger)# type memory 65 any
```

**Related commands** [show trigger](#)  
[trigger](#)

# type periodic

**Overview** This command configures a trigger to be activated at regular intervals. The time period between activations is specified in minutes.

**Syntax** `type periodic <1-1440>`

| Parameter                   | Description                                |
|-----------------------------|--|
| <code>&lt;1-1440&gt;</code> | The number of minutes between activations. |

**Mode** Trigger Configuration

**Usage notes** A combined limit of 10 triggers of the type periodic and time can be configured. If you attempt to add more than 10 triggers the following error message is displayed:

```
% Cannot configure more than 10 triggers with the type time or periodic
```

For an example trigger configuration that uses the **type periodic** command, see "See Daily Statistics" in the [Triggers\\_Feature Overview and Configuration Guide](#).

**Example** To configure trigger 44 to activate periodically at 10 minute intervals use the following commands:

```
awplus# configure terminal
awplus(config)# trigger 44
awplus(config-trigger)# type periodic 10
```

**Related commands** [show trigger](#)  
[trigger](#)

# type ping-poll

**Overview** This command configures a trigger that activates when Ping Polling identifies that a target device's status has changed. This allows you to run a configuration script when a device becomes reachable or unreachable.

**Syntax** `type ping-poll <1-100> {up|down}`

| Parameter | Description   |
|-----------|---|
| <1-100>   | The ping poll ID.   |
| up        | The trigger activates when ping polling detects that the target is reachable.   |
| down      | The trigger activates when ping polling detects that the target is unreachable. |

**Mode** Trigger Configuration

**Example** To configure trigger 106 to activate when ping poll 12 detects that its target device is now unreachable, use the following commands:

```
awplus# configure terminal
awplus(config)# trigger 106
awplus(config-trigger)# type ping-poll 12 down
```

**Related commands** [show trigger](#)  
[trigger](#)

# type pse-port

**Overview** Use this command to monitor an individual Power over Ethernet (PoE) port. This trigger activates if the amount of power being drawn by a port exceeds the capabilities of the port, or if it falls back within the limit again. Note that the switch will take corrective action when the port limit is exceeded, such as shutting down the affected port. This means the amount of power will drop soon after the fault occurs.

**Syntax** `type pse-port <interface> {up|down|any}`

| Parameter                      | Description   |
|--------------------------------|---|
| <code>&lt;interface&gt;</code> | The name of a PoE port.   |
| <code>up</code>                | Activate when the power drawn from the PoE port starts to exceed the port's capability to supply power.   |
| <code>down</code>              | Activate when the power drawn from the PoE port stops exceeding the port's capability to supply power.  |
| <code>any</code>               | Activate both when the power drawn from the PoE port starts to exceed the port's capability to supply power, and when it drops to a low enough value again. |

**Mode** Trigger Configuration

**Example** To configure trigger 1, which will activate if port1.0.1 draws too much power, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 1
awplus(config-trigger)# type pse-port port1.0.1 up
```

To configure trigger 1, which will activate if port1.0.1 draws too much power and also when it stops drawing too much power, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 1
awplus(config-trigger)# type pse-port port1.0.1 any
```

**Related commands**

- [script](#)
- [show trigger](#)
- [type main-pse](#)

**Command changes** Version 5.5.3-1.1: command added

# type reboot

**Overview** This command configures a trigger that activates when your device is rebooted.

**Syntax** type reboot

**Mode** Trigger Configuration

**Example** To configure trigger 32 to activate when your device reboots, use the following commands:

```
awplus# configure terminal
awplus(config)# trigger 32
awplus(config-trigger)# type reboot
```

**Related commands** [show trigger](#)  
[trigger](#)

# type time

**Overview** This command configures a trigger that activates at a specified time of day.

**Syntax** `type time <hh:mm>`

| Parameter                  | Description                       |
|----------------------------|-----------------------------------|
| <code>&lt;hh:mm&gt;</code> | The time to activate the trigger. |

**Mode** Trigger Configuration

**Usage** A combined limit of 10 triggers of the type time and type periodic can be configured. If you attempt to add more than 10 triggers the following error message is displayed:

```
% Cannot configure more than 10 triggers with the type time or
periodic
```

**Example** To configure trigger 86 to activate at 15:53, use the following commands:

```
awplus# configure terminal
awplus(config)# trigger 86
awplus(config-trigger)# type time 15:53
```

**Related commands** [show trigger](#)  
[trigger](#)

# type usb

**Overview** Use this command to configure a trigger that activates on either the removal or the insertion of a USB storage device.

**Syntax** `type usb {in|out}`

| Parameter | Description   |
|-----------|---|
| in        | Trigger activates on insertion of a USB storage device. |
| out       | Trigger activates on removal of a USB storage device.   |

**Mode** Trigger Configuration

**Usage notes** USB triggers cannot execute script files from a USB storage device.

**Examples** To configure trigger 1 to activate on the insertion of a USB storage device, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 1
awplus(config-trigger)# type usb in
```

**Related commands** [trigger](#)  
[show running-config trigger](#)  
[show trigger](#)

# undebug trigger

**Overview** This command applies the functionality of the **no debug trigger** command.

# 69

# Ping-Polling Commands

## Introduction

**Overview** This chapter provides an alphabetical reference for commands used to configure Ping Polling. For more information, see the [Ping Polling Feature Overview and Configuration Guide](#).

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

Table 69-1: The following table lists the default values when configuring a ping poll

| Default           | Value   |
|-------------------|---|
| Critical-interval | 1 second  |
| Description       | No description  |
| Fail-count        | 5   |
| Length            | 32 bytes  |
| Normal-interval   | 30 seconds  |
| Sample-size       | 5   |
| Source-ip         | The IP address of the interface from which the ping packets are transmitted |
| Time-out          | 1 second  |
| Up-count          | 30  |

# active (ping-polling)

**Overview** This command enables a ping-poll instance. The polling instance sends ICMP echo requests to the device with the IP address specified by the [ip \(ping-polling\)](#) command.

By default, polling instances are disabled. When a polling instance is enabled, it assumes that the device it is polling is unreachable.

The **no** variant of this command disables a ping-poll instance. The polling instance no longer sends ICMP echo requests to the polled device. This also resets all counters for this polling instance.

**Syntax** active  
no active

**Mode** Ping-Polling Configuration

**Examples** To activate the ping-poll instance 43, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 43
awplus(config-ping-poll)# active
```

To disable the ping-poll instance 43 and reset its counters, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 43
awplus(config-ping-poll)# no active
```

**Related commands** [debug ping-poll](#)  
[ip \(ping-polling\)](#)  
[ping-poll](#)  
[show ping-poll](#)

# clear ping-poll

**Overview** This command resets the specified ping poll, or all ping poll instances. This clears the ping counters, and changes the status of polled devices to unreachable. The polling instance changes to the polling frequency specified with the [critical-interval](#) command. The device status changes to reachable once the device responses have reached the [up-count](#).

**Syntax** `clear ping-poll {<1-100>|all}`

| Parameter | Description  |
|-----------|--|
| <1-100>   | A ping poll ID number. The specified ping poll instance has its counters cleared, and the status of the device it polls is changed to unreachable. |
| all       | Clears the counters and changes the device status of all polling instances.  |

**Mode** Privileged Exec

**Examples** To reset the ping poll instance 12, use the command:

```
awplus# clear ping-poll 12
```

To reset all ping poll instances, use the command:

```
awplus# clear ping-poll all
```

**Related commands**

- [active \(ping-polling\)](#)
- [ping-poll](#)
- [show ping-poll](#)

# critical-interval

**Overview** This command specifies the time period in seconds between pings when the polling instance has not received a reply to at least one ping, and when the device is unreachable.

This command enables the device to quickly observe changes in state, and should be set to a much lower value than the [normal-interval](#) command.

The **no** variant of this command sets the critical interval to the default of one second.

**Syntax** `critical-interval <1-65536>`  
`no critical-interval`

| Parameter                    | Description  |
|------------------------------|--|
| <code>&lt;1-65536&gt;</code> | Time in seconds between pings, when the device has failed to a ping, or the device is unreachable. |

**Default** The default is 1 second.

**Mode** Ping-Polling Configuration

**Examples** To set the critical interval to 2 seconds for the ping-polling instance 99, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 99
awplus(config-ping-poll)# critical-interval 2
```

To reset the critical interval to the default of one second for the ping-polling instance 99, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 99
awplus(config-ping-poll)# no critical-interval
```

**Related commands**

- [fail-count](#)
- [normal-interval](#)
- [sample-size](#)
- [show ping-poll](#)
- [timeout \(ping polling\)](#)
- [up-count](#)

# debug ping-poll

**Overview** This command enables ping poll debugging for the specified ping-poll instance. This generates detailed messages about ping execution.

The **no** variant of this command disables ping-poll debugging for the specified ping-poll.

**Syntax** `debug ping-poll <1-100>`  
`no debug ping-poll {<1-100>|all}`

| Parameter | Description                       |
|-----------|-----------------------------------|
| <1-100>   | A unique ping poll ID number.     |
| all       | Turn off all ping-poll debugging. |

**Mode** Privileged Exec

**Examples** To enable debugging for ping-poll instance 88, use the command:

```
awplus# debug ping-poll 88
```

To disable all ping poll debugging, use the command:

```
awplus# no debug ping-poll all
```

To disable debugging for ping-poll instance 88, use the command:

```
awplus# no debug ping-poll 88
```

**Related commands**

- [active \(ping-polling\)](#)
- [clear ping-poll](#)
- [ping-poll](#)
- [show ping-poll](#)
- [undebug ping-poll](#)

# description (ping-polling)

**Overview** This command specifies a string to describe the ping-polling instance. This allows the ping-polling instance to be recognized easily in show commands. Setting this command is optional.

By default ping-poll instances do not have a description.

Use the **no** variant of this command to delete the description set.

**Syntax** `description <description>`  
`no description`

| Parameter                        | Description   |
|----------------------------------|---|
| <code>&lt;description&gt;</code> | The description of the target. Valid characters are any printable character and spaces. There is no maximum character length. |

**Mode** Ping-Polling Configuration

**Examples** To add the text "Primary Gateway" to describe the ping-poll instance 45, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 45
awplus(config-ping-poll)# description Primary Gateway
```

To delete the description set for the ping-poll instance 45, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 45
awplus(config-ping-poll)# no description
```

**Related commands** [ping-poll](#)  
[show ping-poll](#)

# fail-count

**Overview** This command specifies the number of pings that must be unanswered, within the total number of pings specified by the [sample-size](#) command, for the ping-polling instance to consider the device unreachable.

If the number set by the [sample-size](#) command and the **fail-count** commands are the same, then the unanswered pings must be consecutive. If the number set by the [sample-size](#) command is greater than the number set by the **fail-count** command, then a device that does not always reply to pings may be declared unreachable.

The **no** variant of this command resets the fail count to the default.

**Syntax** `fail-count <1-100>`  
`no fail-count`

| Parameter                  | Description  |
|----------------------------|--|
| <code>&lt;1-100&gt;</code> | The number of pings within the sample size that a reachable device must fail to respond to before it is classified as unreachable. |

**Default** The default is 5.

**Mode** Ping-Polling Configuration

**Examples** To specify the number of pings that must fail within the sample size to determine that a device is unreachable for ping-polling instance 45, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 45
awplus(config-ping-poll)# fail-count 5
```

To reset the fail-count to its default of 5 for ping-polling instance 45, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 45
awplus(config-ping-poll)# no fail-count
```

**Related commands**

- [critical-interval](#)
- [normal-interval](#)
- [ping-poll](#)
- [sample-size](#)
- [show ping-poll](#)
- [timeout \(ping polling\)](#)
- [up-count](#)

# ip (ping-polling)

**Overview** This command specifies the IPv4 address of the device you are polling.

**Syntax** `ip {<ip-address>|<ipv6-address>}`

| Parameter                         | Description  |
|-----------------------------------|--|
| <code>&lt;ip-address&gt;</code>   | An IPv4 address in dotted decimal notation A.B.C.D |
| <code>&lt;ipv6-address&gt;</code> | An IPv6 address in hexadecimal notation X:X::X:X   |

**Mode** Ping-Polling Configuration

**Examples** To set ping-poll instance 5 to poll the device with the IP address 192.168.0.1, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 5
awplus(config-ping-poll)# ip 192.168.0.1
```

To set ping-poll instance 10 to poll the device with the IPv6 address 2001:db8::, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 10
awplus(config-ping-poll)# ip 2001:db8::
```

**Related commands**

- [ping-poll](#)
- [source-ip](#)
- [show ping-poll](#)

# length (ping-poll data)

**Overview** This command specifies the number of data bytes to include in the data portion of the ping packet. This allows you to set the ping packets to a larger size if you find that larger packet types in your network are not reaching the polled device, while smaller packets are getting through. This encourages the polling instance to change the device's status to unreachable when the network is dropping packets of the size you are interested in.

The **no** variant of this command resets the data bytes to the default of 32 bytes.

**Syntax** length <4-1500>  
no length

| Parameter | Description   |
|-----------|---|
| <4-1500>  | The number of data bytes to include in the data portion of the ping packet. |

**Default** The default is 32.

**Mode** Ping-Polling Configuration

**Examples** To specify that ping-poll instance 12 sends ping packet with a data portion of 56 bytes, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 12
awplus(config-ping-poll)# length 56
```

To reset the number of data bytes in the ping packet to the default of 32 bytes for ping-poll instance 3, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 12
awplus(config-ping-poll)# length
```

**Related commands** ping-poll  
show ping-poll

# normal-interval

**Overview** This command specifies the time period between pings when the device is reachable.

The **no** variant of this command resets the time period to the default of 30 seconds.

**Syntax** `normal-interval <1-65536>`  
`no normal-interval`

| Parameter                    | Description   |
|------------------------------|---|
| <code>&lt;1-65536&gt;</code> | Time in seconds between pings when the target is reachable. |

**Default** The default is 30 seconds.

**Mode** Ping-Polling Configuration

**Examples** To specify a time period of 60 seconds between pings when the device is reachable for ping-poll instance 45, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 45
awplus(config-ping-poll)# normal-interval 60
```

To reset the interval to the default of 30 seconds for ping-poll instance 45, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 45
awplus(config-ping-poll)# no normal-interval
```

**Related commands**

- [critical-interval](#)
- [fail-count](#)
- [ping-poll](#)
- [sample-size](#)
- [show ping-poll](#)
- [timeout \(ping polling\)](#)
- [up-count](#)

# ping-poll

**Overview** This command enters the ping-poll configuration mode. If a ping-poll exists with the specified number, then this command enters its configuration mode. If no ping-poll exists with the specified number, then this command creates a new ping poll with this ID number.

To configure a ping-poll, create a ping poll using this command, and use the [ip \(ping-polling\)](#) command to specify the device you want the polling instance to poll. It is not necessary to specify any further commands unless you want to change a command's default.

The **no** variant of this command deletes the specified ping poll.

**Syntax** `ping-poll <1-100>`  
`no ping-poll <1-100>`

| Parameter | Description                   |
|-----------|-------------------------------|
| <1-100>   | A unique ping poll ID number. |

**Mode** Global Configuration

**Examples** To create ping-poll instance 3 and enter ping-poll configuration mode, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 3
awplus(config-ping-poll)#
```

To delete ping-poll instance 3, use the commands:

```
awplus# configure terminal
awplus(config)# no ping-poll 3
```

**Related commands**

- [active \(ping-polling\)](#)
- [clear ping-poll](#)
- [debug ping-poll](#)
- [description \(ping-polling\)](#)
- [ip \(ping-polling\)](#)
- [length \(ping-poll data\)](#)
- [show ping-poll](#)
- [source-ip](#)

# sample-size

**Overview** This command sets the total number of pings that the polling instance inspects when determining whether a device is unreachable. If the number of pings specified by the **fail-count** command go unanswered within the inspected sample, then the device is declared unreachable.

If the numbers set in this command and **fail-count** command are the same, the unanswered pings must be consecutive. If the number set by this command is greater than that set with the **fail-count** command, a device that does not always reply to pings may be declared unreachable.

You cannot set this command's value lower than the **fail-count** value.

The polling instance uses the number of pings specified by the **up-count** command to determine when a device is reachable.

The **no** variant of this command resets this command to the default.

**Syntax** `sample-size <1-100>`  
`no sample size`

| Parameter | Description   |
|-----------|---|
| <1-100>   | Number of pings that determines critical and up counts. |

**Default** The default is 5.

**Mode** Ping-Polling Configuration

**Examples** To set the sample-size to 50 for ping-poll instance 43, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 43
awplus(config-ping-poll)# sample-size 50
```

To reset sample-size to the default of 5 for ping-poll instance 43, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 43
awplus(config-ping-poll)# no sample-size
```

**Related commands**

- critical-interval
- fail-count
- normal-interval
- ping-poll
- show ping-poll
- timeout (ping polling)
- up-count

# show counter ping-poll

**Overview** This command displays the counters for ping polling.

**Syntax** show counter ping-poll [*<1-100>*]

| Parameter            | Description   |
|----------------------|---|
| <i>&lt;1-100&gt;</i> | A unique ping poll ID number. This displays the counters for the specified ping poll only. If you do not specify a ping poll, then this command displays counters for all ping polls. |

**Mode** User Exec and Privileged Exec

**Output** Figure 69-1: Example output from the **show counter ping-poll** command

```
Ping-polling counters
Ping-poll: 1
PingsSent          ..... 15
PingsFailedUpState ..... 0
PingsFailedDownState ..... 0
ErrorSendingPing   ..... 2
CurrentUpCount     ..... 13
CurrentFailCount   ..... 0
UpStateEntered     ..... 0
DownStateEntered   ..... 0

Ping-poll: 2
PingsSent          ..... 15
PingsFailedUpState ..... 0
PingsFailedDownState ..... 0
ErrorSendingPing   ..... 2
CurrentUpCount     ..... 13
CurrentFailCount   ..... 0
UpStateEntered     ..... 0
DownStateEntered   ..... 0

Ping-poll: 5
PingsSent          ..... 13
PingsFailedUpState ..... 0
PingsFailedDownState ..... 2
ErrorSendingPing   ..... 2
CurrentUpCount     ..... 9
CurrentFailCount   ..... 0
UpStateEntered     ..... 0
DownStateEntered   ..... 0
```

**Table 70:** Parameters in output of the **show counter ping-poll** command

| Parameter            | Description  |
|----------------------|--|
| Ping-poll            | The ID number of the polling instance.   |
| PingsSent            | The total number of pings generated by the polling instance.   |
| PingsFailedUpState   | The number of unanswered pings while the target device is in the Up state. This is a cumulative counter for multiple occurrences of the Up state.            |
| PingsFailedDownState | Number of unanswered pings while the target device is in the Down state. This is a cumulative counter for multiple occurrences of the Down state.            |
| ErrorSendingPing     | The number of pings that were not successfully sent to the target device.<br>This error can occur when your device does not have a route to the destination. |
| CurrentUpCount       | The current number of sequential ping replies.   |
| CurrentFailCount     | The number of ping requests that have not received a ping reply in the current sample-size window.   |
| UpStateEntered       | Number of times the target device has entered the Up state.  |
| DownStateEntered     | Number of times the target device has entered the Down state.  |

**Example** To display counters for the polling instances, use the command:

```
awplus# show counter ping-poll
```

**Related commands**

- [debug ping-poll](#)
- [ping-poll](#)
- [show ping-poll](#)

# show ping-poll

**Overview** This command displays the settings and status of ping polls.

**Syntax** `show ping-poll [<1-100>|state {up|down}] [brief]`

| Parameter | Description  |   |
|-----------|--|---|
| <1-100>   | Displays settings and status for the specified polling instance.   |   |
| state     | Displays polling instances based on whether the device they are polling is currently reachable or unreachable. |   |
|           | up   | Displays polling instance where the device state is reachable.    |
|           | down   | Displays polling instances where the device state is unreachable. |
| brief     | Displays a summary of the state of ping polls, and the devices they are polling.                               |   |

**Mode** User Exec and Privileged Exec

**Output** Figure 69-2: Example output from the **show ping-poll brief** command

```
Ping Poll Configuration
-----
Id Enabled State Destination
-----
1 Yes Down 192.168.0.1
2 Yes Up 192.168.0.100
```

**Table 71:** Parameters in output of the **show ping-poll brief** command

| Parameter | Meaning  |
|-----------|--|
| Id        | The ID number of the polling instance, set when creating the polling instance with the <code>ping-poll</code> command. |
| Enabled   | Whether the polling instance is enabled or disabled.   |

**Table 71:** Parameters in output of the **show ping-poll brief** command (cont.)

| Parameter     | Meaning  |
|---------------|--|
| State         | The current status of the device being polled:   |
| Up            | The device is reachable.   |
| Down          | The device is unreachable.   |
| Critical Up   | The device is reachable but recently the polling instance has not received some ping replies, so the polled device may be going down.    |
| Critical Down | The device is unreachable but the polling instance received a reply to the last ping packet, so the polled device may be coming back up. |
| Destination   | The IP address of the polled device, set with the <code>ip (ping-polling)</code> command.  |

**Figure 69-3:** Example output from the **show ping-poll** command

```

Ping Poll Configuration

Debugging                 : Enabled
    
```

**Table 72:** Parameters in output of the **show ping-poll** command

| Parameter              | Description   |  |
|------------------------|---|--|
| Description            | Optional description set for the polling instance with the <a href="#">description (ping-polling)</a> command.  |  |
| Destination IP address | The IP address of the polled device, set with the <a href="#">ip (ping-polling)</a> command.  |  |
| Status                 | The current status of the device being polled:  |  |
|                        | Up  | The device is reachable.   |
|                        | Down  | The device is unreachable.   |
|                        | Critical Up   | The device is reachable but recently the polling instance has not received some ping replies, so the polled device may be going down.    |
|                        | Critical Down   | The device is unreachable but the polling instance received a reply to the last ping packet, so the polled device may be coming back up. |
| Enabled                | Whether the polling instance is enabled or disabled. The <a href="#">active (ping-polling)</a> and <a href="#">active (ping-polling)</a> commands enable and disable a polling instance.                              |  |
| Source IP address      | The source IP address sent in the ping packets. This is set using the <a href="#">source-ip</a> command.  |  |
| Critical interval      | The time period in seconds between pings when the polling instance has not received a reply to at least one ping, and when the device is unreachable. This is set with the <a href="#">critical-interval</a> command. |  |
| Normal interval        | The time period between pings when the device is reachable. This is set with the <a href="#">normal-interval</a> command.   |  |

**Table 72:** Parameters in output of the **show ping-poll** command (cont.)

| Parameter   | Description  |
|-------------|--|
| Fail count  | The number of pings that must be unanswered, within the total number of pings specified by the <a href="#">sample-size</a> command, for the polling instance to consider the device unreachable. This is set using the <a href="#">fail-count</a> command. |
| Up count    | The number of consecutive pings that the polling instance must receive a reply to before classifying the device reachable again. This is set using the <a href="#">up-count</a> command.   |
| Sample size | The total number of pings that the polling instance inspects when determining whether a device is unreachable. This is set using the <a href="#">sample-size</a> command.  |
| Length      | The number of data bytes to include in the data portion of the ping packet. This is set using the <a href="#">length (ping-poll data)</a> command.   |
| Timeout     | The time in seconds that the polling instance waits for a response to a ping packet. This is set using the <a href="#">timeout (ping polling)</a> command.   |
| Debugging   | Indicates whether ping polling debugging is <b>Enabled</b> or <b>Disabled</b> . This is set using the <a href="#">debug ping-poll</a> command.   |

**Examples** To display the ping poll settings and the status of all the polls, use the command:

```
awplus# show ping-poll
```

To display a summary of the ping poll settings, use the command:

```
awplus# show ping-poll brief
```

To display the settings for ping poll 6, use the command:

```
awplus# show ping-poll 6
```

To display a summary of the state of ping poll 6, use the command:

```
awplus# show ping-poll 6 brief
```

To display the settings of ping polls that have reachable devices, use the command:

```
awplus# show ping-poll state up
```

To display a summary of ping polls that have unreachable devices, use the command:

```
awplus# show ping-poll state down brief
```

**Related commands** [debug ping-poll](#)  
[ping-poll](#)

# source-ip

**Overview** This command specifies the source IP address to use in ping packets.

By default, the polling instance uses the address of the interface through which it transmits the ping packets. It uses the device's local interface IP address when it is set. Otherwise, the IP address of the interface through which it transmits the ping packets is used.

The **no** variant of this command resets the source IP in the packets to the device's local interface IP address.

**Syntax** `source-ip {<ip-address>|<ipv6-address>}`  
`no source-ip`

| Parameter                         | Description  |
|-----------------------------------|--|
| <code>&lt;ip-address&gt;</code>   | An IPv4 address in dotted decimal notation A.B.C.D |
| <code>&lt;ipv6-address&gt;</code> | An IPv6 address in hexadecimal notation X:X::X:X   |

**Mode** Ping-Polling Configuration

**Examples** To configure the ping-polling instance 43 to use the source IP address 192.168.0.1 in ping packets, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 43
awplus(config-ping-poll)# source-ip 192.168.0.1
```

To configure the ping-polling instance 43 to use the source IPv6 address 2001:db8:: in ping packets, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 43
awplus(config-ping-poll)# source-ip 2001:db8::
```

To reset the source IP address to the device's local interface IP address for ping-poll instance 43, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 43
awplus(config-ping-poll)# no source-ip
```

**Related commands**

- description (ping-polling)
- ip (ping-polling)
- length (ping-poll data)
- ping-poll
- show ping-poll

# timeout (ping polling)

**Overview** This command specifies the time in seconds that the polling instance waits for a response to a ping packet. You may find a higher time-out useful in networks where ping packets have a low priority.

The **no** variant of this command resets the set time out to the default of one second.

**Syntax** `timeout <1-30>`  
`no timeout`

| Parameter | Description  |
|-----------|--|
| <1-30>    | Length of time, in seconds, that the polling instance waits for a response from the polled device. |

**Default** The default is 1 second.

**Mode** Ping-Polling Configuration

**Examples** To specify the timeout as 5 seconds for ping-poll instance 43, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 43
awplus(config-ping-poll)# timeout 5
```

To reset the timeout to its default of 1 second for ping-poll instance 43, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 43
awplus(config-ping-poll)# no timeout
```

- [fail-count](#)
- [normal-interval](#)
- [ping-poll](#)
- [sample-size](#)
- [show ping-poll](#)
- [up-count](#)

# up-count

**Overview** This command sets the number of consecutive pings that the polling instance must receive a reply to before classifying the device reachable again.

The **no** variant of this command resets the up count to the default of 30.

**Syntax** `up-count <1-100>`  
`no up-count`

| Parameter                  | Description  |
|----------------------------|--|
| <code>&lt;1-100&gt;</code> | Number of replied pings before an unreachable device is classified as reachable. |

**Default** The default is 30.

**Mode** Ping-Polling Configuration

**Examples** To set the upcount to 5 consecutive pings for ping-polling instance 45, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 45
awplus(config-ping-poll)# up-count 5
```

To reset the upcount to the default value of 30 consecutive pings for ping-polling instance 45, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 45
awplus(config-ping-poll)# no up-count
```

# debug sflow

**Overview** This command enables sFlow® debug message logging, for sFlow sampling and polling activity on the specified ports. If no ports are specified, sampling and/or polling debug messages are enabled for all ports.

The **no** variant of this command disables sFlow sampling and or polling debug message logging on the ports selected. If no ports are specified, sampling and/or polling debug messages are disabled on all ports.

**Syntax** `debug sflow [interface <port-list>] [sampling][polling]`  
`no debug sflow [interface <port-list>] [sampling][polling]`

| Parameter   | Description  |
|-------------|--|
| interface   | Interface information.   |
| <port-list> | The ports for which sFlow debug is to be enabled. The ports to display information about. The port list can be: <ul style="list-style-type: none"><li>• a switch port (e.g. port1.0.12)</li><li>• a continuous range of ports separated by a hyphen, e.g. port1.0.1-1.0.24</li><li>• a comma-separated list of ports and port ranges, e.g. port1.0.1,port1.0.1-1.0.24.</li></ul> |
| sampling    | Debug sFlow sampling for the specified port(s).  |
| polling     | Debug sFlow polling for the specified port(s).   |

**Default** The sFlow sampling and or polling debug is disabled.

**Mode** Privileged Exec

**Examples** To enable sFlow debug message logging for polling and sampling on port1.0.1 and port1.0.7, use the commands:

```
awplus# debug sflow interface port1.0.1,port1.0.7 sampling  
polling
```

To enable logging and polling of sFlow debug messages for polling and sampling on all ports, use the command:

```
awplus# debug sflow sampling polling
```

**Related commands** [show debugging sflow](#)  
[no debug all](#)

# debug sflow agent

**Overview** This command enables sFlow® debug message logging that is not specific to particular ports. For example, sending an sFlow datagram to the collector.

The **no** variant of this command applies the command default.

**Syntax** `debug sflow agent`  
`no debug sflow agent`

**Default** The sFlow agent debug message logging (that is not port specific) is disabled.

**Mode** Privileged Exec

**Example** To enable logging of sFlow agent debug messages, use the following command:

```
awplus# debug sflow agent
```

**Related commands** [show debugging sflow](#)  
[debug sflow](#)

# sflow agent

**Overview** This command sets the sFlow® agent IP address on the switch. This address is inserted into every sFlow datagram sent from the sFlow agent switch to the sFlow collector device. The sFlow collector can then use this address to uniquely identify and to access the switch, such as for SNMP. We therefore recommend that you change this address as little as possible.

Although the agent address can be set to any valid IPv4 or IPv6 address; we recommended that you set the sFlow® agent IP address to be the **local address** that is configured on the switch. For information on local addresses and how to set them up, see the [interface \(to configure\)](#) command. This ensures that the sFlow collector can maintain connectivity to the switch irrespective of the addition or deletion of interfaces (each of which will have its own specific IP address). Note that sFlow is rendered inactive whenever the agent address is not set.

The **no** variant of this command applies its default setting to remove a configured address.

**Syntax** `sflow agent {ip <ip-address>|ipv6 <ipv6-address>}`  
`no sflow agent {ip|ipv6}`

| Parameter      | Description  |
|----------------|--|
| <ip-address>   | The IPv4 address of the switch that is acting as the sFlow agent.  |
| <ipv6-address> | The IPv6 address of the switch that is acting as the sFlow agent. The IPv6 address uses the format X:X::X:X. |

**Default** The sFlow agent address is unset.

**Mode** Global Configuration

**Examples** To set the sFlow agent (IPv4) address to 192.0.2.23, use the command:

```
awplus# configure terminal
awplus(config)# sflow agent ip 192.0.2.23
```

To remove the sFlow agent (IPv4) address, use the command:

```
awplus# configure terminal
awplus(config)# no sflow agent ip
```

To set the sFlow agent (IPv6) address to 2001:0db8::1, use the command:

```
awplus# configure terminal
awplus(config)# sflow agent ipv6 2001:0db8::1
```

To remove the sFlow agent (IPv6) address, use the command:

```
awplus# configure terminal
awplus(config)# no sflow agent ipv6
```

**Related commands** `show running-config sflow`  
`show sflow`

# sflow collector

**Overview** This command has been deprecated. It has been replaced by the [sflow collector id](#) command.

This command sets the sFlow® agent's collector IP address and/or UDP port.

**Command changes** Version 5.5.1-1.1: command deprecated.

# sflow collector id

**Overview** Use this command to set the sFlow® agent's collector IP address and optionally the port and maximum datagram size. This is the destination IP address and UDP port, for sFlow datagrams sent from the sFlow agent. The IP address can be any valid IPv4 or IPv6 address.

Use the **no** variant of this command to remove the configuration for that collector and render it inactive.

**Syntax**

```
sflow collector id <1-5> ip <ip-address> [port  
<1-65535>|max-datagram-size <200-1500>]  
  
sflow collector id <1-5> ipv6 <ipv6-address> [port  
<1-65535>|max-datagram-size <200-1500>]  
  
no sflow collector id <1-5>
```

| Parameter         | Description   |
|-------------------|---|
| <ip-address>      | IPv4 address of the remote sFlow collector.   |
| <ipv6-address>    | IPv6 address of remote sFlow collector.<br>The IPv6 address uses the format X::X:X.                     |
| port              | Destination UDP port for sFlow datagrams sent to the collector.   |
| <1-65535>         | UDP port number (default: 6343).  |
| max-datagram-size | The maximum number of bytes that can be sent in an sFlow datagram sent from the agent to the collector. |
| <200-1500>        | The value set for the max-datagram-size.  |

**Default** By default the collector does not exist until configured with a valid IP address.

**Mode** Global Configuration

**Examples** To set the address of collector 1 to 192.168.1.36 with default port and max-datagram size, use the commands:

```
awplus# configure terminal  
awplus(config)# sflow collector id 1 ip 192.168.1.36
```

To set the address of collector 2 to 12ae::213d::213d::333f and use UDP port 500, use the commands:

```
awplus# configure terminal  
awplus(config)# sflow collector id 2 ipv6  
12ae::213d::213d::333f port 500
```

To set the address of collector 5 to 10.42.2.70 and use UDP port 7777 and have a max-datagram-size of 800, use the commands:

```
awplus# configure terminal
awplus(config)# sflow collector id 5 ip 10.42.2.70 port 7777
max-datagram-size 800
```

To delete collector 5, use the commands:

```
awplus# configure terminal
awplus(config)# no sflow collector id 5
```

**Related commands** [show running-config sflow](#)  
[show sflow](#)

**Command changes** Version 5.5.1-1.1: command added.

# sflow collector max-datagram-size

**Overview** This command has been deprecated. It has been replaced by the [sflow collector id](#) command.

This command sets the maximum size of the sFlow® datagrams sent to the collector.

**Command changes** Version 5.5.1-1.1: command deprecated

# sflow enable

**Overview** This command enables sFlow® globally on the switch.

The **no** variant of this command disables sFlow globally on the switch.

Note that enabling sFlow does not automatically set its operational status to active. To activate sFlow the following conditions need to be met:

- sFlow is enabled.
- The sFlow agent address is set.
- The sFlow collector address is set to a valid (non zero) IPv4 or IPv6 address.
- Polling or sampling is enabled on the ports to be sampled or polled.

**Syntax** sflow enable  
no sflow enable

**Default** sFlow is disabled globally on the switch.

**Mode** Global Configuration

**Example** To enable sFlow operation, use the command:

```
awplus# configure terminal  
awplus(config)# sflow enable
```

**Related commands** [show running-config sflow](#)  
[show sflow](#)

# sflow max-header-size

**Overview** This command sets the maximum header size of the Ethernet frames sampled on a specified port. The maximum header size is measured in bytes, referenced from the first byte of the Ethernet destination address and excludes the Ethernet FCS fields.

If a sampled Ethernet frame is longer than the maximum header size set by this command, then the frame will be truncated to the first N bytes before being placed in the sFlow datagram, where N is the maximum header size set by this command.

The **no** variant of this command resets the max-header-size to its default.

**Syntax** `sflow max-header-size <14-200>`  
`no sflow max-header-size`

| Parameter | Description                                       |
|-----------|---|
| <14-200>  | The maximum number of header bytes to be sampled. |

**Default** The max-header-size is 128 bytes.

**Mode** Interface Configuration

**Usage notes** The header size is measured from the first byte of the Ethernet frame MAC Destination Address.

- For an environment using standard TCP IPv4 over Ethernet frames, consider the following basic protocol structure:

Ethernet header (including the 4 byte 802.1Q header component) = 18 bytes

IPv4 header = 24 bytes

TCP header = 24 bytes

Total = 66 bytes

**CAUTION:** For IPv4, any data existing between 66 bytes and the value set by this command will be included in the sFlow packet samples. For example, with the default of 128 applied, up to 128-66=62 bytes of user data could be included in the sFlow datagram samples sent between the Agent and the Collector.

For more information, see the [sFlow Feature Overview and Configuration Guide](#).

- A similar consideration can be made for an environment using TCP IPv6 over Ethernet:

Ethernet header (including the 4 byte 802.1Q header component) = 18 bytes

IPv6 header = 40 bytes

TCP header = 24 bytes

Total = 82 bytes

**CAUTION:** For IPv6, any data existing between 82 bytes and the value set by this command will be included in the sFlow packet samples. For example, with the default of 128 applied, up to  $128-82=46$  bytes of user data could be included in the sFlow datagram samples sent between the Agent and the Collector.

Note that the agent-to-collector datagrams contain their own UDP headers, which are outside this calculation.

**Example** To set the maximum header size to 160 bytes for ports 1.0.1 and 1.0.7, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1,port1.0.7
awplus(config-if)# sflow max-header-size 160
```

**Related commands**

- [show running-config sflow](#)
- [show sflow interface](#)
- [sflow max-header-size](#)

# sflow polling-interval

**Overview** This command sets the sFlow® counter polling interval (in seconds) for the specified ports. A value of 0 disables polling. A counter sample is taken every N seconds where N is the value set by this command.

The **no** variant of this command applies the default.

**Syntax** `sflow polling-interval {0|<1-16777215>}`  
`no sflow polling-interval`

| Parameter    | Description                      |
|--------------|----------------------------------|
| 0            | Disable polling (the default).   |
| <1-16777215> | The polling interval in seconds. |

**Default** The polling-interval is 0 (polling disabled).

**Mode** Interface Configuration

**Example** To set the polling interval to 60 seconds for ports 1.0.1 and 1.0.7, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1,port1.0.7
awplus(config-if)# sflow polling-interval 60
```

**Related commands** [show running-config sflow](#)  
[show sflow interface](#)

# sflow sampling-rate

**Overview** This command sets the mean sFlow® sampling rate for the specified ports. Sampling occurs every N frames (on average), where N is the rate value set via this command. The sampling rate applies to ingress and egress frames independently. For example, a value of 1000 will sample one frame in every 1000 frames received, i.e. one in every 1000 frames sent from the specified port. A value of 0 disables sampling on the specified port(s).

The **no** variant of this command applies the default.

**Syntax** `sflow sampling-rate <256-16777215>`  
`no sflow sampling-rate`

| Parameter                         | Description                                       |
|-----------------------------------|---|
| <code>&lt;256-16777215&gt;</code> | The sampling rate N, measured in Ethernet frames. |

**Default** The sampling-rate is 0 (sampling disabled).

**Mode** Interface Configuration

**Example** To set the sampling rate to 500 for port1.0.1 and port1.0.3, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1,port1.0.3
awplus(config-if)# sflow sampling-rate 500
```

**Related commands** [show running-config sflow](#)  
[show sflow interface](#)

# show debugging sflow

**Overview** This command displays sFlow® debug settings for agent operation, and for sampling and polling on specific interface ports. If no interface ports are specified, sampling and polling will be applied to all ports.

**Syntax** `show debugging sflow [interface <port-list>]`

| Parameter                      | Description  |
|--------------------------------|--|
| <code>interface</code>         | The interface information.   |
| <code>&lt;port-list&gt;</code> | The ports for which the sFlow debug settings are to be shown. The ports to display information about. The port list can be: <ul style="list-style-type: none"><li>• a switch port (e.g. <code>port1.0.6</code>)</li><li>• a continuous range of ports separated by a hyphen, e.g. <code>port1.0.1-1.0.6</code></li><li>• a comma-separated list of ports and port ranges, e.g. <code>port1.0.1,port1.0.3-1.0.6</code>.</li></ul> |

**Mode** User Exec and Privileged Exec

**Example** To display sFlow debug settings on the agent, and for sampling and polling on ports 1.0.1 to 1.0.9, use the command:

```
awplus# show debugging sflow interface port1.0.1-1.0.9
```

**Output** Figure 70-1: Sample obtained for an sFlow agent

```
awplus# show debugging sflow interface port1.0.1-1.0.9
```

| Port  | Sampling<br>Debug | Polling<br>Debug |
|-------|-------------------|------------------|
| 1.0.1 | Enabled           | Enabled          |
| 1.0.2 | Enabled           | -                |
| 1.0.3 | -                 | -                |
| 1.0.4 | -                 | -                |
| 1.0.5 | -                 | -                |
| 1.0.6 | -                 | Enabled          |
| 1.0.7 | -                 | -                |
| 1.0.8 | -                 | Enabled          |
| 1.0.9 | -                 | Enabled          |

To display sFlow debug settings for all ports, use the command:

```
awplus# show debugging sflow
```

**Related commands** [show running-config sflow](#)  
[show sflow interface](#)

# show running-config sflow

**Overview** This command displays the running system information specific to the sFlow feature.

**Syntax** `show running-config sflow`

**Mode** Privileged Exec and Global Configuration

**Example** To display the sFlow running configuration information, use the command:

```
awplus# show running-config sflow
```

**Output** Figure 70-2: Example output from the **show running-config sflow** command

```
awplus#sh run sflow
!
sflow agent ip 192.0.2.33
sflow collector ip 192.0.2.65
sflow collector max-datagram-size 1200
sflow enable
!
interface port1.0.11-port1.0.22
 sflow sampling-rate 512
```

**Related commands** [show running-config](#)

# show sflow

**Overview** This command displays non-port-specific sFlow agent configuration and operational status.

**Syntax** show sflow

**Mode** Privileged Exec

**Example** To display sFlow configuration and operational status, use the command:

```
awplus# show sflow
```

## Output

**Table 1:** Example output from the **show sflow** command

|                            |  |
|----------------------------|--|
| sFlow Agent Configuration: | Default Values                             |
| sFlow Admin Status .....   | Disabled [Disabled]                        |
| sFlow Agent Address .....  | [not set] [not set]                        |
| Collector Address .....    | 0.0.0.0 [0.0.0.0]                          |
| Collector UDP Port .....   | 6343 [6343]                                |
| Tx Max Datagram Size ..... | 1200 [1400]                                |
| sFlow Agent Status:        |  |
| Polling/sampling/Tx .....  | Inactive because:                          |
|                            | - sFlow is disabled                        |
|                            | - Agent Addr is not set                    |
|                            | - Collector Addr is 0.0.0.0                |
|                            | - Polling & sampling disabled on all ports |

**Table 2:** Parameters in the output of the **show sflow** command

| Output Parameter    | Description  |
|---------------------|--|
| sFlow Admin Status  | Whether sFlow agent operation is administratively enabled.   |
| sFlow Agent Address | The sFlow agent IPv4 or IPv6 address for the device. sFlow is rendered inactive whenever the agent address is not set.   |
| Collector Address   | The IPv4 or IPv6 collector address to which sFlow datagrams are sent. sFlow is rendered inactive whenever the collector address is set to 0.0.0.0 or 0:0::0.0. |
| Collector UDP Port  | The UDP port on the collector to which sFlow datagrams are sent.   |

**Table 2:** Parameters in the output of the **show sflow** command (cont.)

| Output Parameter     | Description   |
|----------------------|---|
| Tx Max Datagram Size | The maximum size of the sFlow datagrams sent to the collector.  |
| Polling/sampling/Tx  | Whether sFlow sampling and/or polling (and hence sFlow datagram transmission) are active. If inactive the reasons are listed. |

**Related commands** [show running-config sflow](#)  
[show sflow interface](#)

# show sflow interface

**Overview** This command displays sFlow agent sampling and polling configuration for all ports or a specified port.

**Syntax** `show sflow interface [<ifrang>]`

| Parameter | Description          |
|-----------|----------------------|
| <ifrang>  | The interface range. |

**Mode** Privileged Exec

**Example** To display the sFlow sampling and polling configuration for port1.0.1, use the command:

```
awplus# show sflow interface port1.0.1
```

**Output** Figure 70-3: Example output from the **show sflow interface** command

```
awplus#show sflow interface

sFlow Port Configuration:
  Default Values:
    Sampling Rate ..... 0 pkts (= disabled)
    Max Sample Header Size .. 128 bytes
    Polling Interval ..... 0 secs (= disabled)

      Sampling      Max Header      Polling
      Rate          Size          Interval
Port      (1 in N pkts) (bytes)      (secs)
-----
port1.0.1          0          128          0
port1.0.2          0          128          0
port1.0.3          0          128          0
...
```

# undebbug sflow

**Overview** This command applies the functionality of the **no** variant of the [debug sflow](#) command.

## Introduction

**Overview** This chapter provides an alphabetical reference of commands used to configure PROFINET.

PROFINET is a field bus open standard for data communication over Industrial Ethernet. PROFINET control and complexity exceeds older field bus systems like MODBUS.

The PROFINET Protocol suite interacts with and also specifies custom settings and profiles for other protocols. Amongst these are MRP, SNMP, and LLDP as well as using base 802.1Q facilities. PROFINET has different conformance classes for required features. The AlliedWare Plus™ implementation is:

- for an IO device with Conformance Class B (CC-B), which requires port configuration, alarms, SNMP, LLDP support, and optional MRP support.

For more information, see the [Profinet Feature Overview and Configuration Guide](#).

To see which version of AlliedWare Plus is certified for PROFINET on this device, see the device's datasheet.

- Command List**
- [“clear profinet full”](#) on page 3487
  - [“clear profinet persistent-storage”](#) on page 3488
  - [“platform mac-per-port”](#) on page 3489
  - [“profinet vlan”](#) on page 3491
  - [“service profinet”](#) on page 3492
  - [“show counter profinet”](#) on page 3493
  - [“show profinet alarm”](#) on page 3494
  - [“show profinet interface”](#) on page 3496
  - [“show profinet sessions”](#) on page 3498
  - [“show profinet status”](#) on page 3499

# clear profinet full

**Overview** Use this command to clear all configured PROFINET settings, including any hidden settings, and stop the service.

**Syntax** `clear profinet full`

**Mode** Privileged Exec

**Usage notes** The command removes all PROFINET related configuration or storage settings set by remote PROFINET controllers. This means the device will be returned to the standard AlliedWare Plus configuration settings.

**Example** To clear all PROFINET settings, use the command:

```
awplus# clear profinet full
```

**Related commands** [erase factory-default](#)  
[clear profinet persistent-storage](#)

**Command changes** Version 5.5.2-1.6 and version 5.5.3-0.1: command added

# clear profinet persistent-storage

**Overview** Use this command to clear the PROFINET persistent storage.

**Syntax** `clear profinet persistent-storage`

**Mode** Privileged Exec

**Usage notes** As part of the PROFINET set of protocols, it is possible for an external PROFINET Controller to set 'persistent' attribute settings which will be restored if the device reboots, for example, to change the IP address of a device or the PROFINET station name (which maps onto the unit's hostname). Not all of these attributes map well to the AlliedWare Plus™ configuration settings, therefore some of these will appear 'hidden' from the AlliedWare Plus command line. This command clears the settings that the Profinet protocol asks to be persistent.

To clear **all** profinet settings, including the 'hidden' ones, use the [clear profinet full](#) command.

**Example** To clear PROFINET persistent storage, use the command:

```
awplus# clear profinet persistent-storage
```

**Related commands** [erase factory-default](#)  
[clear profinet full](#)  
[profinet vlan](#)

**Command changes** Version 5.5.2-1.6 and version 5.5.3-0.1: command added

# platform mac-per-port

**Overview** Use this command to configure your device to use unique MAC addresses per switch port.

This command is used with PROFINET, a communication protocol to exchange data between controllers and devices. PROFINET requires each device port to have a separate MAC address and a MAC address for the device itself.

Use the **no** variant of this command to remove the feature from your device.

**Syntax** `platform mac-per-port [<0-65535>]`  
`no platform mac-per-port`

| Parameter | Description  |
|-----------|--|
| <0-65565> | Device ID in the range of 0-65535. Each device set with this command, connecting to the same network, must use a unique (different) Device ID. |

**Default** Not set

**Mode** Global Configuration

**Usage notes** This feature requires a PROFINET feature license.

Save your configuration and reboot to enable this feature.

A port MAC address is different to the Layer 3 interface/chassis MAC address. This command creates Extended Local Identifier (ELI) addresses per port, as defined by IEEE standard 802c 8.4.4.1. A variety of Layer 2 protocols make use of unique port MAC addresses including: STP, LLDP, SNMPP, MRP, and PROFINET.

To see the MAC addresses on individual ports, use the **show interface** command.

**Example** To configure unique MAC addresses per port on a device, use the commands:

```
awplus# configure terminal
awplus(config)# platform mac-per-port
```

**Output** Figure 71-1: Example output from configuring **platform mac-per-port**

```
awplus(config)#platform mac-per-port
% Save the config and restart the system for this change to take
effect.
awplus(config)#end
awplus#write
Building configuration...
[OK]
awplus#reboot
reboot system? (y/n):
```

**Related commands** [show platform](#)  
[show interface](#)

**Command changes** Version 5.5.2-1.6 and version 5.5.3-0.1: command added

# profinet vlan

**Overview** Use this command to set the VLAN number for the PROFINET protocol.

VLAN configuration on your device is optional, but all ports running between PROFINET devices must belong to the same VLAN using "Access Mode". Configure the PROFINET software globally to listen on that VLAN.

Use the **no** variant of this command to set the PROFINET VLAN to the default.

**Syntax**

```
profinet vlan <vlan-id>  
no profinet vlan
```

| Parameter | Description                                |
|-----------|--|
| <vlan-id> | The ID of the VLAN PROFINET is running on. |

**Default** By default, PROFINET is configured on VLAN 1.

**Mode** Global Configuration

**Example** To configure PROFINET to use VLAN 2, use the commands:

```
awplus# configure terminal  
awplus(config)# profinet vlan 2
```

**Related commands**

- [erase factory-default](#)
- [clear profinet persistent-storage](#)
- [show profinet status](#)

**Command changes** Version 5.5.2-1.6 and 5.5.3-0.1: command added

# service profinet

**Overview** Use this command to enable the PROFINET service (protocol) on your device. Once PROFINET is enabled, you can then proceed with other PROFINET configuration commands.

Use the **no** variant of this command to disable the PROFINET service.

**Syntax** `service profinet`  
`no service profinet`

**Default** Disabled.

**Mode** Global Configuration

**Example** To enable the PROFINET service, use the commands:

```
awplus# configure terminal
awplus(config)# service profinet
```

To disable the PROFINET service, use the commands:

```
awplus# configure terminal
awplus(config)# no service profinet
```

**Related commands** [show profinet status](#)

**Command changes** Version 5.5.2-1.6 and 5.5.3-0.1: command added

# show counter profinet

**Overview** Use this command to display counters related to the PROFINET protocol.

**Syntax** `show counter profinet`

**Mode** Privileged Exec

**Example** To display PROFINET counters, use the command:

```
awplus# show counter profinet
```

**Output** Figure 71-2: Example output from **show counter profinet**

```
awplus#show counter profinet
Tx success          ..... 0
Tx error            ..... 0
Rx success          ..... 0
Rx error            ..... 0
```

**Related commands** [show profinet status](#)  
[profinet vlan](#)  
[service profinet](#)

**Command changes** Version 5.5.2-1.6 and 5.5.3-0.1: command added

# show profinet alarm

**Overview** Use this command to display the status of the alarms that have been activated. Alarms are declared and a mapping is provided in the GSD file for the device.

A GSD file is a readable XML file. The file contains both general and device-specific specifications for communication and network configuration. Each of the entries describes a feature that is supported by a device.

All AlliedWare Plus™ devices that support PROFINET come with a GSD file.

**Syntax** `show profinet alarm`

**Mode** User Exec

**Example** To display PROFINET alarms, use the command:

```
awplus# show profinet alarm
```

**Output** Figure 71-3: Example output from **show profinet alarm**

```
awplus#show profinet alarm
DIAGNOSIS
Max: 200 items
Items in use: 3
[ 0] USI: 0x8002 [Last]      Channel: 0x0003  Ch.error: 0x0002 Ext.error 0x8000

**Command changes** Version 5.5.2-1.6 and 5.5.3-0.1: command added

# show profinet interface

**Overview** Use this command to display the port information as held by the PROFINET protocol module.

**Syntax** show profinet interface

**Mode** Privileged Exec

**Example** To display all the interface information held by PROFINET, use the command:

```
awplus# show profinet interface
```

**Output** Figure 71-4: Example output from **show profinet interface**

```
awplus#show profinet interface

## Introduction

**Overview** This chapter provides an alphabetical reference of commands used to configure MODBUS (Modicon Communication Bus).

MODBUS is a serial communications protocol for client-server communication between a switch (server) and a device in the network running MODBUS client software (client). You can use MODBUS to connect a computer to a remote terminal unit (RTU) in supervisory control and data acquisition (SCADA) systems.

The MODBUS feature allows AlliedWare Plus™ devices to be used for some SCADA processes - such as gathering sensor and alarm information and to control and monitor the state of ports and their PoE state.

The device encapsulates a request or response message in a MODBUS TCP application data unit (ADU). A client sends a message to a TCP port on the switch. The default port number is 502.

For more information, see the [MODBUS Feature Overview and Configuration Guide](#).

- Command List**
- [“clear scada modbus tcp server connection”](#) on page 3501
  - [“clear scada modbus tcp server statistics”](#) on page 3502
  - [“scada modbus tcp server access”](#) on page 3503
  - [“scada modbus tcp server access permit”](#) on page 3504
  - [“scada modbus tcp server connection”](#) on page 3505
  - [“scada modbus tcp server port”](#) on page 3506

  - [“show scada modbus tcp server connections”](#) on page 3508
  - [“show scada modbus tcp server”](#) on page 3510

# clear scada modbus tcp server connection

**Overview** Use this command to forcefully disconnect a MODBUS client that is currently connected to the MODBUS TCP server.

**Syntax** `clear scada modbus tcp server connection <ip-address> <1-65535>`

| Parameter    | Description  |
|--------------|--|
| <ip-address> | The IPv4 or IPv6 address of the MODBUS TCP server. |
| <1-65535>    | The port ID number.                                |

**Mode** Privileged Exec

**Example** To forcefully disconnect a client from the MODBUS TCP server, use the following commands:

```
awplus# configure terminal
awplus(config)# clear scada modbus tcp server connection
198.51.100.200 33229
```

**Related commands**

- [scada modbus tcp server port](#)
- [scada modbus tcp server connection](#)
- [show scada modbus tcp server](#)
- [scada modbus tcp server access](#)
- [clear scada modbus tcp server statistics](#)
- [show scada modbus tcp server connections](#)

**Command changes**

- Version 5.4.8-2.1: command added
- Version 5.4.9-0.1: MODBUS support added for x930, x950 series
- Version 5.5.0-1.1: MODBUS support added for IE510 series

# clear scada modbus tcp server statistics

**Overview** Use this command to reset the MODBUS TCP server statistics.

**Syntax** `clear scada modbus tcp server statistics`

**Mode** Privileged Exec

**Example** To clear the MODBUS TCP server statistics, use the following commands:

```
awplus# configure terminal
awplus(config)# clear scada modbus tcp server statistics
```

**Related commands**

- Version 5.5.0-1.1: MODBUS support added for IE510 series

# scada modbus tcp server access

**Overview** Use this command to configure the type of requests that are allowed to be made to the MODBUS TCP server.

Use the **no** variant of this command to revert to the default of read-only.

**Syntax** `scada modbus tcp server access {read-only|read-write}`  
`no scada modbus tcp server access`

**Default** Read-only.

**Mode** Global Configuration

**Example** To allow read and write requests to the MODBUS TCP server, use the following commands:

```
awplus# configure terminal
awplus(config)# scada modbus tcp server access read-write
```

To change from read-write access back to the default of read-only, use the following commands:

```
awplus# configure terminal
awplus(config)# no scada modbus tcp server access
```

- Version 5.5.0-1.1: MODBUS support added for IE510 series

# scada modbus tcp server access permit

**Overview** Use this command to limit access to a MODBUS TCP server to specific IP addresses.

When no permitted IP addresses are configured, then any IP address can connect to the MODBUS TCP server.

When permitted IP addresses are configured, only those IP addresses will be allowed to connect to the MODBUS TCP server. All other IP addresses will be rejected.

Use the **no** variant of this command to remove an IP address from the list of permitted addresses.

**Syntax** `scada modbus tcp server access permit <ip-address>`  
`no scada modbus tcp server access permit`

| Parameter                       | Description                         |
|---------------------------------|-------------------------------------|
| <code>&lt;ip-address&gt;</code> | The IPv4 or IPv6 address to permit. |

**Default** No IP addresses are configured.

**Mode** Global Configuration

**Example** To allow only 192.168.2.200 to use the MODBUS TCP server, use the following commands:

```
awplus# configure terminal
awplus(config)# scada modbus tcp server access permit
192.168.2.200
```

To remove 192.168.2.200 from the permitted MODBUS TCP server client IP addresses, use the following commands:

```
awplus# configure terminal
awplus(config)# no scada modbus tcp server access permit
192.168.2.200
```

- Version 5.5.0-1.1: MODBUS support added for IE510 series

# scada modbus tcp server connection

**Overview** Use this command to configure the maximum number of concurrent MODBUS TCP clients allowed to be connected to the MODBUS TCP server.

Use the **no** variant of this command to revert to the default of 1.

**Syntax** `scada modbus tcp server connection <1-5>`  
`no scada modbus tcp server connection`

| Parameter | Description   |
|-----------|---|
| <1-5>     | The maximum number of concurrent MODBUS TCP clients allowed to be connected to the MODBUS TCP server. |

**Default** 1

**Mode** Global Configuration

**Example** To configure the maximum limit of MODBUS TCP clients to 5, use the following commands:

```
awplus# configure terminal
awplus(config)# scada modbus tcp server connection 5
```

To reset the maximum limit of the MODBUS TCP clients back to the default of 1, use the following commands:

```
awplus# configure terminal
awplus(config)# no scada modbus tcp server connection
```

# scada modbus tcp server port

**Overview** Use this command to set the port of the MODBUS TCP server on a device. Clients will use this port to connect to the MODBUS TCP server.

Use the **no** variant of this command to disable MODBUS TCP.

**Syntax** `scada modbus tcp server port <0-65535>`  
`no scada modbus tcp server`

| Parameter | Description                              |
|-----------|--|
| <0-65535> | The port number of the MODBUS TCP server |

**Default** Port 502

**Mode** Global Configuration

**Example** To configure port number 34567 as the MODBUS TCP server, use the following commands:

```
awplus# configure terminal
awplus(config)# scada modbus tcp server port 34567
```

To reset the port number of the MODBUS TCP server to the default of 502, use the following commands:

```
awplus# configure terminal
awplus(config)# no scada modbus tcp server port
```

# scada modbus tcp server

**Overview** Use this command to enable MODBUS TCP server on a device.  
Use the **no** variant of this command to disable MODBUS TCP.

**Syntax** `scada modbus tcp server`  
`no scada modbus tcp server`

**Default** Disabled

**Mode** Global Configuration

**Example** To enable the MODBUS TCP server, use the following commands:

```
awplus# configure terminal
awplus(config)# scada modbus tcp server
```

# show scada modbus tcp server connections

**Overview** Use this command to display the information and statistics of the currently connected clients to a MODBUS TCP server.

**Syntax** `show scada modbus tcp server connections`

**Mode** User Exec and Privileged Exec

**Example** To display the information and statistics of the currently connected clients to a MODBUS TCP server, use the following commands:

```
awplus# configure terminal
awplus(config)# show scada modbus tcp server connections
```

**Output** Figure 72-1: Example output from **show scada modbus tcp server connections**

```
